# Glossary

A **plenary session** is a session in which an invited speaker, usually with a significant subject matter, presents their work or viewpoint. All attendees attend these general sessions as they usually begin and end a program of events. Plenary sessions vary in length from one (1) hour to one and a half (1½) hours and can be accompanied by PowerPoint presentations, audio and/or video files and other visual aids.

An **oral presentation** is a brief 15-20 minute individual presentation time moderated by a volunteer. An effective oral presentation should have an introduction, main body and conclusion like a short paper and should utilize visual aids such as a PowerPoint presentation. Oral presentations are divided into different categories based on the program presented. Categories can include: clinical, leadership, scientific, evidence-based practice, or research.

A **poster presentation** is the presentation of research information by an individual or representatives of research teams at a conference with an academic or professional focus. The work is peer-reviewed and presented on a large, usually printed placard, bill or announcement, often illustrated, that is posted to publicize. Exceptions to peer-reviewed posters include Rising Stars student posters and Sigma Theta Tau International's Leadership Institute participant posters.

A **symposium** is a presentation coordinated by an organizer similar to a panel discussion and contains at least three (3) presentations concerning a common topic of interest. Each symposium session is scheduled for 45-75 minutes and allows for questions at the end of the session. Symposia provide an opportunity to present research on one topic, often from multiple perspectives, providing a coherent set of papers for discussion.

A **peer-reviewed paper** is simply an individual abstract that has been reviewed by at least three (3) peer-reviewers to determine the eligibility of the submission to be presented during a program. The determination is made by the peer-reviewer answering a series of regarding the substance of the abstract and the materials submitted. Scores from each reviewer are compiled. The average score must be 3.00 on a 5-point Likert scale in order to qualify for presentation. Sigma Theta Tau International enforces a blind peer-review process, which means that the reviewers do not see the name or institution of the authors submitting the work. All submissions, with the exception of special sessions and invited posters are peer-reviewed.

An **invited** or **special session** is similar to a symposium in the length of time allotted for presentation, but is not peer-reviewed. These sessions focus on a specific area, but are conducted by individuals invited to present the work.

# Introduction

The Honor Society of Nursing, Sigma Theta Tau International (STTI) conducted its 43rd Biennial Convention in Las Vegas, Nevada, USA from 7-11 November 2015. More than 2,000 nurses from around the world gathered at the convention, which had as its theme “Serve Locally, Transform Regionally, Lead Globally.”

Program objectives of the 43rd Biennial Convention include:

- Identify strategies that promote collaboration in interprofessional initiatives
- Enrich the achievement of knowledge, leadership, and professional service to promote and sustain collaboration amongst diverse communities
- Explore innovative strategies to promote excellence in global nursing
- Enhance clinical, patient, and educational outcomes through transformative nursing practice

This PDF ebook is amazingly searchable. In reflection of that, you will not find a lot of internal linking. Simply select the search option and type any search keyword or name you want to explore.

These conference proceedings are a collection of abstracts submitted by the authors and presented at the convention. To promptly disseminate the information and ideas, participants submitted descriptive information and abstracts of at least 300, but no more than 1,500 words. Each oral and poster presentation abstract was peer-reviewed in a double-blind process in which three scholars used specific scoring criteria to judge the abstracts in accordance with the requirements of STTI's Guidelines for Electronic Abstract Submission.

Finally, the opinions, advice, and information contained in this publication do not necessarily reflect the views or policies of STTI or its members. The enhanced abstracts provided in these proceedings were taken directly from authors' submissions, without alteration. While all due care was taken in the compilation of these proceedings, STTI does not warrant that the information is free from errors or omission, or accept any liability in relation to the quality, accuracy, and currency of the information.

# Format for Citing Papers

Author. (Year). Title of paper. In *Title of conference proceedings* (page numbers). Place of publication: Publisher.

Example:

Smith, C. C. (2015). Nursing Research and Global Impact. In *Engaging Colleagues: Improving Global Health Outcomes: Proceedings of the 25<sup>th</sup> International Nursing Research Congress* (pp. xxx-xxx). Indianapolis, IN: Sigma Theta Tau International.

# Table of Contents

Plenary Sessions .....	84
OPEN PLEN - OPENING PLENARY: Sigma Theta Tau International as Edge Runner Through Serving Locally, Transforming Regionally and Leading Globally .....	85
PLEN 2 - PLENARY SESSION 2: Claiming an Area of Knowledge as Nursing Science to Improve the Health of Marginalized Populations.....	86
PLEN 3 - PLENARY SESSION 3: In the Quest for Excellence: The Role of Nurse Leaders in the Post-MDG Era.....	87
Pre-Convention Workshops .....	88
WKSP - WORKSHOP: New Roles for Nurses in a Changing Health Care System...	89
CENE - Sigma Theta Tau International/Chamberlain College of Nursing Center for Excellence in Nursing Education (CENE) Pre-Conference.....	90
CENE PLEN - Engaging Students to Clinically Think: Preparing Practice-Ready Nurses ..	90
CENE - Sigma Theta Tau International/Chamberlain College of Nursing Center for Excellence in Nursing Education (CENE) Pre-Conference .....	92
CENE 01 - Challenges and Tips for the Novice Grant Writer .....	92
CENE - Sigma Theta Tau International/Chamberlain College of Nursing Center for Excellence in Nursing Education (CENE) Pre-Conference .....	93
CENE 02 - Mentoring Millennials .....	93
CENE - Sigma Theta Tau International/Chamberlain College of Nursing Center for Excellence in Nursing Education (CENE) Pre-Conference .....	94
CENE 03 - Challenges and Tips for Experienced Grantwriters: Movement into Nursing Education Research .....	94
CENE - Sigma Theta Tau International/Chamberlain College of Nursing Center for Excellence in Nursing Education (CENE) Pre-Conference .....	96
CENE 04 - Situated Coaching: A Response to the Urgent Call for Transformation in Education .....	96
CENE - Sigma Theta Tau International/Chamberlain College of Nursing Center for Excellence in Nursing Education (CENE) Pre-Conference .....	97
CENE 05 - TIPS (Thoughts, Ideas and Possible Strategies) for Implementation of a Funded Grant.....	97
CENE - Sigma Theta Tau International/Chamberlain College of Nursing Center for Excellence in Nursing Education (CENE) Pre-Conference .....	98

CENE 06 - Fostering Healthy Work Environments: Powered by Civility, Collegiality, and Teamwork .....	98

# **Sigma Theta Tau International 43rd Biennial Convention (07 November - 11 November 2015) Abstracts**

## **Plenary Sessions**

---

## **OPEN PLEN - OPENING PLENARY: Sigma Theta Tau International as Edge Runner Through Serving Locally, Transforming Regionally and Leading Globally**

*Hester C. Klopper, PhD, MBA, FANSA, RN, RM, South Africa*

### Purpose

Attention will be given to initiatives that has been supporting the call to action as we celebrate our achievements as members, chapters and the organization as a whole.

### Target Audience

All convention attendees

### Description

Over the past biennium the STTI board of directors has approved a new Strategic Plan (2014-2020) in line with the organization's vision and mission. Aligned with the strategic plan, the Presidential Call to Action (2013-2015) focused on Serve Locally, Transform Regionally and Lead Globally. During this opening plenary, detailed will be shared on the progress of the organization and feedback on the state of the society in general. Attention will be given to initiatives that has been supporting the call to action as we celebrate our achievements as members, chapters and the organization as a whole. ## PLEN 2 - PLENARY SESSION 2: Claiming an Area of Knowledge as Nursing Science to Improve the Health of Marginalized Populations

*Jacquelyn Campbell, PhD, MSN, BSN, RN, USA*

### Purpose

The purpose of the presentation is to trace the development of an area of nursing science (holistic health responses to violence victimization and improving the health care response to victims) and provide strategic lessons in building from an unwavering purpose to improve the health of vulnerable populations and community collaborations to formulate health policy and epistemology for other emerging areas of nursing science.

### Target Audience

The target audience for this presentation is nursing researchers, clinicians, and nursing students of all levels.

### Description

The meaning of the Greek word episteme is a system of understanding or a body of ideas which give shape to the knowledge of that time, contrasted to "doxa" or common belief or opinion. The collaborative effort of many nurse researchers and practitioners over 25 years has resulted in the holistic health outcomes of violence being recognized both inside and outside nursing as an important area of nursing science. Nursing science has broken ground in integrating knowledge about the physiological and neurobiological with physical and mental health and behavioral responses to being abused and victimized by violence. The nursing knowledge has provided leadership in improving the health care system response and health policy for victims of violence which can significantly decrease the multiple health inequities related to violence for marginalized populations. This presentation will trace this progress and provide strategic lessons in unwavering purpose to improve the health of vulnerable populations, policy formation, community collaborations and epistemology for other emerging areas of nursing science. Specific areas where nursing science has led the way such as the physical and mental health outcomes through physiological and neurobiological alterations such as immune system dysfunction of violence victimization, physiological intersections of violence against women and HIV, the health inequities resulting from violence victimization for marginalized populations, the health outcomes for women and infants from abuse during pregnancy including maternal mortality from homicide and suicide, and the risk factors for intimate partner femicide including strangulation and how to assess danger with abused women. The policy initiatives that have resulted from this work (e.g. routine screening and brief counseling for abused women in the ACA, intersections of HIV and gender based violence) will be described as well as effective nursing interventions improving the health and safety of abused women (e.g. DOVE, IRIS and the MyPlan app) and suggested interventions for other forms of trauma (such as appropriate assessment and interventions for TBI among abused women; appropriate health as well as justice interventions for campus sexual assault victims) and other age and cultural groups building on nursing knowledge. The particular "empowerment" epistemology used by most of the nursing researchers in this field will also be described as appropriate for other fields of nursing science where the purpose is to improve the health of vulnerable populations through research, effective practice and policy formation.

## PLEN 3 - PLENARY SESSION 3: In the Quest for Excellence: The Role of Nurse Leaders in the Post-MDG Era

*Sheila Tlou, Professor, South Africa*

### Purpose

This presentation will identify the global context in which nursing exists and discuss aspects of nursing leadership in the post-2015 era. Dr. Tlou will share reflections on her personal pursuit for excellence and leadership and how she has used those lessons to inspire leadership in the implementation of the Sustainable Development Goals.

### Target Audience

All convention attendees.

# Pre-Convention Workshops

---

## WKSP - WORKSHOP: New Roles for Nurses in a Changing Health Care System

*Joanne Spetz, PhD, FAAN (honorary), USA*

### Purpose

The purpose of this interactive workshop is to provide nurses in clinical practice, education and research with critical information about the affordable care act (ACA) and new roles that are emerging as a result of the ACA.

### Description

The Affordable Care Act and incentives for health care organizations to pursue the “Triple Aim” of better care, better health, and lower costs are spurring significant changes in the financing and organization of health care services in the United States. Greater demand for health care services, particularly primary and ambulatory care, and new payment models are placing pressure on health care organizations to increase the value of the services they provide and to reduce costs. What is the role of RNs in these new care models, and in ensuring access to care for the newly insured? The workshop will begin with a review of key components of the ACA and the current state of ACA implementation. Participants will engage in an interactive activity about the details of the ACA, including how some components are likely to be modified due to administrative decision-making and new legislation. Then, the projected impact of the ACA on employment of nurses and other health workers will be examined, drawing from published research. Workshop participants will learn of several new studies that have projected the impact of the ACA on demand for health care services and the subsequent demand for health care workers. They will engage in “table sharing” activities to discuss how their organizations are facing new demand for services due to the ACA, and also due to the changing demographics of the U.S. population. The last component of the workshop will focus on emerging roles of RNs in Accountable Care Organizations, care management, cost-saving programs, and other new models of care. The skills required of RNs to optimally fill these new roles will be examined. Workshop participants will engage in brainstorming and other activities to link educational and training needs to the competencies required for RNs to play an optimal role in the future.

## CENE PLEN - Engaging Students to Clinically Think: Preparing Practice-Ready Nurses

---

*Patricia Kyriakidis, PhD, MSN, BSN, RN, USA*

### Purpose

The purpose of this presentation is to demonstrate new pedagogical methods to transform education in ways that engage learners to clinically think and reason.

### Target Audience

The target audience of this presentation includes educators and administrators.

### Description

An urgent call for transformation in education was recently issued based on research findings from the Carnegie Foundation, Macy Foundation, Robert Wood Johnson/IOM, the Lancet Commission, and QSEN. Research, currently validated by everyday experience with new graduate nurses, clarifies that the traditional pedagogical strategies of lectures and multiple-choice tests fail to adequately educate or assess graduating professionals for a practice. Graduates do not know how to clinically think and reason, so safe care of patients is not possible. These traditional methods succeed in helping learners acquire knowledge – vast amounts of knowledge. However, they fail to prepare new graduates to USE critical knowledge appropriately and as needed when caring for patients. The education-practice gap continues to widen, to the point that extensive and expensive residency programs are now mandatory to prepare new professionals to become clinically safe enough to practice. Learners convey that they generally do not prepare for class by completing the extensive reading assignments, in part, because faculty bridge the learning gap. Students reveal that teachers bridge the gap by 1) lecturing on the content deemed important, 2) sharing their PowerPoint presentations, and 3) testing primarily on that content. The result is passive learners who enter practice without a solid basis for and understanding about how to integrate theory into practice. Being practice-ready means gaining all essential knowledge but, as importantly, knowing how to use that knowledge in the right patients and at the right time. Teaching for a practice therefore requires a strong foundation in the sciences but also requires that faculty coach learners' thinking and use of that general knowledge from the sciences into specific patient situations (in a context), if it is to be remembered. This imperative calls for change in pedagogical strategies and engagement by learners to use knowledge as they gain it. This session will explore new pedagogical methods that engage learners to become active participants in a lively classroom, provide clinically relevant content, compel the development of clinical thinking and reasoning, and support educators to coach the use of knowledge in specific patient contexts. The first method provides learners with salient, clinically relevant content that better prepares them to clinically think according to the logic of clinical practice rather than the logic of theory. Second, the incorporation of simulated, unfolding, and unprompted cases allows learners to immediately use the knowledge gained by problem-solving authentic patient situations. Using knowledge to problem solve promotes learning to think like a nurse. Third, small group discussions engage learners to think and reason about authentic and common clinical and complex issues that occur in specific patient situations. The in-class challenges provide faculty with opportunities to coach learners in their development of clinical thinking in the context of real patients issues. Making it possible for learners to think and act like a nurse prior to entering practice better prepare them to become practice-ready nurses. To support pedagogical changes, innovative resources that can assist educators to integrate the major research findings and improve engagement and clinical thinking will be examined.

## CENE 01 - Challenges and Tips for the Novice Grant Writer

---

*Mark Haykowsky, PhD, USA*

### Purpose

The purpose of this presentation is to identify the types of grants available for today's nurse educators/researchers and to identify the components of a comprehensive grant application. Participants will also gain an understanding of why grant writing skills are critical for faculty members in programs of nursing.

### Target Audience

The target audience of this presentation is individuals and/or teams who wish to obtain basic skills in grant writing. Specifically, the content will be geared to persons who wish to develop a grant which focuses on educational research in nursing and educational administrators who support faculty who conduct the research.

### Description

"Challenges and TIPS for the Novice Grant writer" is part of the Center for Excellence in Nursing Education (CENE) at Sigma Theta Tau-Chamberlain College of Nursing's Faculty Professional Role Development Program which is designed to assist faculty members achieve career goals that lead to promotion and / or tenure. Specifically, the Faculty Professional Role Development Program is committed to assist faculty members on tenure - track positions and clinical, non - tenure - track positions progress through the ranks of the educational academy. While expectations of faculty members in various ranks vary from university to university, entrance into, and movement throughout the educational system frequently requires nurse educators to seek funding for projects designed to implement and evaluate ' best practices ' in nursing education. Differences and similarities between educational research and clinical research will be identified. Challenges inherent for novice grant writers will be explored and TIPS (Thoughts, Ideas, Possible Strategies) will be discussed. Challenges include identification of the changes in national trends, meeting the expectations for evidence - based practice and education, types of grants available and becoming / maintaining competence in grant writing infrastructures (Holtzclaw, 2009). Specific agencies and foundations that fund research in nursing educational topics will be introduced. TIPS to be discussed include selection of an appropriate team which includes all key personnel including the Principal Investigator, Co-Investigators, graduate research assistants, and staff support. Additional TIPS will provide information about the importance of a compelling abstract, specific aims, the background and significance of the study questions and any preliminary studies that have been conducted. The selection of the appropriate research design and methods to be used to conduct the study and analyze the data will be explored. Emphasis on a realistic budget and the rationale for funds which are requested will be discussed.

## CENE 02 - Mentoring Millennials

---

Mary M. Wheeler, BN, MEd, RN, PCC, Canada  
Janice Waddell, PhD, RN, Canada

### Purpose

The purpose of this presentation is to introduce participants to the characteristics of Millennials and Boomers; compare traditional and new ways of mentoring; and provide an opportunity to practice varied approaches to mentorship.

### Target Audience

The target audience of this presentation are individuals who want to learn how reverse mentorship can be used to recruit, engage and retain millennials.

### Description

Millennials, those born between 1977 and 1997 and also referred to as Generation Y, comprise one of the largest segment of undergraduate and graduate nursing education programs as well as the workforce. Millennials have a wide range of characteristics and talents that they bring to their education programs and their workplace. They are known for being naturally curious, technologically savvy, they want work that is personally fulfilling and that connects to a larger purpose, they also desire a great deal of feedback and like to be noticed. Often limited access to experienced mentors in leadership positions and their advanced knowledge of health care and the workings of the organization can be perceived by Millennials as a barrier to career development and advancement. The second largest cohort in both the educational and nursing workforce are Baby Boomers born between 1946 and 1964. Boomers, as they are often referred to, also have a wide range of characteristics and talents they bring to the academic or work setting including extensive experience and expertise but may be limited in the arena of technology, trends, and understanding younger generational nuances, for example how to communicate with Millennials. Millennials are used to searching for and choosing their own mentors, of which they may have more than one at a time and their mentors are not limited to their academic or work settings. These relationships also tend not to be the traditional mentorship relationship where the mentor, who is older and wiser helps the less experienced mentee with the achievement of their career goals. Today Millennials embrace reverse, group and peer mentorship as ways to achieve their careers goals. Reverse mentoring is where a younger individual acts as a mentor to share their expertise with a more senior colleague, the mentee. This cross-generational relationship can be mutually beneficial to both Millennials and Boomers as they tap into the wisdom of the other. In this presentation we describe the similarities and differences of Millennials and Boomers, show how reverse and other non-traditional models of mentorship may be strategies educational programs and workplaces can use to benefit both groups.

## CENE 03 - Challenges and Tips for Experienced Grantwriters: Movement into Nursing Education Research

---

*Mary Lou Bond, PhD, RN, CNE, ANEF, FAAN, USA*

### Purpose

The purpose of this presentation is to demonstrate new pedagogical methods to transform education in ways that engage learners to clinically think and reason.

### Target Audience

The target audience of this presentation includes educators and administrators.

### Description

An urgent call for transformation in education was recently issued based on research findings from the Carnegie Foundation, Macy Foundation, Robert Wood Johnson/IOM, the Lancet Commission, and QSEN. Research, currently validated by everyday experience with new graduate nurses, clarifies that the traditional pedagogical strategies of lectures and multiple-choice tests fail to adequately educate or assess graduating professionals for a practice. Graduates do not know how to clinically think and reason, so safe care of patients is not possible. These traditional methods succeed in helping learners acquire knowledge – vast amounts of knowledge. However, they fail to prepare new graduates to USE critical knowledge appropriately and as needed when caring for patients. The education-practice gap continues to widen, to the point that extensive and expensive residency programs are now mandatory to prepare new professionals to become clinically safe enough to practice. Learners convey that they generally do not prepare for class by completing the extensive reading assignments, in part, because faculty bridge the learning gap. Students reveal that teachers bridge the gap by 1) lecturing on the content deemed important, 2) sharing their PowerPoint presentations, and 3) testing primarily on that content. The result is passive learners who enter practice without a solid basis for and understanding about how to integrate theory into practice. Being practice-ready means gaining all essential knowledge but, as importantly, knowing how to use that knowledge in the right patients and at the right time. Teaching for a practice therefore requires a strong foundation in the sciences but also requires that faculty coach learners' thinking and use of that general knowledge from the sciences into specific patient situations (in a context), if it is to be remembered. This imperative calls for change in pedagogical strategies and engagement by learners to use knowledge as they gain it. This session will explore new pedagogical methods that engage learners to become active participants in a lively classroom, provide clinically relevant content, compel the development of clinical thinking and reasoning, and support educators to coach the use of knowledge in specific patient contexts. The first method provides learners with salient, clinically relevant content that better prepares them to clinically think according to the logic of clinical practice rather than the logic of theory. ## CENE 04 - Situated Coaching: A Response to the Urgent Call for Transformation in Education

---

*Patricia Kyriakidis, PhD, MSN, BSN, RN, USA*

### Purpose

The purpose of this presentation is: to demonstrate the particular pedagogical method, situated coaching, to transform education in ways that engage learners to clinically think and reason and improve learning.

### Target Audience

The target audience of this presentation includes educators and administrators. (Clinical, academic, administrative)

### Description

It is well known that challenging people to engage in solving problems is a strong pedagogical strategy. For clinicians, clinical problem solving situates learning in the context of a patient's problem which commonly creates a strong instance of learning. Research shows that learners absorb much more than just theory. When presented with real life situations or problems, learners face authentic issues, approach it with seriousness, explore multiple possible solutions when searching for good answers, and can imaginatively solve problems. This kind of learning requires and compels higher levels of thinking and reasoning and it results in higher retention. Situated learning provides greater benefit in two additional conditions. One, learning is further improved when learners come together in interactive dialogue, that is, in communities. Learning is richer and reinforced when communities of learners work together, challenge each others' perceptions and thinking, and can arrive at better informed decisions. Second, learners reap greater benefit when someone more knowledgeable and more experienced coaches their thinking (a situated coach). Situated coaching, as presented in this session, explores the combination of learning in communities while being coached by very knowledgeable and experienced educators. Knowing why learners develop better and learn more does not assist in knowing how to perform as a situated coach and how to transform education that provides situated learning, challenges for problem solving, and communities of learning. This session demonstrates and details how to perform as a situated coach and create communities of learning. Participants will learn by doing. Multiple ways of coaching for situated learning will be demonstrated to include small and large groups of learners. Situated learning in communities offers an additional advantage. During open and lively dialogue, the clinical thinking of the learners becomes visible. As educators move between groups, they can assess what content the learners are drawing from, whether the science is well understood, how learners use knowledge in their thinking to problem solve, whether knowledge is used appropriately and in context, and so on. Over time, educators can evaluate the development of clinical thinking and reasoning in individuals as well as in the whole group. The session will provide a strong alternative to traditional lecture methods.

## CENE 05 - TIPS (Thoughts, Ideas and Possible Strategies) for Implementation of a Funded Grant

---

*Mary Lou Bond, PhD, RN, CNE, ANEF, FAAN, USA*

*Mark Haykowsky, PhD, USA*

### Purpose

The purpose of this presentation is to explore essential components of the implementation of funded grants. Participants will gain an understanding of the steps to be taken to assure that the objectives of the grant are met. Presentations include information about responsibilities of personnel including IRB approval, progress reports and dissemination.

### Target Audience

The target audience of this presentation is individuals and/or teams who wish to review steps of implementation of a funded grant. Specifically, the content will be geared to persons who have been awarded grants in educational research in nursing and educational administrators who support faculty who conduct the research.

### Description

This session is part of the Center for Excellence in Nursing Education (CENE) at Sigma Theta Tau International-Chamberlain College of Nursing's Faculty Professional Role Development Program which is designed to assist faculty members achieve career goals that lead to promotion and/or tenure. Specifically, the Faculty Professional Role Development Program is committed to assist faculty members on tenure-track positions and clinical, non-tenure-track positions progress through the ranks of the educational academy. Obtaining funding for research studies and/or programs of research is a common expectation in most all academic settings. Once a grant has been submitted, there are 'steps' that can be taken to plan ahead for implementation of funded grants or consideration of re-submission for applications which were not funded. While specific procedures for implementation of a funded grant vary from university to university, there are common components to the implementation of all grants. Initial activities following notice of funding include a review of the timelines for all activities, ordering equipment and supplies and recruiting and training of all members of the research team. The importance of obtaining approval from the Institutional Board of Review (IRB) at an early time will be discussed followed by a review of procedures for data collection analysis and maintenance of confidential information. Expectations for submission of progress reports along with requests for any changes from the original application will be reviewed. Scoring systems from selected funding agencies ( for example, STTI and NLN ) will be presented and reasons for re-submission will be explored. Examples of the implementation of funded nursing educational research conducted by the presenters will be included. Reasons for non-submission of grants, including changes in priorities for funding by the agency, changes in priorities of the university and/or investigators and related factors will be explored. Questions and examples from the audience will be invited.

# CENE - Sigma Theta Tau International/Chamberlain College of Nursing Center for Excellence in Nursing Education (CENE) Pre-Conference

## CENE 06 - Fostering Healthy Work Environments: Powered by Civility, Collegiality, and Teamwork

---

*Cynthia M. Clark, PhD, RN, ANEF, FAAN, USA*

### Purpose

The purpose of this engaging session is to provide a deepened and empirical understanding of workplace incivility, its impact on individuals, teams, and workplaces, and to present several practical and evidence-based strategies to cultivate and sustain healthy workplaces.

### Target Audience

The target audience for this presentation is nurse leaders and managers, clinical nurse educators, faculty, and nurses at all levels of the academic and practice workplace.

### Description

Incivility in the health care workplace can have devastating and lasting effects on individuals, teams, organizations, and ultimately patient care. Further, incivility negatively impacts nurse recruitment, retention, teamwork, and job satisfaction. All nurses regardless of setting or position have an ethical imperative to create and sustain healthy work places and to foster an atmosphere of dignity and respect. Every year since 1999 (except 2001 following the 9/11 attacks, when first responders were rated higher), Americans responding to Gallop Polls rate nurses as highest on honesty and ethical standards. While this distinction is impressive, it is important for nurses to consistently display actions that merit this high honor. Nursing practice is guided by codes of ethics detailing the moral and ethical imperatives for nurses. The American Nurses Association (ANA) Code of Ethics for Nurses with Interpretive Statements (2015) clearly articulates the nursing's obligation to foster safe, ethical, civil workplaces. For example, Provision 1.5 Requires nurses "to create an ethical environment and culture of civility and kindness, treating colleagues, co-workers, employees, students, and others with dignity and respect...and that any form of bullying, harassment, intimidation, manipulation, threats or violence will not be tolerated" (p. 4). Provision 6 states, "the nurse, through individual and collective effort, establishes, maintains, and improves the ethical environment of the work setting and conditions of employment that are conducive to safe, quality health care" (p. 23). These provisions support the need for civil actions that must be continuously demonstrated by nurses in all areas of nursing education and practice. Fortunately, nurses in academic and practice settings are eager to address these issues and implement evidence-based, workable solutions to create and sustain healthy workplaces. Imagine a dynamic workplace that is a joy to experience each day - an environment in which you can truly thrive in your career and profession. Join a renowned nurse researcher and accomplished author for a lively and interactive session on creating and sustaining a culture of civility in nursing education and practice, and discover several ready-to-use strategies to foster collegiality including an evidence-based tool to assess the health of your own workplace.

## **Special Sessions**

---

## A 21 - SPECIAL SESSION: Experienced Nurse Faculty Leadership Academy (ENFLA)

*Carol L. Huston, DPA, MSN, RN, FAAN, USA*

### Purpose

To provide an opportunity for the nine 2014/2015 ENFLA Leadership Scholars to present their individualized leadership development plans and share the experiences they encountered, as well as insights gained in achieving these leadership goals.

### Target Audience

STTI members interested in leadership development and particularly those interested in enrolling in future STTI/Chamberlain College of Nursing Center for Excellence in Nursing Education leadership academies.

### Description

In an effort to advance global excellence in nursing education, Sigma Theta Tau International (STTI)/Chamberlain College of Nursing Center for Excellence in Nursing Education (CENE) launched a 12-month Experienced Nurse Faculty Leadership Academy (ENFLA) in October 2014. The ENFLA was designed for experienced faculty (Leadership Scholars) with at least seven years of full-time employment in a faculty role, who wished to increase their leadership acumen and develop or increase the skill sets essential for success in a faculty leadership role. Program goals included to:

- Further academic career development and success.
- Promote personal and professional leadership development.
- Develop and begin to implement a personal leadership progression plan.
- Expand the influence of the Leadership Scholar within his or her sponsoring academic institution, the community, and the profession in the context of teaching, scholarship, or service.
- Advance nursing education through leadership development projects implemented by Leadership Scholars during the program.
- Promote experienced nurse faculty retention in academe.

Using a triad model, nine Leadership Scholars, nine Mentors, and eight Faculty worked collaboratively in this pilot cohort to assist the Scholars in planning and implementing comprehensive leadership projects, as well as identifying and implementing an individualized leadership development plan. Strategies for program and personal goal achievement included online learning activities, online discussion forums, personal reflection assessments, and face-to-face workshops. For this session, each of the nine pilot cohort Scholars will present their individualized leadership development plan and share their experiences they, as well as insights gained in achieving these leadership goals. In particular, Scholars will address how this program and the leadership goals, will allow them an expanded scope of influence as a nursing leader and change agent in the future (Leadership project outcomes are demonstrated by poster presentation at another session at the Convention). Additional information about applying for the 2016/2017 ENFLA cohort will be made available to attendees.

## **A 22 - SPECIAL SESSION: The Maternal-Child Health Nurse Leadership Academy: Taking Clinical Leadership to the Next Level**

*Diane L. Spatz, PhD, RN-BC, FAAN, USA*

*Julia Snethen, PhD, MSN, BSN, RN, USA*

*Patricia Clinton, PhD, MSN, BSN, IA, ARNP, CPNP, USA*

### Purpose

The purpose of this presentation is to present the goals, structure and outcomes of the MCH Academy.

### Target Audience

The target audience for this presentation are nurses who are interested in enhancing their leadership skills and advancing maternal-child health care.

### Description

The Honor Society of Nursing, Sigma Theta Tau International, in partnership with Johnson and Johnson, has advanced the leadership skills of maternal and child nurses and nurse midwives in its 18-month Maternal Child Health Nurse Leadership Academy (MCH). In the 12 years since its launch, more than 296 nurses and nurse midwives from six countries have taken part in the MCH Academy. During this presentation, faculty will discuss the MCH Academy model; this session will offer a synopsis of the MCH Academy goals, objectives, structure, learning activities and outcomes. These nurses and nurse midwives work with mothers and babies up to age five in a variety of health care settings across North America. Over the duration of the academy, Fellows are paired with Leadership Mentors and Faculty Advisors to plan and implement an interprofessional leadership project. MCH is designed to operationalize leadership skills and apply them in health systems for sustainable impact. This academy offers a unique mentorship model that provides the foundation for life changing leadership development. For example, leadership behavior scores for academy Fellows have increased, on average, by 11% and scores for academy Mentors have increased by 9%. At the conclusion of the 18-month academy the Fellows disseminate project results according to the principles of evidence-based research at an international conference. Based on the reports of the MCH participants, 90% of the academy projects are sustained at their institution because of policy changes and improved patient care. In addition, 50% of projects served as a catalyst for other projects aimed at improving the health and well-being of mothers and babies. For example, a Fellow's project decreased NICU stay by 1.47 days during the academy. The MCH Academy experience strengthens individual leadership behaviors in nurses and nurse midwives, enabling them to expand their scope of influence, lead interprofessional teams and facilitate health care system changes to impact quality patient care outcomes.

## **B 21 - SPECIAL SESSION: Save Stan Turns Five: A Large-Scale Interprofessional Practice and Academe Innovation**

*Colette Foisy-Doll, MSN, BScN, RN, CHSE, Canada*

*Sharla King, PhD MEd, Canada*

*Dawn Ansell, BScN, RN, Canada*

*Margot Zemrau, BScN, RN, Canada*

### Purpose

The purpose of this presentation is to share lessons learned in inter-institutional collaboration for IPE; to describe the planning, implementing, and evaluating of HELP! Save Stan Saturday; disseminate research findings; communicate the process we have honed for sustained successful delivery of this large-scale event, and to share challenges and successes encountered on the journey.

### Target Audience

The target audience is healthcare practitioners, educators, and administrators interested in learning about a successful practice-academe initiative and its challenges and successes. Simulationists involved or interested in advancing IPE will be particularly interested.

### Description

The Interdisciplinary Health Education Partnership (IHEP) is an inter-institutional, interprofessional team comprised of healthcare simulation specialists and interprofessional education experts from both clinical practice and academic settings in Edmonton, Alberta Canada. Over the past seven years, IHEP members have successfully developed, implemented, and evaluated multi-modal interprofessional simulations (SIM-IPE) for pre-licensure learners at HELP! Save Stan Saturday (SSS). This annual IPE event offers learners a full day of interprofessional team-based scenarios focused on increasing interprofessional competence. IHEP, through the implementation of SSS, has developed capacity for SIM-IPE in faculty and clinical instructors and successfully provided pre-licensure health science students the opportunity to increase IP competence. Moreover, this partnership has resulted in significant enrichment of SIM-IPE in the nursing and non-nursing simulation practice communities locally and across Canada. On March 14, 2015, the IHEP development team will implement the 5th HELP! Save Stan Saturday! Strong interprofessional partnerships are not simply a "nice to have", they are pivotal to the advancement of team development in nursing and other professions. Inter-institutional partnerships also promote the development of strong, collaborative communities of practice whose collective efforts have the power to shift healthcare culture for safer patient care. Collective findings support that SIM-IPE and IP competency attainment, is positively correlated with improved care outcomes and increased patient safety (Jeffries & Battin, 2011; Lemoine, Chauvin, Broussard & Oberleitner, 2015). The five-member partnership, formally established in 2009, is a collaborative between Alberta Health Services e-SIM (the Provincial Health Authority simulation team), MacEwan University, Northern Alberta Institute of Technology (NAIT), NorQuest College, and the University of Alberta to develop capacity in faculty and students, where three of the post-secondary institutions offer pre-licensure programs in nursing that range from practical nursing to baccalaureate nursing degrees. To date, IHEP has developed, delivered and evaluated relevant interprofessional simulation experiences for pre-licensure students from over 20 disciplines in certificate, diploma and degree programs. To date, nearly 1000 students from the 4 post-secondary institutions have participated in a series of SIM-IPE offerings representing the full continuum of care. This full day event requires the involvement of over 100 specifically trained IP simulation educators who collaborate to deliver upwards of 30 evidence-based interprofessional simulations to pre-licensure students from across all health disciplines. The educators come from both academe and clinical practice settings. Capacity building among educators unfolds through engagement in the coordination, development, and facilitation of interprofessional simulations. Continuing faculty development activities comprise of workshops in debriefing and scenario development for IPE and a 3 day educator training curriculum and course entitled, Sim ETC (Simulation Educator Training Course) that has been offered in 3 Western Canadian provinces. Overcoming Challenges to the Collaboration: Challenges and barriers to the implementation of IPE include: 1) unique, discipline-specific cultures; 2) physical distances that make timetabling and logistics difficult, contributing to the inadequate socialization of undergraduate students from different

disciplines; 3) differences in curricular goals and foci, as well as; 4) variations in areas such as workload, reward systems, research expectations, and varied teaching approaches using simulation within and across institutions for faculty members (Thibault, 2011). The benefits of adopting an inter-institutional collaborative model include; 1) enhanced individual and collective abilities to enact strategic goals in IPE toward transforming clinical education and ultimately improve patient care; and 2) provision of a platform for socialization, and networking with other educators/administrators to overcome common barriers (King et al, 2013). The IHEP team planned for these challenges by: 1) developing infrastructure and governance processes comprised of an oversight committee with representation and voting power from each partner and key stakeholder groups; 2) building a unified vision for SIM-IPE based on common goals; 3) creating a web-based repository for sharing IPE scenarios and resources; 4) employing SIM-IPE 'best practice' as the basis for program and partnership development; 5) creating a SIM-IPE community of practice by promoting collaborative learning, research development and establishing multiple opportunities for building cross-institutional relationships; and 5) creating and delivering relevant, well-designed IPE experiences that mirror students' future practice (Bridges, Davidson, Soule et al., 2011; Greenstock, Brooks, & Bingham, 2013; INACSL, 2011, 2013; Jeffries & Rizzolo, 2013; Lemoine et al., 2015; Thibault, 2011). Identifying a unified approach to curriculum development and delivery of SIM-IPE proved crucial to successful outcomes. The faculty development team, therefore, articulated a shared vision to offer simulation that promoted high levels of realism and interactivity for the learners. Each of the 30+ simulations offered at SSS are grounded in simulation and educational best practices. Therefore, best practice provides a foundation for SIM-IPE design and incorporates, 1) the Simulation Education Framework (Jeffries, 2007); 2) the Canadian Interprofessional Health Collaborative Framework for IPE, (CIHC, 2010); 3) Standards of Best Practice: Simulation by the International Association for Clinical Simulation and Learning (INACSL) (2011; 2013); and 4) an approach to debriefing developed through the Center for Medical Simulation (CMS) at Harvard (Rudolph et al, 2006; 2007; 2008). All SIM-IPE experiences comprised: 1) pre-briefing/briefing; 2) simulation scenario development using a common IHEP template; and 3) a plan for assessment and debriefing grounded in learning objectives for team-based competency acquisition. Only trained faculty facilitate SIM-IPE delivery where debriefing focuses on team competencies in healthcare. Simulation typologies are selected based on their capacity to optimize engagement and interaction for the learner. Low fidelity partial task trainers, medium and high fidelity simulators, standardized patients, embedded actors (confederates), virtual reality, and hybrid simulations are all simulation modalities utilized in SSS. A survey by Adamson (2010, as cited in Jeffries & Battin, 2011), reported antecedents to excellence in faculty development within simulation consortia as; 1) collaborative learning for faculty; 2) support for learning from colleagues and administrators, and; 3) encouragement through the use of varied incentives. Additionally, deliberate efforts to network and reflect on shared experiences, created a capacity building environment for simulationists from the various disciplines. The IHEP team continues to replicate a synergistic phenomenon born of uniting innovative thinkers, life-long learners, and movers and shakers that are impassioned by a shared vision; that of employing SIM-IPE to effect cultural change in healthcare and increase patient safety. Tipping Points: The IHEP team collaborated for the duration of the project funding. New funding proved elusive and the team faced the largest challenge it had encountered to that point: should the partnership fold or should we find a way to continue? Two years have passed since the official closing of the project and the energy, commitment, enthusiasm from all partner sites has not diminished. The team found ways to cut expenses and seek funding from each of the partner sites and vendors to cover the cost of implementation and ensure no charge for students. Resource Allocation: The catalyst for the partnership's work was government funding. The partnership developed principles to guide our initial collaborative work. Each partner had an equal voice at the table, regardless of the size of the institution. The SSS event rotated among institutions to ensure equity. Faculty development debriefing workshops were co-instructed by people from all institutions and the hosting responsibilities were shared equally across institutions. The fact that the partnership still thrives after leadership turnovers and lack of base funding is a testament to the value of the activities and outcomes. Next year, the SSS event will be integrated into a required course for students from one institution. Measurable Positive Student Outcomes: Evidence of positive student outcomes gathered through three sources: 1) survey results; 2) student interviews; and 3) reflections with digital storytelling. The University of West England Questionnaire (Pollard et al, 2004) was used pre and post simulation experience to determine the change in communication and teamwork. Overall, students' perceptions of their communication and teamwork skills increased after completing either simulation. Placing students in teams that are relevant for practice, rather than defaulting to

grouping them by academic credentials, provided positive learning experiences for all participants, as demonstrated by these results. Results from student interviews indicated that 3-6 months post-SSS, students still felt confident to share their ideas, felt they had a better understanding of other disciplines' roles and understood the value of collaboration for better patient care. The digital storytelling narratives revealed that students and faculty appreciated learning in a psychologically safe environment. Moreover, the participants' stories spoke highly of reflective team debriefing strategies that resulted in transformational learning experiences with self-reported increases self-efficacy in IP competencies and skill transferability to team practice for enhanced patient care. Future research is planned to explore point-of-care outcomes for patients and teams. HELP! Save Stan lives on!

## **B 22 - SPECIAL SESSION: How to Build a Successful Mentoring Relationship**

*Mary M. Wheeler, BN, MEd, RN, PCC, Canada*  
*Michelle Cooper, BScN, MScN, RN, ACC, Canada*

### Purpose

The purpose of this presentation is to introduce participants to The Five Phase Mentoring Relationship Model©, purpose, engagement, planning, emergence, and completion and discuss how they can use this model as a framework to build a successful mentoring relationship.

### Target Audience

The target audience of this presentation are individuals who want to learn how to find or be a mentor and build a successful mentorship relationship or enrich their current mentoring relationship.

### Description

Mentoring is a strategy to support retention, succession planning, job satisfaction and role enhancement. It is an approach that enables individuals to engage in conversations and relationships directed at enhancing career satisfaction, professional development and ultimately practice. Mentoring offers many benefits to both mentors and mentees including improved confidence and autonomy in one's role, increased productivity, the development of new knowledge and skills and enhanced networking and inter-professional collaboration. A successful mentoring relationship is founded on mutual trust, shared values, interests, and commitment. It is a complex process and its success is largely dependent on the care taken to build it. The quality of the relationship has a significant effect on achieving mentoring outcomes. Successful mentoring relationships require investing time to understand the why and the how of the mentoring relationship and commitment of time for ongoing focused interaction and reflection. Having a clear career goal that a mentor can help the mentee to achieve or that can be fulfilled by being a mentor is the first step in a successful mentoring relationship. Despite the significantly positive impacts and benefits that mentoring relationships can have, few know how to enter into and establish a mentoring relationship. Building a successful mentoring relationship is a learned skill that can be developed and sustained for both mentors and mentees. In 2007, the authors developed The Five Phase Mentoring Relationship Model (MRM), together with tools to support successful mentoring relationships for an inter-professional e-Mentorship program. Since then the MRM has been used extensively with individuals and organizations as a framework for informal mentorship relationships and formal mentorship programs. This presentation will describe the MRM (purpose, engagement, planning, emergence, and completion) and take participants through each of the phases answering such questions as Why do I want a mentor? How can I find a mentor? How will we work together? How can I achieve my goals? How am I doing? What are we learning? and What are my next steps?

## **B 29 - SPECIAL SESSION: Global Advisory Panel on the Future of Nursing (GAPFON): Recommendations, Strategies and Outcomes**

*Hester C. Klopper, PhD, MBA, RN, RM, FANSA, South Africa*  
*Cathy Catrambone, PhD, RN, FAAN, USA*

### Purpose

To explain the need for GAPFON, its purpose and goals, and how it is positioning itself through global regional meetings to address critical educational, leadership, policy, and workforce issues for nursing within the context of global health.

### Target Audience

Nurses, stakeholders and partners who are in position to positively influence global health, and who can work with GAPFON to increase nursing's voice, vision, and visibility where education, leadership, policy and workforce issues impact global health.

### Description

The purpose of The Global Advisory Panel on the Future of Nursing (GAPFON) is to advance nursing's voice and vision in the context of global health by engaging nurses to lead the formation of health and social policy. This purpose resonates with STTI's mission to advance world health and to celebrate nursing excellence in scholarship, leadership, and service. To lead local, regional and global change effectively, nurses must be recognized for their knowledge and expertise by key global organizations and governments. As a global initiative, GAPFON will invite thought leaders who can influence change, including ministers of health, chief nurses, regulatory bodies, nursing associations and educational institutions to participate in global regional meetings. Examples of stakeholders include STTI, ICN, WHO and the UN. These meetings will serve as a catalyst to stimulate collaboration towards refining nursing education and curriculum development, advancing positive global health strategies, strengthening nursing, and enhancing health outcomes worldwide. Recommendations are expected to address leadership, education, policy, workforce, work environment, MDG's/SDG's, and NCD's. During this presentation GAPFON's purpose will be discussed, as will the initial outcomes and recommendations from the global meetings held to date in the Middle East, Pacific Rim, Caribbean and Latin/Central America. Strategic action plans based on measurable outcomes will be discussed and recommendations developed regarding the process of consensus building among all stakeholders to identify key issues by region from a cultural and political perspective. The purpose of The Global Advisory Panel on the Future of Nursing (GAPFON) is to advance nursing's voice and vision in the context of global health by engaging nurses to lead the formation of health and social policy. ## C 21 - SPECIAL SESSION: Innovation: The Bridge of Industry and Research to Advance Professional Nursing Scholarship

Roy L. Simpson, DNP, RN, DPNAP, FAAN, USA

### Purpose

The purpose of this presentation is to allow the participant to walk away with the understanding of how to make your case to industry to move innovations into the market place for the healthcare industry after attending.

### Target Audience

The target audience of this presentation is nurse leaders, nurses interested in executive leadership, CNO/CNE.

### Description

This presentation will focus on the understanding of the industry of informatics plays in the advancement of innovation. It will describe some of the characteristics that align industry partnerships to advance nurse scholarship through business principles and knowledge. Technology competencies are not just a part of Chief Nurse Executives (CNEs) responsibilities; this understanding and its related skills are critical to CNEs. institutional and organizational leadership. While a thorough understanding of technology's impact on patient care remains the responsibility of nurse informaticians, CNEs will need to possess a broad, working knowledge of IT to safeguard patient care outcomes. CNEs may need more sophisticated technology-related expertise if they are to harness the power of computing to demonstrate the quality- and financially-related advantages that nursing brings to patient care. Given the critical nature of nursing input to the purchase, design, and utilization of systems, baseline information about needed nurse executive competencies could inform educators and professional organizations about the needs for nurse executive education in the IT and nursing informatics arena. Dr. Simpson is Vice President of Nursing for Cerner Corporation. He is responsible for strategic sales, planning the patient care enterprise and industry relations related to professional nurse practice. With more than 600 published articles and presentations on nursing informatics and professional issues to his credit, he is an internationally known speaker with 35+ years' experience and a contributor to numerous professional publications and editorial boards, including Nursing Forum, Applied Nursing Research, Nursing Administration Quarterly, Journal of Continuing Education in Nursing, American Nurse Today and a columnist for technology journals. Dr. Simpson was a pioneer in the development and funding of the Nursing Minimum Data Set (NMDS) along with sentinel research directing core competencies for executives leading with information technology. He is a fellow of the American Academy of Nursing, New York Academy of Medicine and National Academies of Practice. He has held and holds various Board and trustee appointments along with board alignment with Regents College, Excelsior University, MyMedEd, public and private corporations. Simpson and his colleagues initiated a world-class faculty for an online nursing administration and nursing informatics master's program in the 1990's. He is currently employed with Cerner Corporation in partnership with Emory University's Nell Hodgson Woodruff School of Nursing's new Doctorate of Nursing Practice (DNP) program. Dr. Simpson provides consultation in the Health Systems Leadership Track, a unique corporate global program preparing DNP students for executive health leadership.

## C 29 - SPECIAL SESSION: Developing Nursing Education Leaders through Intentional Behavior Change and Expanded Scope of Influence

*Deborah Cleeter, EdD, MSN, RN, USA*

*Trisha Leann Horsley, PhD, RN, CHSE, CNE, USA*

*Elaine C. Hardy, PhD, RN, USA*

*Jennifer L. Embree, DNP, MSN, BSN, RN, NE-BC, CCNS, USA*

*Laura C. Dzurec, PhD, MS, BS, RN, PMHCNS-BC, ANEF, USA*

### Purpose

To inform those interested in developing nursing education leaders through an intentional personal experience and to share outcomes related to three domains of leadership development within the Nurse Faculty Leadership Academy.

### Target Audience

Emerging and experienced nurse leaders who are interested in an experiential academy focused upon behavioral change and expanding scope of influence.

### Description

The Nurse Faculty Leadership Academy (NFLA) is a 20-month personal leadership development experience that engages junior faculty and leaders of their home academic institutions. The experiential nature of the NFLA requires intentionality and commitment from all members of the academy community. The NFLA is designed to facilitate personal leadership development; foster academic career success; promote nurse faculty retention and satisfaction; and cultivate high performing, supportive work environments in academe. A rigorous international leadership development experience, the NFLA is constructed on a behavioral philosophy of leadership development that is integrated throughout all curricular and relational components of the academy. The NFLA employs a triad mentoring structure as the foundation for Scholars' learning milieu. Each triad is composed of an experienced Leadership Mentor, an academy Faculty Advisor, and a Scholar participant. Throughout the academy the triad meets regularly to implement the application of curricular activities, to guide reflective exercises, and to provide a framework for the leadership development process. The Kouzes-Posner 'Leadership Challenge' model serves as a behavioral practice framework for the leadership development curriculum. Three domains form the basis of the experience: individual leadership development, advancing nursing education through leadership of team projects, and the Scholars' expanded scope of influence within their sponsoring academic institutions, the community, and the profession. The structure of the academy includes two immersion leadership development workshops, two in-person Site Visits, and monthly Scholar Community Conference Calls. In addition, triads meet regularly by phone or videoconference for guided advisory conversations. The NFLA leadership development philosophy, history of the academy design, curricular elements and composition, mentoring roles and responsibilities, and the impact of the academy on the future of leadership in nursing education will be described by current faculty. As aspiring leaders, three Scholars from the current cohort will present their leadership development experiences through storytelling and discussion of outcomes from the three domains.

## **D 21 - SPECIAL SESSION: Research Abstracts, Proposals and Grant Writing: Basics from Start to Finish**

*Lois S. Marshall, PhD, RN, USA*

### Purpose

to provide the novice researcher the basics to write a research abstract, proposal, and/or grant for submission

### Target Audience

New nurse researchers and nurses seeking grants

### Description

This presentation will provide the novice researcher the basics to write a research abstract, proposal, and/or grant for submission. This session will enable participants to gain a basic understanding of the steps of the abstract/proposal/grant writing process in order to enable them to put forth a submission in the future. Participants will be able to interact with some past recipients of STTI small research grants who will provide practical information on the writing, submission, and follow-up process.

## **D 22 - SPECIAL SESSION: Getting Published in Nursing Journals: Strategies for Success**

*Susan Gennaro, DSN, RN, FAAN, USA*

*Bernadette Mazurek Melnyk, PhD, RN, CPNP/PMHNP, FAANP, FNAP, FAAN, USA*

### Purpose

The purpose of this presentation is to describe the publishing process and highlight key strategies for successful publication in peer reviewed journals.

### Target Audience

Any nurse interested in submitting their work for publication.

### Description

**Purpose:** Publishing is an important venue to disseminate important work, including scholarly papers, research findings, evidence-based practice change/quality improvement projects, and clinical innovations. However, many important works never make it to publication due to multiple barriers, including perceived inadequate time for writing, lack of mentorship, and inadequate knowledge and skills regarding tactics for successful publication. Therefore, the purpose of this presentation is to describe the publishing process and highlight key strategies for successful publication in peer reviewed journals. **Target Audience:** The target audience for this session is any nurse interested in submitting their work for publication. **Methods:** This session, conducted by the editors of *Worldviews on Evidence-Based Nursing* and the *Journal of Nursing Scholarship*, will highlight key strategies for writing and achieving successful publication. The editors will provide a discussion of how to eliminate barriers to publication as well as the steps in assembling various types of manuscripts. Approaches to dealing with multiple authors, the publication process, and the ethics of publishing will also be discussed. Tactics for resubmission, the peer review process, and how to become an excellent reviewer for journals also will be highlighted. A lively interchange among both editors and the audience provides participants with ample time to have their questions regarding all aspects of publication answered. Although this session is aimed more at beginning authors, more seasoned authors, reviewers, and even editors from other journals have all contributed to make this topic a perennial favorite. **Conclusions:** This session will equip participants with the needed knowledge necessary to be successful in writing, submitting papers for publication, and responding to peer review through resubmission. Open dialogue with the editors of *Worldviews on Evidence-Based Nursing* and the *Journal of Nursing Scholarship* will facilitate a lively session where participants have the opportunity to receive answers to a variety of their burning questions.

## **D 29 - SPECIAL SESSION: Outcomes Impacting Care of Older Adults: Geriatric Nursing Leadership Academy Fellowships**

*Deborah Cleeter, EdD, MSN, RN, USA*

*Heidi K. Holmes, RN, BA, BScN, MScN, RN, GNC(C), FGnLA, Canada*

*Jennifer L. DeClercq, MSN, RN-BC, FGnLA, USA*

*Lisa R. Binns-Emerick, MSN, RN, CS, GNP-C, USA*

*Nancy E. Edwards, PhD, MS, ANP-BC, USA*

### Purpose

To inform nurses of the correlated impact of leadership development through the Geriatric Nursing Leadership Academy fellowships upon practice advancements and policy influence.

### Target Audience

interested in developing as influential leaders within practice, clinical education, and administrative settings.

### Description

Preparing and positioning a global cadre of nurse leaders to transform relevant practice and policy for older adults is essential for the future of healthcare. The international Geriatric Nursing Leadership Academy (GNLA) provides an intentional personal and professional development experience for Fellows who are mid-career geriatric nurse leaders. Through the use of a behavioral leadership development philosophy as the foundation of the fellowship experience, all academy relationships, curriculum activities, faculty modeling, and reflective exercises align with this approach. With formal mentoring and faculty relationships, Fellows engage in eighteen months of meaningful personal development through implementation of an integrated experiential curriculum, development of interprofessional leadership knowledge and skill, and strategic partnerships with senior executives of healthcare organizations. The structure of the academy includes two immersion workshops, two site visits at the Fellows' sponsoring organizations, monthly Fellow community conference calls, and frequent regular triad advisory calls. The GNLA uses the Kouzes-Posner "Leadership Challenge" model as a framework for behavioral change as Fellows purposefully expand both influence and impact in leading policy and practice advancements in caring for older adults. Having concluded the academy's fourth cohort, significant outcomes have been achieved by the Fellows within three domains: individual leadership development; advancement of practice through leadership of interprofessional team projects; and expanded scope of influence at the organizational, community, and professional levels. Faculty and Fellows of the GNLA will present exemplars of the leadership mentoring and faculty relationship triad, individual leadership development, practice outcomes achieved through the interprofessional team projects, and the resultant expanded scope of influence within the field of caring for older adults. In addition, a presentation by the Amy Berman Geriatric Nursing Leadership Awardee will be included in which this emerging leader's significant contributions to the care of older adults is highlighted. The impact of leadership development through the GNLA and its relationship to the future of practice advancements in care of older adults will be described.

## E 21 - SPECIAL SESSION: Everyday Ethics in the 21st Century: Creating and Sustaining a Culture of Ethical Practice

*Cynda Hylton Rushton, PhD, RN, FAAN, USA*  
*Marion E. Broome, PhD, RN, FAAN, USA*

### Purpose

The purpose of this presentation is to explore the ethical issues that keep nurses up at night and to examine the tools and resources that are needed for nurses to practice ethically in the 21st century.

### Target Audience

The target audience of this presentation broadly includes nurses in clinical practice, nurse educators, nurse ethicists and/or bioethicists, academics in ethics, and policy makers.

### Description

Ethical issues in nursing are not new; ask any practicing nurse what keeps them up at night. Nurses in all roles and specialties confront myriad ethical issues in their everyday practice. Yet, there are growing concerns about the prominence of ethical issues in health care and gaps in nursing competence in ethical practice, educational models for teaching ethics, policies that undermine nurse integrity, and an insufficient evidence base to guide interventions. In August 2014, 50 nursing leaders participated in a national summit on Nursing Ethics for the 21st Century, sponsored by the Johns Hopkins School of Nursing and Berman Institute of Bioethics. Participants created a Blueprint for the Future focusing on recommendations in clinical practice, education, policy and research and a vision for 21st Century Nursing Ethics. This interactive, experiential session will explore the ethical issues that keep nurses up at night and examine the tools and resources that are needed for nurses to practice ethically in the 21st century. There will be interactive dialogue with participants about how to live the vision for 21st Century Nursing Ethics in the everyday practice to create an ethically grounded model of transformational nursing practice. Finally, we will explore the elements of a culture of ethical practice and highlight implications for inter-professional practice. Ethical issues in nursing are not new; ask any practicing nurse what keeps them up at night. Nurses in all roles and specialties confront myriad ethical issues in their everyday practice. ## E 22 - SPECIAL SESSION: Becoming an Author: Books, Courses, e-Prints

*Matthew S. Howard, MSN, RN, CEN, CPEN, CPN, USA*

*Mary McAdams, BSN, RN, CEN, CPEN, TNS, USA*

*Dustin Sullivan, BS, USA*

*Kimberly Thompson, MLS, USA*

*Carla Hall, BS, USA*

### Purpose

The purpose of this presentation is to provide participants with a first-hand look at how an idea becomes a published work.

### Target Audience

experienced or potential book authors

### Description

This interactive session will provide new, experienced or potential authors a first-hand look at the publishing abilities offered by STTI. From how an idea turns into a published book, or an online educational course or article or into a published online work, STTI staff will provide participants with their road map to successful publications.

## **E 29 - SPECIAL SESSION: Replication of the Maternal-Child Health Nurse Leadership Academy in Africa**

*Christa Van der Walt, PhD, MSocSc, MEd, BEd, BArtSc, RN, RM, South Africa*

*Karin C.S. Minnie, PhD, RN, RM, South Africa*

*Oslinah Buru Tagutanazvo, PhD, RN, RM, Swaziland*

*Hester C. Klopper, PhD, MBA, RN, RM, FANSA, South Africa*

### Purpose

1. Share the replication and development of the Africa MCHNLA 2. Provide evidence of the success of the Pilot and the current Academy.

### Target Audience

The target audience for this presentation are nurses and midwives who are interested in enhancing their leadership skills and advancing maternal-child health care.

### Description

This special session focuses on the process followed from the inception of the idea to the completion of the first cohort of the Africa Maternal Child Health Nurse Leadership Academy (MCHNLA) in August 2015. We will share the background and history of the replication of the MCHNLA in Africa with reference to the need for leadership development in the field of maternal-child health in Africa, followed by a historical overview of the development of the Africa MCHNLA. This will be followed by our experience of the pilot Academy in the North-West Province of South Africa (2012-2013) and of the first cohort of the Africa MCHNLA (2014-2015). We will then share the process of adapting the curriculum for the Pilot and the first Africa cohort and compare the processes followed between the 2 curricula and again, lessons learned. This will be followed by a discussion of specific issues such as stakeholder involvement, communication, funding, selection of faculty, mentors and mentees, mentoring, and capacity development. We will explain what we did, what happened and how we experienced the pilot Academy by providing an overview of the evaluation results and lessons learned from the Pilot. We will then discuss the role of stakeholders and the challenges faced in marketing the MCHNLA in a continent where it is unknown. We will also give attention to the process followed and reflect on the success and challenges during the process and in terms of the outcomes. With regard to mentee and mentor selection, we will explain the reason for changing the selection process from the MCHNLA North American model. This will be followed by a discussion of mentoring and logistical issues in terms of communication, budgeting, organizing workshops and keeping momentum. In conclusion, we will address the lessons learned in the overall process of replicating the Maternal Child Health Nurse Leadership Academy in Africa.

## F 22 - SPECIAL SESSION: A Digital Destination for All Your Work: The Virginia Henderson Global Nursing e-Repository

*Kimberly Thompson, MLS, USA*

*Matthew S. Howard, MSN, RN, CEN, CPEN, CPN, USA*

### Purpose

The purpose of this session is to inform nurses in all areas of the profession (leaders/faculty members, researchers, clinicians, and nursing students) about this wonderful, free of charge, peer-reviewed alternative publishing resource. Once populated with full-text items, it will become a global resource for nursing research and evidence-based practice materials.

### Target Audience

Nurse leaders, Nursing school faculty, Clinicians, Researchers, Students

### Description

What are you waiting for? Have you written research or evidence-based practice materials that have not been published in a traditional journal, but still deserve to be shared? If the answer is yes, then the Virginia Henderson Global Nursing e-Repository is your answer! Learn more about this free clinical and scholarly dissemination resource and how to submit your materials. Do you want to know more about the repository and the benefits it offers to nurse authors who are eager to share their clinical and academic scholarship on a global basis, thus furthering the growth of the profession as a whole? Are you looking for an alternative publishing resource to submit your evidence-based practice and research related works to? Do you have reports, white papers, faculty created learning objects, capstone projects, a thesis, and/or dissertation that you would like to share with others? Good news! The Henderson Repository offers all nurse authors a free, convenient way to share these types of documents (and others) in a no charge, open-access, peer-reviewed, environment. As a resource of STTI it is open to both members and nonmembers. Come to this session to learn more about this unique alternative publishing opportunity! The purpose of this session is to inform nurses in all areas of the profession (leaders/faculty members, researchers, clinicians, and nursing students) about this wonderful, free of charge, peer-reviewed alternative publishing resource. Once populated with full-text items, it will become a global resource for nursing research and evidence-based practice materials. The target audience for this session include nurse leaders, nursing school faculty, clinicians, researchers, students, and any nurse who is interested in disseminating their research across the globe. ## F 29 - SPECIAL SESSION: EuroVision 2020: Collaboration for Transformation of the European Region

*Joy Merrell, PhD, MSc, BSc, (Hons) (NsgSt), RGN, RHV, RNT, HV, United Kingdom*

*Marie-Louise Luiking, RGN, MA, Netherlands*

*Elizabeth Anne Rosser, DPhil, MN, DipRM, DipNEd, RN, RM, United Kingdom*

*Aida Cruz Mendes, PhD, MSc, RN, MSc, Portugal*

*Margret Lepp, PhD, RN, RNT, Sweden*

### Purpose

To share the achievements, activities and challenges experienced by the five Chapters and one honor society in the European Region to delegates and members outside Europe in order to promote collaboration and learning from one another

### Target Audience

Delegates and STTI members outside of the European Region.

### Description

The purpose of this session is to share the achievements, activities and challenges experienced by the five Chapters and one honor society in the European Region to delegates and members outside Europe in order to promote collaboration and learning from one another. Whilst the global regions were established in 2013 the European Chapters have been meeting annually and collaborating together since 2007. We have developed a regional strategic plan titled Eurovision 2020 which we reviewed and updated in January 2015 which we wish to share with you and we welcome your views and thoughts on our strategic goals and initiatives. A key goal is to expand STTI across Europe. Currently there are approximately 1000 members (active and inactive) in the five European chapters, although in addition there are European nurses who are members of Chapters especially in North America. To raise awareness of STTI in Europe we have successfully hosted European conferences in Cardiff in 2012 and Gothenburg in 2014 – doubling the number of delegates in two years - and will be hosting our third conference in Utrecht in 2016. To support and expand the development of STTI across Europe including widening access to STTI regional events by European nurses, we have established a European Development Fund (EDF) which is mainly funded through profits gained from the conferences. The purpose and administration of the EDF will be fully discussed during the presentation. In order to set the scene for this session the current state of nursing and nursing education across Europe will be presented, which will highlight the similarities as well as differences across the European countries. The challenges and opportunities arising from the European nursing context will then be discussed in relation to STTI's mission, vision and strategy for globalisation. Specifically we will explore challenges with respect to recruitment and retention which although not unique to the European Chapters are influenced by the cultural context. We will discuss initiatives we have implemented to seek to aid recruitment especially of students. We will show how the goals of the European strategic plan support and are congruent with STTI's strategy for globalisation. We have sought to work collaboratively with members outside Europe and initiatives with Gamma Psi at Large Chapter in Hawaii and Omicron Delta Chapter in California will be highlighted. The STTI European Region has expanded since 2007 and we are hopeful of a new honor society being established in Ireland soon. However, there is more to do to raise awareness and widen the membership of STTI across Europe, ensuring that the European region meets the needs of European nurses whilst also ensuring the mission of STTI is retained. As a Region and through this presentation we aim to facilitate collaboration and networking and play an active role in enabling STTI to become the global organisation of choice for nursing it aspires to be. Join us to hear what your European colleagues have achieved and what challenges we still face.

## G 14 - SPECIAL SESSION: Publishing Roles: A Career Road for You

*Susan Gennaro, DSN, RN, FAAN, USA*

*Bernadette Mazurek Melnyk, PhD, RN, CPNP/PMHNP, FAANP, FNAP, FAAN, USA*

### Purpose

The purpose of this presentation will be to describe how to develop a career path in publishing and highlight both the benefits and challenges associated with various publishing roles.

### Target Audience

The target audience for this presentation is nurses with an interest in career roles in publishing, whether in the clinical or academic arena.

### Description

**Purpose:** There are many benefits to pursuing a career path in the publishing world, including opportunities to keep abreast of the latest knowledge, research, developments and innovations in your field and be recognized as an expert in your area. The purpose of this presentation will be to describe how to develop a career path in publishing and highlight both the benefits and challenges associated with various publishing roles. **Target Audience:** The target audience for this presentation is nurses with an interest in career roles in publishing, whether in the clinical or academic arena. **Methods:** This session, conducted by the editors of *Worldviews on Evidence-based Nursing* and the *Journal of Nursing Scholarship*, will highlight various career roles in publishing as well as the benefits and challenges associated with each of them. First, the benefits of being a reviewer for journals will be discussed along with tips for conducting outstanding manuscript reviews. Second, the role and responsibilities of serving on an editorial board will be described. Third, the benefits and challenges of being an associate editor and editor will be highlighted. The editors also will discuss how using and going beyond publishing to impact positive changes in clinical practice and health policy is necessary to improve quality of care and health outcomes. A lively interchange among both editors and the audience will provide participants with ample time to have their questions answered regarding all aspects of career roles in publishing.

**Conclusions:** This session will equip participants with the needed knowledge necessary to be successful in pursuing a career path in publishing, including the role of manuscript reviewer, being on an editorial board, and assuming the roles of assistant/associate editor or editor. Open dialogue with the editors of *Worldviews on Evidence-based Nursing* and the *Journal of Nursing Scholarship* will facilitate a lively session where participants will have the opportunity to receive answers to a variety of their burning questions.

## G 21 - SPECIAL SESSION: Is Leadership in STTI in Your Future? A Dialogue with the Leadership Succession Committee

*John J. Whitcomb, PhD, RN, CCRN, FCCM, USA*

*Safiya George Dalmida, PhD, APRN-BC, USA*

*Suzanne Prevost, PhD, RN, COI, USA*

*Patrice Nicholas, DNSc, DHL (Hon), MPH, MS, RN, ANP, FAAN, USA*

### Purpose

The purpose of this presentation is to educate members about leadership opportunities at the chapter, regional, and international levels of STTI in advancing the vision of STTI as the global organization of choice for nursing.

### Target Audience

target audience of this presentation includes new STTI members to seasoned members who have interests in assuming leadership roles in the honor society, including chapter leaders, regional leaders, and international leaders.

### Description

This session will focus on leadership opportunities within STTI across all levels of the organization. From chapter level leadership to regional to international levels of leadership, STTI welcomes your engagement in the mission of the Honor Society of Nursing, Sigma Theta Tau International, aimed at advancing world health and celebrating nursing excellence in scholarship, leadership, and service. The session will offer examples of leadership opportunities and exemplars of leadership trajectories from early membership in STTI to international leadership. Also incorporated into the presentation will be the roles and responsibilities of the Leadership Succession Committee, including member development and mentorship for leadership roles. The process of nominee selection and biennial ballot preparation will be discussed, including the education and experience needed for specific offices and leadership opportunities. We will review the process for assessing expertise and skill levels of candidates, as well as the role of the Leadership Succession Committee as a resource during the delegate and convention briefings. This session will focus on leadership opportunities within STTI across all levels of the organization. *Cynthia Vlasich, MBA, BSN, RN, USA*

### Purpose

The purpose of this presentation is to inform participants about STTI's Global Initiatives, discuss the foundation of these initiatives and how our United Nations affiliation impacts our global reach.

### Target Audience

The target audience for this presentation is nurse leaders around the globe who wish to learn more about STTI and its global initiatives and our United Nations affiliation.

### Description

The history of Sigma Theta Tau International (STTI) is varied and rich. It includes a deliberate decision to become international, including global expansion, which was formalized at the 1985 Biennial Convention in Indianapolis, when the House of Delegates voted to add "International" to Sigma Theta Tau's name. The international work of STTI undertaken since that time has led to the current Global Initiatives department. Focusing on the past five years, STTI has made great strides in its global advancement. For example, STTI has its first president, elected by the full House of Delegates, from outside of North America. STTI launched its first formal presence outside of America, contracting with a nursing organization in South Africa to specifically conduct work to advance the organization, under the auspices of STTI. STTI launched its first International Leadership Institute based outside of North America, with the Maternal-Child Health Nurse Leadership Academy in Africa. Global regions were identified and Regional Coordinators elected from around the world. Six hundred ninety-seven institutions are now engaged with STTI, through 499 chapters, located in 26 countries. Currently, over 135,000 members can be found in 92 countries across the globe. In July 2012, the United Nations Economic and Social Council (ECOSOC) granted Special consultative status to STTI, which refers to expertise in the field of nursing and global health. This demonstrates STTI's commitment to achieving international cooperation toward solving humanitarian related issues. This was predicated on the approval as an associated non-governmental organization (NGO) by the Department of Public Information of the United Nations (UN) in December 2009. Through our UN affiliation, STTI commits to disseminate information and raise public awareness about the purposes and activities of the UN and related issues of global concern. STTI will continue to conduct outreach around the world to help our nurse members better understand the work of the UN, including the Sustainable Development Goals (SDGs). The Global Initiatives department focuses on various strategic directions. These directions include work to support STTI through Educational Standards, Regulation and Licensing; Global Member Engagement; Global Expansion; Relationship/Reputation Building; and the Global Advisory Panel on the Future of Nursing.

## H 22 - SPECIAL SESSION: Preparing Future Nurses for Practice: Becoming a Teacher-Scholar

*Susan S. VanBeuge, DNP, MSN, BSN, BS, APRN, FNP-BC, CNE, FAANP, USA*

### Purpose

The purpose of this presentation is to discuss how to prepare individuals interested in pursuing a position in an academic setting. We will review the responsibility of a faculty member beyond teaching to include research, and service.

### Target Audience

The target audience of this presentation are those interested in pursuing a career in higher education and finding balance between being fully engaged in your teaching career while maintaining clinical proficiency and acumen.

### Description

This session is being offered to those individuals who are interested in pursuing a teaching position in nursing and want to know about the faculty role in higher education. We will review the concepts of working in academia to include the major areas required: teaching, research, and service. If an attendee is looking for a position as a new faculty or moving from the community college level to the research university focus, this session will focus on the expectations of a new and established faculty member in this endeavor from the perspective of the department/school of nursing to the university level. A trend in nursing education is to recruit faculty in clinical practice to teach at all levels to include baccalaureate, masters, and doctorate. Faculty coming from the clinical areas have strong skills in bedside nursing to independent clinical practice, and nurse executive leadership or researcher roles. Blending these strong skills to fit into the academic setting requires additional skill acquisition, mentorship of other nurse educators, and education preparation. Nurse educators in academia bring skills to the university setting in their own departments and to the university through committee work, leadership, and working with others through interprofessional collaboration activities. Academic nursing practice is broken down into three areas: teaching, research, and service. Teaching is one of the major areas of focus in academia where faculty are engaged in evidence-based delivery of teaching concepts and theory to students at every level. Depending on the setting, teaching may be the main focus of the role of a faculty member or secondary to research. In the area of nursing research, those interested in this area develop their own focus of research supported by grant funding, either internally or externally. Faculty who pursue this area will devote great time to the research process. Service is also an important piece of the academic role. Service may include the faculty clinical practice to maintain licensure and clinical proficiency, participation in committee work, or service to the community. This session will highlight how the role fits from the micro level within the School of Nursing to the macro level of the University.

## H 29 - SPECIAL SESSION: Wartime Nurse Heroes Recognition

*William T. Campbell, EdD, MS, RN, USA*

*Evelyn R. Hayes, PhD, MPH, FNP-BC, USA*

*Patricia D'Antonio, MSN, PhD, RN, FAAN, USA*

*Doris T. Lippman, BSN, MeD, MA, EdD, APRN-BC, RN, FAAN, USA*

### Purpose

To inspire today's nurses with the courageous stories of risk and self-sacrifice of nurses worldwide during times of global conflict. To officially recognize these nurse heroes and tell their stories forward.

### Target Audience

Nursing faculty who teach nursing foundation courses or nursing history courses at all levels, nurses who are interested in nursing history and/or wish to learn about their profession, and nurses who want to be inspired by the accomplishments and sacrifices of other international nurses.

### Description

Over the centuries nations have engaged in conflicts that have often resulted in massive physical and emotional injuries. Warriors have fought with bravery and courage. Their sacrifices have generally been recognized and honored. However, equally courageous nurses have played a major role in preservation of life and comfort. Although these brave nurses have asked little in return for their service, it is crucial that they receive the recognition and honor so justly deserved. Florence Nightingale lost several of her volunteer nurses during the Crimean War to disease. Dorothea Dix, Supervisor of Union nurses, almost lost Louisa May Alcott to typhoid during the American Civil War and did lose Alcott's supervisor, Hannah Ropes. Edith Cavell, a British nurse in Belgium during WWI, was executed by the Germans for her unbiased nursing care without regard to nationality. Several Turkish nurses died during the cholera epidemic that struck during the Balkan War in 1912. Nie Yuchan, Dean of the Peking Medical College School of Nursing, joined the Chinese exodus during the War of Resistance, but reopened her School maintaining the confidence of all nurses both in Free and Occupied China. Recently, 60 nurses and health workers of the polio vaccine program in Pakistan were murdered by the Taliban. Over the history of nursing many military and civilian volunteer nurses have risked their lives for their patients and their profession during times of conflict. While each of these individuals served as nurses and delivered nursing care to their patients in their localized conflict, each of them impacted others throughout their global region, and their service is an example of selfless sacrifice and leadership globally for all of us. At the 2013 STTI House of Delegates a call was issued to establish a taskforce to investigate how best to recognize and honor these "nurse heroes." This Special Session is a small part of this recognition of these remarkable nurses from around the globe and throughout history. In this session nurse historians will introduce the topic and the need for international recognition, as well as the history of the STTI presidential call. A brief representative discussion, led by members of the STTI Wartime Nurse Heroes Task Force, will highlight the sacrifice of a few representative nurses from around the world and from STTI's global regions. A call has been issued to all global regions to nominate a nurse from their region who deserves recognition and presentation of that nurse's accomplishments during this session. Nurses who suffered and sacrificed while delivering nursing care in North America, Europe, Africa, Asia, Latin America, and Oceania will be named along with their stories of sacrifice individually and collectively. The session will conclude with recommendations to STTI for the future of this taskforce and its vital work. Hopefully this special session will become a catalyst to create a conversation about these inspiring nurses and a permanent listing and/or repository of their names, accomplishments, and sacrifices where they can be recognized and honored for decades to come.

## **C 23 – CHAPTER LEADER SESSION: Creating a Unified Board**

*Jessica Wendorf, BS, CAE, CNP, USA*

*Katherine Rogers, BA, USA*

### Purpose

The purpose of this presentation is to demonstrate how to unify a board of directors.

### Target Audience

target audience of this presentation is anyone who is serving, or wishes to serve on, a board of directors.

### Description

The purpose of this presentation is to demonstrate how to unify a board of directors for non-profit association chapters. Attend this session to learn how you can build relationships and address expectations to create a unified board. Attendees will discuss how to set expectations, manage conflict, and build relationships with board members, while also learning how to effectively communicate as a team. The target audience of this presentation is anyone who is serving, or wishes to serve on, a board of directors.

## **F 23 – CHAPTER LEADER SESSION: Financial Stewardship through Policies and Procedures**

*Jessica Wendorf, BS, CAE, CNP, USA*  
*Jenny Paugh Hoffman, BS, USA*

### Purpose

The purpose of this presentation is to prepare STTI chapter leaders with the resources to be fiscally responsible.

### Target Audience

target audience of this presentation is STTI chapter treasurers and leaders who manage chapter finances

### Description

This session outlines the best policies and practices for board members, finance committee members, and other volunteer stewards of your STTI chapter's finances. This session is not eligible for continuing nursing education credit hours, as it will discuss the STTI bylaws requirements, as well as best practices in the financial realm for STTI chapters, only.

# Clinical Oral Presentations

---

## A 01 - Cardiovascular Issues: Engaging Risk and Care

### Cardiovascular Risk Factors among College Students: Knowledge, Perception and Risk Assessment

---

*Dieu-My T. Tran, PhD, RN, USA*

*Lani M. Zimmerman, PhD, RN, USA*

#### Purpose

The purpose of this presentation is to inform and share a new perspective of a global problem, cardiovascular disease, by providing an original research on college students' knowledge and perception of cardiovascular risk factors in addition to their 10-year and 30-year cardiovascular risk estimates.

#### Target Audience

The target audience of this presentation is researchers, clinicians, administrators, and policy makers.

#### Abstract

**Background:** Young adults in the United States are not realistic about their health and eating habits; one-third do not understand the association between their current health behaviors and the impact on their future cardiovascular disease risk.

**Purpose:** To assess a college population of young adults' knowledge and perception of cardiovascular risk factors and to screen for their cardiovascular risks and cluster subgroups with similar characteristics.

**Conceptual Framework:** The conceptual models guiding this study were the Health Belief Model and the Information, Motivation and Behavioral Skills Model.

**Method:** A descriptive research study was conducted in 158 college students, who attended a Midwestern university. The average age of the participants were 24.33 years old (ages 19-39). Participants' socio-demographics, knowledge (Heart Disease Fact Questionnaire) and perception (Health Beliefs Related to Cardiovascular Disease) of cardiovascular risk factors, and biomarkers (random blood glucose, blood pressure, lipid panels, height and weight) were assessed. The Pooled Cohort risk equations and 30-year cardiovascular disease assessments were generated for cardiovascular risk estimates. Hierarchical clustering analysis was used to identify subgroups of high risk individuals.

**Results:** College students were knowledgeable ( $M=13.9$ ,  $SD=2.30$ ) about cardiovascular risk factors, but did not perceived themselves at risk for cardiovascular disease. There were no significant relationships found between knowledge and perception of cardiovascular risk factors. Knowledge of cardiovascular risk factors was correlated with the lifetime risk estimates  $\rho=.17$ ,  $p=.048$ , and perception of cardiovascular risk factors were positively associated with the 30-year cardiovascular disease estimates  $\rho=.16$ ,  $p=.048$ . The average lifetime risk assessment (31.4%) was higher compared to the average 30-year cardiovascular disease assessment (4.8%). The cluster technique identified white, single males with a family history of heart disease, overweight/obese, hypertensive, and occasionally (weekly) consumed red meats were considered the higher risk group to target for cardiovascular risk reduction intervention compared to other subgroups.

**Conclusions:** This study demonstrated that high knowledge level of cardiovascular risk factors is not sufficient to maintain an optimal cardiovascular risk estimates, but changing perception of cardiovascular risk factors may play a bigger role in long-term cardiovascular risks. It also identified a high risk subgroup of a population that should be targeted for cardiovascular risk reduction.

## A 01 - Cardiovascular Issues: Engaging Risk and Care

### Factors Influencing Well-Being among Post Myocardial Infarction Patients

---

*Sanguan Thanee, PhD, RN, Thailand*

#### Purpose

The purpose of this presentation is to participate and communicate the results of research to an interested audience.

#### Target Audience

The target audience of this presentation is nursing staff, researchers, health care professionals, health care providers, and health care institutes.

#### Abstract

Post myocardial infarction patients tend to be functional decline and re-hospitalization because illness progression and complications.

**Purpose:** The objectives of this predictive study were to examine correlated and predicting factors of well-being among post myocardial infarction patients.

**Methods:** A sample consisted of 201 myocardial infarction patients who follow up at outpatient department. A package of questionnaires included personal information, health perception, well-being, mental and emotional status, depression, stress management, functional performance, illness adjustment, food consumption, physical activity, and adherence to treatment and risk control. Data were analyzed by descriptive, Pearson correlation, and multiple regressions.

**Results:** The results found that well-being was correlated to health perception ( $r = .349$ ,  $p < .001$ ) functional performance ( $r = .365$ ,  $p < .001$ ) illness adjustment ( $r = .177$ ,  $p = .006$ ) mental and emotional status ( $r = .604$ ,  $p < .001$ ) adherence to treatment and risk control ( $r = .138$ ,  $p = .026$ ), and depression ( $r = -.548$ ,  $p < .001$ ) Predicting factors of well-being were mental and emotional status (Beta =  $.430$ ,  $p < .001$ ) and depression (Beta =  $-.286$ ,  $p < .001$ ). Total variances explain 41.6 %.

From the research results, health care providers and health care institutes should develop guideline and conduct research to promote mental and emotional status, and reduce depression.

## A 02 - Promoting Health for Patients with Diabetes

### Improving Glycemic Control among Incarcerated Men: A Health Promotion Model

---

*Paula Kelly Ranson, MSN, BSN, RN, PHN, CCHP, USA*

#### Purpose

offer an innovation to an established program in the correctional environment which is focused on improving health literacy and self-care.

#### Target Audience

Health educators and nurse leaders.

#### Abstract

**Statement of Problem:** In California's state prison system, diabetic inmates are fed the same diet as the rest of the prison population, and many have poor blood glucose control. A current program allows certain inmates to carry glucometers and testing supplies and to test their blood sugar but improvements in glycemic control have been modest. This innovation sought to learn if improved health literacy would result in a reduction in HbA1c in an environment in which no variables such as dietary changes or other rewards were offered.

**Methodology:** Utilizing the Health Promotion Model as a framework that includes nursing and behavioral science perspectives, nursing-led education which was supported by other disciplines aimed to improve health literacy. Diabetic inmates who expressed a desire to participate were permitted to carry a glucometer and supplies and were given individualized diabetes education. During scheduled appointments, medical and mental health care providers reinforced information and a dietician was available to help the patient learn more about the meals that were provided to him. Participants were re-assessed for improvements in HbA1c at least every 6 months.

**Description of Innovation:** Evidence and theory-based strategies were incorporated into the intervention. Research indicates that individuals who are involved in their health care decisions are more likely to take action and make a behavior change; therefore the intervention was aimed at increasing autonomy and participatory behavior. Because research has also shown that self-monitoring strategies increase compliance with goals of glycemic control, inmates were encouraged to test their blood sugar as desired and to keep a record for review. Evidence indicates that social support is a strong predictor of success with changing behavior; therefore a collaborative team acknowledged and encouraged the patient's effort.

**Implications for Research:** Further study is needed to develop interventions specifically designed for incarcerated diabetics. Poor health literacy, depression and lack of autonomy may be barriers to glycemic control for incarcerated diabetics. Peer and organizational support, a self-testing program and education may improve glycemic control.

## A 02 - Promoting Health for Patients with Diabetes

### Health Coaching with Peer Support to Improve Diabetes Self-Management Education

---

*Chondra Butler, DNP, RN, AGCNS-BC, USA*

#### Purpose

The purpose of this presentation is to demonstrate an effective interdisciplinary approach to diabetes self-management education through the use of a health coaching and peer support program to assist patients in gaining better glycemic control through weight loss, glucose monitoring, nutrition improvement, physical activity, medication compliance, and complication prevention.

#### Target Audience

The target audience of this presentation is any health care provider or educator who may come in contact with an individual with type 2 diabetes.

#### Abstract

**Introduction:** Type 2 diabetes mellitus (T2DM) affects nearly 25 million Americans, with the highest mortality rate being among African-Americans. Complications of diabetes often lead to increased hospitalizations, more patient and hospital spending, and additional co-morbidities. T2DM is best controlled through improved patient self-care which is achieved through self-management education and peer support.

**Purpose:** The purpose of this project is to demonstrate how a professionally guided health coaching program, in conjunction with peer support groups, can improve type 2 diabetes self-management of African-American patients at a state-funded hospital. This is accomplished through health coaching sessions related to stress management, exercise, medication compliance, and nutrition in conjunction with telephone coaching sessions.

**Methods:** Patients were selected from the medical-surgical floor during hospital admission over a period of eight weeks. Patients completed a Foundations Class which included questionnaires about diabetes self-care and perceived stress levels along with a behavior modification video. Patients then attended a series of four interdisciplinary Health Coaching Classes in which a different topic was discussed at each. A specific activity was done in each class with correlating homework assignments and peer discussion. Topics included stress management, exercise, medication, and nutrition. The patients received telephone coaching in between classes. Progress was measured by weekly weight checks during the classes and weekly self-monitored blood glucose averages.

**Findings:** SDSCA: General diet and glucose testing showed statistically significant differences in pre- and posttest findings indicating that health coaching with peer support helped improve self-management in relation to these topics. There was not enough evidence to support statistical improvement in specific diabetic diet, exercise, or foot care.

PSS: The results showed statistically significant differences in the pre and posttest scores indicating that health coaching with peer support decreases patients' perceived stress levels.

Blood Glucose and Weight: There is not enough evidence that health coaching with peer support decreases patients' weight or blood glucose levels.

Although not all statistically significant ( $p < .05$ ), the mean differences in all variables showed overall improvement.

**Conclusions:** Health coaching with peer support helps improve diabetes self-management among individuals with T2DM. The outcomes of this project showed an overall improvement in self-management

practices including weight loss, glycemic control, glucose monitoring, nutrition, physical activity, and stress.

## A 03 - Initiatives in Advanced Practice Nursing

### Subtle Signs: Assessing for Dementia Warning Signs during an Acute Episode of Grief in Recently Widowed Individuals

---

*Debbie Nogueras, PhD, MSN, ARNP, BC, USA*

#### Purpose

The purpose of this presentation is to discuss the importance of recognizing the similarities of grief and early warning signs of dementia present during an acute episode of grief. Research revealed a missed diagnosis of dementia in individuals who became widowed where changes in behavior were considered related to grief.

#### Target Audience

The target audience of this presentation is clinicians, practitioners, and adult children of elderly parents.

#### Abstract

This presentation will discuss the importance of recognizing the similarities of grief and early warning signs of dementia that may be revealed the grieving period. In 2012, it was estimated that 43.1 million Americans will reach 65 years of age in the next 20 years, and up to 27 million people are living with undiagnosed dementia worldwide. Early diagnosis could create a saving of up to \$10,000 per person in health care costs.

A pilot study was conducted to learn more about the experiences of adult children of elderly parents who have been diagnosed with dementia. Specifically, the study sought to learn about experiences that seemed strange or unusual, but not recognized then as early warning signs of dementia. This IRB approved pilot study utilized basic qualitative design, with nine individuals participating in interviews. The participants were asked to describe the time prior to their parents being diagnosed with dementia, using the storytelling approach recalling their earliest memories and experiences they now realize were warning signs of this disease. After transcription of the interviews and coding, the thematic analysis revealed several themes: grief, spousal covering, and failure to diagnose.

Grief is expressed physically, emotionally, socially, and spiritually. The manifestations of grief can include detachment from others, social isolation, behaving in ways that are not normal for the individual, anxiety, and forgetfulness. These are similar to the early warning signs of dementia (memory loss, difficulty performing familiar tasks, disorientation, poor or decreased judgment, and changes in mood, behavior, and personality). Participants reported a missed diagnosis of dementia in their parents by health care providers during this time. In several stories, providers delayed diagnosis stating that the changes in behavior were related to acute grief and would not consider a geriatric assessment. This failure to assess and diagnosis is a critical incident which leads to safety and quality of life issues, as well as stress in family members. Results from the study indicate a need for further research to develop assessment and educational materials for health care providers, individuals, and communities.

## A 03 - Initiatives in Advanced Practice Nursing

### ICU Patients' Survival and Nursing Critical Patient Severity Classification System (CPSCS)

---

*You Lee Yang, MSN, RN, South Korea*  
*Mona Choi, PhD, RN, South Korea*

#### Purpose

The purpose of this presentation is to explore the relationship between Intensive Care Unit(ICU) patients' survival rate and classified patient severity using CPSCS recorded by nurses.

#### Target Audience

The target audience of this presentation is critical care or nursing informatic system specialist in clinical setting.

#### Abstract

**Purpose:** To explore the relationship between ICU survival rate and patient severity classified using CPSCS recorded by nurses.

**Method:** The study design was retrospective research. We included patients who were admitted to 2 medical and 2 surgical ICUs at a university hospital in Seoul, Korea in 2012. The data of patient information and nursing records were retrieved. CPSCS was recorded daily based on 10 nursing intervention criteria, and classified patients from grade 1 to 6. After patients who were re-admitted to ICU and spent less than 24 hours in ICU were excluded, 1267 patients were included in analysis. Survival analysis was conducted by Kaplan-Meier test, Log-rank test, and Cox proportional hazard regression using STATA 13.0.

**Results:** Eighty five percent of patients were CPSCS grade 5 out of 6 highest severity. ICU survival rate was 47.5% on 1<sup>st</sup> month. There was a significant difference of survival rate between the units (Medical vs Surgical ICUs), severity grade, and pneumonia Dx. In the Cox hazard regression model, 'treatment (more than 30min)', 'treatment (less than 30min)' and 'vital sign' were statistically significant as the risk factors of ICU patients' mortality.

**Conclusion:** The CPSCS was a statistically significant predictor of ICU mortality depending on ICU length of stay. Existing nursing records in EMR should be further studied to emphasize nursing contribution to patient outcomes.

## A 03 - Initiatives in Advanced Practice Nursing

### Achieving Certification for a Nurse-Run School-Based Health Center in Nevada

---

*Sherrilyn Coffman, PhD, RN, USA*

*Cheryl L. Darby-Carlberg, DNP, MSN, BSN, APRN, RN, IBCLC, USA*

#### Purpose

The purpose of this presentation is to describe the certification process for school-based health centers in Nevada, and the development of one center operated by the Nevada State College School of Nursing to achieve certification standards.

#### Target Audience

The target audience of this presentation is nurses and advanced practice nurses with an interest in pediatrics, family health, and school-based health care.

#### Abstract

On December 4, 2014, the Joel and Carol Bower School Based Health Center became the first of seven school-based health centers in the state of Nevada to achieve state certification. This status was accomplished through a focused planning effort, implementing the new State of Nevada Standards for School Based Health Centers. Only certified school-based health centers (SBHCs) are eligible to receive Nevada Medicaid and Nevada Check-Up reimbursements from the Division of Health Care Financing and Policy at the higher Provider Type 17 level. Thus achieving certification provides higher reimbursement, as well as evidence of program quality.

The Bower School Based Health Center (SBHC) was founded in 2004 as a partnership between Nevada State College (NSC) School of Nursing and the Clark County School District (CCSD) to address significant unmet health needs of children in Henderson, Nevada. In 2007 the health center was officially named in honor of Dr. Joel Bower and his late wife Carol, long-standing community supporters. Operated by the NSC School of Nursing, the center serves children ages 4-19. The CCSD maintains the physical facility (a double-wide portable) on the grounds of Basic High School, 400 Palo Verde, Henderson, NV 89015. Nevada State College pays staff salaries, purchases medical and program supplies, and oversees programs and activities. The mission statement is as follows:

The mission of the Dr. Joel and Carol Bower School-Based Health Center is to provide high quality, accessible health care to all children in Henderson schools, especially the uninsured, underinsured, and vulnerable populations. The Health Center is dedicated to treating the whole child; to promote physical, emotional, and social health, effectively manage chronic illness, and minimize health-related school absences.

Nurse practitioners staff the center 4 days per week during the regular school year, and 2 days per week during the summer. The center also employs a full time coordinator and a certified medical assistant. A volunteer medical director comes from the community, and the nursing director is a faculty member of the Nevada State College School of Nursing. Students come predominately from seven schools in the local area, and approximately 70% of students seen are uninsured or underinsured. Many of these students do not qualify for federal and state insurance programs for children. Without adequate health insurance, these children often have prolonged absences from school for illnesses which could have been much shorter had medical care been available. This also impacts the education these children receive.

Achievement of certification involved a developmental progression, supported by state and community resource groups. In 2012 the state of Nevada established standards for school-based health centers in Nevada. The Bower SBHC was awarded a \$ 50,000 planning grant from the state, which resulted in establishment of mental health services and re-institution of the clinic laboratory. An asthma management program was supported by a local hospital foundation. Mental health support groups for

high school students were initiated and received financial support from a local community foundation. A local health fair was held in 2014 to market the center and celebrate its ten year anniversary.

In 2014, the state developed an official process for certification of school-based health centers. Goals of certification were to increase emphasis on best practices, reduce site-to-site variability, increase the ability to study clinical outcomes, and increase the potential for insurance reimbursement. Specific standards, which served as the criteria for certification, were developed in the following areas: (a) facilities, (b) operations and staffing, (c) laboratory services, (d) clinical services, (e) data collection and reporting, and (f) quality assurance activities. The presentation will include photos, specific descriptions, and utilization data for the SBHC, to illustrate services provided which met certification standards.

## A 04 - Promoting Family Healthy in the Clinical Environment

### A Descriptive Study of the Surgical Nurse Liaison's (SNL) Role from the Perspectives of Patients and Their Families in Alleviating Anxiety during a Surgical Procedure

---

*Reginald Perez Fernandez, MSN, RN, USA*

#### Purpose

The purpose of this presentation is to exhibit five themes identified that relate to specialized practices of the SNL across the perioperative continuum. Patients and their families recognize that the relationship formed with an SNL makes an impact on the quality of their perioperative experience.

#### Target Audience

The target audience of this presentation are peri-operative leaders, educators, nurses, and staff who are interested in an innovative approach that may change traditions and attitudes about families of surgical patients and would focus on a positive and meaningful experience for the staff and the patients and families being served.

#### Abstract

Surgery is stressful for both patients and their families. During a surgical procedure, patients require complex and specialized care, but their family members may also need attention due to their own unique stressors while in the hospital. An understanding of their perioperative experience allows the nurse to provide compassionate and competent care. This qualitative study evaluates whether the role of a surgical nurse liaison (SNL) in the perioperative area alleviates patients' and families' anxiety and improves their experience during a surgical procedure. The study utilizes a descriptive approach to elicit the thoughts and feelings of six patients and six family members and allow them to describe their experience with the SNL. The study identifies five themes related to specialized practices of the SNL across the perioperative continuum. Patients and their families recognize that the relationship formed with an SNL makes an impact on the quality of their perioperative experience.

## A 04 - Promoting Family Healthy in the Clinical Environment

### A New U.S.A.B.I.L.I.T.Y. Survey on Technology by Older Adults

---

*Meriam Caboral-Stevens, PhD, MSN, BSN, RN, NP-C, USA*

*Martha Whetsell, PhD, RN, USA*

*Lorraine S. Evangelista, PhD, MSN, BSN, RN, FAHA, FAAN, USA*

#### Purpose

To present the development of a survey instrument to examine usability of technology by older adults

#### Target Audience

nurses, advanced practice nurses, nurse informatics specialists

#### Abstract

**Background:** An aging population and surge in use of technology are two socio-cultural trends occurring simultaneously. Statistics have shown that by 2050, there will be 83M older adults in the US, more than doubled the projected 42M in 2010. Ownership and use of technology are accelerating rapidly as produce and services becomes affordable. Older adults are now the fastest growing internet users worldwide, however only 47% have access to the internet at home. Cognitive and functional limitations associated with aging could prevent successful interface by older adults with technology. At the same time, numerous websites are not always user friendly to older adults, thus quality of information being disseminated is an issue. The confluence between aging and technology could present challenge with their interface. Issues related to interface could be addressed through usability evaluation/testing. Usability refers to the fit between the users and technology. Usability testing/evaluation measures the effectiveness of the product to the users and their satisfaction with the use of the product. Review of the literature recognized a need for a single standardized usability questionnaires/surveys and paucity of well-validated tools to measure usability in older adults.

**Conceptual framework:** A U.S.A.B.I.L.I.T.Y. Model<sup>®</sup> was developed from integration of theories/concepts from the Roy Adaptation Model, Technology Acceptance Model and Theory of Planned Behavior that would explain the intent to use technology by older adults and/or those with low or limited literacy. The assumptions of the conceptual model are: 1) when a person turns on a device, he/she interfaces with the system and design, and operates in an environment of learning; 2) the person affects the state of the machine by manipulating the controls; 3) the person processes the information in front of him/her based on their own unique individual factors; 4) interface between the person and the system is influenced by four determinants: efficiency, learnability, perceived user experience and perceived control and 5) the person's perceived usability of the website would either lead to their intention to use or not to use the technology. The four determinants of usability in this conceptual model were: efficiency, learnability, perceived user experience and perceived control. Perceived control is believed to play a significant role in successful aging. The lack of instrument that measures all four determinants of usability, mainly perceived control, prompted the researchers to develop a new tool.

**Purpose:** To present the development of a survey instrument to measure usability of a computer system by older adults.

**Methods:** An 8-step process of instrument development was adapted from Cronbach and Straub to construct the new usability. Experts examined face and content validity. The instrument was pilot tested to determine reliability.

**Findings:** A 25-item U.S.A.B.I.L.I.T.Y. Survey<sup>®</sup> was developed. The survey was on a 5-point Likert scale, with answers ranging from 1 (strongly disagree) to 5 (strongly agree). It consisted of 9-item efficiency (4-item ease of use and 4-item usefulness), 4-item learnability, six-item perceived user experience and six-item perceived control (3-item attitudinal and 3-item cognitive). Scores ranged from 29- 121, with score

over 98 indicating good “fit” or interface. Experts reported content validity acceptable at .97. The internal consistency of the subscales ranged from .71 to .95.

**Conclusion:** Technology offers an invaluable resource to older adults in maintaining their independence and improving quality of life. Usability is a key towards acceptance of technology by intended users. Understanding that having a user friendly interface could facilitate a good patient-provider encounter including teaching and learning. The derived conceptual model was developed to explain intent to use technology by older adults. The newly constructed survey instrument adds to the group of psychometric instruments currently available to nurses for the evaluation of the usability of online resources.

## A 04 - Promoting Family Healthy in the Clinical Environment

### Sex Difference in the Association of Sleep Disturbances with Cognitive Function Impairment in Elderly

---

*Hsiao-Yean Chiu, PhD, RN, Taiwan*

*Pei-Shan Tsai, PhD, RN, Taiwan*

#### Purpose

The purpose of this presentation is to deliver the knowledge with regard to the impact of sleep on cognitive impairments in elderly population according to sex.

#### Target Audience

The target audience of this population is clinical and community nurses in geriatric and gerontology fields.

#### Abstract

**Objectives:** To examine the prevalence of sleep disturbances and cognitive impairment in elderly people according to gender, and to determine the association of sleep with cognitive impairment according to sex.

**Methods:** This was a cross-sectional study derived from the 2009 population-based Taiwan National Health Interview Survey. A total of 2413 elderly (ages of 65 years or older) with 1094 males and 1319 female were included. The cognitive impairment as well as subjective sleep characteristics including sleep hours, difficulty in initiating sleep, difficulty in maintaining sleep, early morning awakening, daytime sleepiness, difficulty in breathing during sleep, and daytime naps were assessed by survey questions.

**Results:** The prevalence of cognitive function impairment was 16.3% in male and 27.1 % in female elderly people. Both male and female elderly people with cognitive function impairment had higher prevalence rates of sleep disturbances in elderly adults than those without cognitive function impairment. In male elderly people, difficulty in breathing during sleep and prolonged sleep duration (> 8.5 h) were significantly associated with cognitive function impairment (adjusted odds ratio = 2.43 and 2.06, 95% confidence intervals =1.48-3.98 and 1.19-3.60, respectively) after adjusted for potential confounders. In female elderly people, only prolonged sleep duration (>8.5h) had higher likelihoods of cognitive function impairment (adjusted odds ratio = 2.35, 95% confidence interval =1.36-4.07) controlling for confounders.

**Conclusions:** This population-based study confirms that gender-specific association between sleep disturbances and cognitive function impairment in elderly people, warranting further investigation of the underlying causes.

## B 01 - Promoting Psychiatric Health in the Clinical Environment

### Yrbs, 2013: Surveillance of Mental Health Services in Rural Eastern Region Middle and High Schools

---

*Cynthia Ann Leaver, MSN, PhD, RN, FNP-BC, FAzCIM, USA*

*Jesus Cepero, PhD, RN, NEA-BC, USA*

*April Greenlee, BSN, RN, USA*

*Laura E. Henderson, MPH, MD, FAAP, USA*

#### Purpose

This assessment monitors adolescent students', in a rural, eastern US, school system, perception of the six health-risk behaviors that contribute to leading causes of death and disability among youth. Also, this assessment evaluates the parents perception prevalence of chronic disease, insurance status, health care utilization, and barriers to healthcare access.

#### Target Audience

The target audience of this presentation is school health, mental health, and population health researchers and providers.

#### Abstract

**Purpose:** The purpose of this assessment is monitor middle school (MS) and high school (HS) students', in a public, rural school system in a eastern region of the US, perception of the six types of health-risk behaviors that contribute to leading causes of death and disability among youth and adults.

Also, this assessment evaluates parents of pre-school through 12-grade students, of the same public school system, perception prevalence of chronic disease, insurance status, health care utilization, and barriers to healthcare access.

**Method:** Survey method of computerized random selection, students and parents from study population, implemented the Survey Monkey® data collection for the Youth Risk Behavior Survey (YRBS, 2013), HS and MS instruments, with time of survey completion dependent on students attendance in computer lab course; postal-mail, paper method and at-home completion of survey, was implemented for the West Virginia School Health Technical Assistance Center Parent Survey 2013 (PS, 2013) instrument. PS, 2013 data was hand-punched researcher into Survey Monkey. Descriptive statistics were calculated.

**Results:** Parent n=465 (13%), HS n=1015, MS n=1089. All cohorts of study were reasonably distributed across population considering, appropriate age, grade and gender.

Parent report identified n=234 (45.03%) behavior was most frequent health concern, n=311 (69.58%) identified probable or definite use of health center if available.

Depression and suicide risk behavior revealed HS student n=187 (18.07%) identified themselves as seriously considering suicide; MS student n=246 (22.67%) identified themselves as seriously though of killing themselves.

**Conclusion/implication:** Reports from HS and MS for depression and suicide reported higher than respective state, high school report higher than national report, where no national report is available for middle school. Need for continued support of school based health clinic where mental health services are provided is supported by this assessment. Continued evaluation of health care needs of students and provision of services by school based health clinics is warranted.

## B 01 - Promoting Psychiatric Health in the Clinical Environment

### Social Determinants of Depression among HIV Positive Patients in Karachi, Pakistan

---

*Sahreen Malik Bhanji, MScN, BScN, RN, Pakistan*

#### Purpose

The purpose of this presentation is to understand the Background, Significance and purpose of the study, the Methodology, Results and discussion, Strengths and Limitations and proposed Recommendations of the study conducted to identify the social determinants of depression among HIV positive patients.

#### Target Audience

The target audience of this presentation is Nurses Doctors community and public health workers NGO's

#### Abstract

**Objective:** The study aimed to calculate the estimated proportions of depression, stigma, and social support. The study also intended to identify the association between socio-demographic characteristics, social determinants like stigma, and social support and depression among the HIV positive patients in Karachi, Pakistan.

**Methodology:** An analytical cross-sectional study was conducted among 200 HIV positive patients, who were recruited from the Sindh AIDS Control Program Treatment Center Karachi, Pakistan, from April to June 2014. Data was collected through a modified truncated questionnaire consisting of four parts measuring socio-demographic and background characteristics of the participants' depression, social support, and stigma through an investigator designed questionnaire, the Self-Reporting Questionnaire (SRQ 20), the Social Provisions Scale, and the BERGER HIV Stigma Scale, respectively. Data was analyzed using descriptive and inferential statistics. Logistic regression analyses were performed to study the risk factors of depression.

**Results:** A total of 200 people living with HIV/AIDS were interviewed. The mean age of the participants was 34 years  $\pm$ 10.9 years. The findings of the study revealed that, among the total participants, more than half of the females (69.4%) suffered from depression while the number of males who suffered depression was 91 (55.5%). The results of the Social Provisions Scale score showed that 99 (49.5%) of the participants missed social support from families and friends, while 101 (50.5%) participants appreciated the provision of social support. The results of the Berger HIV stigma scale were quite significant, as a majority of the HIV positive participants (76%) felt stigmatized, while only a few (24%) never felt stigmatized or humiliated. The logistic regression analysis indicated a significant association between Gender ( $p=0.034$ ), socio-economic status ( $p=0.001$ ), history of substance abuse ( $p=0.00$ ), employment status ( $p=0.001$ ), and depression.

**Conclusion:** The findings from our study confirm an association between socio-demographic variables like gender, socio-economic status, history of substance abuse and employment status, whereas, social support was found as a buffering factor against depression. Though, depression was found to be less common among people experiencing the stigma associated with the disease, given the fact that social support from family, relatives and friends might have neutralized its effect. All the same, the prevalence of depression and its associated factors is much reported in literature, yet its treatment remains a highly underfunded component of HIV prevention, care and treatment. These findings call for identification and treatment of such mental disorders as an integral part of HIV prevention and treatment strategies for HIV positive populations. Along with that, the findings put a heavy responsibility on the shoulders of medical and social service providers to develop strategies which do not stereotype this vulnerable population, and remove the barriers that hinder their adjustment in the society.

## B 01 - Promoting Psychiatric Health in the Clinical Environment

### Stigma in Mental Health: A Concept Analysis

---

*Linda Carman Copel, PhD, MSN, MSMFT, BSN, RN, PMHCNS, BC, CNE, ANEF, NCC, FAPA, USA*  
*Khamis Al-Mamari, MSN, RN, USA*

#### Purpose

The purpose of this presentation is to describe the concept of stigma and discuss the significance of stigma in mental health through the use of a concept analysis. An additional purpose is to propose a model to illustrate the concept of stigma in mental health.

#### Target Audience

The target audience of this presentation is clinicians and educators.

#### Abstract

People with mental health disorders endure stigma. Negative labeling and stereotyping of clients diagnosed with chronic physical and mental health conditions has grown dramatically in our society and makes stigma a universal health issue. The concept of stigma has been well documented and is associated with groups of people who suffer from health conditions such as human immunodeficiency virus (HIV), mental illness, disability, and other debilitating illnesses. Furthermore, ethnic minorities are particularly vulnerable to the five major types of stigma identified in the literature. The negative influence of stigma on people's lives creates a negative self-concept and causes individuals to be socially distance from the society (Parcesepe & Cabassa, 2012). Alonso and colleagues (2008) noted that stigma associated with mental disorders is significantly higher than stigma associated with physical disabilities. The concept of stigma in mental health has become a subject of investigation and debate. It is known that stigma is a major source of stress, contributes to social disadvantage and is a social determinant of population health (Hatzenbuehler, Phelan, & Link, 2013). Stigma may disqualify certain groups (e.g. disabled individuals, psychiatric patients, people struggling with addiction, and acquired immunodeficiency syndrome [AIDS]) from full social acceptance and the ability to conform to the normal standards of society. It frequently leads to cognitive ambivalence, which causes emotional conflict. People with mental health disorders are more likely to encounter stigma from others in public places or in health care systems (Rusch, Angermeyer, & Corrigan, 2005; Totic et al., 2012). They often have to struggle with several problems: coping with the disease, its symptoms, and its consequences. Additionally, they have to deal with misconceptions about mental health problems that result in further stigma. To understand the concept of stigma and its associated nuances, a concept analysis was undertaken.

The purpose of this presentation is to describe the concept of stigma generated from a concept analysis and to discuss the significance of stigma in mental health. An additional purpose is to propose a model to illustrate the concept of stigma in mental health. Using Walker and Avant's concept analysis methodology, the antecedents, characteristics and consequences of stigma are described. The various types of stigma identified in the literature contribute to the overall development of the concept analysis. The findings of the concept analysis revealed that there are both positive and negative outcomes or consequences to the concept of stigma. Lastly, a model entitled, Stigma in Mental Health, is proposed from the findings of the concept analysis. Recommendations for effectively addressing the concept of stigma in mental health are proffered.

## B 02 - Promoting Practice in the Perinatal Patient and Family

### Parents' Experiences of Communication with Neonatal Intensive-Care Unit Staff: An Interview Study

---

*Helena Wigert, PhD, RN, Sweden*

#### Purpose

Present the current nursing research in neonatal intensive care Getting in touch with other researched nurses in the same area for future partnerships worldwide

#### Target Audience

Nurses working in the neonatal area and midwives in childbirth. Even lecturers who teach nursing students and nurses at the clinic.

#### Abstract

**Background:** An infant's admission to a neonatal intensive-care unit (NICU) inevitably causes the parents emotional stress. Communication between parents and NICU staff is an essential part of the support offered to the parents and can reduce their emotional stress. To better meet the communication needs of parents, it is important to know how they experience communication with the staff at the NICU. The aim of this study was to describe parents' experiences of communication with NICU staff.

**Methods:** A hermeneutic lifeworld interview study was performed with 18 families whose children were treated in the level III NICU at a university hospital in Sweden. The NICU has a family-centred care policy and parents are welcome to spend as much time as they want in the unit with their child. The interviews were analysed to gain an interpretation of the phenomenon of how parents in the NICU experienced their communication with the staff, in order to find new ways to understand their experience.

**Results:** Parents' experience of communication with the staff during their infant's stay at the NICU can be described by the main theme 'being given attention or ignored in their emotional situation'. The main theme derives from three themes; (1) meeting a fellow human being, (2) being included or excluded as a parent and (3) bearing unwanted responsibility.

**Conclusions:** This study shows that parents experienced communication with the NICU staff as essential to their management of their situation. Attentive communication gives the parents relief in their trying circumstances. In contrast, lack of communication contributes to feelings of loneliness, abandonment and unwanted responsibility, which adds to the burden of an already difficult situation. The level of communication in meetings with staff can have a decisive influence on parents' experiences of the NICU.

The staff should thus be reminded of their unique position to help parents handle their emotional difficulties. The organization should facilitate opportunities for good communication between parents and staff through training, staffing and the physical health care environment.

## B 02 - Promoting Practice in the Perinatal Patient and Family

### Stress Beyond the NICU Discharge: Implications to Outcome

---

Amy Nagorski Johnson, PhD, MSN, RNC-NIC-E, USA

#### Purpose

The purpose of this presentation is to examine the relationship of the high risk family experience in clinical settings to the consequences of unresolved family stress to identify collaborative strategies to normalize stress.

#### Target Audience

The target audience of this presentation are nurses who work in acute clinical settings as well as collaborative partners in academia who work with families of young children.

#### Abstract

**Purpose:** The high risk family experience in the NICU is a major stress event that is not necessarily resolved with discharge. Many families report worry and stress for up to a year beyond the birth of their NICU infant, yet this is not currently a focus of assessment for this population. Because stressors can induce behavioral, physiological, and biochemical changes to such a degree that family adaptation is challenged, resolving the stress before discharge and supporting the family with collaborative follow-up care should be a nursing priority. The purpose of this study was to examine the relationship between unresolved family stress and high risk family experiences.

**Methods:** This cross-sectional correlation design had fifty-four mothers of infants 6 months of age or older enrolled in a University child care setting. The Family Emotion Expressiveness (FEE) tool was completed by the mothers at the time of enrollment. This tool measures the emotional climate of the family, indicating high and low emotions and yields information on infant behaviors and adaptation. Data was analyzed using Pearson correlation coefficients to determine relationship between variables.

**Results:** The initial findings of this pilot study demonstrated a positive correlation between NICU admissions and family stress ( $r = .88$ ) and high risk primiparous births without NICU admissions and family stress ( $r = .72$ ). Of interest, previous studies have used positive correlations of FEE as predictors of infant and toddler behavior patterns as a response to the family emotions.

**Significance of Findings:** The findings illustrate a lasting unresolved family stress well beyond the birth of the baby. It appears that the NICU admission is much more stressful than the high risk pregnancy, and that the majority of the NICU admissions were not for extremely premature infants. Because stress seems to have become the “normal” for these families at more than 6-months out from the birth, clearly early identification of at risk families and collaborative interventions to normalize stress is indicated. This might, in fact, make us rethink discharge teaching.

**Conclusion:** Identifying and providing support for at risk families as an early intervention before discharge can enhance infant and family outcome through transformative nursing practice changes. These changes serve families locally, but can transform outcome regionally while prioritizing family needs as a global quality indicator.

## B 02 - Promoting Practice in the Perinatal Patient and Family

### Evaluation of the Effectiveness of a Community-Based Behavior Change Campaign in Haiti: Newborn Umbilical Cord Care

---

*Susan M. Walsh, DNP, MSN, BS, RN, APN, C-PNP, USA*

#### Purpose

to present compelling reasons for developing a community campaign focused on reducing neonatal mortality in Petit-Goave, Haiti. These data highlight how understanding cultural aspects of local traditional health beliefs impacted the design, implementation and evaluation of the campaign. This strategy can be formative for advancing local and international nursing practice.

#### Target Audience

for those seeking a deeper understanding of the influence cultural and local or traditional health care can have on individuals and their communities and how these influences impact the synthesis of evidence-based interventions into nursing practice.

#### Abstract

Great strides in reducing under-five mortality have been made globally since 1970. The reduction of under-five mortality is occurring at a faster rate now than any other time within the past 20 years. Still, approximately seven million children under the age of five died in 2012 with 99% of these deaths occurring in low- and middle-income countries (WHO, 2014a). The proportion of under-five childhood deaths occurring within the first month of life in 1990 as compare to 2012 has escalated from 37 percent to 44 percent respectively even though the prevention of most neonatal mortality is possible (UN, 2014b). One of the greatest coverage gaps in fulfilling the Millennium Development Goals' health agenda for children includes addressing interventions to prevent neonatal mortality (Requejo et al., 2014).

Sepsis is the third leading cause of neonatal death worldwide (WHO, 2014b). Bacterial infections originating in the umbilical cord (omphalitis) can lead to sepsis and neonatal death (Faridi, Rattan & Ahmad, 1993; Mir et al., 2011; Mullany et al, 2007). Simple affordable interventions are available and may prevent such deaths (Countdown, 2013; Mullany et al., 2006b). In low-income countries, the use of daily applications of 7.1% chlorhexidine digluconate, a topical antiseptic delivering 4% chlorhexidine, to the newborn's umbilical stump during the first week of life can decrease omphalitis and the risk of developing neonatal sepsis (Arifeen et al., 2012; Imdad et al., 2013; Mullany et al., 2006b; Sazawal et al., 2012b; Soofi et al., 2012). The World Health Organization has recommended the application of 4% chlorhexidine to the umbilical cord stump of infants delivered in the community setting in low resource countries since 1999 (WHO, 2013).

The benefits of chlorhexidine use may be particularly important in Haiti (Walsh, S. et al, 2015). Haiti is the poorest country in the Western Hemisphere, with 62% of the population living on less than \$1.25 (US) a day. Haiti's neonatal mortality rate is 25.5 per 1000 live births compared with less than 3 per 1000 live births in North America and 13.6 per 1000 in the Dominican Republic, Haiti's island neighbor (UNICEF, 2013). In Haiti, neonatal mortality accounts for one-third of the under-five deaths with 6 % of these newborn deaths caused by sepsis (WHO, 2014c). Although more than 90% of women in Haiti receive at least one antenatal visit, approximately 63 % of deliveries occur at home (UNICEF, 2013). Compared with institutional births in developed countries, evidence suggests that home births in low income countries incur a higher risk for cord infection (Imdad et al., 2013).

Local cultural beliefs can have a strong influence on cord care practices including unhygienic and traditional cord care practices common in low-resource settings (Herlihy et al., 2013; Smith, 2009; Walsh, S., et al, 2015 ). Several studies have sought to understand implications for chlorhexidine use among mothers and health workers in Bangladesh, Nepal, Pakistan, Tanzania and Haiti (Alam et al., 2008; Alper, 2007; Arifeen et al., 2012; Imdad et al., 2013; Mullany et al., 2006 a,b; Mullany et al., 2007; Sazawal et al., 2012b; Soofi et al., 2012; Walsh, S. et al, 2015). A number of unhygienic substances such as goat

scat, dirt/dust, burnt nutmeg and cotton, crushed charcoal, ash, palm oil, recipe of leaves were reported in Petit-Goâve, Haiti as substances used for neonatal cord applications (Walsh, S. et al, 2015). Similar substances were applied to the neonates' cords over 50% of the time in Sylhet District, Bangladesh (Alam et al., 2008). The application of mustard oil and other potentially unclean substances to the umbilical cord increases cord infection; one study conducted in Southern Nepal indicated an increased neonatal cord infection risk from 29% to 62% (Mullany et al., 2007). The effectiveness of chlorhexidine to prevent omphalitis is likely to decrease if such traditional cord care practices are not restricted (Alam et al., 2008; Mullany et al., 2006a).

We previously explored cord care practices and demonstrated a potential acceptability for introducing a new cord care practice such as chlorhexidine use in Petit-Goâve, Haiti (Walsh, S. et al, 2015). We then sought to evaluate the effectiveness of a community-based behavior change campaign among women who deliver at home with a traditional birth attendant (TBA). This campaign aimed to increase the proportion of women who apply chlorhexidine to their newborn's umbilical cord daily for the first 7 days after birth while preventing the application of unhygienic substances to the umbilical cord during the first 4 weeks after birth. We used a controlled trial in Petit-Goâve, Haiti to evaluate this campaign which was based on the recommendations made by the World Health Organization (WHO) for newborn care (WHO, 2013).

The setting for the campaign was in Petit-Goâve, Haiti, a district served by Global Health Action (GHA), a non-profit organization that conducts community-based health and development programs in Haiti (GHA, 2014). GHA trains and supports TBAs, who assist in approximately 900 home-based deliveries annually, and Community Health Workers (CHW), who visit mothers and neonates during the post-partum period. Eligible women were greater than 18 years of age and experienced an uncomplicated delivery by a TBA and gave birth to an apparently healthy baby who was one week of age ( $n \approx 200$ ). Our intervention group included mothers who received prenatal care from the nurse at the local community clinic who had been trained in the WHO cord care protocol. A natural occurring comparison group were mothers who delivered within the catchment area of the trained TBAs who either received antenatal care at a facility other than the community clinic or did not receive any antenatal care. A verbal questionnaire was given to the consenting mothers at 1 week post-delivery, following the CHW's routine newborn assessment. A second questionnaire was given when the infant was 4 weeks of age.

[Data collection and analysis to be completed 6/2015] Descriptive statistics and unadjusted and adjusted analyses will be used to determine the differences in the mother's cord care practices between the intervention and control groups. Preliminary data ( $N=80/200$ ) indicate compliance with chlorhexidine application and an absence of other topical substances used. However cloth coverings were frequently applied. Potential implications include recognition of traditional beliefs and practices of newborn cord care being essential to ensure acceptability of a new cord care practice to reduce neonatal cord infections. Haitian mothers and local caregivers appear willing to adopt a new cord care practice. An important cultural consideration to the campaign might include directives for clean cloth cord coverings. If a non-traditional cord care practice delivered by community health providers is successful, this strategy can be used for improving other aspects of newborn care.

## B 03 - Engaging Interprofessional Teams

### Project Empower: An Interdisciplinary Project

---

*Dawn Garrett-Wright, PhD, PMHNP, CNE, USA*

*Sandra Starks, EdD, LCSW, USA*

*Cheryl Wolf, PhD, NCC, LPCA, PHR, CHt, USA*

#### Purpose

The purpose of this presentation is to describe Project Empower; a multidisciplinary project providing mental health services and case management to low income individuals and families from diverse backgrounds and providing training opportunities for students from various disciplines. The partners in this program represented Social Work, Nursing and Counseling.

#### Target Audience

The target audience of this presentation are nurses and nurse educators seeking new strategies for forming interdisciplinary partnerships to educate undergraduate and graduate students, as well as provide service to underserved populations.

#### Abstract

The purpose of this presentation is to describe an interprofessional project that brought together Social Work, Nursing and Counseling. Project EMPOWER was a grant funded project began by Social Work faculty from WKU. The acronym E.M.P.O.W.E.R. represents the overall goals for the project of Enhancing skills and abilities while providing Motivation for goal attainment and Prosperity, Overcoming challenges with the use of team Work through increased positive Energy to reach higher and gain Respect for self and others. Project EMPOWER offered free psychosocial assessments, referrals, counseling services and resources for children, adolescents, adults and families. The primary populations served by Project EMPOWER were residents in the local Housing Authority, women staying at a local domestic violence shelter and refugees from various countries that migrated to the local area. Services were provided by partnerships between the university, local mental health providers, the Bowling Green Housing Authority and the Bowling Green International Center. Graduate nursing students in a Masters program for Psychiatric Mental Health Nurse Practitioners (PMHNP) joined the team to gain hours to complete a required practicum. The nursing students, along with students from Social Work and Counseling, were allowed to conduct initial psychosocial assessments, make referrals to other service providers as needed, run group education and empowerment sessions for children, adolescents and adults and conduct therapy/counseling for adult clients under the supervision of an expert Licensed Clinical Social Worker. This provided the nursing students experience in assessment and conducting therapy, which are required competencies for completion of a PMHNP program and to sit for certification. Nurses also participated in the project by serving on the Project EMPOWER Board of Directors and in provision of education to community providers and board members on topics related to mental health.

Challenges and benefits for the project were numerous. The challenges for the project included finding funding and resources to continue the project beyond the initial grant funding, provision of services to clients who spoke numerous languages and had varying levels of comfort with mental health services, and finding space to conduct assessments and groups. Benefits from Project EMPOWER were noted for faculty, students and community participants. Faculty formed new interprofessional partnerships that continued past the end of the original grant funded project. In addition, faculty obtained research and practice opportunities. Faculty for the project were licensed mental health professionals and services provided could be counted toward maintaining clinical competence and certification. Students were able to learn new skills in a safe environment with supervision from expert clinicians. Interprofessional meetings also provided students with learning opportunities and the ability to see client care issues from a variety of disciplinary perspectives. Finally, those benefiting most from Project EMPOWER were those in the community who received services. In the local community where Project EMPOWER provided services, it can take up to 6 months to obtain an appointment with a psychiatric provider. Project EMPOWER provided high quality services free of charge within days or weeks of the initial assessment.

Community participants typically received about 8 sessions of therapy/counseling by a graduate nursing or social work intern or LCSW and referrals to other providers were made as needed. Approximately 450 clients were served in some capacity during the three year duration of Project Empower. Other outcomes included the incorporation of health and wellness education and training for underserved populations, expanded mental health services for refugees and victims of domestic violence in the local community, training of interns from three health service disciplines, and expanded community partnerships to provide services to underserved populations.

## B 03 - Engaging Interprofessional Teams

### A Global Nursing Initiative: An Interdisciplinary, Multicultural Collaboration for Nurse Practitioner Students

---

*Patricia McKiernan Ciarleglio, MSN, MS, BS, RN, FNP, USA*

*Frances McGill, BS (Nsg), RN, MD, USA*

*Shelly Rodrigo, MSc, MPhil, PhD, RN, USA*

#### Purpose

The purpose is to convey to nurses, students and nurse educators the importance of international and interprofessional involvement. The description and objectives of the program and experiences will be of interest to other faculty who may be considering a similar program or expanding an existing one.

#### Target Audience

The target audience will be nursing educators, students, and administrators who may be interested in collaborating with professionals from other countries and cultures to develop and expand programs for international experiences for nursing students.

#### Abstract

This paper describes a collaborative program between St. Georges University, Grenada, West Indies and Regis College, Weston, Massachusetts, where faculty from both schools worked to provide an international, interdisciplinary health care experience for nurse practitioner students at Regis College, and for the medical and nursing students in Grenada.

The literature review presented provides a strong rationale for the benefits of this project which relates to the theme of the convention to Serve Locally, Transform Regionally and Lead Globally.

In March 2010, four family nurse practitioner students from Regis College School of Nursing, Sciences and Health Professions (SNSHP), in Weston, Massachusetts, spent a week at St. George's University (SGU) Grenada, West Indies. The goal was to understand health care in Grenada in order to broaden students' competency in treating patients from other cultures. Research has shown that nursing students who participate in an international nursing experience reap many benefits, including but not limited to: increased cultural sensitivity, increased self-awareness of one's own cultural values, and increased self-confidence skills (Smith & Curry, 2011). Working with local health care providers helped students to bridge the gap between diverse international health care systems. As a result of such experiences, the academic, professional and social lives of nursing students have been changed, with an increased appreciation and understanding of poverty, socio-political health issues, and world geography.

The goal of educating the Nurse Practitioner is to develop clinical and professional expertise necessary for comprehensive primary care and specialty practice in a variety of settings. Nurse practitioners must achieve core competencies in management of the patient problems, nurse practitioner-patient interaction, teaching and coaching patients, students and staff, managing and negotiating health systems, ensuring quality of health care practices, and cultural competence. (American Academy of Nurse Practitioners 2013 Position Statement on Nurse Practitioner Curriculum)

The specific objectives of the Grenada international experience were to engage in a hands-on clinical learning experience, learn challenging decision making and clinical diagnosis with limited options for diagnostic testing, and interact with patients from races and cultures other than the students own. Additionally the students were tasked to learn how culture, lifestyle and diet affect general health in Grenada, to understand how patient education and learning takes place in Grenada, and to participate in the care of the underserved.

Students from Regis College were invited to submit a written application, with a statement of personal and professional goals, for selection to the Grenada experience. There were several criteria for selection

of students which included good academic standing at Regis College, personal and professional maturity; capability of adapting to a new culture; a positive attitude during challenging situations; and an interest and /or experience in international learning. Recommendations from faculty at Regis College were helpful in determining some of these criteria.

The varied clinical experiences that provided cultural immersion included governmental clinics, private practices, university health services and health fairs for residents of Grenada. However, clinical experiences were designed to meet each student's specific educational focus, such as women's health, pediatrics, general medicine, or geriatrics; the process enabled by individual sessions with preceptors. Group visits to a local nursing home, and a psychiatric hospital included performance of physical exams, with a specific focus on breast exams, and vision exams for the residents. In addition, students visited a home for severely disabled children and adults, where they participated in assessing the residents' health status and any recommended treatments. They also participated in rural community health fairs, located in schools or community centers, working under the supervision of licensed health care providers. During the entire program they worked alongside medical and nursing students from Grenada, as well as other nursing programs who were visiting at the same time.

The paper also presents in-depth information on the evaluation process. In every clinical session, preceptors provided a written evaluation of each student, and students, in turn evaluated their preceptors. A summary and analysis of these evaluations are described in the paper. At the end of the experience, there was a joint meeting for students who have participated from Regis College, St. George's University and other nursing programs that were present that week. This provided a venue for sharing and reflection on the varied experiences.

The opportunity for interdisciplinary education enabled students from varied health care Programs, to benefit from the exchange of ideas and approaches to health care. An Institute of Medicine report (2011) called upon health educators to incorporate more interprofessional learning into the curriculum. This was restated in 2013 by the Joint Commission where improved interprofessional communication was found to be a critical area to help prevent patient errors.

The program expanded student learning and awareness of the necessity for cultural competence in health care; a required component of health education in the US. The welcome reception, with emphasis on culture, the island and hospital tours, all oriented the American NP students to Grenada. Working directly with Grenadian residents, and with physicians educated there, or in other countries, the NP students gained a different perspective on health care systems, patient expectations, and provider-patient relationships. In addition, students lived in the community and worked with minimal equipment and technological support. They spoke with patients, staff, and residents of the surrounding communities, took public buses, and ate in local restaurants.

The program, now in its fifth year, has expanded from four to six students, and approximately half of those who apply are accepted. Some students had many years of nursing experience while others had backgrounds in biomedical research, Peace Corps, military, journalism, business, and public health.

The international visiting nursing student programs have become the St. George's University Global Nursing Initiative, which has included nursing students from Barry University, Indiana Wesleyan University, and University of Toronto. It has expanded the Regis International experience, and brought a new dimension to the St. George's University's (SGU) Program in Nursing. Some of the many benefits reported from the experience were an increased confidence in clinical skills, becoming more culturally sensitive and competent, and a broader view of health care delivery.

## B 03 - Engaging Interprofessional Teams

### Health Team Members' Perceptions of Strategies for Patient-Centred Care in Acute Care Settings

---

*Linda M. Ferguson, MN, PhD, RN, Canada*

#### Purpose

to provide learners with the opportunity to explore the issue of patient-centred care in the acute care settings, based on health professional and patient/family perspectives of strategies that could enhance the patient/family experience of involvement in their own care with an interprofessional team in the acute care setting.

#### Target Audience

nurses in acute care settings, managers committed to enhancing the quality of the in-patient experience, and nurse educators preparing pre-licensure students for professional patient-centred practice.

#### Abstract

Patient-centred care is an ideal of interprofessional collaborative care, and an expectation of patients and their families. Patients and their family members are often referred to as members of the interprofessional team for their care. However, according to patient surveys, this ideal of Interprofessional collaborative care and patient-centred care is often not achieved in the acute care setting. In this session, we report on a qualitative study examining the perceptions of 15 healthcare professionals about patient-centred care on an acute care medical unit in a tertiary care teaching hospital. Professions in this study included nursing, pharmacy, physical therapy, occupational therapy, social work, home care coordination, and unit administration. The perceptions of these healthcare professionals are compared to those of 28 in-patients and family members on the same medical unit. Perceptions of how patient-centred care should be enacted and the effectiveness of this implementation differed somewhat among various health professionals as well as their patients. Most offered suggestions as to how patient-centred care could be improved, many suggestions which differed from the suggestions of their patients and families. These suggestions from healthcare professionals and their patients will be explored for feasibility and possible efficacy.

## C 01 - Clinical Education Strategies

### Mastering Clinical Dilemmas: A Newly Licensed RN Clinical Management Best Practice

---

*Diana Halfer, MSN, RN, NEA-BC, USA*

#### Purpose

to report on an evidence-based practice project conducted at Magnet-designated hospitals to analyze issues for newly licensed RNs to resolve the clinical dilemma of "getting work done," discuss the major challenge identified, managing clinical situation for multiple patients simultaneously, and implementation of a nurse residency program best practice.

#### Target Audience

nursing leaders and clinical educators that support the role transition of newly licensed RNs in acute care settings.

#### Abstract

Seven clinical nurse practice issues challenge the successful role transition and integration of newly licensed RNs (NLRNs) into acute care clinical nursing practice. Of the seven--delegation, autonomous clinical decision-making, prioritization, RN-MD collaboration, restoring self-confidence through feedback, conflict resolution and getting work done--"getting my work done" was identified as the issue of greatest concern and the only one for which 907 nurses (NLRNs, experienced clinical nurses, managers, and educators) participating in a nation-wide nurse residency program study in Magnet-designated hospitals could not identify effective strategies. It is the management component of nurses' clinical practice that was cited as causing the most difficulty. This presentation will discuss an evidence based management practice project conducted with NLRNs 6-8 months post-hire working in Magnet-designated hospitals. The purpose of the study was two-fold: analyze the interview data and literature to understand the dimensions of the "getting work done" issue and then implement a potential best management practice project and evaluate its effectiveness. Data analysis included asking NLRNs "what are the similarities and differences in your nursing practice now (6-8 months post-hire) and when you were with your preceptor?" A spontaneously NLRN-drawn sketch, conceptualizing differences in the clinical practice role when NLRNs care for patients assigned to their preceptor (transition stage of professional socialization—post-hire to 3 months) and when they are in the integration stage and assigned their own patients. The sketch was later validated by 20 hospital site investigators. These differences in conceptualization of the nurse practice role, combined with interview data and literature review, led to identification of the major challenge faced by NLRNs—managing clinical situations for multiple patients, simultaneously—labeled "multiple patient-simultaneity complexity" (MP/SC). Mastering "simultaneous" responsibility for a multiple patient assignment is unique for nurses practicing in acute care inpatient settings and is different from "sequential" responsibility for a series of patients practiced by other professional health care providers. NLRN perceptions of not making the "right" decisions when managing multiple, competing patient needs contributed to their feeling "bad about themselves" and feeling as if they "let their patients down" and was identified by some as the reason why they would leave nursing. The literature review of complexity science and complex, adaptive systems provided the framework for the development and testing of a best management practice. This practice consisted of NLRNs reading a clinical practice dilemma scenario, followed by individual action commitment and then a class discussion using principles of complexity science. After reading the MP/SC scenario the NLRNs answered three questions: what would you do in this situation?; how would you feel about yourself as a nurse after making and acting on the decision?; and what could you do, to prevent the situation from happening again? The individual action commitment stimulated NLRNs to practice clinical reasoning and decision-making with the data at hand. At the end of the class discussion, NLRNs were asked for feedback on the activity and would they make a different decision after the class discussion. Class educators were asked about the usefulness of the practice in helping NLRNs master MP/SC dilemmas. Educators reported that after the class, NLRNs did gain insight into the multiple, potential correct answers to the MP/SC dilemma and all but one educator in the nine Magnet hospitals reported plans to incorporate the practice into their residency

program. Evidence also indicated a reduction in NLRNs negative feelings about the consequences of MP/SC decisions and an increase in collaboration after the class discussion. Based on the results of the study, the investigators concluded that the residency class has the potential for resolving the MP/SC issue cited as the NLRNs major challenge in getting work done.

## C 01 - Clinical Education Strategies

### A Process for Nurse Practitioner Students to Find Preceptors and Clinical Sites

---

*Maria A. Lofgren, DNP, MSN, BSN, ARNP, RN, NNP-BC, CPNP, USA*  
*Lou Ann Montgomery, PhD, RN, USA*

#### Purpose

The purpose of this poster presentation is to provide a process that meets the needs of Advanced Registered Nurse Practitioner (ARNP) students needing clinical experiences provided by competent, credentialed, licensed ARNPs, and to help ARNP faculty and students navigate through the legal placement process.

#### Target Audience

The target audience of this poster presentation is for academic faculty who teach ARNP students, administrative staff looking to facilitate ARNP students' clinical placement for recruitment and retention, and for ARNP students looking for clinical sites and preceptors.

#### Abstract

As a result of the Affordable Care Act, nurse practitioner programs have steadily increased across the country. To meet the demands for more providers, many academic institutions have developed distance learning programs leaving students to find preceptors and clinic sites on their own. At UI Hospitals and Clinics, many of our rising-star staff nurses were enrolled in such programs and needed clinical sites. Because of perceived and real barriers to placing students for clinical rotations within our institution, they often sought placement elsewhere, which often lead to them taking a position outside our organization upon graduation. In an effort to remove barriers and promote employee retention even if their future role changed, we developed a process to help both the students and the academic ARNP faculty navigate through our system to obtain clinical experiences provided by competent healthcare providers. The Department of Nursing's affiliation agreement that already existed was used and an addendum contract for the placing department was developed with hospital legal services. All UI Hospital and Clinics ARNPs were asked via a survey for permission to be placed on a master list of staff willing to be preceptors for ARNP students. A checklist was developed to guide the ARNP students through the steps of the placement process. The checklist involved three major categories: requesting official placement from school, information on how to secure a preceptor, and other required regulatory paperwork. Once the checklist was completed, the addendum was routed for signature from hospital administrators and the department head of the preceptors.

Since the inception of this process in 2012, ARNP students not employed by UI Hospitals and Clinics have also navigated through our system. To date, we have established affiliation agreements with twenty one ARNP academic programs in nine states. There have been 63 ARNP students covered under 103 addendum contracts for clinical experiences. Future plans include exploring alternate clinical experiences for students beyond 1:1 preceptors, developing recruitment and recognition strategies for preceptors, and migrating the paperwork process to an electronic workflow.

## C 01 - Clinical Education Strategies

### It's a Matter of Time: Formative Feedback in Online Learning Environments

---

*Deborah L. Sikes, MSN, RN, CNE, USA*

#### Purpose

The purpose of this presentation is to describe the results of a study to determine student satisfaction with timeliness of instructor feedback in online graduate nursing courses with a focus on the statistically significant relationship between timely feedback and student satisfaction ( $p = .000$ , Chi-square = 33.9,  $df = 1$ ).

#### Target Audience

The target audience for this presentation is faculty and nurse educators teaching in distance or online learning environments.

#### Abstract

Students desire to know how they are performing in online learning environments. The challenge for instructors teaching in the online learning environment is providing students with information to improve their performance prior to the assignment of a final grade. Formative feedback is an assessment element used to provide learners with information about how they are performing. Formative feedback is defined as "information communicated to the learner that is intended to modify the learner's thinking or behavior for the purpose of improving learning" (Shute, 2008, p.1). The formation of learning goals are assessed and evaluated in a manner that allows students to make changes and expand learning based on suggestions from instructors (Shute, 2008). Students perceive effective instructor feedback to be feedback provided in a timely manner with specific, constructive guidance to make changes and apply to future assignments (Getzlaf, Perry, Toffner, Lamarche, & Edwards, 2009). Failure to provide timely feedback may decrease motivation to make changes and decrease deeper learning (Stein, Wanstreet, Slagle, Trinko, & Lutz, 2013).

What is meant by "timely" feedback? Timely feedback can range from 24 hours to two weeks, depending upon the setting for the instruction (Ferguson, 2011; Getzlaf et al., 2009). The purpose of this presentation is to describe the results of a study to determine student satisfaction with timeliness of instructor feedback in online graduate nursing courses. Using a mixed-method approach, a mid-semester survey was distributed to 611 students enrolled in an online graduate nursing program. Results of the study will be discussed with a focus on the statistically significant relationship between timely feedback and high student satisfaction with feedback to make changes to future assignments ( $p = .000$ , Chi-square = 33.9,  $df = 1$ ). The target audience for this presentation is faculty and nurse educators teaching in distance or online learning environments. With increasing demands on organizations to decrease costs, the techniques provided in this presentation will demonstrate specific tools to improve timely feedback to learners in multiple learning environments. Using tools as Blackboard Collaborate®, Blackboard IM®, and Join.Me®, learners will discover virtual communication tools to implement and share feedback with students and colleagues (Blackboard, 2012; Join.Me, 2015). Upon completion of this session, the learner will be able to describe at least three approaches to improve student satisfaction with timely feedback and differentiate at least three preferred generational strategies for providing timely feedback.

## C 02 - Teaching and Learning in a Virtual Environment

### Using Multi-User Virtual Environments (MUVE) in Nursing Education

---

*Estelle Codier, PhD, MSN, BSN, RN, USA*

#### Purpose

The purpose of this presentation is to describe use of multi-user virtual environments (MUVE) in nursing education. Avatar student and instructor presence in solo, one-on-one and small group learning activities will be discussed, as well as performance outcome findings from research on over 400 learning activities in Second Life.

#### Target Audience

The target audience of this presentation is nurse educators on all levels of nursing education as well as educators in the clinical practice.

#### Abstract

Multi-user virtual environments have been called the most important teaching innovation of the 21st century. An outgrowth of multiuser gaming, MUVEs are not games, but rather three dimensional virtual worlds in which multiple users can interact in their avatar forms. When used for learning purposes, MUVE environments can be a useful form of simulation learning that can easily and inexpensively offer a wide variety of learning activities. The purpose of this oral presentation will be to introduce and describe MUVE learning, including its history, development, and pedagogical advantages over traditional learning methodologies. Second Life, the largest free, public MUVE will be described in detail. On the basis of data from over 400 nursing learning activities, the presenter will review four general types of MUVE learning activities, and review the literature for what is known about learning outcomes in MUVE learning. The presentation will conclude with an explanation of best practices for MUVE learning in nursing.

## C 02 - Teaching and Learning in a Virtual Environment

### College of Nursing Response to the Ebola Education Crisis: The Need for a Safe, Interactive, Clinical Education Strategy

---

*Linda Carl, EdD, MSN, BSN, BGS, RN, USA*

*Dee McGonigle, PhD, MSN, BSN, RN, CNE, FAAN, ANEF, USA*

#### Purpose

The purpose of the Ebola Treatment Center education model is to create a realistic and protected learning environment free from the risk of contracting the disease by simulating and animating best-practices and crisis management that translates into knowledge and skills applied in real world practice.

#### Target Audience

Nursing students, all nurses including specialty practice and inter-professional team members.

#### Abstract

In 2014, reports emerged about spread of the deadly Ebola virus from South Africa to the United States (US) (Centers for Disease Control & Prevention, 2014). News media, political figures, healthcare professionals, and the public showed grave concern and fear over healthcare delivery system failures to protect against cross contamination across US borders, in the community, and within hospitals. As the Ebola crisis played out in multi-media forums and around the world, hospitals and providers voiced the need to know how to render safe and effective care and how to protect from acquiring the virus while treating an infected patient (American Nurses Association, 2014). The College of Nursing immediately responded to the Ebola pandemic recognizing the need to incorporate the global crisis into a safe and accessible 3D virtual learning environment (VLE) free from the risk of exposure to the virulent infection. A Virtual Ebola Treatment Center was built by an interprofessional education and simulation-animation team that included nursing students, a faculty mentor, a virtual environment designer and developer, a virtual world specialist, and supportive administrative leadership. With mentor guidance, the students proposed an architectural design for the Center in the School of Nursing virtual learning space that was underpinned by an education model designed to provide realistic and protected learning for students, partner organizations, and stakeholders. The Ebola Treatment Center came to life with scripted simulations and animations framed in the novel education model. The model provides unlimited access to learning opportunities and data that enhances education delivery for each student. The simulated- animated clinical practicum is grounded in project management principles and the data, information, knowledge, and wisdom (DIKW) model using an interprofessional practice framework (McGonigle & Mastrian, 2015). The model includes 3D simulated infrastructure, teaming processes, crisis and disaster management workflow, and assessment of costs necessary to prevent, treat, and contain a biological public health crisis. The importance of the interactive learning education model to the conference theme is that the model demonstrates how web-based clinical education strategies, coupled with clinical simulation and animation methodologies, disseminates evidence-based practice standards in a safe, effective virtual learning environment. The model provides an opportunity to acquire screening, treatment, crisis management, and leadership knowledge to apply in the real world without the risk of contracting communicable diseases. The methods used include practicum faculty acting as mentors to facilitate learning, to monitor and evaluate clinical learning outcomes, and to guide critical debriefings. The disruptive innovation model is used to drive virtual learning experience process change in real time based on formative and summative data analyzed from student performance and success criteria. Expanding the virtual Treatment Center infrastructure, in strategically planned steps, and the inclusion of fixed and live avatar patients and providers, personal protective equipment, robotics, air ambulances, and emergency services, excite the interactive learning. Protocol driven patient admissions include safe donning and doffing of personal protective gear, HazMat Suits, patient containment transport units, a Bio-containment room, and a Quarantine ante-room. The learning simulation-animation scripts will be updated to mimic lessons learned based on real world root cause analyses. The implications for the use of evidence-based clinical education strategies is focused on protecting the US Homeland from the spread of Ebola and other infectious disease and will include disaster response to biological, biochemical,

and other terrorist threats. Using new knowledge gained, and depending on the student demographic, the Homeland may be simulated in different parts of the world or use scripted avatar role play with diverse ethnicity creating culturally competent learning while students share vast differences in values, beliefs, and worldviews. The disparities provide the learner with the wisdom to engage in evidence-based clinical, political, and global decision-making in the best interest of the public good in the real world.

## C 02 - Teaching and Learning in a Virtual Environment

### An Interprofessional Web-Based Approach to Critical Care Education: Development and Financial Impact

---

*Linda K. Heitman, PhD, RN, APRN-ACNS, BC, USA*

*Amy L. Essner, BSN, RN, CCRN, USA*

*Lisa M. Job, MSN, RN, APRN, ACNS, BC, USA*

*Ronald N. Kiplinger, BS, RRT, USA*

#### Purpose

The purpose of this project was to create a web site to be used for the online clinical orientation and continuing education of nurses in three specialized critical care units in a non-profit community hospital.

#### Target Audience

The target audience for this presentation would clinical nurse educators, nurse managers and clinical directors responsible for clinical orientation, continuing education and cost management.

#### Abstract

The purpose of this project was to create a web site to be used for the online clinical orientation and continuing education of nurses in three specialized critical care units in a non-profit community hospital. Review of the previous educational model identified the need for additional evidence-based content. The former face-to-face orientation classes and supplemental online courses were time consuming and expensive. In addition, revision of the program was needed to address the various levels of experience of nurses starting to work in the units: experienced critical care nurses, experienced non-critical care nurses and graduate nurses. The team also identified the need to provide an opportunity for periodic remediation of educational content for nurses currently working in the units.

To begin, the interprofessional team was assembled consisting of a Clinical Nurse Specialist Consultant, Critical Care Educator, Cardiothoracic Clinical Nurse Specialist, Respiratory Therapist and Information Technology Specialist. A survey was completed by the management team and staff to identify priorities to be included in course content. A prototype of the prospective website was created. Administrative approval to purchase a unit-specific portal was obtained in order to establish a secure website. The unit-specific portal allowed off-site access by the management team and staff. The range of capabilities of the existing learning management system (LMS) was reviewed for compatibility with the new web site. Testing capabilities of the LMS allowed for the creation and application of post-tests to accompany each module. Results of scores from the post-tests identified problem areas that needed to be addressed with each newly hired nurse. The team conducted a review of current educational content. Each team member was asked to compose learning modules that focused upon their specific areas of expertise. Evidence-based unit policies and procedures were included in the creation of each module. Upon completion of the modules, the Information Technology Specialist supervised team members in providing narration for each module before posting them to the website. All newly hired nurses were required to complete a pre-hire online assessment which assessed (1) clinical competence, (2) personality and attitude, (3) interpersonal skills and (4) critical thinking. The management team reviewed each assessment prior to the beginning of orientation to determine content areas that may need specific remediation prior to and during working in the units.

A review of the potential financial impact of the changes was significant. The previous educational model required face-to-face classes in addition to a licensing fee for supplemental online courses. The licensing fee cost \$2,000.00 per year. With the previous model, the cost for each orientee to complete the online program was approximately \$2,140.00 (60 hours)-\$3,400.00 (100 hours) per person depending upon the length of time necessary to complete all courses. In 2011, 15 people completed orientation resulting in an approximate cost of \$32,000.00. The average number of clinical hours spent with a preceptor ranged from 320-640 hours at an average of \$16,254.00 per person. The orientation of only 3 graduate nurses resulted in a cost of \$48,762.00. The website will result in substantial cost savings over time.

This project promoted collaboration through interprofessional review of content for the development of a critical care web site. The financial savings was substantial. The modules enhance continuing education for nurses currently working in the units by providing access to content review. In the future, capabilities to monitor yearly clinical competencies and results will be recorded on the website. Verification of professional certifications, required for all critical care nurses, will be maintained on the site providing ease of access for the management team. This individualized web-based approach to critical care education promotes quality and safety for critically ill patients by promoting a consistent standard of nursing education for new and experienced critical care nurses.

## C 03 - Enhancing Clinical Education

### Evaluating and Developing Supplemental Clinical Faculty Competency

---

*Jennifer Titzer, DNP, RN, USA*

*Gina L. Schaar, DNP, MSN, RN, USA*

*Constance F. Swenty, DNP, MSN, RN, USA*

*Marilyn Ostendorf, DNP, MSN, RN, USA*

#### Purpose

The purpose of this presentation is to describe a program designed to evaluate the educational needs of supplemental nursing clinical faculty and develop pertinent professional development workshops.

#### Target Audience

The target audience of this presentation is nurse faculty, academic and clinical leaders, and clinical faculty.

#### Abstract

**Purpose:** Due to the shortage of nurse faculty, employment of clinical experts as supplemental clinical faculty is essential. As a result, nursing programs are challenged to offer strategic development and evaluation methods which address the unique needs of the supplemental clinical faculty. In order to support students' learning needs and program outcomes, it is essential that these faculty are provided ongoing professional development. To create a supplemental clinical faculty development program, assessment of their challenges and needs is necessary. Data from the initial supplemental clinical faculty evaluation and initial development workshop are presented.

**Methods:** Focus groups and online surveys were used to identify the challenges and educational needs of supplemental clinical faculty, which include adjunct clinical faculty, clinical teaching partners assigned to dedicated education units, and clinical teaching associates used in a senior nursing internship course. The supplemental faculty's ability to assess student learning and the benefits and challenges the faculty experience were evaluated. The focus group discussion involved open ended questions eliciting participant feedback. The online survey questions mirrored the focus group questions; however, they were scored using a Likert scale. This data was then used to develop an initial educational workshop for supplemental clinical faculty.

**Results:** Fifteen supplemental clinical faculty attended the focus groups and 18 completed the online surveys. The results from the online surveys indicated that over 90% of the supplemental clinical faculty felt confident in their ability to address student issues and provide feedback. The participants were confident in their ability to coach student critical thinking. Despite this level of confidence, 23% of the online respondents felt more training and education would help them better meet the needs of the nursing students. Focus group responses suggest supplemental clinical faculty need more tools to better evaluate the level of students. They felt it was difficult to differentiate between the expectations for the less experienced students. In addition, the supplemental clinical faculty felt the course specific clinical evaluation forms were ambiguous and lacked consistent guidelines for assessing student outcomes. This feedback supports the need for further formal development workshops for supplemental clinical faculty specifically addressing the leveling of student performance and fostering a greater understanding of the clinical evaluation metrics.

**Conclusions:** Common practice in many undergraduate nursing programs is to utilize supplemental clinical faculty; however, current literature regarding ongoing development of these individuals is limited. Ongoing supplemental clinical faculty development is necessary to ensure successful attainment of program and student outcomes. This pilot study is an initial step in identifying and addressing the unique needs of clinical experts placed in the role of supplemental clinical faculty.

## C 03 - Enhancing Clinical Education

### Strategies for Developing Expert Clinicians into Clinical Faculty: Lessons Learned from a Hybrid Faculty Academy Experience

---

*Lisa A. Seldomridge, PhD, MSN, BSN, RN, USA*  
*Tina P. Brown Reid, EdD, MSN, BSN, RN, USA*  
*Katherine A. Hinderer, PhD, RN, CCRN, CNE, USA*  
*Judith M. Jarosinski, PhD, RN, CNE, USA*

#### Purpose

to describe lessons learned from offering a faculty academy experience to over fifty expert nurse clinicians. Delivered through a combination of online and face-to-face sessions, this collaborative between three nursing programs in a geographically rural area is in its fourth year of operation.

#### Target Audience

expert nurse clinicians with an interest in teaching at the undergraduate level and current faculty who might wish to develop a similar initiative.

#### Abstract

Background: Across the U.S., the scarcity of nursing faculty has been identified as central to the ongoing nursing shortage. Recruitment and retention of highly qualified individuals from diverse backgrounds to teach students in clinical settings is challenging regardless of locale, but is more acute in rural and physically-isolated communities. Educating practicing nurse experts about the complexity of the clinical academic environment requires a multidimensional approach along with ongoing mentorship and support during the transition from one role to the other.

The Eastern Shore Faculty Academy and Mentoring Initiative (ES-FAMI), a regional educational program serving a geographically-isolated peninsula in Maryland, is a partnership among three schools of nursing: a four-year comprehensive public university, a two-year community college, and a four-year private institution with an Afrocentric focus. The ES-FAMI experience, offered in a hybrid format, includes face-to-face meetings, interactive online modules, simulated clinical teaching experiences, and mentoring. Specific goals of the ES-FAMI are to recruit a racially, ethnically, and gender-diverse group of participants with special emphasis on the clinical specialties of psych/mental health, maternal/newborn, pediatrics, and community health. Topics for the online modules include exploration of the similarities and differences in curriculum design of the three partner programs, legal aspects of clinical teaching, how to create an environment for student learning while protecting patient safety, approaches to structuring for pre-and post-clinical conferences, alternative approaches to evaluating student performance, dealing with difficult student situations, and managing the personal challenges of multiple simultaneous roles.

Originally designed as a three year grant, the project was so successful that a one-year extension was sought to continue offering the academy and expand the mentorship aspects of the program. Mentoring activities include periodic face-to-face meetings to discuss challenging clinical situations and how to manage them, one-to-one shadowing with experienced faculty, site visits to academy graduates who had undertaken clinical teaching assignments for one of the partner schools, and workshops on such topics as “organizing a clinical experience”, “methods to track student assignments/patient diagnoses/clinical skills”, and “providing constructive feedback on student written work”. To date, seven academies have been held, yielding forty-four graduates, 77% of whom have taken clinical adjunct teaching assignments with one or more of the three partner schools. At the conclusion of the four year Maryland Higher Education Nurse Support Program-II grant project, nine academies will have been held with a projected total of sixty participants.

Conclusion: This structured faculty academy experience has given clinicians the foundational tools needed to transition to a clinical faculty role and has provided the partner schools with a pool of talented part-time educators. Ongoing challenges include the need for continued mentorship of academy

participants, redefinition of roles and expectations with each of the partner schools, the need for strong leadership from at least one of the partners to assure quality and continuity in online course management and implementation of simulated teaching experiences, and the importance of a flexible plan for sustainability when grant funding ends.

## C 03 - Enhancing Clinical Education

### Creating Caring Learning Environment Practice Partnerships (CLEPPs)

---

*Ruby A. Wertz, MSHA, BSN, RN, USA*  
*Neal S. Rosenburg, PhD, MSN, BSN, BA (Hons), RN, USA*  
*Susan C. Adamek, MSN, RN, NEA-BC, FACHE, USA*  
*Kimberly Falco, DNP, RN, USA*

#### Purpose

The purpose of this presentation is to describe the process of developing caring learning environment practice partnerships between selected healthcare organizations and Nevada State College School of Nursing anchored in Jean Watson's Caring Science Theory.

#### Target Audience

The target audience of this presentation is Deans or Directors of Schools of Nursing, Chief Nurse Executives of healthcare organizations, nurse educators and clinical educators.

#### Abstract

Reports by the Institute of Medicine (IOM) and the Robert Wood Johnson Foundation (RWJF) (2010) call for nurse leaders to improve how nursing students are educated by improving the bridge between theory and clinical practice. Such partnerships facilitate collaboration between academic and clinical practice settings for better utilization of resources and the development of creative ways to prepare nursing students in providing safe and effective patient-centered care to higher acuity patients in a complex healthcare systems (Glazer, Erickson, Mylott, Mulready-Shick, & Banister, 2011). Creating new and innovative models that utilize the traditional dedicated education unit (DEU) model presents unique and valuable opportunities for nursing students and staff nurses. The utilization of existing philosophical frameworks within a baccalaureate nursing program and a large healthcare system serves as the guiding theory of establishing academic – practice partnerships in an effort to stabilize, structure, and strengthen relationships. Creating such relationships, based in the caring sciences offers both academic units and clinical sites rich opportunities to ameliorate learning opportunities for all stakeholders. This bi-directional learning model benefits nursing students, staff nurses and academic/clinical administration.

In August 2014, Nevada State College's School of Nursing initiated discussions with two selected healthcare organizations, Dignity Health St. Rose Dominican Hospital's Siena Campus and the VA Southern Nevada Healthcare System to gauge interest in creating caring learning environment practice partnerships (CLEPPs) anchored in Jean Watson's caring theory. The creation of caring science units (CSUs) offers a novel approach to the dedicated educational units (DEUs). This innovative collaboration benefits nursing students and clinical units by offering a structured and consistent model of clinical experiences for all stakeholders.

The two healthcare organizations were chosen due to similar values and ideals related to the environment for nursing care delivery. The chief nurse executives, the clinical educators, the Dean of the School of Nursing and a nursing faculty responsible for clinical coordination met to discuss the vision, structure, and outcomes of the caring science units and the practice-partnership. Meetings continued during the implementation of the CSU's. The clinical liaisons from both organizations attended a faculty development workshop in January 2015 in which Jean Watson's caring theory was explored for integration into both the curricular and the clinical settings.

Caring science units (CSU) are similar to the dedicated education unit (DEU) models described in the literature where the unit staff nurses play a role in the education of the nursing students by functioning as a clinical instructor. Specific units are designated as a CSU in each healthcare organization and the nurse manager and clinical educator identified clinical nurse mentors on those units. Each practice setting designated a clinical liaison that communicates with the Nevada State College (NSC) clinical instructor,

the NSC nursing students, the nurse mentors at each organization and the NSC clinical coordinator to enhance communication and success of the CSU.

These practice partnerships create a caring learning environment that benefits both the healthcare organization and the school of nursing. The nursing students are in an environment that facilitates learning both the art and science of nursing care, as well as the transition from nursing student to new graduate nurse. The team of leaders developing the new, innovative CLEPPs shares exemplars of how nursing practice grounded in caring science leads to improved patient outcomes and patient satisfaction. The clinical nurse mentors receive education regarding the nursing curriculum, learning objectives for the course, teaching strategies to promote critical thinking/clinical reasoning, and effective feedback and evaluation. This enhances education and professionalism of nursing in the healthcare organization and introduces nurses to the nurse educator role.

## C 04 - Improving Clinical Teaching Methods

### One School's Journey through High Fidelity Simulation Curriculum Integration

---

*Ludy Llasus, PhD, RN, APRN, NP-C, AACN LANP Fellow, USA*

#### Purpose

The purpose of this presentation is to allow the learner: 1. To examine the process of integrating HFS into a BSN curriculum. 2. To learn about the experience of integrating HFS into a BSN curriculum across three programs tracks. 3. To identify success and challenges encountered in the experience.

#### Target Audience

The target audience of this presentation is nurse educators involved curriculum development in pre-licensure nursing education. Nurse educators involved in clinical simulation education will benefit from the information shared in this presentation.

#### Abstract

**Background:** This abstract describes one BSN program's journey in HFS curriculum integration. The IOM report on the Future of Nursing (2010) recognized the need for a highly educated nursing workforce to address the realities of health care in the 21st century. Nursing education facing the challenge related to clinical practice sites, many nursing program has adapted use of simulation as an educational tool to enhance clinical education. Simulation has been found useful for teaching to improve clinical judgment, increase safety and decrease errors (Bearson & Wiker, 2005). The use of simulation can help prepare clinically proficient health care professionals (Harder, 2010). Recent findings by the NCSBN national simulation study found substantial evidence that substituting for up to half of traditional clinical hours with high-quality simulation experiences produces comparable end-of-program education outcomes (Hayden et. al., 2014).

**Curriculum Development and Simulation Program Implementation:** Our school's simulation program began small and has undergone many changes since 2005. Our program started using low fidelity simulation in the foundations nursing course to prepare students for their first clinical rotation. The overwhelming response from students encouraged faculty to move forward in using this methodology in other courses. A shared clinical simulation center in the state was established in 2009. Faculty training in immersive simulation methodology by expert simulation faculty was provided for faculty identified as simulation champions. Educational packages for simulation education were initially used to match curricular needs to enhance learning. Clinical faculty, who had various degrees of comfort and skill in setting up, implementing, and debriefing, conducted the simulations. However, variability in students HFS learning experience and costs of using the packages were no longer financially sustainable. The program's simulation coordinator worked with faculty simulation champions from each level of the program to identify student learning needs, mapped out the curriculum with faculty teaching the didactic courses and developed clinical HFS scenarios that were congruent across the curriculum. Jeffries (2005, 2007) framework was used to guide the development and design of the scenarios. Schedules were mapped out and logistical planning was addressed with the clinical simulation center SIM ops committee. During this time, the program established the concierge simulation model where a dedicated set of faculty trained in simulation methodology will facilitate the scenario and conduct debriefings. This provided consistency in the HFS learning experience for BSN students and simulation technicians.

**Outcomes:** Integrating HFS in the nursing curriculum takes time, resources, and dedicated faculty. Full implementation of the newly developed HFS scenarios were undertaken in summer and fall 2013 and continues to be implemented in the curriculum to augment student clinical learning experiences. With the HFS curriculum infrastructure in place, the program is now positioned to conduct a more robust research focusing on evaluation of student learning, knowledge transfer, simulation and debriefing practices.

## C 04 - Improving Clinical Teaching Methods

### A Collaborative Project to Improve Associate Degree Nursing Students Knowledge, Skills and Attitudes about Quality Improvement

---

*Rebekah Powers, DNP, RN-BC, CMSRN, CSPHA, USA*

*Laurie Brannigan, MSN, RN, USA*

*Christina Ramdeo, MSN, RN, CNOR, CHTS-CP, USA*

#### Purpose

The purpose of this presentation is to enhance the knowledge of registered nurses and educators on a collaborative endeavor to improve associate degree nurses knowledge, skill, and attitudes about quality improvement in acute care settings.

#### Target Audience

The target audience of this presentation is registered nurse educators and clinicians who work at or do clinical rotations in acute care settings.

#### Abstract

Problem: Associate degree nursing (ADN) students were having challenges understanding their role in the quality improvement (QI) process furthermore, NCLEX was including more questions on QI.

A collaborative project was developed between a community college ADN program and the county hospital. The topic selected was the nonconformity on restraints from the most recent hospital regulatory survey.

Students attended a class on QI, EBP, regulatory agencies, and how to create scientific posters. Students were randomized into groups of 4. The student groups then created a group charter outlining each team member's responsibility, timelines, and consequences of failing to participate fully in the project. Students received copies of most recent regulatory survey findings, current hospital policy, and web links to Center for Medicare & Medicaid Services (CMS) information on restraints. Students examined the regulations regarding restraints, differentiated the types of restraints and learned about the nurses responsibilities when caring for patients in restraints. This information was then translated into a scientific poster. Students also participated in QI during clinical rotations by helping during NDNQI Skin Survey day, and attending Quality Management (QM) meetings.

Students presented posters at hospital shared governance council meeting. Posters were set up conference style and students presented as hospital staff rotated between posters. Hospital staff completed an evaluation form and a winning poster was determined. Students also presented posters to second and third semester nursing students and advisory board members. Posters were then given to hospital educators to use for in-services on restraints.

The project helped address QSEN competencies in the areas of evidence-based practice (EBP), quality improvement (QI), teamwork and collaboration.

Students were asked to evaluate the project process and accomplishment of identified objectives and evaluate their team members participation in the project (peer eval).

Outcomes: Improved scores on ATI predictor test Indicator: QI from 78.5% to 91.2%, students stated they "felt professional during the presentation", became more "focused on safety", began "looking for ways to improve care", and were more "patient centered when providing care during clinical rotations". Several students connected to the project on an emotional level, and discussed how they would feel if their family members were restrained.

## C 04 - Improving Clinical Teaching Methods

### An Adapted Clinical Teaching Model: Shifting from Traditional to Targeted

---

*Sheila Epp, MN, BSN, RN, Canada*

#### Purpose

The purpose of this presentation is to share an innovative approach to clinical education that is part of a new integrative curriculum for a Bachelor in Science Nursing degree program.

#### Target Audience

The target audience of this presentation is nursing educators, health care program educators, administrators, and all health care professionals that have contact with health care students in clinical practice.

#### Abstract

Health systems and care environments are faced with increasing complexity as a result of advancing knowledge and technology. At the same time, many agencies are experiencing financial resource and human resource constraints. These factors come together to generate a wide array of ethical and safety challenges for both health care and health care education.

Nursing programs, similar to several other health education programs, have struggled to provide graduates with the knowledge, skills, and abilities needed to enter such complex health care environments. The natural temptation is to add more content, assessment, and practice to already dense curricula. The result can create the perfect academic crisis; mounting stress and overload for both the student and the teacher. Further, nursing programs encounter increasing inability to meet their determined demands for safe, quality practice placements in the overtaxed care environments that are also often saturated beyond capacity with the volume of practice placements required from multiple health care programs.

In an effort to address these multiple challenges, our School of Nursing engaged in a curriculum review which included an extensive environmental scan. The environmental scan revealed several pieces of evidence that informed the development of an integrative curriculum for the development of entry level competencies for the graduate nurse. The newly developed curriculum includes an innovative clinical education model adapted from the Oregon Clinical Education Model developed by the Oregon Consortium of Nursing (Nielsen, Noone, & Voss, 2013). Our clinical education model shifts the early practice learning from random chance practice learning to targeted, focused practice learning experiences through the usage of Intentional Learning (IL) activities (Gubrud-Howe & Schoessler, 2008; Taylor Huber & Hutchings, N.D). The threading of concepts and learning outcomes across suites of courses, and the use of (IL) activities within several practice courses, are the hallmarks of the revised curriculum. Intentional Learning activities integrate knowledge, lab learning, and practice, thereby supporting the student to develop deep thinking and strong reasoning abilities (Benner, 2010; Taylor Huber & Hutchings, N.D; Tanner, 2006). As the student gains knowledge, skills, and abilities in an integrative manner, their level of responsibility for complex, holistic patient care is steadily increased.

An integrative curriculum with the adapted innovative clinical education model balances targeted learning with quality experiential learning to produce strong graduates who provide safe, competent, ethical professional nursing care. Integration and intentional learning are pedagogical approaches that could be adapted and infused into the curriculum of other courses and other disciplines.

## D 01 - The Use of Simulation in Nursing Education

### Teaching the Nursing Process through the Use of Simulation in the Lecture Hall

---

*Nola Schrum, MS, RN, CCRN, USA*

*Deborah A. Tapler, PhD, RN, CNE, USA*

#### Purpose

discuss an innovative teaching strategy to introduce simulation to the classroom and improve student understanding of the nursing process

#### Target Audience

nursing faculty in an undergraduate program

#### Abstract

The nursing process is a difficult concept for undergraduate students at any level to grasp. Yet, nursing faculty members expect students to apply this problem solving strategy as they individualize care for their assigned patients. According to Novak (2013) and Kirkman (2013), stimulation may be a more effective method to transfer knowledge than reading a textbook or listening to a lecture. Not all students have experienced a hospital setting prior to the beginning of nursing school which can lead to increased anxiety and fear about the first "real" patient encounter in a clinical assignment. Traditionally, a computerized slide presentation has been used to convey the steps of the nursing process in the classroom. Lack of a clear understanding of the concept became evident as faculty reviewed the students' written care plans during clinical rotations. Thus, a new strategy was conceptualized by faculty to improve students' understanding and application of the nursing process. Given the literature support for varying the methods used for instruction of a large student body (Foronda & Bauman, 2014), the faculty incorporated simulation into the classroom to teach the interrelated topics of clinical reasoning and the components of the nursing process as key factors for comprehensive nursing care.

The nursing process, otherwise known as ADPIE (Assessment, Diagnosis, Planning, Intervention, and Evaluation), was taught to junior students in the didactic setting by using simulation techniques with a standardized patient in the lecture hall. After a brief lecture using a computerized slide presentation highlighting the elements of the nursing process, the simulation strategy is introduced to the students sitting in the classroom. A standardized patient is brought into the classroom via stretcher with full moulage in place. A faculty member approaches the patient and models a real life encounter as would be performed by a registered nurse. The faculty introduces herself to the patient and performs a five minute clinical assessment to gather data which is verbalized to the students as it is identified. The standardized patient interacts with the faculty by answering questions about his current medical status. Students are expected to take notes throughout the demonstration identifying any abnormal data which can be used later to construct a patient-specific plan and nursing care interventions (steps of the nursing process). In front of the students, interventions are incorporated into the scenario such mobilizing the patient to a chair, using of an incentive spirometer, and administering medications. The patient data obtained is the foundation with which students build a concept map. The standardized patient is used to accomplish learning objectives for junior level students. This strategy acts as a bridge between the conceptual understanding of the nursing process and the reality of a hospitalized patient. The real time interactions portrayed between the faculty "nurse" and the "patient" allows the students to observe a comfortable way to approach and interact with a hospitalized patient during their future initial encounter. By observing this teaching strategy, the students become actively engaged in the activity, thus reducing their anxiety and uncertainty experienced when approaching patients for the first time. Students report that the use of simulation in the lecture hall provides a method to envision their role as student nurses in the clinical setting. This innovative teaching approach changes the classroom environment to a setting characterized by active and experiential learning.

## D 01 - The Use of Simulation in Nursing Education

### A Poverty Simulation for Health Care Professions Students

---

*Lori I. Kidd, PhD, RN, CNS, USA*

*Sheri Hartman, MSN, RN, CPNP, USA*

#### Purpose

to describe planning and implementation of an interprofessional simulation to help health care professions students become more aware and sensitized to the experience of living in poverty. The presentation will also present results of research conducted to evaluate changes in attitude.

#### Target Audience

nurse educators, clinicians, or administrators. The information is useful to anyone working with vulnerable populations or those engaged in interprofessional collaborations.

#### Abstract

**Purpose:** Research was conducted to evaluate whether a poverty simulation presented for health care professions students effected a change in attitudes toward those living in poverty.

**Problem:** Poverty is on the rise in the United States (National Center for Health Statistics, 2012). Poverty is a significant social determinant of health, impacting mental illness, obesity, cardiovascular health and other acute and chronic illnesses. It is essential that nursing students and other health care professionals develop an empathic understanding for the complexity of poverty and related health outcomes, yet few undergraduate students may have real life experience or exposure with this vulnerable population (Patterson & Hulton, 2011; Yang, Woome, Agbemenu, & Williams, 2014). It is also important to educators and clinicians to work in collaborative interprofessional groups to provide the most comprehensive and highest quality health care for clients.

**Methodology:** Undergraduate students (n=80) enrolled in nursing, social work, and child life specialist programs in a large midwestern University participated in a poverty simulation. An interprofessional team organized and conducted the simulation. The simulation lasted approximately 3 hours and required the students to role play being part of a low income family for a month. An effort was made to put students from different health care majors together in families and during debriefing to allow different perspectives to emerge. Community volunteers who had real life experience living in poverty staffed resource agencies providing assistance. Students were asked to complete a pre and posttest that assessed attitudes toward those living in poverty (Short Form of the Attitude Toward Poverty Scale, Yun & Weaver, 2010). A section for general comments collected qualitative data.

**Analysis:** Paired sample t-tests were used to determine differences in attitude toward those living in poverty pre and post simulation. T-test analysis was completed on questionnaires that were fully completed (n=37), contained <10% missing data (n=58), and with mean replacement for missing data (n=58). Qualitative comments were insufficient to analyze beyond basic descriptive statistics (i.e. percentages of objectives met, etc). Additional analysis of data from a scheduled simulation April 2015 will be included in the presentation.

**Findings:** There was no significant overall change in attitudes pre and post simulation; however, multiple items of the scale demonstrated significance ( $p < .05$ ). Subjective comments about the experience were very positive.

**Implications for Nursing:** Although subjective data indicated effectiveness of the poverty simulation, more rigorous methodology is necessary to collect reliable empirical evidence. Additional simulations emphasizing interprofessional collaboration will be offered to subsequent classes of students. Simulations can also be adapted to incorporate more vulnerable populations such as more older adults and clients with chronic mental illness.

## D 01 - The Use of Simulation in Nursing Education

### Unfolding Case Study Using Human Patient Simulation in an Advanced Practice Nursing Program

---

*Linda A. Mason Barber, PhD, MS, BSN, APRN, ANP-C, USA*

#### Purpose

The purpose of this presentation is to describe the development and implementation of a human patient simulation learning experience in an advanced practice nursing program using an unfolding case study approach with standardized patients.

#### Target Audience

The target audience of this presentation is dean's and faculty of nursing programs, nurse educators, graduate students in advanced practice or nurse educator nursing programs, and advanced practice nurses.

#### Abstract

**INTRODUCTION:** The use of human patient simulation (HPS) in nursing education has expanded in recent years, in part due to the increasing challenges educators face in finding sufficient clinical placement for students. Limitations imposed by clinical entities deemed appropriate for precepted experiences for students in advanced practice nursing programs have increased. HPS using standardized patients offers a viable adjunct to clinical experiences in which advanced practice nursing students can develop and be evaluated in terms of their clinical knowledge, skills, and attitudes. HPS has been shown to be an effective alternative to traditional clinical experiences for students in an undergraduate nursing program. Literature, however, is limited on the use of HPS for the purpose of educating and evaluating advanced practice nursing students.

**PURPOSE:** The purpose of this presentation is to describe the development and implementation of a HPS learning experience in an advanced practice nursing program using an unfolding case study approach with standardized patients.

**METHODS:** Advanced practice nursing students in their final semester of a family nurse practitioner program at Mercer University in Georgia participated in a clinical experience conducted in the school's simulation laboratory as part of a clinical practicum course. A faculty developed unfolding case study consisting of three distinct, sequential patient scenarios served as the basis for the experience. Standardized patients recruited for the scenarios were provided background information and scripts to familiarize them with the patient presentation of joint pain, initially, and subsequent abdominal pain, and to coach them in terms of appropriate actions and responses to student questions and examination during the progressive scenarios. Program faculty served as observers and evaluators of student performance throughout the experience. Students were presented with the standardized patient for evaluation in a simulated outpatient setting. Consistent with an unfolding case study, each student engaged in three separate, supposedly time-lapsed, sequential encounters with the standardized patient over a three-hour time period. Patient charts and supporting data pertinent to each encounter were reviewed by the student prior to and during each visit. A health history and physical assessment were completed at each patient encounter, concluding with documentation of findings and a comprehensive treatment plan. Student assessment of evolving patient issues and evaluation of previous assessment findings and treatment plans served as the foci of faculty observation. Evaluation of student performance in the areas of communication, physical assessment, and documentation skills also was conducted. Debriefing, faculty feedback, and student self-evaluation of performance followed completion of the sequence of scenarios. In addition, students were asked to complete a written evaluation of the experience using an evaluation form designed by faculty.

**RESULTS:** Positive feedback from students and faculty supported the value of the simulated experience in reinforcing student clinical knowledge and skills. Written evaluation from students also supported

advancement of knowledge and, along with oral feedback from faculty, identified gaps in teaching and learning which served as a valuable outcome of the simulated clinical experience.

**CONCLUSIONS:** HPS using standardized patients and an unfolding case study approach may be a viable adjunct to traditional precepted clinical experiences for reinforcing knowledge and skills and assessing student learning in an advanced practice nursing program. In addition, identification of teaching and learning needs of students related to clinical knowledge, skills, and attitudes may be derived from these experiences. Debriefing, feedback, and student self-evaluation are important components of simulated learning experiences. Implications for educational and clinical practice and research are evident.

## D 02 - Discussions of Quality of Life in Critically Ill Patients

### Factors Predicting Quality of Life of Thai Patients with End-Stage Renal Disease Depending on Hemodialysis

---

*Geneva Chonpimai, MS, Thailand*

*Areewan Oumtanee, PhD, MS, RN, Thailand*

#### Purpose

The purposes of this research are to study the quality of life of patients with ESRD and to identify the factors in predicting the quality of life of patients with ESRD at a private dialysis center located on Bangkok, Thailand.

#### Target Audience

Hemodialysis Nurse, administrator, and Nurse manager

#### Abstract

**Introduction:** Quality of life is one of the indicators to identify whether a person could live in a society happily and be satisfied with life. In particular, patients with End Stage Renal Disease depending on hemodialysis (ESRD). The illness has various impacts on the physical, psychological and social well-being. Those are affected on their quality of life. Thus, nurses should enhance the patients' quality of life.

**Purpose:** The purposes of this research are to study the quality of life of patients with ESRD and to identify the factors in predicting the quality of life of patients with ESRD at a private dialysis center located in Bangkok, Thailand.

**Sample:** There were 180 patients from a private dialysis center, willing to participate in this study.

**Study instruments:** this study used a set of questionnaire consisting of 3 parts: 1) personal factors including, sex, age, marital status, educational level, duration of hemodialysis treatment, 2) Quality of life WHOQOL-BREF questionnaire, and 3) Evaluation form of Barthel Activity of Daily Living (ADL).

**Data analysis:** Statistics used in this study were Sum, Mean, SD, Pearson correlation, and stepwise multiple regression.

#### **Results:**

1. The quality of life of patients with ESRD was moderate level (Mean = 91.68, SD = 11.54).
2. Age was negatively and significantly associated with quality of life of patients with ESRD at the 0.05 level ( $r = -0.266$ ).
3. Different income of patients could make different quality of life.
4. Other personal factors: sex, marital status, education and duration of hemodialysis treatment did not make a difference on the Quality of life.
5. Performance of Activities of Daily Living (ADL) was positively and significantly correlated with the quality of life of patients with ESRD at the 0.01 level ( $r = .418$ ).
6. Factors predicting quality of life of patients with ESRD were ADL ( $R^2 = .175$ ), income more than 10,000 baht per month ( $R^2 = .062$ ) and age ( $R^2 = .039$ ), respectively. The overall percentage of prediction was 27.6. The study equation was as follows: Quality of life =  $.944$  activities of daily living +  $.194$  income +  $.008$  age.

**Conclusion:** The study findings indicate that patients with ESRD have moderate quality of life. Thus, nurses should promote patients' quality of life by counselling with their family for both ADL and financial support.

## D 02 - Discussions of Quality of Life in Critically Ill Patients

### Patients with Advanced Lung Cancer: Quality of Life and Perception of Dyspnea

---

*Barbara A. Roces, PhD, PhD, NP, RN, USA*

#### Purpose

To discuss the examined relationship between quality of life and perception of dyspnea in a group of advanced lung cancer patients.

#### Target Audience

Practitioners involved in palliative care and end of life care.

#### Abstract

**Background:** Dyspnea perception can be defined as a multidimensional experience of breathing discomfort, influenced by physiological, psychological, social, and environmental factors, that includes secondary psychological and behavioral responses and cannot be defined only by physical objective abnormalities. Dyspnea is the most common and distressing symptom in patients with advanced lung cancer and decreases one's quality of life (QOL). Furthermore, dyspnea has been found to interfere with physical activities such as walking, work, and psychological activities such as disposition, taking pleasure in life, relationship with others, and sleep. Thus, it can be hypothesized that quality of life is related to perception of dyspnea in advanced lung cancer patients; although no published reports have examined this relationship in this population.

**Objective:** The purpose of this study was to examine the relationship between quality of life and perception of dyspnea in a group of advanced lung cancer patients.

**Method:** This was a descriptive correlational, cross-sectional study. Quality of life was measured using The Assessment of Quality of life at the End of Life (AQEL). Perception of dyspnea was measured using the Cancer Dyspnea Scale (CDS). The participants were 22 patients in a hospice care setting diagnosed with advanced lung cancer that reported dyspnea.

**Results:** The findings supported the literature review suggestions that there was indeed relationship between the subscales, AQEL, and CDS measurement total scores. In the sample of advanced lung cancer patients in the hospice care setting, results revealed the AQEL subscales (basic function, activity, cognitive function and perception of care) had a significant correlation to the AQEL total score. In addition, the physical symptoms (pain and bowel movement) indicated a strong inverse relationship to the AQEL total score. As indicated by prior research, analysis revealed the CDS subscales (discomfort, anxiety, and sense of effort) had a strong significant relationship to the CDS total score. Furthermore, it is important to note that the result geared toward the second aim of this research study, indicated no significant relationships between the participants demographics, AQEL total score, and CDS total score.

**Implications:** Increased knowledge of the relationship between quality of life and perception of dyspnea in advanced lung cancer patients can provide a basis for the development of more refined assessment tools, enhanced symptom management, and overall improvement of the care of advanced stage lung cancer patients.

**Conclusions:** Precipitants of dyspnea included both physical and emotional sensations triggered by immediate reactions connected to participants' experience of dyspnea perception amongst advanced lung cancer patients in the hospice setting.

## D 02 - Discussions of Quality of Life in Critically Ill Patients

### Determinants of Quality of Life Among Congestive Heart Failure Persons

---

*Aporn Deenan, PhD, MSc, BHe, RN, Thailand*

#### Purpose

The purpose of this presentation is to understand quality of life and its predicting factors of congestive heart failure persons

#### Target Audience

1. Nurses who work with congestive heart failure persons both in clinics and communities  
2. Nurses researcher who interested in congestive heart failure population

#### Abstract

Most of cardiovascular diseases usually end up with congestive heart failure and hospitalization. Symptoms of congestive heart failure are illustrated by dyspnea, edema at legs, fatigue, and restless and affect functional performance, mental health, and quality of life among congestive heart failure persons. The objectives of this descriptive study were to examine quality of life and its determinants. A sample of 200-congestive heart failure persons who received health care services at outpatient department was recruited. Instruments were a package of interviewing questionnaire including demographics, quality of life, health perception, functional performance, mental and emotional problems, food consumption, physical activity, illness adjustment, and depression. Data were analyzed using descriptive, Pearson's correlation, and Multiple Regression. The results were as follow:

Majority was male (56.0%), mean age 57.31 (SD. = 15.60), marital status (90.0%), employee (53.5%), illness duration average 42.42 (SD. = 66.27; 83.0%), and history of hospitalization (74.0%). The results also found that significant factors related to quality of life included health perception ( $r = .290, p < .001$ ), functional performance ( $r = .471, p < .001$ ), illness adjustment ( $r = .324, p < .001$ ), mental and emotion problems ( $r = .559, p < .001$ ), physical activity ( $r = .178, p = .006$ ), food consumption ( $r = -.200, p < .001$ ), and depression ( $r = -.317, p < .001$ ). Stepwise Multiple regression suggested that predicting factors of quality of life were mental and emotional problems (Beta = .433,  $p < .001$ ) and functional performance (Beta = .267,  $p = .001$ ). Total variance explained 36.8%

From the research results, health care providers should develop intervention and conduct research based on promoting functional performance and managing mental and emotional problems to improve quality of life among congestive heart failure persons.

## D 03 - Preventing Disease through Promoting Healthy Food Choices in Children

### Adolescent Food Choices: A Two City Comparison Cape Town and the Bronx

---

*Eleanor T. Campbell, EdD, MEd, MA, BS, RN, USA*  
*Natasha Nurse, RN, CNS, USA*

#### Purpose

The purpose of this presentation is to inform the health care community about factors influencing adolescents' healthy and unhealthy food choices and the impact of these factors on the rising international rate of childhood obesity

#### Target Audience

The target audience of this presentation is nurses working with children, adolescents and their families particularly in school and community settings, including policy makers and other stakeholders interested in school health and prevention of child and adolescent obesity.

#### Abstract

A mixed method design including survey questionnaires and focus group interviews was used to gather information about the daily food choices and factors influencing food choices among a cross-section of adolescent youths from seven schools in Cape Town, South Africa and two faith-based youth programs in the Bronx, New York. The purpose of this study was to compare responses between the schools and the two international cities in order to shed light on the global impact of food choices on childhood obesity rates.

Findings showed no significant differences in healthy food choices among subjects regardless of income level. However for unhealthy food choices, there were significant differences between adolescents from low and middle socioeconomic levels. Interview data indicated money, convenience of location, and parents as contributing to adolescents' unhealthy food choices. Low income students selected more unhealthy foods as a substitute for lunch while middle income adolescents purchased more unhealthy foods after school and on week-ends with families.

Barriers to healthy food choices at school were identified as: social stigma and lack of variety in school food menus. Powerlessness to initiate the process to effect changes in school lunch menu options was also identified.

The results of this study will add to the research on childhood obesity as it helps to explain the food choice patterns among adolescents in Cape Town, New York, and similar urban environments, and identifies areas for international community collaboration to improve food health literacy and food health policies.

## D 03 - Preventing Disease through Promoting Healthy Food Choices in Children

### Patterns of Body Mass Trajectory among Japanese Children and Impacts of Life Style Factors during childhood

---

Chiyori Haga, PhD, RN, PHN, Japan  
Yoko Aihara, PhD, RN, PHN, Japan

#### Purpose

Understanding the variations in growth patterns, while considering body size in children, is essential to determine the optimal time for initiating interventions to control body size. Here, we aimed to conduct an explorative analysis for identifying the variations in the developmental patterns of body size in Japanese children.

#### Target Audience

The target audience of this presentation is nurses working for public health to promote the health of children.

#### Abstract

**Introduction:** Childhood overweight and obesity are global health problems. Understanding the variations in growth patterns, while considering body size in children, is essential to determine the optimal time for initiating interventions to control body size. In this study, we aimed to conduct an explorative analysis for identifying variations in the developmental patterns of body size and the impact of lifestyle factors in Japanese children.

**Methods:** The data included details of all 155 children (76 boys, 79 girls) born from April 2, 2005 to March 31, 2006 in Tsuru city, Japan. We used a discrete mixture model to explore the patterns of body mass index (BMI) trajectories. BMI was calculated as weight (kg)/height (m<sup>2</sup>) and standardized using the z-score; it was measured at birth and then annually until the age of 9 years. We also used a multinomial logistic regression to identify factors associated with overweight in children.

**Results:** Five patterns of BMI trajectory were identified in both boys and girls. The three patterns associated with obesity or overweight in boys were being obese since the age of 5 years (4.0%), being overweight since the age of 5 years (20.0%), and gradually being overweight since the age of 7 years. The only pattern associated with overweight in girls was being overweight since the age of 4 years.

**Conclusion:** The results show that preschool age is a crucial period for becoming overweight in childhood; thus, intervention programs should target overweight preschoolers. Children who are not overweight but who show a gradual increase in their BMI during preschool should also be targeted by early intervention programs because they could become overweight after reaching school age. We also found that maternal working and children's extracurricular activities were associated with overweight or obesity. However, the factors may differ by sex.

## D 03 - Preventing Disease through Promoting Healthy Food Choices in Children

### Keeping the Child with Food Allergies Safe at School

---

*Scarlet R. Spain, DNP, CNS, FNP-BC, USA*

#### Purpose

The purpose of this presentation is to provide best practice recommendations for keeping the child with food allergies safe while at school.

#### Target Audience

The target audience is pediatric nurses or advanced practice nurses. This lecture will provide best practice management for keeping the child with food allergies safe at school that can be disseminated to patients and patients families.

#### Abstract

Rates of children suffering from food allergies have increased dramatically in prevalence in the past decades. It has been documented that the overall prevalence of pediatric food allergies has increased 18% from 1997 to 2007 (CDC). Children having accidental exposures to allergens in the school setting are not uncommon. Literature demonstrates that many school staff has very little knowledge regarding the commonality and prevalence of food allergies and may lack awareness of the signs and symptoms of reaction related to food allergy. Research also shows that there may not be properly trained staff to treat a child experiencing a reaction related to food allergy. This concern becomes increasingly difficult in schools where a licensed nurse is not employed full time.

This lecture examines the initiation of a doctoral level best practice project for keeping the child with food allergies safe at school. A systematic review of the literature was conducted to identify the best evidence regarding keeping the food allergic child safe at school. After inclusion and exclusion criteria were applied, there were a total of 16 articles for review. An intensive analysis and synthesis of the literature was performed which culminated into best practice research on the topic. A food allergy management policy was implemented in the school that encompassed the literature findings. Best practice recommendations identified, include careful monitoring to achieve complete avoidance and the initiation of an emergency care plan. Also, emergency medications must always be available for the student. Education of staff regarding best practice for management of food allergies is of extreme importance. This lecture examines these key components and also reviews the initiation and findings of a best practice doctoral project in a local school that utilized the practice recommendations as designed by the project coordinator. At the end of this lecture, the attendee should be able to identify the key components related to school safety for the food allergic child.

## E 01 - Psychiatric Clinical Education: Enhancing Mental Health Knowledge

### Clinical Education Focused on Providing Care for Clients Experiencing Delirium: Enhancing Nurses' Knowledge, Self-Efficacy, and Application to Practice

---

*Sherida Ingram, BScN, RN, Canada*

*Yolanda B. Babenko-Mould, BScN, MScN, PhD, RN, Canada*

*Richard Booth, RN, BScN, MScN, Canada*

#### Purpose

The purpose of this mixed methods study was: a) to assess nurses' knowledge and self-efficacy prior to and immediately after involvement in a clinical education session about how to provide care for the delirious hospitalized client, and b) to explore nurses' experiences of applying this knowledge to practice.

#### Target Audience

The target audience for this presentation is nurses, both in the academic setting and in the clinical setting. The findings of this study may be pertinent to continuing education programs and professional development for nursing leaders, advanced practice nurses, educators and students alike.

#### Abstract

Background: Delirium is an urgent health condition that requires treatment without delay to lessen the chance of increased morbidity and mortality. Despite the seriousness of delirium, it is reported that both nurses and other healthcare professionals fail to detect the presence of delirium in 60% of clients in acute care settings (Mitstarz, Elliott, Whitfield, & Ernest, 2011). A primary reason why delirium is poorly recognized is due to a lack of education (Gordon, Melillo, Nannini, & Lakatos, 2013; McCrow, Sullivan, & Beattie, 2014; Tabet, Hudson, Sweeney, Sauer, Bryant, Macdonald, & Howard, 2005). It was proposed that if education can support nurses' abilities to provide more effective and safer client care, then it was prudent and timely to generate deeper insights related to how nurses' knowledge and self-efficacy would be influenced as a result of participating in a clinical education session. In addition, given that knowledge translation is pivotal factor in nursing education and practice, it was important to explore how nurses' knowledge was applied to their practice after participation in an education session.

Purpose and Design: The purpose of this mixed methods study was two-fold: a) to assess nurses' knowledge and self-efficacy prior to and immediately after involvement in a clinical education session about how to provide care for the client at risk for delirium and for the acutely delirious client in a hospital setting, and b) to explore nurses' experiences of applying knowledge from the education session to the practice setting. The education session focused on objectives related to the risks, signs and symptoms of delirium, standardized screening tools available for delirium and management strategies of the client at risk for delirium and the acutely delirious client.

Methods: Upon receipt of ethics review board approval, unit coordinators and educators of two participating acute care hospital facilities were provided with a Letter of Information about the study, which was sent via email. The study information was distributed by unit coordinators and educators to nursing staff. Thus, all eligible RNs at the acute care facilities involved in point-of-care-nursing practice were invited to volunteer to participate in the education sessions. Recruitment posters were also distributed throughout the two facilities. At each education session, a package was distributed to attendees containing the Letter of Information, the Consent Form, and the Demographic Questionnaire. In order to address part 'A' of the study, the pre-test knowledge instrument and pre-test self-efficacy instrument were distributed for completion immediately before the education session. The post-test knowledge instrument and post-test self-efficacy instrument were distributed for completion immediately following the education session.

A total of six education sessions were held; four sessions at the first facility and two at the second facility. Fifty-six participants took part in the education sessions and completed the pre and post-test instruments. Each education session was held as a face-to-face 60 minute 'lunch and learn' session lead by the primary researcher. A pre-prepared slide presentation and the same case study were utilized in each session to ensure consistency of presented material.

**Instruments:** Two researcher-designed instruments were utilized for the quantitative methods part of the study: the Knowledge Instrument to Care for a Client at Risk for Delirium and of the Acutely Delirious Client and the Self-Efficacy Instrument to Care for a Client at Risk for Delirium and of the Acutely Delirious Client Instrument. Both instruments were completed prior to and immediately after the education session. In part 'B' of the study, seven nurses volunteered to participate in the individual audio-recorded interviews at least two weeks after the education session to explore their experiences of translating the knowledge developed from the clinical education session into practice. Individual interviews were conducted using a semi-structured interview guide and interviews were subsequently transcribed verbatim. Descriptive content analysis was conducted on the transcribed data in order to develop categories and themes related to nurses' experience of knowledge translation regarding the topic of delirium.

**Outcomes:** The results of the quantitative portion of the study indicated that nurses had a higher level of knowledge and self-efficacy about the care of clients at risk for or experiencing delirium as it relates to assessment, screening and management of delirium after participating in the education session. The qualitative findings highlighted participants' rich experiences and revealed the categories of: empathy, knowledge acquisition, competence, leadership, and confidence. Themes, which served to capture the essence of participants' experience included: enhancing emotional intelligence, strengthening clinical judgment to enhance quality of care, and increasing leadership competency.

**Implications:** Nurses' were found to have gained knowledge of the risks, signs, symptoms and management of the delirious client and for those at risk for delirium after attending the education sessions. This may allow for recognition of delirium and increase nurses' abilities to prevent exacerbation of delirium. Nurses' overall higher ratings of self-efficacy, as a result of involvement in the clinical education session, suggest that nurses who believe they can assess for and manage clients' delirium may decrease the overall incidence of delirium.

As a result of increased knowledge, nurses may be able to provide more comprehensive screening, and seek treatment modalities earlier, preventing further decline in the clients overall status. Providing a more timely diagnosis and early treatment may decrease the clients' length of stay, potential risk of institutionalization following discharge, loss of function and decrease the use of restraint. Further, increased self-efficacy for caring of this population may enable the nurse to manage clients experiencing delirium, while providing support the client and family with more confidence.

**Recommendations:** Delirium education is recommended to strengthen nurses' knowledge and self-efficacy of caring for this high risk population. Education programs for nurses should be based on evidenced-based practices. In this way, education being received should be consistent and the management of these clients will become a standard of care. Collaboration between academic faculties and hospitals is recommended to increase the awareness of delirium with both students and professional nurses.

**Conclusion:** Education sessions to prevent delirium increased nurses' competence and confidence. Delirium is one of the most common conditions found in the acute clinical setting, yet it remains one of the least recognized and understood conditions. Studies, such as this, have shown that simple and inexpensive clinical education programs have the potential to significantly decrease the prevalence of delirium (Tabet et al., 2005). Therefore, an investment and valuing of ongoing continuing professional development in education can ultimately positively impact quality and safe client care.

## E 01 - Psychiatric Clinical Education: Enhancing Mental Health Knowledge

### Nursing Perspectives of an Advanced Psychiatric Mental Health Nursing Curriculum: Findings of a Qualitative Research Study

---

*Jeanette Rossetti, EdD, RN, USA*  
*Kelly Bryant, MS, RN, CNE, USA*  
*Patricia Jones-Bendel, MSN, USA*  
*Faith Stauserboll, BSN, RN, USA*

#### Purpose

The purpose of this presentation is to share the results of a research study that aimed to assess the experience of and the impact that an advanced continuing education curriculum had on the nurses' psychiatric nursing practice utilizing Tidal Model Principles.

#### Target Audience

The target audience of this presentation are nurses in clinical practice, staff development and administration.

#### Abstract

Preparing psychiatric mental health nurses to provide holistic person centered care promoting self-management and recovery following principles of the Tidal Model presents an opportunity for consistent practice and clear articulation the nurses' role on the interdisciplinary team. Nursing staff from a Midwestern Behavioral Health Hospital in the United States attended an advanced nursing curriculum titled Advanced Psychiatric Mental Health Nursing Curriculum: A Journey of Therapeutic Engagement. This research study aims to assess the experience of and the impact that this advanced continuing education curriculum had on the nurses' psychiatric nursing practice and the application of the Tidal Model principles. A qualitative interpretive descriptive design will be used to gather and analyze data from participants. Such an approach provides a rich description and understanding of the nurses' experience. Focus group interviews will be the main method of data collection; utilizing open ended questions with the two cohorts of nurses that attended the 18 hour advanced Psychiatric Nursing Curriculum. A focus group schedule will be developed with a semi-structured interview guide. There will be two focus group moderators for each session. One moderator will lead the session and one moderator will take notes and ensure that the audio tape is working properly. Focus groups will be audio taped and transcripts will be transcribed. The constant comparative method of analysis will be employed by members of the research team that led the focus groups. After transcription and coding of focus group discussions has taken place, the research team will generate a set of statements and themes that embody each group's discussions and main points. Conclusions will be presented that describe the experience and impact of the advanced psychiatric mental health nursing curriculum and the application of the Tidal Model principles that the nurses' utilize in their daily psychiatric nursing practice. The implications of this research study have potential to transform psychiatric nursing practice and provide patient centered and recovery oriented principles of nursing care.

## E 01 - Psychiatric Clinical Education: Enhancing Mental Health Knowledge

### Enhancing Mental Health Nursing Practicum with Clinical Simulation: A Comparison of Student Outcomes

---

*April L. Mouser, DNP, MSN, BSN, RN, USA*  
*Lizann Atkin, MSN, BSN, RN, USA*

#### Purpose

The purpose of this presentation is to describe a modified mental health nursing practicum consisting of 31% clinical simulation and the resulting statistically significant student outcomes.

#### Target Audience

The target audience of this presentation is nurse educators, academic administrators, and simulation center directors who participate in the development, assessment, and innovation of clinical curriculum.

#### Abstract

**Background::** Opportunities for experiential mental health experiences in acute care settings are decreasing. In addition, acute care settings are restricting student practice opportunities thus, limiting the quality of learning experiences. An excellent experiential alternative is the use of clinical simulation. Simulations can be used to supplement and enhance mental health nursing practicums by providing students with opportunities to interact, assess, and manage common mental health nursing challenges.

#### **Objectives:**

1. The learner will be able to articulate the steps used to create an enhanced, comprehensive mental health simulation program, including topic selection and scenario development.
2. The learner will be able to compare and contrast student learning outcomes between a traditional mental health nursing practicum and the practicum enhanced with 31% clinical simulation.

**Purpose:** The purpose of the study was to compare student learning outcomes between two groups of students in the mental health nursing practicum, traditional practicum versus a practicum enhanced with 31% simulation.

**Methods:** The control group is a traditional clinical group, in which 8.8% (8 hours) of clinical hours are spent in simulation. The experimental group received 31% (28 hours) in simulation. Students were selected based on self-enrollment into practicum courses. The study was conducted over three semesters involving six clinical groups. The study assessed the students' didactic course performance such as exam scores and ATI standardized test performance as student learning outcomes.

The students in the experimental group experienced a series of seven simulations, progressing from an orientation to mental health nursing and assessment of common mental health disorders to a simulation depicting common adverse medication effects of antipsychotic and antidepressant medications. The students in the control group experienced two simulations, an orientation to mental health nursing and a simulation that could depict adverse medication effects or suicidal ideation.

Student learning outcomes were analyzed using matched pair t-tests and aggregate group data. Students were matched based on nursing grade point average (GPA) within and across semesters.

**Results:** Initial data reveals significant differences in both didactic course grades and standardized test performance of students in the experimental group with average nursing GPAs of 3.25 or lower and in students who had previously repeated nursing coursework, particularly on topics presented in the simulation scenarios found on the standardized test.

No significant difference was noted among students with nursing GPAs of 3.26 or higher on the didactic course grade or standardized testing performance.

**Conclusions:** Increased clinical simulation, focused on common mental health nursing topics, improves student learning outcomes and performance in higher risk student populations, those with nursing GPAs of 3.25 or lower or who have previously repeated nursing coursework.

## E 02 - Promoting Sexual Health in the Adolescent Population

### Urban Adolescent Sexual Health Education: An Innovative, Nursing Student-Led Initiative

---

*Katie Daley, BS, MSN, RN, CNL, USA*  
*Beth-Anne Christopher, MSN, RN, CNL, USA*  
*Tanya R. Friese, DNP, RN, CNL, USA*  
*Jennifer B. Rousseau, DNP, WHNP, USA*  
*Cate Maidlow, BA, MSN, RN, CNL, USA*

#### Purpose

The purpose of the presentation is to share the perceptions of pre-licensure student in an innovative clinical placement. In this clinical, students delivered adolescent sexual health education within a public school system to fulfill Generalist Entry Master's Women's Health and Public Health nursing learning objectives.

#### Target Audience

The target audience of this presentation is nursing school faculty interested in developing innovative clinical sites and leveraging academic-practice partnerships to meet clinical objectives. Additionally, the target audience includes Public Health, Community Health and Women's Health nursing faculty interested in identifying opportunities for integrated clinical experiences.

#### Abstract

**Problem Statement:** A large urban school district resides in a county that reported the highest rates in the nation of gonorrhea, second highest rates of both chlamydia and syphilis, as well as a 43% increase in HIV diagnoses among 15-19 year-olds since 2000. Teens served by this district were also twice as likely as other teens in the same state to engage in sex before the age of 13, and to give birth (Chicago Public Schools, 2013a). Due to this high rate of sexually transmitted infections (STI) and pregnancies, the district adopted a policy requiring district-wide sexual health education by 2016 (Chicago Public Schools, 2013b). The school district developed an evidence-based curriculum and teacher certification program to meet this policy. This presented a challenge for some schools to find the resources necessary to deliver the curriculum.

During the same time period, a college of nursing was seeking a clinical site to integrate women's health (WH) and public health (PH) objectives within the Generalist Entry Master's (GEM) nursing program. As schools of nursing are expanding enrollment, it has become more challenging to find adequate sites for clinical education (Aponte and Agues, 2010). Early in 2014, eight GEM students were selected to pilot curriculum delivery at two schools to fulfill indirect hours required for graduation and to sit for the Clinical Nurse Leader certification boards. The initial group of GEM students found the experience valuable to their nursing education and unanimously reported that the content was "relevant" to the nursing role but there was no long term plan to continue the opportunity.

To address these problems, two student leaders in the GEM program worked with faculty to develop and implement an integrated WH/PH practicum by preparing GEM students to deliver sexual health education within the school district. Curriculum delivery is important because it meets the short-term needs of both the school district and GEM nursing students, and has long-term potential to reduce rates of STIs and teen pregnancies. This interprofessional experience also serves to broaden a student nurse's exposure to professional opportunities in the community that focus on prevention and emotional/physical wellness. These roles are crucial to meet the needs created by a changing healthcare system. The purpose of this presentation is to assess the GEM students' perceptions of success in meeting practicum objectives and measure change in knowledge, skills, and attitudes related to age and culture- appropriate teaching, leadership, and working with youth to promote healthier attitudes toward sex and sexuality.

**Theoretical/conceptual framework:** This project was guided by Benner's novice to expert model to measure student perceptions of increased proficiency in the role of a nurse outside of the hospital (Benner, 1984).

**Methodology:** A post-practicum survey design was used. GEM students were recruited by flyers and informational sessions. Interested students were interviewed by the student leaders and faculty. The 15 selected students completed on-line school district sexual health training, and then delivered the eight-week sexual health program (100 to 200 minutes a week) as part of their integrated practicum. Sixteen 5-9<sup>th</sup> grade student groups from three schools took part. GEM student pairs taught the program with each pair teaching two student groups. Post-practicum questionnaires assessed: success in meeting practicum objectives, comfort level discussing sensitive topics, and perception of nursing knowledge, skills, and attitudes.

**Results:** Ninety-eight percent of GEM students reported meeting practicum objectives; 93% reported feeling comfortable speaking about sensitive topics; 92% identified with attributes consistent with Benner's classification of competent or expert nurses.

**Implications:** An integrated practicum provides a way for GEM nursing students to leverage their skills teaching sexual health, meet both WH/PH objectives, and gain experience in the community. Such a practicum could result in a cost effective way for high-risk schools to deliver sexual health programs and lower rates of STIs and pregnancy.

## E 02 - Promoting Sexual Health in the Adolescent Population

### Access to Information, Attitudes and Decision Making Regarding Pregnancy Prevention by Teenagers Using a Primary Health Care Clinic in Tshwane, South Africa

---

*Sanah Mataboge, BCur, MCur, DCur, RN, South Africa*

#### Purpose

to communicate the access to information, attitudes and decision making regarding pregnancy prevention by teenagers using a primary health care clinic in Tshwane, South Africa. Inform attendees of the need to design interventions additional to information provision to address teenage pregnancy

#### Target Audience

reproductive health care providers and teenagers/adolescents care givers who provide health promotion programmes to this group.

#### Abstract

Teenage pregnancy is a global reproductive health problem even though numerous interventions to curb the incidence are in place. Teenagers access information and support on teenage pregnancy prevention within families, media, schools and community at large. Programmes such as national adolescents friendly clinic (NAFCI), Love Life, Soul City and life orientation subject are provided to teenagers in South Africa, however their attitudes lead to making decisions to fall pregnant.

The purpose of the study was to explore and describe access to information, attitudes and decision making regarding pregnancy prevention by teenagers using a primary health care clinic in Tshwane, South Africa.

A qualitative, exploratory and descriptive design was used. The population was teenagers who were teenage mothers or were pregnant. The research setting was a selected primary health care clinic in the western side of Tshwane. Purposive sampling was used and semi-structured interviews were conducted until data saturation was reached. Tesch's data analysis method was used, ethical principles were observed and trustworthiness was ensured.

The findings emerged with sources of information regarding teenage pregnancy prevention as peers, boyfriends, mothers, educators and media. Information on the need to access the contraception was provided however some teenagers never used the information towards prevention of pregnancy. It is recommended that teenagers should use the information accessed to prevent pregnancy positively.

Key words: teenagers, pregnancy, access to information, media

## E 02 - Promoting Sexual Health in the Adolescent Population

### Sexual Health Advice Given on Popular Web-Based Magazine Sites Targeting Adolescent Women

---

*Olivia Sutter, USA*

*Victoria von Sadvoszky, PhD, RN, FAAN, USA*

#### Purpose

The purpose of this study was to examine the sexual advice posted on four popular magazine sites adolescent women frequent.

#### Target Audience

Nurses Researchers

#### Abstract

Adolescent women are at greatest risk for contracting sexually transmitted infections (STIs; Centers for Disease Control (CDC), 2014). Sexual risk behaviors are the most common cause of transmission of STIs in adolescent and young women (CDC). One of the primary sources of information that adolescents will use for sexual health information is the web (Kaiser, Family Foundation, 2013); however, little is known about the type of content available on popular web sites specifically targeting adolescents. The purpose of this study was to examine the sexual advice posted on four popular magazine sites adolescent women frequent. Four web-based magazine sites were chosen based on rankings from amazon.com. An adaptation of PRISMA guidelines was used to guide the methods of this study (Moher, et al., 2009). The word "sex" was typed into the search box on each website. All link titles appearing from the search were examined for inclusion into the study. Inclusion criteria were any advice or articles related to: 1) sexual health/STIs, 2) sexual/romantic relationship content, and 3) sexual behaviors. A total of 541 links were found and 158 met the inclusion criteria. Data analysis is in process. All data are being content analyzed using McLaughlin & Mariscuilo's (1990) technique for types of advice presented around STIs, sexual health, sexual behaviors, and romantic relationships. Content within the categories will look at types of information and pictures portrayed on website pages. Descriptive statistics will be used to summarize findings the demographics of each magazine website, as well as, content in each category. The anticipated results of this study will delineate what types of information are being distributed by popular teen magazine websites and the specific content of those messages. Implications for future research are pending results. The practice implications of these findings will be to understand alternative sources of information for sexual health in this age group. This information will help practitioners discern which websites have evidence-based information and can be used for referrals.

## E 03 - Evaluation of Clinically Relevant Tools and Methods

### The Efficacy and Reliability of Mobile Application as an Effective “Voice” of the Female Patients with Anorexia Nervosa (AN) in Silent Cultures, Which Regard Disordered Eating as Taboo

---

*Princess Stephanie Fumi Hancock, DNP, MA, BSN, BA, RN, USA*

#### Purpose

The purpose of this presentation is to educate, inform, raise awareness and show nurses how the use of mobile application as a self-reporting monitoring tool in outpatient treatment of females with Anorexia Nervosa who are from silent cultures regarding AN as a taboo, can produce effective treatment outcomes.

#### Target Audience

The target audience of this presentation is the following: RNs, APRNs, Administrators, and Nurse Educations.

#### Abstract

Many people struggle with eating, poor body image, and mood disorder problems and do not know where to turn for help (National Eating Disorders Association, 2005). Anorexia Nervosa (AN), a type of Disordered Eating Behavior can be deadly. AN has the highest suicide rates of any psychiatric condition and is the third most common chronic illness among females in America (2005). Although associated primarily with western culture, EDs have been reported throughout the world in a variety of social and cultural contexts (Garcia de Amusquibar, 2000; Garcia de Amusquibar & De Simone, 2003; Pike & Mizushima, 2005). Only 1 in 10 people with EDs receive treatment and about 80% of the girls/women who have accessed care for their eating disorders do not get the intensity of treatment they need to stay in recovery.

**PURPOSE:** This parallel double-blinded program captured a range of detailed qualitative and quantitative data about the subjects' everyday functioning, in their natural settings. This qualitative data is generated through participants' observation, via clinician's web-based counterpart application. It evaluates the self-efficacy, reliability, and validity in whether the use of a mobile application (e.g. cell phone app) is a self reporting monitoring and intervention tool in female patients in non-communicative cultures over 21 years old with AN will produce better treatment outcomes compared to the face-to face standard of care intervention currently provided in outpatient settings.

**METHODS:** The subjects [N=6] were grouped using the “tossed coin” method. Using smart phones, Ecological Momentary Interventions/ Ecological Momentary Assessment (EMI/EMA) were delivered to participants. The experimental group (N =3) received the treatment. The control group (n=3) was exposed to only one on-one site assessment/ intervention. All (Hispanic, African American, and African) groups are an equal amount of cultural background.

**INSTRUMENTS:** They include a mobile application used to measure patients' behavioral pattern in real time. The recruitment involved the distribution of flyers. Consent forms were obtained, data collected through a Demographic Data Questionnaire and Weight & Mood (ED) Self-efficacy scale.

**FINDINGS:** At the end of the 90-day program, data revealed a decrease in the perception of AN as a taboo amongst the 2 of groups represented (African American & Africans) in the experimental group. It provided an avenue for discourse amongst family members before arrival at the clinic at the end of each month. In addition, it had a dramatic impact on patients' ability to provide actual real time data of their daily activities to the clinicians, which enabled clinicians to have a better understanding of patient's appropriate treatment needs. There was 3/3 (100%) response in all groups (experimental group) represented. Though 100% completion was accomplished, 1 (33%) of the participant (Hispanic) was still

on the fence about using mobile application to track their daily activities. Factors that contributed to their indecision included (Education and Social Status: Though participant was educated and understood the use of mobile apps, her family remained skeptical as they are afraid their immigration status may be monitored). Subjects participated fully and provided actual data, which ultimately assisted clinicians in providing a better-suited outpatient treatment for subjects as well as open the channel for further discussions and family inclusion in patients' treatment. This is reported to have led to better treatment outcomes such as patient's effect self-care management, compliance with treatment, stable Weight/BMI maintenance. With the control group, 1 out 3 (33.3%: African American) subjects completed their participation.

There were 3 expected monthly visits for both the experimental and the control groups in the 90-day research period. All participants in the experimental group completed 3 visits while only the African American participant completed 1 visit in the control group. By Day 30, post implementation data collection, clinicians reported a 100% increase in the reliability and efficacy of Recovery Record as an adjunct to their treatment for patients with AN in their outpatient clinic. In addition, they recorded a 100% increase in family participation in patients' treatment. In the control group, which concluded with only 1 subject (African American), mode of treatment remained, outcome remained the same with patients' family still guarded and not open to discussing patients' disease

The rationale and success in using mobile technology to disseminate EMA / EMI points to the self-report data that were, by tradition, collected retrospectively, requiring participants to summarize their experiences over time period is affected by information recall (Scallon et al., 2003; Smyth & Stone, 2003; Stone & Shiffman, 1999). Second, EMA/EMI via mobile technology provided the opportunities to record participants in their natural habitat rather than in the outpatient setting, which can be regarded as an artificial environment where participants may not necessarily share past events and occurrences accurately. Third, because data was collected multiple times a day, there were variables that were explored to assist in designing the best evidence-based practice treatment protocol for patients with AN.

## E 03 - Evaluation of Clinically Relevant Tools and Methods

### Reflection Beyond Action: A Modified Version of Tanner's Clinical Judgment Model

---

*Eva Peisachovich, PhD, RN, Canada*

#### Purpose

The purpose of the presentation is to disseminate the work that led to the addition of another layer to The Clinical Judgment Model.

#### Target Audience

The target audience of the presentation are nurse educators, nursing students, and nurse administrators.

#### Abstract

The concept of Reflection-Beyond-Action emerged from the data analysis of a recent study that explored internationally educated nurses' (IENs) experience and understanding of clinical judgment when engaged in a simulated clinical environment. I observed that all participants corroborated that their worldview changed due to their experience in this study; further, participants illustrated this point as, through their participation, they gained a broader and more inclusive understanding of the influence of cultural differences and its overall impact on professional competence and clinical judgment. This understanding stemmed from the participants' reflection-in-action and reflection-on-action, which ultimately led participants to self-awareness and critical consciousness of the meaning of patient care and overall nursing practice. In the context of this study, I refer to this awareness as reflection-beyond-action. In this context, reflection-beyond-action refers to provide an ability to recognize how the reflection of societal influences and the dynamics of culture and communication impact the way one perceives oneself and others.

Reflection-beyond-action is an approach that provides one with the ability to interpret and view practice as a holistic approach to care. This process of reflection elicited the participants' interpretations by gaining access to their thoughts, feelings, values, and actions. In doing so, it led participants to recognize the challenges they face as they transition to practice, as illustrated by the notion of unlearning and unknowing. The findings of the study suggest that unlearning is a process of building expertise and that old knowledge is foundational to the creation of new knowledge. Through reflection, participants were able to recognize the need for self-observation in order to be self-informed and to unlearn. Unlearning brings one closer to developing as a professional and to gaining professional competence, as it provides a broader perception of both the world and the individual's role in it. Unknowing emerged through participants' experience of being underexposed or unexposed to circumstances presented in the study and was determined to be a prerequisite to knowing. Both unlearning and unknowing are integral to the education of IENs, as they call upon the learner to examine prior beliefs and assumptions and to consider their implications for practice. This, in turn, impacts practice, as who we are is who we bring to practice.

The analysis of this study led to a modified Tanner's Model of Clinical Judgment by adding another layer to the "reflecting" stage. The modified version includes the concepts of unlearning and unknowing. Ultimately, this integration provides the practitioner with the ability to reflect beyond action.

This paper provides potential approaches to apply the concept of reflection-beyond-action in the context of clinical judgment in both the education of IENs and the nursing profession.

## E 03 - Evaluation of Clinically Relevant Tools and Methods

### Construct Validity and Factor Structure of the Posttraumatic Growth Inventory (PTGI) among Korean Americans

---

*Kunsook S. Bernstein, PhD, RN, PMHNP-BC, FAAN, USA*

#### Purpose

The purpose of this presentation is to share the psychometric properties of the posttraumatic growth inventory including Construct Validity and Factor Structure among Korean Americans.

#### Target Audience

The target audience of this presentation is mental health clinicians, nurses, and healthcare providers.

#### Abstract

**Purpose:** To examine the psychometric properties of the Korean version of Posttraumatic Growth Inventory (PTGI-K) including factor structure of the PTGI-K and potential construct bias in the PTGI-K across gender. PTGI is designed to measure positive changes emerging from traumatic experiences have been described as an enhancement of an individual's ability to cope with adversity.

**Design:** This study employed a purposive and non-probability sampling strategy, and a total of 310 Korean Americans from the Korean community in New York and New Jersey completed surveys. Data were collected between July 2014 and November 2014.

**Method:** Participants completed paper questionnaires consisting of socio-demographic inventory, PTGI-K, Trauma history questions. Exploratory, confirmatory, and multiple-group confirmatory factor analyses were used for data analyses. To ensure that the exploratory and confirmatory factor analyses were conducted with distinct sets of participants, the total sample of participants (N=310) was randomly divided into two equal subsamples (n1=155, n2=155). T-test and Chi-square analyses were used to determine no differences existed between the subsamples.

**Findings:** Results suggested that a three-factor structure of the PTGI-K was the best fit for the data and the new structure of the PTGI-K was variant across gender. The most frequent traumatic event was reported to be the death of a loved one (26.3%). Other frequent lifetime traumatic events were acute/chronic diseases (14.9%), financial problems (12.5%), or sudden accidents (10.7%). The sample consisted of 60.3% of women and 39.7 % men and the mean age was 54.8 years (SD = 16.24), ranging between 19 and 93. KA men and women showed very similar socio-demographic profiles, except PTGI-K scores and marital status. As compared with their KA men counterparts, KA women were more likely to have higher PTGI-K scores ( $t = -3.55, p < .001$ ) and less likely to be married or cohabited ( $\chi^2 = 9.16, p < .01$ ).

**Conclusion:** This study supports the use of PTGI-K in future research for measuring positive growth as a result of traumatic or highly stressful events PTGI among KAs. Study findings also imply the ways in which KAs experience trauma and growth is different from their American counterparts. The new factor structure of the PTGI-K can help mental health professionals and researchers better understand how KAs express their psychological changes after traumatic events. Further research is needed to investigate the psychometric structure of the PTGI-K with a large sample of data both cross-sectionally and longitudinally.

## E 04 - Training Nurses in a Simulated Environment

### Transforming Nurse Residency Skills Training Using Simulation: A Deliberate Practice Approach

---

*Kelly La Frenz, MSN, RN, BC, USA*  
*James Cavalier, MBA, MSN, RN, CRRN, USA*  
*Richard Morse, BSN, RN, CCRP, USA*

#### Purpose

The purpose of this presentation is to discuss the development, implementation and evaluation of a simulation program for new graduate nurses informed by deliberate practice. Outcomes related to participants' comfort in performing clinical nursing skills are presented, demonstrating the efficacy of simulation in enhancing new graduates confidence performing these skills.

#### Target Audience

The target audience for this presentation is registered nurses engaged in providing skill and competency based education in any setting.

#### Abstract

**Background:** New nurses perceive that they do not have sufficient practice time for technical and clinical skills prior to and during orientation in professional practice (Candela & Bowles, 2008; Hartigan, Murphy, Flynn, & Walshe, 2010). Additionally, nurses have indicated that their preparation should be more reality based (Hartigan, Murphy, Flynn, & Walshe, 2010). Since 2005, a National Cancer Institute-designated Comprehensive Cancer Center has implemented a Graduate Nurse Residency Program that is committed to building confidence in graduate nurses through a structured, professional transition-into-practice experience that is customized to individual developmental needs. A review of participant evaluations from the Graduate Nurse Residency program over a 2-year period identified clinical skills that graduate nurses were least confident performing at the end of one year of practice. It is believed that a combination of infrequency of exposure to these skills, coupled with insufficient practice and demonstration of these skills may have contributed to these responses. Graduate nurse responses indicated they were least comfortable performing the following clinical skills: set up of blood administration sets, use of a complex intravenous tubing set-up, peripheral intravenous (IV) insertion, Foley catheter insertion, nasogastric (NG) tube insertion, central venous catheter (CVC) dressing change, tracheostomy (trach) care/airway management, and chest tube management.

The National Council State Boards of Nursing (NCSBN) Simulation Study recognizes the challenge for students to obtain high-quality clinical experiences (Hayden, Smiley, Alexander, & Kardong-Edgren, 2014). There are only seven Boards of Nursing that have a specific number of mandated clinical hours in their Bachelor of Science in Nursing (BSN) programs (NCSBN, 2009), which can lead to variability in the amount of clinical skills experience a graduate nurse obtains. Graduate nurses (GNs) hired from BSN programs across the nation participating in the Graduate Nurse Residency program have stated during debriefs that they had limited opportunities to perform some of these skills during nursing school. Clinical skills practice was dependent on type of clinical rotation sites available which has resulted in a wide range in level of preparedness of new graduates for performing clinical skills on patients.

A committee was formed to review the identified skills and determine methods to increase confidence and competency in performance. Healthcare simulation was selected as the instructional approach. The Dick and Carey Systems Approach Model for Designing Instruction was selected as the guiding framework for the simulation based instruction. Simulation of the skills identified above were planned strictly for practice and not for competency assessment.

**Aim:** The aim of these simulation education sessions was to improve learner confidence in the performance of selected skills as measured by self-report.

**Intervention:** The committee separated the skills into two skill sets: beginner (peripheral IV starts, Foley catheter insertion, NG tube insertion and CVC dressing change) and advanced (trach care/airway management, chest tube management and blood administration and intravenous tubing set-up). Baseline learner knowledge and the instructional setting was considered. Simulation skills sessions were designed in 2 four-hour segments during months two and three, respectively of the residency 12-month curriculum. For each of the sessions, learner objectives were developed to guide instruction. Institutional policies, procedures, and Mosby's Nursing Procedures and Skills checklist were selected for content development and learner self-evaluation of performance.

Ericsson's Deliberate Practice was selected as the theoretical foundation for the simulation methodology. Deliberate practice is continuous practice with a focus on competency mastery. Deliberate practice encourages learner-centered and paced educational approaches where learners are provided supervised practice until mastery in a skill is achieved. The goal is to move the learner from novice performance to mastery in a particular skill set (Ericsson, Krampe, Tesch-Romer, 1993; Ericsson, 2008). Partial task trainer simulators in a low fidelity environment comprised the simulation technique. The focus of the technique is to increase the validity of the training by minimizing the effects of increased situational fidelity to teach skills that can be easily transported into a real world situation. In essence, we sought to ensure technical skills in the areas identified were mastered so in escalating patient situations learners have a strong appreciation of the skills to perform competently in their roles. Skills were divided into stations. Developers conducted practice runs of procedures and skills to determine flow and timing. Subject matter experts (SME) for each skill were identified. The SMEs provided the content for orientation of facilitators for each of the skills stations. Additionally, an orientation for learners and facilitators was developed.

The first skills simulation day was implemented in May 2013. Nurse Educators and clinical staff with expertise in specific skills volunteered as facilitators for the stations. The participants were provided an orientation to the simulation lab and expectations. Stations were set up for each skill and printed procedure guidelines were provided. The participants were divided into small groups and each group was given 30 minutes to rotate through each of the skills station.

The program was piloted with two residency groups who completed the beginner and advanced simulation days. From feedback during this pilot period the developers identified that more didactic overview of chest tube and trach/airway stations was required. Also, the advanced skills stations required additional time for completion. It was identified that the blood administration sets and complex intravenous tubing set-up session could be moved to the beginner skills day and coupled with the peripheral IV start station. Port-a-cath accessing and de-accessing was added to the advanced day due to request from previous evaluations and recent past learners.

**Outcomes:** At the beginning of the nurse residency program, the GNs are asked which skills they feel uncomfortable performing. After completion of the residency program 12-months later, their comfort with these skills is again assessed. With two groups of residency classes attending the program, there was a reduction in request for skills by 86.3%. Only 13.7% of respondents said they were uncomfortable with the skills. A further reduction in request for skills by 92.7% was noted after program revisions were made following the pilot period where only 7.3% of respondents said they were uncomfortable with the skills. Additionally, after each skills session, GNs attitude towards the benefits of the simulation experience was assessed. 99% of the survey respondents reported that they agreed or strongly agreed that the simulation was beneficial.

**Conclusions:** Simulation can be introduced into the nurse residency period for new graduate nurses to successfully enhance participants' comfort with both fundamental and advanced clinical skills. Integrating a deliberate practice approach to this training can further enhance both participants comfort with performing these skills, and ultimately their efficacy in delivering safe, effective care at the bedside.

## E 04 - Training Nurses in a Simulated Environment

### Nurses' Reactions of an Emergent Pediatric Educational Simulation

---

*Kenneth L. Hoffman, BSN, RN, CEN, EMT-P, USA*  
*Victoria von Sadvoszky, PhD, RN, FAAN, USA*

#### Purpose

The purpose of this study was to examine nurses' reactions to an emergency simulation exercise, specifically: 1) what went well, 2) what did not go well, 3) their confidence level during the simulation, and 4) reasons why wrong orders are followed in an emergency situation.

#### Target Audience

All staff development and nurse educators involved in simulation exercises

#### Abstract

**Introduction:** Resuscitation of critically ill children has long been associated with poor outcomes (Cheng, et al., 2012). One way to train staff to respond to resuscitation is through simulation. Simulation is used to increase repetition and enhance competence before performing complex tasks, which allows errors to be made in relative safety (Chan, et al., 2012). While there is much information on simulations with adult models, there is little concerning pediatric simulations (Barata, et al., 2007). Pediatric patients' symptoms during deterioration vary from their adult counterparts and can often go unrecognized (Straka, et al., 2012); hence it is important to study how pediatric nurses' reactions are affected in emergency simulation situations. The purpose of this study was to examine nurses' reactions to an emergency simulation exercise, specifically: 1) what went well, 2) what did not go well, 3) their confidence level during the simulation, and 4) reasons why wrong orders are followed in an emergency situation.

**Methods:** Forty-three nurses participating in 10 simulations were videotaped during an in-service on non-critical care inpatient units. Data were analyzed and reported by simulation group (N = 10). After IRB approval two independent reviewers, who extracted utilizing a form created around the research questions, reviewed all videotapes. Specific data extracted were: 1) what went well (observed and self-reported), 2) what did not go well (observed and self-reported), 3) their confidence level during the simulation (self-reported), and 4) reasons why wrong orders are followed in an emergency situation (self-reported). There was a 100% agreement on data extracted from the videos (self-report of groups and observed correct technique by reviewers). Data were analyzed using McLaughlin and Marascuilo's (1990) three-phase content analysis technique. First, units of analyses were identified. There was 100% agreement between the reviewers. In the second phase, one of the reviewers created categories and definitions using the units. Finally (third phase), the second researcher sorted the units into the defined categories using the definition. Again, interrater reliability was 100%. Frequencies and percentages for each category were calculated. Groups were divided by those who had more experience (3 or more years; n = 5) and less experienced (less than 3 years; n = 5).

**Results:** More experienced groups reported catching med errors, rapid response, and good communication compared to less experienced groups regarding what went well during their simulation. In regards to what didn't go well, experienced groups reported a lack of response to critical indicators (signs and symptoms); whereas, less experienced groups focused on incorrect technique. Less experienced groups also reported less confidence in emergency simulations compared to more experienced groups. Reasons why wrong orders were followed were similar between subgroups. Both subgroups reported chaotic situations and the assumption that the person giving the orders is correct were the most cited reasons for following incorrect orders. In regards to observed performance, there was an actually equal level of correct assessment and performance across experienced and less experienced groups. Moreover, during debriefing both groups could answer questions about assessment and technique correctly.

**Implications:** Non-critical care pediatric nurses perform assessments and techniques correctly in critical care simulations. Staff development measures need to focus on improving confidence levels, response times to critical indicators, and remaining calm and thinking through orders in chaotic situations. Further research needs to the effects of simulation on confidence levels and improving performance over time. Other avenues for research need to focus on why wrong orders are followed and how this translates into real patient situations.

## E 04 - Training Nurses in a Simulated Environment

### Navigating a Disaster: A Capstone Simulation Integrating Leadership Skills, Ethical Principles, and Clinical Reasoning

---

*Lynn L. Wiles, PhD, MSN, BSN, RN, CEN, USA*

*Denise B. Isabel, MSN, RN, RN, USA*

#### Purpose

The purpose of this presentation is to share a novel simulation approach that incorporates assessment, prioritization, patient care, and clinical reasoning skills with leadership and ethical principles when teaching disaster preparedness in a pre-licensure BSN curriculum.

#### Target Audience

The target audience for this presentation includes educators and service personnel who are interested in creating a simulation experience that combines clinical reasoning and psychomotor skills with leadership and ethical principles that are utilized when providing care to patients injured in a manmade or natural disaster.

#### Abstract

Disaster preparation is a way of life in this southeastern coastal community that is home to the largest US Navy base in the US. Recent disasters include hurricanes, nor-easters, severe thunderstorms with tornados, and several aircraft incidents involving multiple injured patients. Likewise the heavy joint-forces military presence and the region's reliance on bridges and tunnels for transportation provide a potential terrorist threat. The opportunity to practice disaster management skills prior to participating in a manmade or natural disaster has a realistic meaning for nursing students at this university.

Disasters can be natural or manmade, intentional or accidental, and may come with or without warning. Typically, the event overwhelms available resources. Health care professionals and community volunteers are forced to work outside of their comfort zone and find that patient care often stretches both human and material resources. When disasters occur without warning the community relies on providers having background knowledge of how to respond with emergencies occur. Until such time as pre-made plans are able to be implemented and resources assembled, search, rescue, and treatment of victims is accomplished by bystanders who may or may not have prior training.

Disaster preparedness content is required in all BSN programs accredited by the Commission on Collegiate Nursing Education. A literature review yielded few examples of the integration of disaster planning in nursing curricula. It is believed that faculty may not be adequately prepared to teach content. One study reported that nursing students were unaware of the scope of disaster nursing, lacked recognition of available resources, and did not understand the role of nurses during disasters.

Clinical simulation provides an opportunity to develop the skills nursing students need to respond to manmade and natural disasters. This simulation focuses on the response phase of a natural disaster that occurs without warning. Students are asked to use clinical reasoning to save life and limb. Additionally students must practice their leadership and communication skills when planning and provide care and apply ethical principles of beneficence versus non-maleficence and teleological versus deontological theory related to mass casualty triage.

Students in the final week of their BSN program participate in this capstone clinical simulation. The setting is the School of Nursing building in the aftermath of a severe thunderstorm causing partial building collapse of the adjacent bookstore and eateries. Using a combination of live actors and simulation equipment, ten patients arrive in the skills lab seeking help for a variety of illnesses and injuries. The age range and clinical conditions of the patients represent each of the clinical courses in the nursing curriculum and include chest pain, hypoglycemia, injuries ranging from minor orthopedic injuries to life-threatening trauma, a non-English speaking female who is in labor, and a former military member who's

Post Traumatic Stress Disorder has been triggered by the destruction. The lights in the lab are dimmed to mimic a power outage, running water is turned off, and students are able to use only the supplies found in the lab and do not have access to the supply closet that requires a prox card, thus electricity, to enter it.

Students are assigned to assume the role of nurse, triage nurse, or incident commander. Those in the nurse role assess their patients and use mass casualty triage tags to communicate pertinent information to the triage nurse and use existing supplies to provide care to patients as deemed necessary. The triage nurse collaborates with the incident commander to make immediate decisions on the severity of patients and to prioritize which two of the 10 patients will be transported from the scene- one by ground and one by air. Additionally, the incident commander is given the opportunity to ask for one piece of equipment from both the helicopter and the ground transport unit and collaborates with the team to establish what equipment meets the needs for the greatest number of remaining patients. The simulation lasts approximately 15 minutes.

During 45 minute debriefing session students analyze organizational challenges that arose as they made decisions based on patient status, immediate needs, and available resources. The legal and ethical consequences and emotional responses of mass casualty triage are explored. Faculty members provide students with feedback about assessment, clinical reasoning, and communication skills including clarity of report and the use of SBAR. As a team, students reflect upon the appropriateness of their decisions and predict how different decisions might have altered the outcomes affecting multiple patients, thus linking the simulation to patient outcomes.

Students are provided the opportunity to apply the nursing process, demonstrate leadership concepts, nursing skills, and effective communication to coordinate patient care. Designating patient triage categories provides an opportunity to initiate discussions about professional standards related to moral, ethical, and legal conduct and requires students to reflect on their beliefs. Additionally this disaster simulation addresses the best practices, core knowledge and nursing skills outlined by the Association of Community Health Educators and the Emergency Nursing Association including critical thinking, assessment, technical skills, and communication.

This capstone simulation incorporates the clinical reasoning and psychomotor skills learned throughout the program with leadership, team building and management skills learned during the students' final semester. This novel approach uses simulation to meet the BSN curriculum requirements as well as provides the opportunity to practice the concepts in a realistic setting. This can easily be adapted for use in areas of the country where earthquakes, landslides, and other natural disasters are a concern.

## F 01 - Health Promotion in the Oncology Patient

### Indigenous Peoples' Perspectives and Experiences of Cancer Screening Services in Southwestern Ontario, Canada

---

*Heather K. Krohn, PhD, MEd, BScN, RN,, Canada*

#### Purpose

The purpose of this study was to gain an understanding of the perceived and experienced barriers that prevent or delay participation by First Nations and Métis populations in breast, cervical and colorectal cancer screening, as well as those factors that are likely to promote their use of cancer screening services.

#### Target Audience

The target audience of this presentation includes those who provide health care services to Indigenous populations and those who provide cancer education and screening services cross-culturally to Indigenous and other vulnerable population groups.

#### Abstract

**Background:** First Nations and Métis (FNM) peoples experience a disproportionate burden of cancer as compared with non-indigenous populations in Canada. Their perceptions of cancer and their unique worldviews of health have a significant impact on the choices they make regarding participation in cancer screening.

**Purpose:** The purpose of this study was to gain an understanding of the perceived and experienced barriers that prevent or delay participation by FNM populations in breast, cervical and colorectal cancer screening, as well as those factors that are likely to promote their use of cancer screening services.

**Setting and Sample:** The study was conducted with 12 FNM communities located in both urban and rural areas of Southwestern Ontario. The sample included 107 participants.

**Method:** A qualitative interpretive study design was used within a participatory action research framework. Data were collected through personal interviews and focus groups. Thematic data analysis was completed to define the underlying common themes of experience in relation to cancer and cancer screening.

**Results:** FNM perceptions and experiences of cancer and cancer screening services are complex, deeply seeded, longstanding and vary by community. The collective experience of increasing rates of cancer within their close-knit communities has resulted in much fear about cancer.

The most commonly expressed barriers to participation in cancer screening among FNM groups were fear of being diagnosed with cancer, lack of knowledge about cancer and cancer screening, transportation issues, and mistrust of mainstream health care providers. Cancer screening procedures for breast, cervical and colorectal cancer were often perceived as painful, invasive, and offensive to FNM ways of being; especially in relation to their beliefs and values about privacy and modesty.

**Conclusions:** Cancer is a major concern among FNM peoples and they positively value ongoing community involvement in cancer education and screening activities. Participation in cancer screening among FNM peoples presents significant challenges due to a wide range of historical, socio-cultural, geographical, infrastructural and economic barriers.

Educational programs about cancer and screening processes need to be more culturally congruent with FNM worldviews of health and health care. Direct and ongoing consultation with FNM groups is essential to increase cancer awareness and screening rates within their communities.

## F 01 - Health Promotion in the Oncology Patient

### Exploring Cervical Cancer Treatments, Coping and Women's Sexual Self-Concept after Cervical Cancer

---

*Barbara Hollie, PhD, RN, ANP-BC, USA*

#### Purpose

Assist nurses to help identify and provide interventions for women at risk for sexual self-concept problems after cervical cancer treatment

#### Target Audience

nurse educators and nurses

#### Abstract

**Background:** There is a long history of physical, psychological and sexual sequelae and stress associated with cervical cancer and treatment. The disease is stressful and it dramatically impairs sexuality and how women adjust after the disease and treatment. Yet, women and their families usually content with these circumstances in silence and for prolonged periods of time. How well women cope with cervical cancer and the related issues has long been thought to be important to their survivorship. Which strategies would help and when, was equally important. No empirical studies were found that focused on the relationship between coping and its association to women's sexual self-concept. Sexual self-concept was defined as a combination of perceptions, beliefs, attitudes, and feelings that women hold about their sexual selves (Vickberg & Deaux, 2005). Just as self-concept is believed to be integral to being whole (Roy, 2009), sexual self-concept is conjectured to be an important part of women's holism.

**Purpose:** The purpose of this study was to identify predictor sexual self-concept variables and examine associations among cervical cancer treatment, select demographic variables, coping and women's sexual self-concept.

**Methods:** A cross-sectional, descriptive correlational design was utilized to examine relationships among cervical cancer treatment (e.g. surgery, radiation therapy, chemotherapy and combinations), select demographic variables (e.g. age, race, cervical cancer stage, SES, subjective-objective health status, time since treatment began), coping (e.g. cognitive coping, positive or negative religious coping), and sexual self-concept (e.g. sexual-esteem and sexual satisfaction).

**Results:** No significant relations were identified between age, race, and cancer treatment. Cognitive coping concepts were important predictors of sexual self-concept and important associations between the coping variables and selected demographics were found. Significant relationships were found between health status and religious coping and overall the further women were from treatment the less cognitive coping was used. The sample of 99 women was diverse with 55% white women, 17% women of color that included African American, Hispanic, American Indian/Alaska Native and mixed race, including heterosexual and homosexual women from 20 years to over 70 years of age, 70% had some college or a degree and reported a \$35, 000 or more income. Findings revealed support for the coping variables as predictors related to women's sexual self-concept.

**Conclusions:** Understanding how women cope prior to cancer treatment can be instructive to strategies to maintain/encourage a positive sexual self-concept and lessen stress during cervical cancer treatment.

## F 01 - Health Promotion in the Oncology Patient

### Women's Global Health Initiative: Prevention of Cervical Cancer Using Visual Inspection with Acetic Acid and Cryotherapy

---

*Amy K. Moore, DNP, RN, FNP-C, USA*

*Laura L. Opton, DHSc, RN, CNE, USA*

#### Purpose

The purpose of this presentation is to describe the implementation of a women's health program in Jinotega, Nicaragua focused on visual inspection of the cervix with acetic acid and immediate treatment with cryotherapy if indicated. The program could be replicated and sustained in other low resource countries.

#### Target Audience

The target audience of this presentation undergraduate and graduate nursing students and faculty, licensed vocational nurses, registered nurses, and advanced practice nurses interested in women's health and global health.

#### Abstract

Cervical cancer is the most common type of cancer in women between 15 and 44 years of age in Nicaragua (ICO Information Centre, 2014), yielding one of the highest cervical cancer rates in Latin America, and the incidence is on the rise (Soneji & Fukui, 2013). The ICO Information Centre on HPV and Cancer (2014) estimates that 934 women are diagnosed with cervical cancer annually in Nicaragua, resulting in 424 deaths. In an effort to reduce the cervical cancer risk in this region, a partnership has been formed with a health sciences center in the United States, the Nicaraguan Ministry of Health, and a non-governmental organization to establish a women's health program to promote early diagnosis and treatment of cervical dysplasia. A framework for this effort was fashioned after similar programs implemented in regions of Africa and Guatemala (World Health Organization, 2012), and the program is enhanced by the interprofessional focus of the partnership, which includes faculty and students from the schools of allied health, medicine, nursing, and pharmacy. The plan involves training health care workers in the Jinotega region, with a combined rural and urban population of approximately 500,000, to perform visual inspection of the cervix using acetic acid (VIA) and treatment with cryotherapy if indicated. Faculty and students from the health sciences center traveled to Jinotega in January 2014 to begin the first phase of the program and to conduct the first VIA clinics. Three goals of the women's health initiative include developing a sustainable regional program to (a) create awareness in the Nicaragua region about prevention of cervical cancer, (b) screen women in the region using VIA, and (c) treat patients with a positive test using cryotherapy or refer patients for further evaluation if not eligible for cryotherapy. The women's health initiative in Nicaragua has grown, resulting in six to seven annual trips to Jinotega. Faculty are also exploring the possibilities of replicating the program in other low resource countries.

## F 02 - Clinical Education Topics in the Emergency Department

### The Lived Experience: How Emergency Department Nurses Resolve Emotional Pain after Patient Perpetrated Workplace Violence

---

Wanda J. Christie, PhD, RN, USA

#### Purpose

The purpose of this presentation is to share the feelings and thoughts of interviewed RNs in order to increase awareness about workplace violence perpetrated by patients and promote discussion of methods to prevent or reduce incidents.

#### Target Audience

The target audience for this presentation is all RNs who have patient contact and anyone in a management position.

#### Abstract

Background: Patient perpetrated workplace violence (PPWPV) is recognized as a high risk against Registered Nurses (RN) and can result in unresolved emotional pain. Sensitizing framework for this study was the Theory of the Nurse as Wounded Healer (NWH) which explored recognition, transformation, and transcendence of emotional pain after PPWPV.

Aim: The aim was to: 1) describe the ED RNs thoughts, feelings, and behaviors after experiencing PPWPV.

Methods: After IRB approval, descriptive phenomenology with purposive sampling allowed for recruitment of thirteen ED RNs in southeast US who reported PPWPV. Semi-structured interviews were audio-taped and transcribed verbatim. Content analysis and constant comparison identified different codes and themes developed.

Results: Four themes were identified: Feelings: anger, fear, sadness, helplessness, seeking revenge, dissociating and distancing themselves emotionally from patients and environment. Working in the ED: perceptions of peer support were high; but administrative and safety support perceptions were low. Perceptions included upper level administrators lacked understanding and security was not as 'present' as needed. Crisis intervention classes were not helpful. Changes: the ED RN discussed both physical and psychological changes in themselves and their peers after PPWPV. Coping: Both effective and ineffective resolutions after PPWPV were found. Effective methods included humor, exercise, and talking to the facility's employee health program therapists, administrators, peers, family or friends. Ineffective methods included excessive alcohol intake, smoking, eating too much, and depending on prescription medications for stress and sleep.

Conclusions: The ED RN may experience PPWPV that can have negative ramifications on their emotions. The NWH theory promotes recognition of emotional pain. Nurses need to be open, supportive of the team, and verbalize feelings after PPWPV. The ED RNs wanted administration policies that require strict enforcement by nurses, patients, and families. Nurses wanted written policies to ensure legal protection and guidance. The nurses wanted administrators to be more visible in their stance against PPWPV. Additional studies are needed to examine effective resolution of emotional pain after PPWPV, and to compare ED RN satisfaction with administration support after PPWPV.

## F 02 - Clinical Education Topics in the Emergency Department

### The Relationships between Patients' Perceptions of Nurse Caring Behaviors, Nurses' Perceptions of Nurse Caring Behaviors and Patient Satisfaction in the Emergency Department

---

Theresa Bucco, PhD, RN-BC, USA

#### Purpose

The purpose of this presentation is to examine the relationships between the PATIENTS' PERCEPTIONS OF NURSE CARING BEHAVIORS, NURSES' PERCEPTIONS OF NURSE CARING BEHAVIORS AND PATIENT SATISFACTION IN THE EMERGENCY DEPARTMENT. perceptions of nurse caring behaviors

#### Target Audience

The target audience of this presentation is nurses, educators and administrative executives interested in the ED and/or patient satisfaction.

#### Abstract

**Background:** Approximately 100 million people seek care in Emergency Departments (ED) yearly which can be overwhelming for many Emergency Department nurses. Thus, caring for these patients and meeting their needs is challenging for Emergency Department nurses. It is the patients' perceptions of the first caring encounters in the ED that can have a significant impact on patient satisfaction.

**Objective:** The purpose of the study is to examine the relationships between patients' perceptions of nurse caring behaviors, nurses' perceptions of nurse caring behaviors and patient satisfaction in the Emergency Department.

**Methods:** This was a descriptive cross sectional study that examined the relationships between patients' perceptions of nurse caring behaviors, nurses' perceptions of nurse caring behaviors and patient satisfaction in the Emergency Department. Eighty-six nurse/patient dyads participated in this study. Nurse participants completed the Nurse's Background Information questionnaire and the Caring Behaviors Inventory-24. Patient participants completed the Patient Background Information questionnaire, the Caring Behaviors Inventory- 24 (CBI-24) (Wu, Larrabee & Putnam, 2006), and the Patient Satisfaction Instrument (PSI) (Hinshaw & Atwood, 1982).

**Results:** Data collected and analyzed indicated that there was a positive relationship between patients' perceptions of nurse caring behaviors and patient satisfaction in the Emergency Department. However, patient satisfaction was statistically significant and negatively associated ( $\beta = -.41$ ,  $p < .001$ ) for the categories of CBI dyad difference scores for the group of nurses who rated themselves more caring than patients rated the nurses. In addition, patient satisfaction scores were not statistically significant for nurse gender, marital status, ethnicity, professional education, employment status or ED experience. There was no statistical significance detected for patient satisfaction scores in relation to patient gender, race, ethnicity, marital status, highest level of education, employment status, previous ED visits and Emergency Severity Index. Additionally, there were statistically significant differences ( $p < .001$ ) between nurses' and patients' perceptions on the subscales of the CBI. These differences were noted on the assurance and connectedness subscales.

**Discussion:** This study indicated that patient satisfaction was significantly related to the patients' perceptions of nurse caring behaviors in the ED. The results of this study may help ED nurses to meet the need and expectations of ED patients to deliver individualized patient care.

### Emergency Room Nurses Transitioning from Curative to End-of-Life Care: The Rural Influence

---

*Roberta Rolland, PhD, RN, FNP, USA*

#### Purpose

to share the results of this study that explored the needs of rural ER nurses with the intent to help develop education, resources, and support unique to end-of-life care in rural communities.

#### Target Audience

all professional nurses in the clinical setting, in addition to, nurse educators considering the topic covers nurses in an acute care setting and the cultural influences of rural communities.

#### Abstract

Emergency Room (ER) nurses in rural communities face unique obstacles and barriers while caring for patients and families at end-of-life. Standard guidelines, programs, and resources may be more difficult to implement in smaller rural hospitals with a limited budget and staff. For this reason, it is important to explore the needs of rural ER nurses to develop education, resources, and support unique to end-of-life care in rural communities.

A secondary content analysis was performed to examine rural influences on ER nurses transitioning care from curative to end-of-life care. The preliminary study using grounded theory explored the personal transitioning of ER nurses (N = 10) when the focus of care changes from curative to end of life. Participants included both rural (n = 6) and urban (n = 4) registered nurses working in ER settings. Urban nurses served as a contrasting group to enhance the likelihood of identifying rural components and influences.

Rural concepts and characteristics as outlined in Lee and McDonagh (2006) were used as a guide for examining the content of the categories and sub-processes of the preliminary study. The categories were preparing caring, immersion, making sense, changing gears, and reflecting with a core category, caring driven. The sub-processes involved focus, feelings, and conflict. Both rural and urban ER nurses moved through the categories in a forward sequence.

The secondary analysis revealed several rural components within various sub-processes. Rural concepts including lack of anonymity, distance, and informal networks were evident among rural nurses. Differences found among rural and urban nurses involved the sub-process, conflict. Staff resources and connectedness had a greater effect on the transitioning of ER nurses. In addition to support for patients and families, rural nurses expressed a need for personal and emotional support. Knowledge and experience influenced both groups. Education was essential among rural nurses since they commonly found themselves in charge of critical situations. Such rural concepts as time and distance were compensated in some aspects with technology however, barriers remain.

Implications for nursing include strategies to improve staff resources, end-of-life education, and personal support. Educational strategies may involve traditional methods and more innovative methods using simulation with end-of-life care. Staff resources were essential elements to support nurses caring for dying patients and their families. Mentoring programs designed to create a culture of support may influence preparedness, decision making, and coping, and consequently, enhance end-of-life care.

## F 03 - Outcomes of Nursing Interventions

### A Retrospective Study Exploring Nursing Sensitive Interventions for Patients on a Skilled Nursing Unit in a Rural Midwest Hospital

---

Carol-Ann Moseley, PhD, MS, BAN, RN, USA

#### Purpose

The purpose of this presentation is to present research findings to assess the impact of nurse sensitive indicators on patient outcomes on a skilled nursing unit. The presenter will correlate patient characteristics with specific outcomes that could assist nurses to improve patient outcomes through implementation of specific individualized nursing interventions.

#### Target Audience

The target audience of this presentation is nursing staff and administrators interested in examining patient characteristics on a skilled nursing unit as they relate to patient outcomes, including the Rothman Index score and 30-day readmissions.

#### Abstract

**Purpose and Research Questions:** The purpose of this study was to assess the impact of nursing interventions on a skilled nursing unit (SNU) when a change in patient health status was identified. Patient characteristics were correlated with specific variables such as Rothman Index (RI) scores and 30-day readmission status. Nurses could then implement specific individualized interventions to improve patient outcomes. The study questions were: a) What are the characteristics of our SNU patients? and b) Can use of the RI discharge score alert the nurse to the need for increased interventions to lower the risk for 30-day hospital readmission?

**Background and Significance:** It is imperative that nurses use evidence based practice and research as a basis for making patient care decisions. This is especially important in the context of the rapidly changing healthcare environment of today. The SNU at our hospital was concerned about improving discharge outcomes and reducing hospital readmissions. Research studies have shown that when a patient with heart disease is admitted to a SNU that has specific nursing interventions developed for patients with heart disease, there are improved patient outcomes (Allen et al., 2011; Jacobs, 2011). This led to the idea that a study of our SNU patients would help nurses improve patient outcomes (Hain et al., 2012; Li et al., 2012). The RI software uses clinical measurements from the following four categories: nursing assessments, vital signs, laboratory results, and cardiac rhythms in an algorithm that translates to a RI score reflecting patient progress or lack of progress over time (Rothman et al., 2013). Bradley et al. (2013) concluded there was a strong relationship between the RI score at the time of discharge and unplanned readmissions within 30-days. They found cutoff points in the RI that helped the health care provider to identify patients at high risk for readmission which was considered to be the first step to reduce readmissions. Health care clinicians who use the latest RI score to individualize the patient's discharge plan may help to reduce the risk for 30-day readmissions (Yale-New Haven Hospital, 2013).

**Design and Methodology:** This was a retrospective study of information gathered from medical records of patients on a SNU during 2013. Variables were extracted from the medical records and sent to the principal investigator in the form of a Limited Data Set and analyzed with the statistical program SPSS Statistics Desktop, V22.0.

**Results:** Table I: Descriptive Statistics of Patient Characteristics in Percentages

	Age <65	Age 65-74	Age 75-84	Age >85	Married	Gender	DNR	
						Male	Female	Order
Study Group	18.3	22.2	33.3	26.1	45.0	39.8	60.2	29.3

Comparison Group	11.2	17.3	34.3	37.2	28.4	38.3	61.7	38.1
------------------	------	------	------	------	------	------	------	------

Patients were classified into the following RI cutoff points related to their risk for 30-day readmission: high-risk (RI <70), medium risk (RI=70-79), low risk (RI=80-89), and lowest risk (RI = 90-100) (Bradley et al., 2013).

**Discussion:** Our SNU population had similar characteristics as populations identified in other studies, such as gender, race, education, and language. The analysis between our study group and the comparison group (Li et al., 2012) on the patient characteristics showed the following: our group of patients had a higher percentage in the <75 age group and a lower percentage in the >85 age group. Our group of patients showed a significant difference in percentage of married patients as compared to the comparison group. Our group of patients had a 29.3% of DNR orders as compared to 38.1% in the comparison group. Data analysis showed the following percentages by RI risk category for the 30-day patient readmission rate: RI high-risk group = 36.4%, RI medium risk group = 21.8%, RI low risk group = 28.6% and RI lowest risk group = 11.5%. This is comparable to the findings discussed in the Bradley et al. (2013) study.

**Implication:** Patient characteristics on our SNU in 2013 differed from some patient characteristics found in other studies. Prior to implementing evidence based interventions, our staff needs to look closely at how patient characteristics were applied in other studies. Nurses need to consider if a specific intervention could be used in our distinct patient population or if it needs to be modified to be effective within our population. Nurses need to identify any declining trend in the RI score and implement evidence based interventions to improve the overall patient condition as indicated by an increasing RI score. Our SNU needs to address the issue that 36.4% of our RI high-risk patients are readmitted within 30 days. An RI score in the high risk category (<70) at discharge should alert the nurse to implement interventions focused on individualized needs for health care and support services at home or an alternate health care facility. Nursing interventions should include education to promote health practices, to increase coping skills, and to ensure patient and family know when and how to contact health care providers to decrease potential 30-day readmissions.

## F 03 - Outcomes of Nursing Interventions

### Patients' Perceptions of Hope and Hope-Engendering Nurse Interventions

---

*Debra Haas Stavarski, PhD, RN, USA*

#### Purpose

The purpose of this presentation is to share findings from a research study that explored patients' perceptions of hope, hope-engendering nurse interventions, and the relationship between patients' perceptions of hope and patients perceptions of hope-engendering nurse interventions.

#### Target Audience

The target audience of this presentation is practicing nurses, nurse educators, nurse administrators, nurse researchers, and students.

#### Abstract

Hope is a basic human need and has the ability to restore health. Hope enhances quality of life, promotes health and healing, and has been shown necessary for recovery. Patients with an acute illness may have feelings of hopelessness or reduced hope. Hospitalized patients experience health/illness transitions which require preparation for discharge. If patients experience healthy transitions they may have a better sense of well-being about their health/illness condition upon discharge. Nurses play a role in fostering hope during health/illness transitions such as patient hospitalization. Nurse patient relationships, communication, and nurse actions may influence patients' perception of hope. The National League for Nursing identifies caring as one of the core values for nursing of which promoting hope is an essential component. However, with increased emphasis on cost control and productivity, time for hope-engendering nurse interventions may be in jeopardy. There is a paucity of research about nurses' influence on patients' perception of hope in the acute care medical-surgical setting, therefore the need for this study.

The purpose of this descriptive correlational study was to explore patients' perceptions of hope, patients' perceptions of hope-engendering nurse interventions; and to explore the relationship between patients' perceptions of hope-engendering nurse interventions and patients' perceptions of hope during a health/illness transition.

A convenience sample of 97 patients from five acute care medical-surgical hospital settings participated. Patients completed the Hope-Engendering Nurse Intervention – Patient Version (HENI – PT) Instrument, the Herth Hope Index (HHI), and a demographic questionnaire at the bedside. The HENI – PT instrument was developed and pilot tested prior to use in this study. The instrument measures perceptions of hope-engendering nurse interventions, which are behaviors designed to promote patients' feelings of hope for positive outcomes. The HENI – PT contains four subscales, which are attributes of hope-engendering nurse interventions. The 44 item instrument has a 5-point Likert Scale and consists of two parts, Part A with ratings for the frequency of nurse actions and Part B the effectiveness of nurse actions. For this study, the Cronbach's alpha reliability coefficient was .97 for the HENI – PT total scale. The HHI measures patients' perceptions of hope. The instrument has three subscales, which are factors associated with hope. The 12 item instrument has a 4-point Likert Scale. The HHI is used extensively and is reported to be valid and reliable. For this study, the Cronbach's alpha reliability coefficient was .88 for the HHI total scale.

Descriptive and inferential statistics were computed using SPSS®. Patients' perceptions of hope were high, with a mean score of 41.92 for the total scale, and a possible range of scores from 12 to 48. Patients' perceptions of hope-engendering nurse interventions were low, with a mean score of 358.07 for the total scale, and a possible range of scores from 44 to 1100. There was a statistically significant, weak relationship between HENI – PT and HHI ( $r = .27$ ;  $p = .008$ ).

Findings suggest a need to understand hospitalized patients' perceptions about and sources of hope, in order to implement appropriate nursing interventions. Nurses may not be providing hope-engendering nurse interventions in the acute care setting, which suggest a need for nursing education in pre-licensure and practice settings, and establishing expectations for nurse hope-promoting activities in the provision of care.

This study explored the use of the Hope-Engendering Nurse Intervention – Patient Version (HENI – PT) Instrument and the Herth Hope Index (HHI) in a population of patients in an acute medical surgical setting and further developed a new instrument to measure hope-engendering nurse interventions. Further research is needed to determine what other factors influence patients' perceptions of hope during a health/illness transition, as nurses are in a position to foster those other factors that influence patients' hope.

## F 03 - Outcomes of Nursing Interventions

### A Retrospective Study of the Impact of Educational Intervention on the Use of the Rothman Index System on Patient Outcomes

---

*Penny Phillips, MS, BSN, RN, RN-BC, USA*

*Kathleen Jochem, MS, RN, ACNS-BC, USA*

*Marilyn Shepherd, BSN MSN, MBA, RN, CNE, CDE, CWOCN, USA*

*Carol-Ann Moseley, PhD, MS, BAN, BA, RN, USA*

#### Purpose

The purpose of this presentation is to present the findings from a research study designed to assess the impact of increased nursing staff use of the Rothman Index on patient outcomes of two medical-surgical units in a rural regional mid-western hospital.

#### Target Audience

The target audience of this presentation is nursing staff and administrators interested in continual measurement of adult medical-surgical patient condition over time based on data that is available through the Electronic Health Record (EHR).

#### Abstract

**Background & Significance:** The Rothman Index (RI) provides a tool to continually track and trend the patient's condition based on data extracted from the Electronic Health Record (Wolters Kluwer Health, 2013). The patient's RI score is calculated from 26 data points. These data points originate from four categories: nursing assessments, vital signs, laboratory result, and cardiac rhythm (Rothman, Rothman, & Beals, 2013). The RI is a measure of patient progress or lack of progress over time (Rothman, Solinger, & Rothman, 2012, Yale-New Haven Hospital, 2013). Research has found the use of the RI in patient care can positively impact outcomes (Wolters Kluwer Health, 2013; Yale-New Haven Hospital, 2013; Bradley, Yakusheva, Horwitz, Sipsma, & Fletcher, 2013). The RI was implemented in 2011. Nursing staff viewing of the RI was minimal prior to August of 2012. Then intensive nursing staff education was presented and RI viewing increased. This study compared patient outcomes prior to the intensive education with patient outcomes post education. The population was medical surgical on two units.

**Purpose:** This research assessed the impact of increased nursing staff use of the RI on patient outcomes of medical-surgical units at Midwestern rural hospital.

**Research Questions:** Does re-education have an impact on utilization of the RI? Does use of RI by nursing staff improve patients' outcomes?

**Methods:** The design was a retrospective study of data retrieved from medical records. Information Systems retrieved data from medical records of individuals admitted to two Medical-Surgical units. Data was collected during 3 time periods. The 3 time periods were chosen to coincide with low use (Group 1), post education use (Group 2) and sustained use post education (Group 3). These time periods were chosen based on previous studies of the RI that found its use by nursing staff improves patient outcomes.

**Results:** The total group of 8750 cases was tested for differences in discharge disposition (home or other than home) and patient outcomes. Cases discharged to home had higher RI scores than cases who were not discharged home  $p = .000$ . Significant differences between the disposition groups at the  $p = .000$  were found for the following variables: discharge RI scores, length of stay, number of diagnosis, 30-day readmit, Rapid Response time, and R I views. The cases were also analyzed by groups. The groups were determined to be similar related to unit, age, length of stay, number of diagnosis, 30-day readmit, last RI, and DRGs. Significant findings were found between the groups in RI views and Rapid Response times. The lowest viewing of the RI was in Group 1, the group prior to re-education. The highest viewing of the RI was Group 2, the group immediately after re-education. Group 2 had significantly more ( $p = .008$ ) staff views of the RI than Group 1. The numbers of viewing of the RI decreased for Group 3 but

remained higher than Group 1, but were not statistically significant. Rapid response calls were lower for Groups 2 and 3 than in Group 1. There was a statistical significance ( $p = .008$ ) between Group 1 and Group 2 in Rapid Response calls with Group 2 having fewer Rapid Response calls times. Rapid Response calls for Group 3 remained lower than Group 1 but were not statistically significant. Codes blue calls for Group 1 was eleven, for Group 2 was ten and Group 3 was four.

**Discussion & Implications:** RI graph re-education resulted in increased graph viewing by nurses. We conclude that due to increased viewing nurses identified downward trends in the patient's overall condition leading to earlier intervention and prevention of deterioration to the point of necessitating a rapid response or Code Blue.

Based on these patient outcomes it appears that routine re-education and requiring RI graph viewing at a minimum during all hand-off reports would be beneficial. Findings of the study will be shared with nursing leadership to set benchmarks for patient discharge.

## F 04 - Simulation in the Clinical Education Environment

### Use of Standardized Patients to Enhance Health Assessment Skills of Undergraduate Nursing Students

---

*Kellie Dionne Bryant, DNP, WHNP, USA*  
*Larry Slater, PhD, RN-BC, CCRN, USA*

#### Purpose

The purpose of this activity is to educate nursing faculty on the use of Standardized Patients to enhance undergraduate health assessment course. This presentation will discuss the findings from our study on the use of Standardized Patients during our final health assessment return demonstration exam.

#### Target Audience

The target audience of this presentation are undergraduate nursing faculty and administrative personnel responsible for making curriculum decisions.

#### Abstract

**Background:** Standardized Patients (SPs) have been used in medical education since the 1960's however the concept of using SP's in the field of nursing education is a recent concept. The undergraduate nursing health assessment course has been taught in the same traditional manner for decades. In order to learn physical assessment skills, students are often asked to take part in peer physical examinations (PPEs), where students practice and validate assessments on one another. Although students may tolerate PPEs, this methodology often promotes simple memorization over critical thinking. Additional drawbacks with PPE's are some students may feel uncomfortable being examined by their peers, lack of opportunity to assess abnormal assessment findings, and potential exposure of student's personal medical conditions through PPS. An alternative to using PPEs for testing purposes is the use of SPs to portray patients in a health assessment course. Use of SPs can decrease student's anxiety, increase critical thinking, and also enhance learning through immediate feedback from the SPs. The purpose of our study was to evaluate student's satisfaction with assessing SPs versus their peers during the final physical assessment return demonstration.

**Methods:** Our health assessment course was revised in an effort to find innovative teaching modalities that would enhance critical thinking and decrease memorization of assessment skills. A major revision was the use of SPs for the final physical assessment return demonstration. Our instructional team incorporated the use of SPs and interactive case studies into the course and SPs were hired for the final head-to-toe return demonstration. For the final return demonstration, we developed 3 patient scenarios that all contained one abnormal physical assessment finding that students had to identify during the exam. The return demonstration started with students reading a brief summary of the patient's reason for admission. Students were then given 15 minutes to obtain a brief history on the reason for admission and then perform a basic bedside nursing head-to-toe assessment. Students were required to properly demonstrate all physical assessment techniques outlined on the form and correctly verbalize their findings in order to pass the final return demonstration. A survey was developed by the principal investigator to collect information on student preparation, comfort, and confidence in performing their final head-to-toe return demonstration on student partners or standardized patients. The survey was reviewed by two experts in nursing education, simulation, and health assessment for content validity, and the survey was finalized based on their feedback. The survey included the collection of demographic and cohort information and 13 Likert-type questions and 5 open-ended response questions related to the return demonstration experience. Two undergraduate cohorts were given the survey. Cohort 1 consisted of students who performed PPE's for their final assessment during the fall 2012 semester. Cohort 2 consisted of students who completed their final return demonstration on a SP during the spring 2013 semester. In this mixed method, descriptive, IRB-approved study, a convenience sample of 117 students (70 in the first cohort; 47 in the second cohort) participated.

**Findings:** The findings showed that students in the cohort 2 were more nervous and less comfortable with the use of SP's than cohort 1 ( $p < 0.05$ ). However, the second cohort felt that their final demonstration required more critical thinking and less memorization than cohort 1 ( $p < 0.05$ ). Cohort 1 reported that they did not like performing their assessment on their partner, felt the final demonstration required less critical thinking and more memorization, the final exam was not a realistic representation of the clinical experience, and they were nervous performing in front of their partner. Cohort 2 stated felt their final exam was more realistic, feedback from the SP's was valuable, and they felt more comfortable examining an SP versus their partner.

**Conclusion:** Nurse educators continually look for ways to improve teaching modalities and ensure we are preparing students to provide safe and competent patient care. Research has shown that the use of SPs in nursing education enhances communication skills, increases student self-confidence, encourages critical thinking, and assists students in overcoming nervousness and anxiety. Incorporating the use of SPs in the undergraduate nursing curriculum can improve students' assessment skills, which can then translate to clinical practice. Focusing on the essential assessment skills needed for the new graduate and incorporating case-based scenarios using SPs has shown to increase students' critical thinking skills and provide a more realistic clinical experience. Additional research should be conducted to examine the cost versus benefit of the use of SPs in the undergraduate nursing program.

## F 04 - Simulation in the Clinical Education Environment

### Peer Assisted Learning in a Simulated Emergency Department Experience for Undergraduate Nursing Students

---

*Deborah A. Tapler, PhD, RN, CNE, USA*  
*Nancy McMenamy, MS, RN, CNE, USA*  
*Cynthia Denise Bain, MSN, RN, CNE, USA*

#### Purpose

present an innovative simulation approach using peer assisted learning for junior and senior nursing students to increase their level of competence and confidence in the care of patients in the emergency department.

#### Target Audience

nursing faculty and staff involved with the planning and implementation of simulation scenarios in an undergraduate program.

#### Abstract

The role of peer assisted learning (PAL) in simulation is an emerging concept in nursing education and collaborative learning. Peer assisted learning is defined as “the act or process of gaining knowledge, understanding, or skill from students who are either at different or equivalent academic or experiential levels” (Henning, Weidner, and Marty, 2008, p. 85). According to Topping (2001), learning through teaching others, a key element of PAL, is the highest level in the learning approach hierarchy. According to Stone, Cooper, and Cant (2013), peer learning has been utilized to promote the foundations of nursing practice such as critical thinking and the acquisition of clinical knowledge and skills. Social cognitive theory (SCT) supports the use of peer learning strategies by joining students in activities that have similar knowledge levels and outcome objectives to build confidence in learning (Owen & Ward-Smith, 2013). In an effort to address IOM mandates for safety in nursing communication and to incorporate innovation into simulation experiences, the faculty developed an undergraduate simulated experience using standardized patients in an emergency department (ED) scenario. Nursing students at the junior and senior level participate in a simulation focused on five patients presenting to the ED. The five live actors (three adult patients and two pediatric patients with parents) have applicable moulage applied and are instructed to portray the specified clinical manifestations of their disease or injury. The use of standardized patients is an excellent approach to hands-on learning and offers the students more complex interactions requiring spontaneous responses. This strategy promotes active learning through the use of a dynamic learning environment and the application of previous and current knowledge in a simulated practice setting. Prior to the initiation of the simulation experience, all students are oriented to the clinical expectations of the learning activity and the documents required for data collection. Two junior students are assigned to a specific standardized patient. They then conduct an admission assessment using interviewing techniques and document vital signs. Subsequently, the senior students enter the ED area with outcome objectives to receive a SBAR report from the junior students assigned to each patient, gather any additional data about the patients through collaborative questioning of the junior students and the patient, and ultimately prioritize the acuity of the five patients based on their data collection. The junior students gain confidence and competence by repeatedly presenting their patient information to each team of senior students who rotate through the data collection process for the five patient scenarios. Through the process of cognitive modeling, the junior students elevate their clinical reasoning skills by observing enhanced assessment and interviewing techniques demonstrated by senior students. The junior students are able to identify data gaps from their initial patient assessment that are illuminated by the actions of their higher level peers. Peer assisted learning offers several benefits to a simulation experience. Students at both levels gain critical knowledge and skills about nursing concepts (i.e., disease and nursing processes). They practice professional communication skills through collaborative efforts to understand the acute care needs of each patient and family. Each student gains increased self-confidence by having the opportunity to practice in a safe, learner-centered environment, by interacting with realistic patients with unknown symptomology and natural responses, and by developing positive reciprocal relationships with their

peers. Through the use of peer assisted learning in a simulated educational environment, peers helping peers learn has been very effective.

## F 04 - Simulation in the Clinical Education Environment

### Community Mental Health Clinical Experiences Utilizing High Fidelity Simulations with Baccalaureate Nursing Students

---

*Jene' M. Hurlbut, PhD, MSN, MS, BSN, RN, CNE, USA*

*Brian C. Oxhorn, PhD, MSN, RN, USA*

*Nancy Milloer Bryan, MSN-APN, RN, USA*

#### Purpose

The purpose of this presentation is to share the results and rationale for using high fidelity simulation as an important educational tool in the delivery of community mental health clinical experiences. The simulations developed were based on real-life clinical situations that a student could encounter within the clinical setting.

#### Target Audience

The target audience of this presentation is mental health and community health nursing educators, nursing students, and community health and hospital based employers/educators.

#### Abstract

Historically nursing students have a fear of clients encountered in health care settings that have a mental health diagnosis. Unfortunately, this fear is often the result of the stigmatization present within society and the media related to individuals diagnosed with a mental health issue. Students for the most part have little experience with mental health care facilities and the populations who seek services at these sites. Additionally, there is a lack of mental health clinical sites that offer students the ability to interact with clients and there are more nursing programs competing for these few sites. Due to these reasons, the use of high fidelity simulation was implemented in the didactic portion of the mental health course. The overall goals of using simulations during the mental health course was to: address the fears students experience when interacting with clients with a mental health problem prior to clinicals; improve the ability and confidence to respond appropriately when faced with emergent mental health needs; decrease the stigmas students might have regarding someone diagnosed with a mental health problem; and improve the use of therapeutic communication skills to ensure safety. The high fidelity simulation utilized was developed to mimic a real-life emergent mental health situation that a student could possibly encounter within the clinical setting. Examples of some of the salient points included in the simulation were: recognizing signs and symptoms of depression, assessing for suicidal ideations and the importance of asking direct questions related to intent, how to deal with the asking of personal information and the expression of sexual advances, how to respond if a patient cries or becomes emotional, and how to respond to a patient who asks the student to keep a secret. Students were provided a de-briefing time immediately after the simulation to discuss perceived performance and feelings surrounding the scenario. During the debriefing session students were provided with immediate feedback from faculty surrounding their responses during the simulation. Overall, the majority of the students felt this was a positive learning experience.

## G 01 - Alternative Methods of Nursing Care

### The Implementation and Use of Mindfulness to Reduce Compassion Fatigue and Attrition Rates with Faculty/Staff in an Urban School

---

MaryKay Maley, DNP, MSN, BSN, APN, FNP-C, RN-BC, USA

#### Purpose

The purpose of this presentation is to introduce the concept of mindfulness and how it can address stress and compassion fatigue.

#### Target Audience

The target audience of this presentation is for anyone who is experiencing stress in their daily lives.

#### Abstract

Urban cities in America are frequently cited for their perennial rates of poverty, violence, and crime. Children growing up in these cities are often plagued with emotional scars from witnessing crimes, being abused, and living in poverty. Providing a learning environment that is safe and nurturing for these children is an overall educational goal. However, faculty and staff of these urban schools, in trying to meet this goal, are experiencing a stress-like phenomenon known as compassion fatigue. Compassion fatigue is a serious entity, related to over-caring. Compassion fatigue has been linked to numerous psychological and physical health issues such as anxiety, depression, gastrointestinal disturbances, acid reflux disease, as well as, addicted behaviors. In addition, it has been associated with higher job attrition. To combat compassion fatigue, an intervention known as mindfulness and mindfulness-based stress reduction (MBSR) can be introduced. Mindfulness is an old Buddhist intervention turned new, thru the works of Jon Kabat-Zinn Ph.D. Mindfulness teaches the mind to develop an awareness and appreciation of what is occurring in the here and now. It orients one to current feelings, allowing one to respond rather than react. Mindfulness is practiced formally through meditation, as well as, other activities such as yoga, body scanning, and breathing; informally through continuous acknowledgement of moment-to-moment experiences. Today, mindfulness is being utilized as a safe, effective intervention in a variety of situations, such as chronic pain, fibromyalgia, stress, and cancer, in addition to, improving overall mental well-being. However, mindfulness as a nursing intervention is just beginning to evolve. It is hoped that this project, not only benefited, the population intended but will act as an introduction to the concept of mindfulness for the discipline of nursing.

**Purpose:** The purpose of this translational research project was to look at the feasibility of implementing mindfulness, as an evidence-based therapeutic intervention, to help reduce compassion fatigue and to improve faculty and staff attrition rates.

**Method:** Implementation of the mindfulness intervention included an educational didactic workshop, basic exercises in mindfulness, a take-home manual, and the development of a mindfulness web-portal to promote sustainability of the project. Outcomes were measured using Stamm's ProQOL-V Scale, in addition, to a descriptive analysis of demographics and a post-program satisfaction survey.

**Findings:** Scores obtained from the ProQOL-V scale confirmed the presence of compassion fatigue and burnout prior to intervention. Post-testing showed program satisfaction with a high interest in implementing mindfulness activities. Self-reported improvements were noted in mood/emotion (88%) following the workshop. ProQOL-V Scale was repeated in 6 months with only a 37% return rate. These scores, however, showed no indication of burnout or compassion fatigue. Faculty and staff attrition rate declined from 24% (2013) to 11% (2014).

**Conclusion:** It appears that Mindfulness training is a feasible intervention to implement with individuals experiencing the effects of stress and compassion fatigue. More research is needed to extend these preliminary findings into the realm of nursing both clinically and academically.

## G 01 - Alternative Methods of Nursing Care

### Using Guided Imagery to Reduce Pain and Anxiety

---

Linda C. Cole, DNP, RN, CCNS, CPHQ, USA

#### Purpose

The purpose of this presentation is to identify the impact of pain on physiological and psychological functioning and describe the effect of guided imagery on pain, anxiety, and medication use.

#### Target Audience

The target audience of this presentation is novice to expert nurses and advanced practice clinicians.

#### Abstract

Background: The Institute of Medicine in 2011 reported over 100 million American adults are affected by chronic pain which is more than the combination of those affected with heart disease, cancer, and diabetes. Also the United States is estimated spends up to \$635 billion annually in medical treatment and lost productivity due to chronic pain. The 2007 National Health Interview Survey reported 38% of American adults use some form of integrative or complementary and alternative medicine (CAM). The National Center for Complementary and Alternative Medicine estimates CAM use accounts for \$33.9 billion total health care expenditures spent out of pocket. Conditions associated with pain are the number one reason adults reported as the reason for using CAM therapies. Research on guided imagery has produced mixed results in its use in pain management.

Purpose: The study examined the impact of guided imagery on pain and anxiety in adult patients at a tertiary care hospital located in the Texas Medical Center in Houston, TX.

Materials & Methods: After Institutional Review Board approval, patients were recruited from an advanced practice nurse (APN)-led pain management service. Consented patients received an MP3 player with a guided imagery recording along with instructions to use the recording twice daily. Pain and anxiety scores along with analgesic and anti-anxiolytic use were recorded pre-intervention and 24 and 48 hours after enrollment.

Results: Thirty six patients were enrolled.

- Pain scores declined by 6 % (48 hour) pain score from pre-intervention score.
- 28% (24 hours) and 50% (48 hours) decline in anxiety scores when compared to pre-intervention.
- Analgesia use declined 16% (24 hours) and 19% (48 hours).
- Positive feedback was received from the participants.
- 

Conclusions:

- Statistical significance was seen with anxiety scores at 24 hours ( $p = 0.0001$ ) and 48 hours ( $p < 0.0001$ ) but not with the other measures due to small sample size.
- Clinical significance was seen with declines at 48 hours in anxiety scores (50%), analgesia use (19%), and pain scores (6%).
- Guided imagery appears to be a viable CAM approach to reduce pain, anxiety, and analgesic use.

## G 01 - Alternative Methods of Nursing Care

### Effect of Ethnicity and Parental Illness Representations on Complementary and Alternative Medicine (CAM) Usage and Asthma Control in Childhood Asthma

---

Alexis Marie Guay, BSN, RN, USA

Kimberly J. Arcoleo, PhD, MPH, USA

#### Purpose

to explore lifetime and current prevalence, ethnic differences, and role of parental illness representations (IR) in CAM use and asthma control.

#### Target Audience

primary care and school nurses and NPs.

#### Abstract

**Background:** Asthma is the most prevalent chronic condition in childhood in the US. Puerto Ricans (PR) are disproportionately affected compared to Mexicans. In the last decade, the incidence of asthma in the United States has increased by nearly 15% (CDC Asthma's Impact on the Nation, 2013). Particularly concerning is the asthma incidence disparity between ethnicities: 7.7% of whites have been diagnosed with asthma, compared to 11.2% of blacks, and 6.5% of Hispanics. Despite the low prevalence in Hispanics as a whole, the statistics for different Latino subgroups tell a different story. 16.1% of Puerto Ricans have asthma, compared to only 5.4% of Mexicans (Akinbami et al., 2012). CAM usage in childhood asthma as high as 89% has been reported, but the evidence does not support CAM as an effective asthma management tool. Despite high CAM use, only 18% of parents reported CAM usage to the provider. There is potential to improve controller medication adherence while remaining sensitive to parents' ethnomedical beliefs.

**Purpose:** To explore lifetime and current prevalence, ethnic differences, and role of parental illness representations (IR) in CAM use and asthma control.

**Theory:** The Common Sense Model of Illness Representation provides the theoretical framework. The model describes a cognitive processing system that includes situational stimuli (perception of the child's symptoms), objective representation of the health threat (illness representation) with its treatment decisions (CAM and controller medication use) and appraisal of the outcomes (asthma control) for the success or failure of the treatment decisions. A feedback loop is included in the model with IRs potentially changing over time as the parents gain experience with their child's asthma. The model has three tenets: the parent is an active problem solver; the IR is the central cognitive contrast that drives the parent's treatment decision and appraisal of the outcomes; and IRs are personalized and may not be in agreement with the medical facts.

**Subjects:** 536 Latino parents and their children with asthma (aged 5-12 years). Families were recruited from 4 clinics located in Bronx, NY and Phoenix, AZ. To be eligible for the study, children must have met the following criteria: a) The child had to be between the ages of 5 and 12, b) had a diagnosis of asthma as obtained from their medical record, c) identified as Latino as described by the child's primary care caregiver, d) had no other significant pulmonary complications or conditions, e) participating parent must have had the majority responsibility for the child's day-to-day asthma management and care, f) no cognitive learning disability that would interfere with the parent or child's ability to participate in the interview process.

**Method:** Longitudinal study of parental IRs, treatment decision, and asthma control. Structured interviews with parents (including questions about specific CAM therapies), short interviews with children, children's lung function, and children's medical records reviews were conducted at enrollment, and 3, 6, 9, and 12 months post-enrollment. Baseline data used for these analyses.

**Results:** 74% of the sample reported lifetime CAM use. Significantly more Mexicans reported lifetime and current CAM use compared to PR (67% versus 33%,  $p=.04$ ; 65% versus 35%,  $p=.01$ , respectively). Parental IRs were significant predictors of current CAM use ( $OR=.49$ ,  $p=.05$ ) but not lifetime CAM use. There was significant interaction of ethnicity and CAM ( $p<.0001$ ). Mexican children are significantly more likely to have well-controlled asthma, regardless of CAM/controller combination. Parental beliefs aligned with the professional asthma management model were predictive of well-controlled asthma ( $p=0.4$ ).

**Conclusion:** This study demonstrated that Mexicans and PRs have different IRs, CAM usage, and asthma control. It is important to understand IRs and CAM, so effective communication and shared decision-making can occur. HCPs who are familiar with and sensitive to IRs and care needs of diverse groups can play a decisive role in improving health outcomes of patients with asthma by heightened awareness of and respect for cultural differences among the children and families they interact with. To develop effective interventions that target asthma health disparities, we must first understand the characteristics of these groups and how they interact to impact parental IRs, CAM usage, and asthma control.

## G 02 - Learning While Serving: Clinical Education Strategy

### An Innovative Collaborative Approach for Applying Public Health Principles in a Global Setting

---

*Cynthia Ringhofer Brown, DNP, MS, MPH, RN, RDN, USA*  
*Mary Tanner, PhD, RN, USA*

#### Purpose

The purpose of this presentation is to promote an innovative collaborative approach for integrating baccalaureate public health nursing competencies and promoting principles for service-learning through course work and field experience in a global setting.

#### Target Audience

The target audience for this presentation is nurse educators, public health instructors, public health nurses, and nurses interested in promoting service-learning in an academic program.

#### Abstract

Nurse educators are accountable for addressing student competence in public health nursing practice within their baccalaureate undergraduate curricula. Factors that challenge this responsibility include limited availability of clinical sites, student enrollment in online programs and participation from remote sites throughout the United States. Other issues that exist are the need for meaningful student engagement with the community as they assess populations and promote the health of communities through advocacy, health teaching, and health related interventions. A recent Institute of Medicine report on "The Future of Nursing" also charges educators with promoting collaborative partnerships including interdisciplinary and intraprofessional efforts to promote health. The newly revised "Code of Ethics for Nurses" further elaborates on the obligation to support social justice and global health efforts. In our baccalaureate program, an educational service learning experience was implemented over a semester culminating in a two week field experience immersion in Belize. As a result of this experience, students effectively collaborated with numerous community partners leading to improvements in the health and well-being of various populations. Some examples of the community partners included the Ministry of Health, the district department of health, area elementary schools, rural health workers and clinics, local diabetes association, village council, and a cultural exchange company. Urban and rural populations that were targeted in these interventions included school aged children, adults, and individuals with diabetes or hypertension. Intraprofessional collaboration was successful because students from three different undergraduate programs: RN to BS, traditional, and post-baccalaureate worked cooperatively for the betterment of the community. In addition, students participated in meaningful self and group reflection throughout the semester. This innovative approach was successful in promoting collaboration with community partners and among the students in the various undergraduate programs. Nursing students exemplified professional values and ethically and culturally appropriate behavior during this service-learning experience. Our goal is that this experience will prepare students for their future practice to care for patients from all over the world and to empower communities toward positive change in health. Future recommendations include expansion of opportunities to promote group bonding prior to the field experience and increased availability of culturally appropriate and country specific health education resources.

## G 02 - Learning While Serving: Clinical Education Strategy

### Health Care in Global Context: Service Learning to Increase Cultural Competency in Migrant Latino Health

---

*Jean Ann Davison, DNP, RN, FNP-BC, USA*

#### Purpose

To describe a seven year inter-professional service learning course to increase students' understanding of migrant Latino health. When training health care providers, the service-learning approach is an innovative pedagogical strategy that benefits both patients and students by creating collaborative partnerships among health professions schools, healthcare organizations and other community settings.

#### Target Audience

educators, nurses, health-care and community leaders.

#### Abstract

**Purpose:** To describe a seven year interprofessional service learning course to increase students' understanding of migrant Latino health. When training health care providers, the service-learning approach is an innovative pedagogical strategy that benefits both patients and students by creating collaborative partnerships among health professions schools, healthcare organizations and other community settings.

**Background:** According to the 2010 US Census report, the Hispanic/Latino population accounted for over half of the 27.3 million increase in the total US population. The US Department of Health and Human Services have set forth national standards on culturally and linguistically appropriate services (CLAS) for health care organizations and providers to deliver culturally competent care; intended to advance health equity, improve quality and help eliminate health disparities.

Present United States Latino health disparities include-

- Latino/Hispanic adults have the largest age-adjusted prevalence of diabetes.
- Prevalence of obesity is largest for young Latino males < 20 years old.
- Hispanic children are twice as likely to be hospitalized for asthma.

As educators, we should provide opportunities for students to experience interprofessional culturally competent health care. One way to do this is to provide service learning opportunities.

**Description of Program:** Part of our vision as a university is to increase inter-professional education, cultural competency and cultivate sustainable, long-term collaborations globally. This course offers a unique opportunity for an inter-professional team of students to learn experientially about the health needs of Latino immigrants. This course focuses on social justice and the need to work collaboratively by offering service learning opportunities both domestically and internationally within the local Latino community and abroad with Central America agencies.

#### **Goals of the course:**

At the end of this course the student will be able to:

1. Explain the relevance of culturally competent global health approaches to health assessment and interventions at home and abroad.
2. Identify factors affecting global health and Latino/Hispanic immigration to include travel, cultural, social, economic, political and environmental factors.
3. Understand and report Latino population health disparities, using epidemiological and demographic measures.

4. Identify evidence-based, cultural competency programs to improve Latino population-global health.
5. Apply ethical principles to global health and humanitarian aid.
6. Practice culturally-competent care through participatory service-learning
7. Effectively present and educate the public on global migrant health issues.
8. Be able to meet with Latino community agency leaders and stake holders to forge community partnerships, both locally and globally.

**Teaching methods:** Preparation for humanitarian assistance:

- Brief presentation by guest speakers on immigration and Latino health to provide current and relevant information to students along with agencies representatives who provide background on the services they provide.
- Inter-professional team based learning activities such as presentations around their professional training in providing care to Latino children and families.
- Directed study reading of Sonia Nazario's *Enrique's Journey: The Story of a Boy's Dangerous Odyssey to Reunite with His Mother* along with articles on both sides of the immigration debate prior to their service learning experience to discuss these issues in small groups and relate this to their current practice sites.
- Experiential service-learning activities per contract agreement with opportunities for work with local community agencies and/or spring break opportunities in Central America:

**Results:** This global service learning course helps students increase their cultural competency, understanding of health disparities and models for providing humanitarian aid.

## G 02 - Learning While Serving: Clinical Education Strategy

### Nursing Students Serving, Transforming, and Leading within 5 Miles to 3000 Miles

---

*Sheri P. Palmer, DNP, RN, CNE, USA*  
*Karen H. de la Cruz, MSN, AACNP, FNP, USA*

#### Purpose

The purpose of this presentation is to share how our chapter encourage students to serve, transform, and lead in a variety of settings. Settings include those in our neighborhood to far islands of the South Pacific. We will describe cultural diversity courses that our nursing programs offer.

#### Target Audience

The target audience of this presentation are any individuals interested in starting or improving courses designed to strengthen cultural competence within nursing students.

#### Abstract

**Purpose/Aims:** Our local chapter of Sigma Theta Tau includes students who serve, transform, and lead in a variety of settings. These settings include those in our own neighborhood to the far lying islands of the South Pacific. We will describe cultural diversity courses that our nursing programs offer. Essential components of discussion will include (a) selection and sustainability of the sites, (b) utilizing STT awards and other financial resources to help the student, and (c) interprofessional and community collaboration.

**Rationale/ Background:** Emphasis is being placed on educating nursing students to provide culturally competent care. One way of accomplishing this is for nursing schools to develop a carefully selected, sustainable cultural diversity courses that immerse students in another culture. Students from other disciplines may be included for interprofessional collaboration to broaden the experience. Establishing connections within the community is vital to a successful cultural diversity course. We have utilized many local and international sites over the years. Each of these sites have posed unique challenges in setting up effective cultural nursing learning experiences.

**Description:** In our presentation we will discuss: 1) The initial process for selecting a local or international site. These are based on key factors including student interest, cultural diversity, language feasibility, and potential healthcare opportunities. Ultimately, sites are chosen based on the criteria of sustainability, safety, diversity, cultural experiences and clinical opportunities. 2) Financial help to the student is another topic of interest. Along with awarding Sigma Theta Tau cultural diversity awards, our institution offers mentoring awards and research scholarships.

3) Students are able to practice collaborative care along with culturally-competent nursing care. We will identify "lessons-learned" examples on how we have included interprofessional collaboration.

**Outcomes/Conclusions:** Cultural diversity courses for nursing students can be a benefit to students, faculty and partners. Collaboration has provided enriching experiences preparing students to deliver culturally appropriate care both locally and internationally

## G 03 - Strategies to Transition Education into Clinical Practice

### Translating Clinical Education to Nursing Practice in Rwanda: Enhancing Maternal and Child Health

---

*Yvonne Kasine, BSN, RN, Canada*

*Yolanda B. Babenko-Mould, BScN, MScN, PhD, RN, Canada*

*Sandra Regan, BScN, MA, MScN, PhD, RN, Canada*

#### Purpose

to present findings from a qualitative descriptive study about nurses' experience of translating clinical education knowledge and skills into practice to enhance maternal and child health in Rwanda, Africa after completing the Helping Babies Breathe continuous professional development course.

#### Target Audience

nurse researchers, clinical nurse educators, and administrators of clinical practice environments who have an interest in knowledge translation of clinical education to practice.

#### Abstract

Nursing is a dynamic profession for which nurses need to continuously update their knowledge and skills (Adeniran, Smith-Glasgow & Bhattacharya, 2013). As members of the healthcare team, nurses need continuing education to keep up with changes in the healthcare environment. Evidence shows that approximately 25% to 35% of acquired knowledge is forgotten one year after its acquisition (Custers, 2010). As nurses constitute the backbone of the healthcare system, the need to maintain and update their knowledge and skills is paramount to achieving improved patient outcomes. One of the areas which is important to update is newborn resuscitation. It is important for nurses to have the knowledge and skills about the current practices pertaining to newborn resuscitation.

According to the World Health Organization (WHO), each year, three million deaths occur during the neonatal period worldwide (2013). Approximately 99% of neonatal deaths occur in developing countries with the highest rates in Sub-Saharan Africa (Lawn, Cousens & Zupan, 2005). Despite a global decline in the mortality rates among children aged five years and under, neonatal mortality is either increasing or not changing in developing countries over time (United Nations International Children's Emergency Fund [UNICEF], 2013). Unlike developed countries where neonatal mortality rates are low, developing countries show excessive neonatal mortality rates (Lawn et al., 2005). For example, the neonatal mortality rate per 1000 live births is estimated around 43 in Burundi and 21 in Rwanda compared to Denmark and Canada where the neonatal mortality rates are approximately 2 and 4 per 1000 live births respectively (United Nations, 2011).

Lawn et al. (2005) highlight that about 23% of the neonatal deaths in developing countries are related to birth asphyxia. In Rwanda, neonatal asphyxia is the leading cause of mortality accounting for 38% of all neonatal deaths (Republic of Rwanda, Ministry of Health, 2012). It is documented that inadequate knowledge and skills for newborn resuscitation among birth attendants contributes to increased neonatal deaths in developing countries (Hoban et al., 2013; WHO, 2013). In an effort to reduce neonatal mortality in resource limited areas, the American Academy of Pediatrics (AAP) instituted the Helping Babies Breathe (HBB) course in 2010 (AAP, 2010). HBB is a hands-on short continuous professional development (CPD) course which is delivered through the train-the-trainer model. In this model, experts in newborn resuscitation train local birth attendants through theoretical knowledge and resuscitation skills (AAP, 2010). Afterwards, the local trainers train their fellow birth attendants in newborn resuscitation (Korioth & Writer, 2010).

Studies demonstrate a positive relationship between the reduction of neonatal mortality and in-service neonatal resuscitation education for nurses and midwives in developing countries (Carlo et al., 2010; El Fattah & El Dein, 2012). Lee et al. (2011) found that neonatal resuscitation education for practicing birth attendants reduce intrapartum-related mortality by 30%. Likewise, Carlo et al. (2010) found that the

neonatal mortality rate during the first week following births in Zambia decreased after two neonatal resuscitation educational programs were carried out for birth attendants. Similarly, results from a study conducted in Rwanda (Musafili, Essen, Baribwira, Rukundo & Persson, 2012) and another from Ethiopia (Hoban et al., 2013) indicated increased knowledge and skills in newborn resuscitation among nurses who attended HBB educational sessions. However, nurses face many challenges in applying the knowledge and skills gained through in-service neonatal resuscitation courses (Bream, Gennaro, Kafulafula, Mbweza & Hehir, 2005). The majority of existing body of literature to investigate the effectiveness of newborn resuscitation courses in reducing neonatal mortality in developing countries uses the post positivism paradigm and quantitative methods (Carlo et al., 2010; El Fattah & El Dein, 2012; Little, Keenan, Niermeyer, Singhal & Lawn, 2011; Musafili et al., 2012).

Despite the evidenced role of newborn resuscitation in reducing neonatal mortality in developing countries, birth attendants continue to face barriers to the application of the knowledge and skills they gain through neonatal resuscitation education. Only one study using qualitative approach to study factors that hinder or facilitate nurses from proper newborn resuscitation was retrieved. This study was done by Bream, Gennaro, Kafulafula, Mbweza and Hehir in 2005. Bream et al. (2005) conducted their study in one central hospital in Malawi. Nurse-midwives who participated in this study reported that their rich experience and commitment to their job were facilitators to performing newborn resuscitation. However, they also voiced several barriers that prevented them from performing newborn resuscitation. Participants reported that they often missed basic equipment for newborn resuscitation such as the linen to cover up the baby, warmer table, and the clock to estimate the APGAR. Understaffing was also considered by nurse-midwives as a barrier to timely newborn resuscitation. For example, nurse-midwives participating in the study reported having to leave the suffering baby unattended to care for the dying mother, which in some cases resulted in the death of the baby. Inadequate communication between the nursing, administrative, and equipment maintenance staff was reported by participants as a negative factor to newborn resuscitation. Above the mentioned factors, lack of posted newborn resuscitation protocols in delivering rooms constituted a big challenge to nurse-midwives to perform proper newborn resuscitation in Malawi.

The literature review highlights that 'in-service' newborn resuscitation courses increase knowledge and skills among nurses. Nonetheless, we still need to know about nurses' experiences of translating new knowledge and skills into practice after participating in clinically-based continuing education such as newborn resuscitation courses. In addition, factors that hinder or facilitate nurses in developing countries to apply the knowledge and skills they gained from participating in such courses in their professional practice need to be explored.

Therefore, the purpose of this research was to use a qualitative descriptive study design to explore nurses' experiences of translating knowledge acquired from education workshops focused on maternal, newborn, and child health (MNCH) into practice in Rwanda. After receiving ethics approval in Rwanda, nurses in the Eastern province of Rwanda were invited to participate in the Helping Babies Breathe (HBB) educational workshop. Prior to the start of the workshop, nurses were provided with a letter of information about the study and a consent form. Nurses who wished to participate in individual interviews at least 4 weeks after the workshop signed and returned the consent form to a research team member. Thus, a purposeful sampling strategy was used to select 10 nurses to participate in audio-recorded individual interviews to gain an understanding of how nurses described applying the knowledge they developed from the HBB course into practice. After the audio-recorded interviews were transcribed verbatim, content analysis of the transcripts was conducted to identify emergent categories and themes. The initial thematic findings, related to knowledge and skills gained from the education workshop and facilitators and barriers to applying knowledge in practice, will be presented at the convention. In particular, findings suggest that nurses' professional development would greatly benefit from additional maternal, newborn, and child health-focused educational workshops. It is proposed that, in turn, increased professional development through continuing education would lead to a higher quality of nursing care and improved patient outcomes. Further, Rwandan healthcare delivery could be improved and newborn mortality reduced if newborn resuscitation continuous professional development courses were established on an ongoing basis. Overall, the health care delivery in Rwanda could be strengthened by the service of more

knowledgeable nurses. These findings could inform continuing professional development offerings and health human resources policies and planning to address nurses' continuing education needs in Rwanda.

## G 03 - Strategies to Transition Education into Clinical Practice

### An Academic-Practice Partnership to Transition Diverse Associate Degree Nursing Graduates into Acute Care and Community Health Settings

---

Joyce A. Wright, PhD, MSN, BSN, RN, CNE, USA

#### Purpose

□The purpose of this presentation is to describe a current program to expand a diverse competent nursing workforce through a one year BSN program for the Associate Degree Graduate Nurse (ADGN) and concurrently increasing the ADGN's clinical competency with a nursing residency in acute care and public health.

#### Target Audience

The target audience of this presentation is Baccalaureate Nursing Educators, Acute Care Nurses and Administrators and Public Health Care Agency Nurses and Administrators.

#### Abstract

An exceptional academic-practice partnership, funded by the Health Resources and Service Administration (HRSA), has been developed by a Northeast University, two Associate Degree Nursing Programs, a Magnet Designated Medical Center and an urban Public Health Department to implement an innovative one-year RN-BSN program with a concurrent nursing residency. This enhanced one-year program has provided diverse Associate Degree Nurse Graduates (ADGN) to put theory into practice by teaming up with preceptors at the Medical Center and Public Health Department for an intensive, hands-on clinical experience. The success of the ADGN students was accomplished through financial assistance, mentoring, and a comprehensive network of student support services. A Summer Leadership Program has promoted the professional development and leadership abilities of the ADGN students. Data collection of year one is completed and year two is in progress on the following essentials of the program; clinical decision making, critical thinking, reflective journaling and the benefits of mentoring. At the completion of the program, each graduate has returned to their respective grade school to present on professional nursing to enhance recruitment of the next generation of diverse nurses. Through the implementation of this HRSA funded program, the University will graduate a total of 24 diverse BSN degree-holding nurses which will have completed the residency and be highly marketable and employable post-graduation.

## G 04 - Preparing Nursing Students for End-of-Life Care

### Virtual Life and Death: Preparing Nursing Students for End-of-Life Care

---

*Leona A. Konieczny, DNP, MPH, BSN, ADN, RN-BC, CNE, USA*

#### Purpose

to share educational strategies using technology to educate and prepare students to provide end-of-life nursing care. Methods such as a virtual patient and simulation experiences are used to expose students to the direct and psychosocial care activities.

#### Target Audience

educators of pre-licensure nursing students in a course with clinical component and healthcare organization educators who prepare staff for providing end-of-life care. Educators interested in incorporating various technologies to teach caring would also be in the targeted audience.

#### Abstract

How does the educator prepare students for the profound experience of providing care at end-of-life? Technology can be used to provide the knowledge and skills needed before the nursing student faces this situation in the reality of the clinical experience. The learning laboratory using simulation provides exposure in the affective area. In a gerontological course prior to the clinical experience, nursing students meet a virtual patient. Over the course of the semester, the students meet, interview, and assess this a virtual female adult patient. There is an unfolding case study that is presented to students throughout the semester. The students have practice communicating with the virtual patient before they are caring for patients in a long term care setting. This virtual patient is used as an exemplar in teaching various concepts such as communicating with a person who has sensory deficits related to aging or providing care to a person with a chronic condition. In addition to interaction in the virtual world, the faculty posts discussion board threads in BlackBoard incorporating other concepts related to caring such as safety risks or the social isolation that can happen to older adults. Students post and respond to each other to share their plan of care and feelings about the situation. Most of the students are in the sophomore year of study and may have limited contact with older persons outside of possible personal experience. The technology and virtual setting support classroom learning and provide a safe place to practice and confront feelings about caring for someone whose health issues may not resolve. The use of technology can meet diverse learning styles. The students can virtually experiment by practicing interviewing and assessment. One section of the virtual experience is reflection on performance. Novice nursing students may approach nursing as solely health restoration. The technology is used to introduce the concept of the provision of palliative nursing care. The experience with this virtual patient concludes with an experience in the laboratory on campus with the human patient simulator. During the simulation, the simulated patient experiences a deteriorating change in status. In this scenario, there is another person in the role of family member or support person. The simulated patient dies during the scenario. This technology presents the opportunity to confront the end of life and the nursing care required for the patient and the family. The students apply the skills and knowledge related to end-of-life. During the debriefing of the simulation, students verbalize their feelings related to the scenario. The student has flexibility to interact with the virtual patient. The student encounters with this virtual patient meets the student need to manage the amount of time and schedule. The student has unlimited access to learning in the virtual world. The use of simulation can provides experience that offsets the variability of experience in clinical sites. Multiple technologies including virtual patient experience, web assisted learning management system, and high-fidelity human patient simulation are used to educate and support nursing students on the caring and compassion given at the time of death.

## G 04 - Preparing Nursing Students for End-of-Life Care

### Experiencing Loss in Simulation: A Meaningful Way to Integrate Theory into Practice

---

*Debbie L. Rickeard, MSN, BScN, BA, RN, CCRN, CNE, Canada*  
*Judy Bornais, BScN, BA, MSc, RN, CDE, Canada*

#### Purpose

This presentation will describe how simulation based pedagogy can be used to integrate End-of Life competencies into practice. The scenario assists students in learning how to approach patients and family members and collaborate with other members of the healthcare team to deliver safe quality care in an emotionally charge scenario.

#### Target Audience

The target audience of this presentation is faculty teaching in theory and simulation, clinical instructors, and clinical preceptors.

#### Abstract

The Canadian Association of Schools of Nursing developed Palliative and End-of-life Competencies which were disseminated in 2012. Determining how to best incorporate competencies into a curriculum can be a challenge. As educators, it is not possible to expose every student to every clinical situation. Nursing graduates enter their professions often without ever having seen, much less obtained experience with, such high-stakes situations such as working with a patient who is living with or dying from a progressive life-threatening illness. But can experiencing death and dying be learned in a classroom setting?

One solution is to use a simulated learning environment to allow students to experience loss in a safe setting with opportunities to debrief. By complementing our traditional teaching with simulation, we, as educators, are addressing our need to do more with less. In making simulation real, we can deliver our teaching in an engaging yet effective manner, in so doing transform nursing education through a simulation-based pedagogy.

This presentation will describe the pedagogical approach and include feedback from fourth year nursing students involved in the end-of-life scenario. Suggestions and recommendations for how such a simulated learning environment could be replicated in other institutions will be shared. This will include assisting students in learning how to approach patients and their family members with respect and dignity during this time. As well as collaborating with other members of the healthcare team to deliver safe quality care in an emotionally charge scenario.

## G 04 - Preparing Nursing Students for End-of-Life Care

### Care for Dying Patients in a Skilled Nursing Facility: A Train-the-Trainer Program

---

Linda K. Norlander, BSN, MS, RN, USA

#### Purpose

describe a model for training staff in skilled facilities using a train-the-trainer format developed through a collaboration between hospice and skilled nursing facilities.

#### Target Audience

Clinicians working in long term care, end-of-life care and geriatric care.

#### Abstract

A growing number of patients are dying in skilled nursing (SN) facilities. It is estimated that by the year 2020 up to 40% of United States' deaths will occur in nursing homes. Many of the facilities are under prepared to care for patients at the end of life. In order to meet the needs of these patients, CHI Franciscan Hospice developed a train-the-trainer program in partnership with representatives from the SN facilities. Seed grant money for this project was provided by the Robert Wood Johnson Executive Nurse Alumni Association. This presentation will discuss both collaborative development of the curriculum and the results of the five session training program.

The curriculum was divided into five sessions occurring one month apart. After each session, SN staff were asked to go back to their facility and do a training session based on the information and tools from that session. One of the unique aspects of this project was the opportunity to debrief at the beginning of each session.

Session content included:

- An overview of hospice services in skilled nursing facilities including discussion of “what is a good death,” how to collaborate with hospice to provide care and what is the regulatory environment.
- Communication and relationships including discussion of advance directives, how to have difficult conversations about dying with patients and families and how to collaborate with hospice on developing a plan of care.
- Pain and symptom management.
- Regulatory and Compliance including discussion about what the regulatory environment is for both hospice and for skilled nursing facilities.
- Bereavement. Discussion of bereavement for families and for staff who have long-term relationships with patients.

The ELNEC Geriatric Curriculum provided the evidence based framework for the sessions.

## H 01 - Promoting Cardiovascular Related Education

### The Relationship between Cardiovascular Risk Factors and Knowledge of Cardiovascular Disease in African Men in the North-West Province

---

Adele Burger, BCur, BACur, BTech (OccHlth), RN, RM, OHNP, PHC, South Africa  
Ronel Pretorius, PhD, RN, RM, South Africa  
Carla Fourie, PhD, RN, RM, South Africa  
Alta Schutte, PhD, South Africa

#### Purpose

The gap between cardiovascular risk factors and cardiovascular disease (CVD) knowledge has to be determined before prevention programs and policies can be developed. Therefore, the purpose of this study was to investigate the relationship between CV risk factors and knowledge of CVD disease in a group of African men.

#### Target Audience

The target audience of this presentation is policy makers, primary health care nurses and nurse educators.

#### Abstract

**Background:** In South Africa, the prevalence of cardiovascular disease (CVD) is often underestimated. CVD occurs commonly, especially in urban areas with two thirds of Africans presenting with multiple risk factors for CVD. Although several studies have been done on the high prevalence and burden of CVD, there is limited research investigating possible relationships between CV risk factors and CVD knowledge. **Objective:** This study aimed to determine the relationship between CV risk factors and knowledge of CVD in a group of African men. **Subjects and Method:** The study included 118 African men employed at the Vaalharts Water Scheme, North-West Province, South Africa. Participants completed questionnaires on general health information, as well as a Heart Disease Knowledge Questionnaire. Individual health screening included anthropometric measurements (height, weight, waist circumference and body mass index), blood pressure (BP), rapid testing of blood glucose and cholesterol. By using Pearson correlations we determined whether CVD knowledge scores relate to individual CV risk factors. **Results:** The mean CV knowledge score was 75% with an acceptable Cronbach's alpha of 0.64 (CA=0.64). Participants had a mean BP of 146/92 mmHg, which falls in the hypertensive range of the European Hypertension guidelines. Their fasting blood glucose levels of  $5.8 \pm 2.0$  mmol/L were higher than the normal cut-off range of 5.6 mmol/L. Their body mass index was  $25.9 \pm 5.9$  kg/m<sup>2</sup>. Overall, we observed a lack of association between CV risk factors and CVD knowledge. Only one borderline significant association existed between triglycerides and CVD knowledge ( $r=0.167$ ;  $p=0.071$ ). **Conclusions:** Despite African men having an increased CV risk and a relatively good understanding of CVD risk factors, there seems to be a disconnect between their CV risk and CVD knowledge. Our results suggest that a good CVD knowledge does not appear to influence changes in CV risk factor levels.

## H 01 - Promoting Cardiovascular Related Education

### Walking for Heart Health in Rural Women

---

*Elisabeth J. Marigliano, BSN, RN, USA*

*Pamela Stewart Fahs, PhD, RN, USA*

*Cristina Ludden, MA, BS, USA*

#### Purpose

The purpose of this presentation is to share the outcomes of a pedometer based walking program in a rural community in upstate New York. This health promotion endeavor was successful in increasing steps and improving select cardiovascular risk factors in rural women.

#### Target Audience

The target audience of this presentation are researchers, public health officials and policy makers interested in community based health promotion initiatives to improve cardiovascular risk factors.

#### Abstract

**Purpose:** To examine the effects of a walking program on outcomes such as blood pressure, total and HDL cholesterol, body mass index (BMI), 10 year cardiovascular risk and results of a 6-minute walk test for adult women in a rural community in upstate New York.

**Method:** A 10 week walking program was initiated in a rural community in upstate New York; a convenience sample of 70 eligible females was obtained from this walking program. We successfully retained 62 of those participants to study completion; however 2 participants did not have a post cholesterol reading. We collected pre and post BMI, total cholesterol, HDL, blood pressure and a 6 minute walk test on the selected women. Pedometer activity was collected throughout the program with computer downloads at 5 and 10 weeks. Socio-demographic variables such as age, self-identified ethnicity and reported educational level are used to describe the sample and trends in the data. In this quasi-experimental study we conducted eight paired t-tests of pre and post data with Bonferroni correction for multiple t-tests.

**Findings:** The age range was 29-79 with a mean age of 55 years. The mean pretest weight was 181 lbs. and the mean pretest BMI was 30.7. Upon completion of the walking program there was a statistically significant improvement ( $p < .05$ ) in the following measures: weight, BMI, total cholesterol, systolic blood pressure and the 6 minute walk test. All comparisons retained significance except improvement in total cholesterol after the Bonferroni correction. Although not statistically significant there was also an improvement in diastolic blood pressure, HDL and 10 year cardiovascular risk. We also discovered a statistically significant increase in aerobic steps from midway through the end of the study, after an incentive raffle challenge was implemented.

**Conclusions:** The data suggest that a community walking program utilizing pedometers with tracking capabilities was successful in increasing steps and improving select cardiovascular risk factors in a rural community in upstate New York.

## H 01 - Promoting Cardiovascular Related Education

### The Impact of Cardiac Education on Changes in Lifestyle Behaviors

---

Wanda Lawrence, PhD, RN, MSN, USA

#### Purpose

The purpose of this presentation is to share findings of a pilot intervention study that revealed that interventions to increase knowledge level of heart attack and reduce cardiac risk factors among African American women in a housing development resulted in changes in lifestyle behaviors.

#### Target Audience

The target audience of this presentation is practice nurses, student nurses, health educators, and nurse educators. Findings of this study reveal the critical need for client education in community, clinical and academic settings.

#### Abstract

Cardiovascular disease ( includes heart attack and chest pain) is the number one killer of American women and more than half of the deaths are directly attributable to "heart attack", resulting in many deaths within one hour of onset of symptoms and generally before reaching a hospital. Heart attack is a health disparity which has received attention nationally over the last decade. However, the death rate for African American women who have heart attacks continues to be twice that of white women. Literature addresses three specific problems facing African American Women who have heart attacks: they are not aware of risk factors, they do not know the signs and symptoms of a heart attack, and they delay treatment. It is documented in the literature that African American women tend to present symptoms of a heart attack that are atypical, thus not responding in a timely matter, resulting in delay treatment and death. Receiving treatment as early as possible can delay morbidity and mortality. Consequently, if African American women do not recognize these atypical signs, then they will continue to delay initiating emergency treatment resulting in a continued increase in deaths related to heart attack. Using a mixed research design, a pilot intervention study was implemented to determine if interventions used to increase awareness of heart attack prevention showed positive outcomes. Ten African American women ages 25-65 living in a government housing development, participated in a three month heart prevention education program, consisting of seven weeks of classroom education and seven weeks of exercise with a certified fitness trainer, for one hour, two days a week. In addition, participants were motivated and encouraged to use knowledge gained from the cardiac classes to implement lifestyle behavior changes, to include eating healthy and increasing physical activity. Baseline data was obtained to include a pre-test related to heart attack. Measurements such as weight, body mass index ( BMI) , blood pressure and body measurements such as hip, thigh, waist and upper arm were also obtained. The same measurements were obtained at the end of seven weeks and again at the end of the 3 month period, and a comparative analysis was performed. The women also completed a cardiac post-test at the 3 month period. Data revealed significant results at P-value <0.05 for increase in knowledge, decrease in blood pressure and weight. There was also some reductions in other body measurements. This presentation will focus on the methodology used in the study and the research findings. The presentation connects with the convention theme to serve locally, transform regionally and lead globally. The results of the study were significant to make a difference in the housing development of which the research occurred, and as a result, the researcher has received request to duplicate the program. Results of the program has significance to reduce heart attack risk factors which will impact health of the community, state, nationally as well as and internationally. This research can be duplicated in other countries to improve reduction of cardiac disease.

## H 02 - Setting the Workplace Culture: Nursing Programs in the Clinical Setting

### An Exploratory Study on Nurse-to-Nurse Collaboration (NNC) in Baccalaureate Prepared Registered Nurses

---

*Robert Anthony Mele, BS, RN, USA*

*Kiara J. Goldwag, BS, RN, USA*

#### Purpose

The purpose of this presentation is raise awareness of intraprofessional collaboration amongst nurses and prevent horizontal violence from causing harm to patients. By exercising collaborative behaviors, patients can receive safer quality care by utilizing multiple nurse's skills, education, and experiences synergistically.

#### Target Audience

The target audience of this presentation are nurses throughout all levels of education, experience, and specialties. All nurses can become advocates of intraprofessional collaboration or nurse-to-nurse collaboration (NNC).

#### Abstract

The purpose of our experiment was to assess the current state of Nurse-to-Nurse Collaboration (NNC) in baccalaureate prepared registered nurses (RN) who have graduated from Hartwick College. Due to the current scarce awareness of intraprofessional relations compared to interprofessional collaboration, aspects of healthcare ranging from nurse job satisfaction to patient safety are affected. From the research that was gathered, intraprofessional collaboration is critical to patient safety, outcomes, nursing satisfaction, and can affect a specific unit environment and culture. Data was collected via SurveyMonkey and utilized Dougherty and Larson's "Nurse-to-Nurse Collaboration Scale" (2010). This survey was distributed to 254 graduates, twelve emails failed to deliver, leaving 242 potential responses. From this pool, 67 responses were provided, creating a 27.69% response rate. This survey was available for a total of 30 days. Our findings showed exceptional collaboration in all five components that were tested. Our findings were later disseminated into a hypothetical research project. This project would hypothetically consist of a month long awareness month as a campaign, with an inservice to bring about revolutionizing current collaborative practices. By promoting collaboration patients can receive safe and quality care while health care professions will feel more trusted, respected, and empowered in their practice.

## H 02 - Setting the Workplace Culture: Nursing Programs in the Clinical Setting

### Implementation of a Nurse Residency Program for Long-Term Care New Nurses in NJ

---

*Nancy Bohnczyk, MA, BSN, RN, CNE, USA*  
*Edna Cadmus, PhD, RN, NEA-BC, FAAN, USA*  
*Susan Salmond, EdD, RN, ANEF, FAAN, USA*  
*Linda Hassler, MSN, RN, GCNS-BC, FNGNA, USA*  
*Katherine Black, MSN, RN, USA*

#### Purpose

The purpose of this presentation is to demonstrate implementation of an innovative Nurse Residency program in Long Term Care facilities in NJ to assist new graduate nurses in their transition into practice. Rutgers University, in collaboration with NJAC, (supported by \$1.6 million in funding from the CMS), led implementation.

#### Target Audience

The target audience of this presentation are nursing educators, practitioners, and leaders from academe and healthcare institutions who are interested in collaborating to provide a smooth transition from student to professional for new graduates, thereby reducing nursing turnover and increasing quality of care.

#### Abstract

Background: Long Term Care Facilities have a nurse turnover rate of 41% nationally, which results in a replacement cost of up to \$88,000/nurse. Beyond cost, staff instability leads to reduced quality of care; decreased resident and staff satisfaction; and increased hospital readmission. NJ has one of the highest re-hospitalization rates in the US, ranking 48th among all states for older adults with chronic diseases.

In response to this issue and the 2010 Institute of Medicine Report (The Future of Nursing: Leading Change, Advancing Health) recommendation, the New Jersey Action Coalition (NJAC) organized eight different task forces. One of its initiatives is to implement Nurse Residency Programs to assist new Registered Nurses in their transition into practice. In collaboration with Rutgers University School of Nursing (as well as a variety of stakeholding organizations) and supported by \$1.6 million in civil monetary penalty monies from the Centers for Medicare and Medicaid Services, NJAC is leading an effort to develop, implement, and evaluate a twelve month Nurse Residency Program in NJ's Long Term Care Facilities, the first of its kind in the United States. This poster presentation will focus on the implementation and preliminary evaluation of this ongoing project to date.

Method: LTC Facilities throughout NJ were recruited to participate. A unique curriculum was developed to educate experienced facility RNs to serve as Preceptors for their new RN (Nurse Residents). Prior to and following implementation of the educational intervention, data is collected at the individual, unit and organizational level using various standardized tools. Over 60 days of classroom, observational and simulation-based educational days are then provided to the Nurse Resident, incorporating the Nurse of the Future Core Competencies and the Nurses Improving Care of Healthsystem Elders (NICHE) Geriatric Resource Nurse Competencies, as well as other Evidence-Based Practice frameworks. Monthly education and support programs bring together the Preceptor and Nurse Resident cohort group. Each Preceptor/Nurse Resident dyad has a Rutgers Faculty Liaison as a resource and support. Two cohorts with a total of 31 facilities and 71 nurses are part of this study.

Results: Cohort One will finish in April 2015 and Cohort Two in November 2015. Data will have been collected for Cohort One by the time of this presentation; and baseline survey results will be available for Cohort Two.

Discussion/Conclusions: The long range goals for this project are to:

- increase LTC Facility resident (patient) satisfaction
- decrease nursing turnover in LTC Facilities
- develop this model into a sustainable statewide standard

The project will be approximately 90% completed by the time of this presentation, but already there is evidence of successful implementation and continuing interest throughout LTC facilities. Interest in the program is apparent outside of NJ as well, and plans are in place to share the program content for replication elsewhere.

Available results for Cohort One and Two will be included in the presentation.

## H 02 - Setting the Workplace Culture: Nursing Programs in the Clinical Setting

### Use of the Ethical Positioning System for Solving Ethical Dilemmas

---

*Joan Dorman, MSN, RN, CEN, USA*

#### Purpose

This presentation is intended to provide clinical nurses with a resource for dealing with the ethical dilemmas so common in nursing today. This is a six step system for resolving these dilemmas in a logical manner, using knowledge of ethical principles and the ANA Code of Ethics for Nurses.

#### Target Audience

This presentation is intended for nurses working in a clinical setting. It is common for nurses in today's health care environment to find themselves facing ethical dilemmas. These are situations in which the best response cannot be found on google or in even the best of resources.

#### Abstract

It is typical in nursing education to value critical thinking, clinical reasoning, and problem solving as necessary skills. Students practice these throughout their education, and generally feel confident in their ability to arrive at acceptable solutions.

At some point, however, students and nurses are faced with particular problems for which they do not feel prepared. These are the ethical dilemmas, so common in today's healthcare environment. The associated feelings of powerlessness, faced in these situations, have driven many nurses from the bedside.

It is apparent that nurses need a framework for systematically examining these dilemmas and reducing the feelings of despair. It became apparent that the nursing process, which students and nurses use on a daily basis, could be adapted for use in making ethical decisions. That is how The Ethical Positioning System evolved.

The tool consists of six steps. The first step involves assessing the situation, including all elements of its context. Next, the nursing dilemma is stated in a sentence or two. The third step, which is planning, calls for addressing all possible solutions to this ethical dilemma, along with the pros and cons of each choice. These choices are then evaluated in terms of the applicable ethical principles and the appropriate provisions of the American Nurses Association (ANA) Code of Ethics. To summarize and conceptualize this stage, all of this data is entered into a diagram, which is step four. At this point, it is usually clear that one tentative solution exceeds the others. The nurse then moves on to the final stages, implementation and evaluation.

## H 03 - Can Nurses Care for Themselves?

### Shift Work and Nurses' Health: Understanding the Consequences to Take Action!

---

*Letha M. Joseph, MSN, RN, AGPCNP-BC, USA*

#### Purpose

The purpose of this educational activity is to enable the learner to - 1. Familiarize the recent research on health consequences of working night shift. 2. Identify evidence based strategies helpful in reducing harmful effects of shift work.

#### Target Audience

Nurses who work rotating shifts and nurse managers and nurses who are in administrative roles who can impact work schedule and influence policy decisions to minimize harmful effects of shift work

#### Abstract

Shift work has negative impact on nurses' physical, mental and social health. It affects patient and staff safety as well as quality of care. Nurses who work night shift may experience professional isolation. Awareness of these risks will help nurses who work shift work and those nurses who are in the managerial roles to identify strategies to minimize the risk by life style modification and policy revisions.

Evidence supports the association between night shift work and several disease conditions such as certain malignancies, cardio vascular disease, gastrointestinal disease, metabolic syndrome, diabetes mellitus, sleep disorders and fatigue. Disturbed sleep- wake cycle has negative impact on mental health as evidenced by an increase in incidence of depression, anxiety disorders, and problems with concentration and memory among nurses who work night shift.

Fatigue and lack of attention or impaired concentration negatively affect patient safety. Rotating shifts challenge biological clock and adjustment. Strategies to improve nurses' ability to stay awake at work such as provision for 'power nap breaks' and presence of bright lights at nurses' station, may help nurses to remain alert and reduce errors. After night shift work, there is an increased risk of motor vehicle accidents due to the inability to stay awake while driving. Work place solutions to minimize the harm will improve patient safety and nurses' safety.

Shift work sleep disorders are preventable and manageable to a great extent with life style modification. Nurses need to identify helpful strategies to improve the quality of sleep. There are technological assistance which might offer help prior to pharmacological agents.

Management can organize activities to ensure professional involvement of nurses who work night shift. Today's technology allows nurses to be part of work place committees without needing to attend meetings in person during day time when they are not at work. Involvement with professional organizations and preparing for specialty certifications as a team, organizing and being part of a journal club and similar activities will ensure professional development of nurses who continue to work the night shift.

Activities designed for health promotion and prevention of shift work disorders can influence the life style and modify these risk factors. They should focus on improving the quality of sleep, social interaction, health status and work-life balance. Knowing the individual risk factors and identifying personal strategies to minimize the risk may help those 'night owls' to remain healthy and productive.

## H 03 - Can Nurses Care for Themselves?

### Effective Use of Employee Vaccination Data to Improve Healthcare Workers' Seasonal Influenza Vaccination Rates

---

*Fatsani L. Dogani, PhD, MPH, RN, USA*

*Aaron Mendelsohn, PhD, MPH, USA*

*Cassius Lockett, PhD, MS, USA*

#### Purpose

The purpose of this presentation is to highlight how seasonal healthcare influenza vaccination data can be analyzed to identify work areas that can potentially benefit from increased education.

#### Target Audience

The target audience of this presentation is healthcare workers, those that work in infection control and hospital administrators,

#### Abstract

Influenza is a global health problem annually resulting in excess mortality and morbidity. Vaccination is a well-established preventative measure for influenza and is especially encouraged in healthcare workers to prevent passing disease to patients. The objective of this study was to use employee vaccination data to assess factors associated with vaccination uptake (the percentage immunized) among workers at a large, healthcare institution in California during the 2006/2007 through 2011/2012 seasons. A combined cohort/cross sectional study design was utilized. Basic descriptive analyses were used to describe vaccination rates and reasons for vaccination declination by important subgroups. A logistic regression model was fit to examine factors (i.e., age, gender, job category, and work department) associated with vaccination uptake. The vaccination rates increased from 48% in 2006/2007 to 74.9% in 2011/2012. During the 2009 influenza pandemic, 72% of employees were vaccinated with the seasonal flu vaccine versus 68% who were vaccinated with the 2009 H1N1 vaccine. The most common reason for declination across all job categories was "personal reasons" (58%), followed by "I get ill from the flu vaccine" (16%). Data from the 2011/2012 season showed that vaccination rates varied by age (OR=1.005) and employee type (nursing assistants versus nurses, OR = 1.408), and location (working in a procedure area compared with working in medical surgical units, OR = .840). Although statistical differences were found, there were no real clinical differences seen as evidenced by small differences in percentage vaccination rates. The identification of factors related to vaccination uptake is an important step in developing targeted strategies to increase compliance with vaccination recommendations.

## H 03 - Can Nurses Care for Themselves?

### Is Sitting Time Associated with Increased Health Risks in Nurses?

---

*Lizbeth P. Sturgeon, PhD, RN, CNE, USA*

*Dawn Garrett-Wright, PhD, PMHNP, CNE, USA*

*Eve Main, DNP, USA*

*M. Susan Jones, PhD, MSN, RN, CNE, ANEF, USA*

*Donna S. Blackburn, PhD, RN, USA*

#### Purpose

The purpose of this presentation is to explore the Sitting Time of nurses in the United States in relation to general health.

#### Target Audience

The target audience of this presentation is practicing nurses and nurse educators.

#### Abstract

**Background:** Sitting time (ST) has increased substantially in the last 50 years and is an emerging health risk. There is evidence that prolonged ST is a risk factor for all-cause mortality, independent of physical activity. Nurses are particularly at risk due to low baseline physical activity, older age, and the increasing use of computers in patient care, education, and research facilities. There are no studies of nurses in the United States that examine their average daily ST in relation to health risk.

**Objective:** The purpose of this descriptive correlational study was to explore the ST of nurses in the United States in relation to general health.

**Method:** A convenience sample (n = 86) was recruited from a 2014 Annual Research Conference held in the southwestern U.S. Participants completed demographic items, general health questions, and the Workforce Sitting Questionnaire (Chau, 2011), which asked ST while traveling, working, watching TV, using the computer at home, and doing other leisure activities on work and non-work days. Data were analyzed using descriptive and correlational statistics.

**Results:** The average age of the participants was 47.4 years and 91% of the sample was female. The average BMI was 26.6 (SD ± 5.0) and 75.9 % of the participants described their general health as excellent or very good. The percentage of participants indicating that they were currently taking a medicine for blood pressure was 25.3 %, for high cholesterol was 17.7 %, and/or for diabetes was 3.8 %. Total average ST was 10.5 hr (SD ± 3.7) on workdays and 10.3 hr (SD ± 4.9) on non-workdays. Across domains on workdays the average ST was 1.3 hr (transportation), 5.5 hr (at work), 1.3 hr (watching TV), 1.9 hr (home computer use), and 0.9 hr (other leisure activities). Total ST and ST domains for work days were not associated with self-reported BMI. Sitting time domain for working on a non-work day did correlate with BMI (r = -.26). There was also an association in the average ST for non-work days with current usage of blood pressure medications (r = -.44).

**Discussion:** Evidence from earlier studies indicates that sitting for prolonged periods of time each day leads to negative health outcomes; this study demonstrated a relationship between working on a non-work day and BMI. In addition, the usage of blood pressure medications was associated with average ST on a non-work day. These findings support and add to our understanding of the effects of sitting time on increased health risks.

## H 04 - Technology that is Transforming Nursing

### Creating Innovative Educational Modalities to Transform Community Health Nursing

---

*Elizabeth F. Sefcik, PhD, MSN, RN, GNP-BC, USA*

#### Purpose

The purpose of this presentation is to highlight the clinical component of a virtual-based course offered in a southwestern University for the past ten years. The virtual course adds flexibility for students in managing their course work, assists faculty in this time of faculty shortage, and is cost-effective.

#### Target Audience

The target audience of this presentation is faculty that are teaching community health courses traditionally or virtual-based. Because of the effectiveness of this innovation, health care programs could emulate this online community health course.

#### Abstract

**Introduction:** Nursing faculty have long been resolute in fostering an educational environment where high quality, fiscally-responsible, student-centered, and evidence-driven curricula are standard. Online education is growing exponentially and is a critical component of academic institution's long-term strategies. The perception of the value of online education increased from 57.2 to 69.1 percent between 2003 and 2013. (Allen & Seaman, 2013). The purpose of this presentation is to highlight the clinical component of a virtual-based course offered in a southwestern University for the past ten years. The initial virtual clinical was designed 10 years ago by an inter-professional team with two math faculty including the Team Leader who is the author of the abstract. The course was initiated by this nursing faculty in 2004 with Hesi exams to measure learning outcomes of students from the objectives in the virtual course and a real setting in which the students were in the community. This virtual course continues to add flexibility for students in managing their course work, diminishes costs associated with travel to campus, allows for creative development of their work, and produces a professional learner product .

**Methods:** A gap analysis was conducted in order to identify strengths and opportunities with course innovation. The gap analysis was conducted in 2014, and demonstrated areas within the virtual clinical that could be more user friendly and more adaptive to the current literature, and student population. Gap analysis recommendation led to the program redevelopment with townships added to the virtual Island (Lil-Wald) named after the Founder of Public Health Nursing—Lillian Wald.

Based on the findings, the designer, community health team members, and an undergraduate computer science major began revising the Island which includes 10 townships. Student feedback and a comprehensive review of the salient literature were obtained to provide a roadmap for incorporation of relevant evidence-based findings and structured revision of the course. The designer analyzed opportunities, delineated current and desired states, identified two-and five-year goal statements, and outcome indicators. The team also created interviews from individuals, families, and communities in each township that represented the theme of the township. For example, Clara Barton (founder of the American Red Cross) where interviews have proposed disasters, such as tornadoes.

**Scope:** The faculty was intentional in aligning the virtual education with national standards proposed by AACN guidelines. The innovative constructive pedagogy names townships on the Lil-Wald Island which includes the names of past nurse leaders. In-depth study about prominent nurse leaders revealed several noteworthy leaders from the past such as Florence Nightingale, Mary Brackenridge, Margaret Sanger, Mary Mahoney and present nurse leaders such as Jean Watson, Virginia Henderson, Margaret Leininger, and Luther Christman. These nurse leaders are not limited to these few mentioned. The students in the Blackboard course have the ability to review nursing history of these leaders in placing the cursor over the township that is named after each person with a drop down picture and brief history of

each. In addition, participants review the YouTube Windshield Survey (which assesses a town or neighborhood), and then conduct their own survey on the link provided in the course of google maps. The students have the ability of reviewing their real community setting of their choice from the region of the State that the student lives in by selecting a health department located online, and near them. The learner then selects online data from this health department following the guidelines provided for them. The community assessment is continued by utilizing the online resources available for the student, such as the Center for Disease Control, the US Census Bureau, the State Department of Health and Human Resources to name a few. Once the community is assessed, the learner analyzes the data obtained, and establishes three problems with two priority problem that is translated into two Nanda Community Nursing Diagnoses. The next steps include development of a plan and intervention for the Nursing Diagnoses. The plan is usually a teaching plan that is outlined. Evaluation follows.

**Results:** In choosing a student peer as a partner in the clinical virtual, the students have an opportunity to interact with each other in formulating their assessment of the community –both in the virtual setting, and the real setting. The pair search individually for online resources that are given them in resource links provided on Lil-Wald Island. Links such as the Center for Disease Control, the U.S. Census Bureau, and others enrich their data assessment including of course links to the University library. After the assessment of the individual, family, and aggregate/community, the students analyze their assessment data, and formulate priority problem lists culminating in two community health diagnoses. With the priority Nanda community diagnosis, the students integrate more evidence-based information for their plan and intervention. The plan which is designed to be delivered to the appropriate audience then is evaluated for effective learning outcomes, and a conclusion written that reflects their work and outcomes.

**Conclusion:** The community health nursing course is an online didactic with the virtual community health clinical innovation in Blackboard technology. The students are able to access on computer, and/or mobile device. This course has surpassed our expectations in providing both the knowledge base in community health nursing care, and meeting the clinical course objectives and learner outcomes. This innovation is inclusive of all cultures and genders, and it has a focus on the underserved populations with health disparities. The virtual Lil-Wald Island includes nursing history, as well as focuses on past and current nurse leaders. From there, the students apply and demonstrate knowledge and application of the nursing process and demonstrate these principles in a professional paper. This innovative clinical assessment has a long term record of effectiveness and student success with initial Pre-Post customized community health nursing Hesi Tests which demonstrated higher mean scores than the real community setting.

**Recommendation:** Because of the effectiveness of this innovation, this virtual modality is recommended for other academic health programs as well as community health nursing clinicals. Health care programs could emulate this virtual online community health course in similar community health clinical courses in this time of faculty shortage, distance education, and cost effectiveness.

## H 04 - Technology that is Transforming Nursing

### In Their Shoes: A Poverty Simulation

---

*Jacqueline Paik, MSN, BSN, RN, PHN, USA*

*Dolores J. Wright, PhD, MS, BS, RN, PHN, USA*

#### Purpose

The purpose of this presentation is to discuss a method designed to impact the affective domain of student nurses related to poverty. I will also enable the learner to compare poverty presented in a didactic format in contrast with a poverty simulation experience.

#### Target Audience

The target audience of this presentation is faculty of nursing schools and all nurses who instruct or precept nursing students in the clinical area.

#### Abstract

**Background:** Poverty is the most influential social determinant of health. Because nurses care for people from all socioeconomic groups, they will encounter people who live in poverty who often feel that health care providers are frequently insensitive to their needs and concerns. Therefore it is incumbent upon nursing faculty to address poverty-related-to-health issues with their students.

**Purpose:** The goal of this educational experience was to use and evaluate a poverty simulation that explores undergraduate public health nursing (PHN) students' attitudes about those living in poverty.

**Description:** A four hour poverty simulation was included as part of the students' clinical experience. The simulation was conducted within a school of nursing's conference rooms and classrooms, each of which offered an experience that a family in poverty likely has. These experiences included taking public transportation, paying bills, dealing with daily needs (groceries and school crises), filling out annual paperwork for various agencies, attending health care appointments, and interacting with the police. Prior to proceeding through these experiences, students completed attitudes toward poverty (ATP) scale and were preassigned to a "family" of three to four members. After completing the simulation the students again completed the ATP scale and participated in a debriefing session.

**Findings:** Debriefings with students illuminated themes, including: 1) Receiving government assistance is harder than people think; 2) Poverty isn't about being lazy; 3) Poverty creates a snowball effect in the family. Based on student feedback, the simulation was successful in sensitizing PHN students to the experiences of living in poverty.

## H 04 - Technology that is Transforming Nursing

### Peer Review in the Online Environment

---

*Mary Alice Momeyer, DNP, MSN, BSN, RN, ANP-BC, GNP-BC, USA*

*Carolyn Schubert, DNP, MSN, BSN, CNE, USA*

*Joni Tornwall, RN, BSN, MEd, USA*

#### Purpose

The purpose of this presentation is to discuss the importance effective of peer review as a communication strategy contributing to effective teamwork and quality of care. On line nursing students share their perceptions of peer review and the the challenges and barriers requiring attention for effective skill building.

#### Target Audience

The target audience of this presentation is nursing faculty teaching at all levels BSN, MSN, and Doctoral who have the opportunity to incorporate peer review as a learning strategy and activity and build students confidence and competency in giving peer feedback.

#### Abstract

Peer review, collaboration and group work are documented drivers of continuous quality improvement in healthcare (IOM, 2010; Ray & Meyer, 2014). The ANA (1988) defined the importance of peer review as an organized effort to make judgments about the quality and appropriateness of care and services provided by someone of equal rank. As a characteristic of a mature profession, peer review emphasizes and promotes accountability to professional standards. It supports development and socialization into the nursing role and is a tool for empowerment. In the academic setting, peer review is a tool for student engagement providing experience in reviewing others' coursework according to set standards such as assignment rubrics (Boehm & Bonnel, 2010). Effective peer review requires knowledge, skill and self confidence using methodologies to provide constructive feedback to colleagues. Few studies examine if and how these requirements are addressed in academia. The on line learning environment poses additional and unique challenges. With the increasing number of online nursing programs, many students are educated without real-time or face to face interactions with faculty or peers. This environment can have an isolating effect on learners and present barriers to communications, collaboration and group work, impeding efforts such as peer review. According to Maine and Wu (2010) it is imperative in an online course to maintain interaction, provide on line situations for critical thinking, and ensure the active and 'safe' engagement of learners. Online tools present a frame for conducting peer review and offer definition, consistency and ease of access to students in on line courses. To evaluate the perceptions and efficacy of on line peer review methodology, a pilot study was conducted. One hundred and fifty on line graduate nursing students were asked to identify their perceptions of specific barriers and developmental needs after using an on line peer review tool. A Likert scale survey was used in addition to open ended questions to gather qualitative feedback. Initial results confirmed the need for structured teaching and learning about the peer review concept and process, as well as experiences and strategies to build confidence and competence in implementing peer review in nursing practice.

## A 07 - Competencies in Undergraduate Nursing Programs

### Making the Most Out of QSEN 's Knowledge, Attitude and Skills (KAS) Competencies in an RN to BSN Program: A Three Level Education Approach

---

*Guillermo Valdes, DNP, RN-BC, USA*  
*Roxana Orta, DNP, ARNP-BC, USA*

#### Purpose

The aim of this educational initiative is to validate QSEN competencies significance when generating BSN nurses as competitive employment candidates in a quality and safety driven healthcare organizational environment.

#### Target Audience

Target audience are Nurse Executives, Organizational Executive Leadership and Education and Development Staff, Quality and Safety Management, Academic Educators and or Clinical Nurse Educators.

#### Abstract

**Literature Review:** Nurse Executives, leading nursing organizations, and Magnet Hospitals, all recognize the unique value that baccalaureate-prepared nurses bring to the practice setting, AACN (2014). Academic institutions must consistently educate BSN nurses to be competitive in a healthcare environment where nurses are resourceful as accountable patient advocates. The Quality and Safety Education for Nurses Institute (QSEN) have developed competencies that closely look at nursing knowledge, skills, and attitudes to be furthered enhanced in nursing programs concentrating on Patient-Centered Care, Teamwork & Collaboration, Evidence Based Practice, Quality Improvement, Safety; and Informatics. QSEN pursues strategies to build will and develop effective teaching approaches to assure that future graduates develop competencies in these areas of practice, QSEN (2014).

**Purpose:** The aim of this educational initiative is to validate QSEN competencies significance when generating BSN nurses as competitive employment candidates in a quality and safety driven healthcare organizational environment.

**Objective:** To promote QSEN competencies all throughout the RN to BSN program.

**Methods:** QSEN competencies are progressively embedded all throughout the BSN curriculum in three courses: an introductory Transition Professional Nursing course, middle of the program Research and Evidence Practice course, and in a Capstone Leadership and Management Course. Where students culminate to write a comprehensive PICO or PDSA Quality Improvement Project.

**Results and Outcome:** Two cohorts have successfully completed the program with QSEN centered education developing Evidence- Based Practice knowledge and skills, acquiring situational awareness when facilitating patient and family centered positive attitude, effectively applying quality improvements methods and population specific healthcare clinical competencies. Local hospitals have participated with the college to recruit our RN to BSN students for employment. Graduates of the RN to BSN program continue to be competitively hired by local tertiary, secondary and primary healthcare organizations during and after the program for staff, regulatory leadership and executive positions.

## A 07 - Competencies in Undergraduate Nursing Programs

### Putting It All Together: Integrating Multiple Evidence-Based Core Competencies from across the Spectrum to Redevelop Community Health Online RN-BSN Courses

---

Melissa D. Myers, MSN, BSN, RN, CNE, CPN, USA  
Leslie B. Schoenberg, BSN, MSN, RN, CNE, CPNP, USA

#### Purpose

The purpose of this presentation is to share how the American Association of Colleges of Nurses (AACN), Recommended Baccalaureate Competencies and Curricular Guidelines for Public Health Nursing (2013), Master Instruction, Quality Matters, and the Nurse of the Future into an online RN-BSN CH course.

#### Target Audience

The target audience for this presentation is nurse educators in the classroom or online setting.

#### Abstract

##### **Three (3) Measurable Objectives**

1. Describe how the American Association of Colleges of Nurses (AACN), Recommended Baccalaureate Competencies and Curricular Guidelines for Public Health Nursing (2013) can be integrated into an online Community Health (CH) course for RN-BSN students.
2. Examine the process of incorporating Master Instruction, Quality Matters, and the Nurse of the Future into an online RN-BSN CH course.
3. Demonstrate the use of concept mapping of the CH course outcomes with BSN Essentials and core competencies.

**Purpose, Aims, Background, Problem:** Public health nursing is evolving due to a paradigm shift emphasizing population health, health promotion, and disease prevention (American Public Health Association, 2013). Numerous leading health agencies have responded to this need by creating new core competencies and pedagogical frameworks. Nurse educators face the challenge of integrating the AACN baccalaureate nursing essentials with these new public health core competencies. Emerging instructional frameworks can enhance the foundation of RN-BSN CH courses. Concept mapping is an effective tool to ensure that key concepts from across disciplines are integrated into online courses. Nursing faculty play a key role synthesizing this information to optimize student learning of foundational CH concepts.

**Methods, Results, Implications, Discussion, Conclusions:** The recently developed AACN Competencies for Public Health Nursing (2013) integrate population-focused content into baccalaureate level community health curriculum. In addition, several educational frameworks including Master Instruction, Quality Matters, and the Nurse of the Future have been demonstrated to improve student learning. Answering this call for transformation, the CH nursing courses at Chamberlain College of Nursing have been redeveloped and redesigned to incorporate these essential concepts and frameworks. This presentation will describe the process of concept mapping and course redevelopment incorporating the AACN public health nursing, Master Instruction, Quality Matters, and the Nursing of the Future into our online CH nursing courses.

## A 08 - Altering Nurses' Perspectives through Evidence

### Social, Cultural and Behavioural Contexts of 2014 Ebola Virus Disease (EVD) Outbreak in Nigeria: Community Perspectives and Nurses' Preparedness

---

*Mildred E. John, PhD, BSc, RN, RM, RNE, FWACN, Nigeria*

*Margaret I. Ekanem, BSc, RN, RM, RPHN, Nigeria*

*Ibitoru Peterside, BSc, RN, RM, RPHN, Nigeria*

*P. E. Samson-Akpan, PhD, MPH, BSc, RN/RM, Registered Nurse Educator, FWACN, Nigeria*

*Idongesit I. Akpabio, PhD, MSc, MPA, BSc, RN/RM, FWACN, Nigeria*

*Ijeoma Okoronkwo, PhD, MSc, BSc, RN, RM, RNT, FWACN, Nigeria*

#### Purpose

to highlight the community perspectives of socio-cultural beliefs and practices that influence Ebola control in Nigeria. It will also present results of the preparedness of nurses to provide socio-culturally relevant care to Ebola patients and psychosocial counselling to family members.

#### Target Audience

Health care providers of different cadres, Health promotion professionals Participants and delegates at the 43rd biennial convention of Sigma Theta Tau International

#### Abstract

**Background:** The current Ebola outbreak in West Africa has been described as the largest, most deadly since Ebola was first discovered in 1976 (WHO, 2014). The affected nations have suffered tremendous social problems while survivors and families of victims have suffered stigmatization and severe psychological distress. As at February 4, 2015 there have been nearly 22,500 Ebola cases in eight countries, with over 9,000 deaths including health workers (WHO, 2015). This international health emergency has led to the recruitment and training of hundreds of health workers from other countries (including Nigeria) to help with Ebola control in hardest hit nations. The outbreak of Ebola Virus Disease (EVD) in Nigeria between 15/07/2014 and 15/09/2014 had twenty cases with eight deaths in two states. During the period, the health response faced significant challenges because Ebola is not just a medical problem, but also a people problem with community responses being driven by cultural beliefs and practices. Some socio-cultural beliefs and practices are deep rooted and have the tendency to influence Ebola control. Few studies exist in this area. Guidelines for Ebola control suggest that understanding and consideration of local views and responses to the outbreak is very important. This study sheds new light on the rarely considered issue of socio-cultural influences on Ebola control.

The two aims of the study were: to identify the socio-cultural beliefs and practices and behavioural responses that may influence the control of Ebola in the community; and to determine nurses' knowledge of the socio-cultural perspectives of Ebola and their preparedness to provide relevant socio-cultural care.

**Materials and methods:** Qualitative and quantitative methods were used. For the qualitative part, Kleinman's mini-ethnographic explanatory model (1978) was used to explore the socio-cultural and behavioural perspectives of Ebola Virus Disease in different communities. Data were collected through focus-group discussion (FGD) and semi-structured interview from 178 conveniently selected adults living in four communities in two South-South states of Nigeria. Questionnaire was used to collect quantitative data from 85 nurses randomly selected from 6 community health centres. The choice of the two states (Rivers and Akwa Ibom) hinged on two factors. Firstly, because there was Ebola outbreak in Rivers State (with 4 cases and 2 deaths) and to avoid quarantine and EVD-related stigma, many contacts migrated to nearby states including Akwa Ibom State. Secondly, these 2 states are located in the tropical rain forest where "bush meat" is a prized delicacy and hunters and sellers of "bush meat" get into close contact with infected wild animals.

Ethical approval was obtained from the Health Ethical Committees of Rivers state and Akwa Ibom state.

Qualitative data were transcribed for content analysis using NVivo 7.0 and socio-cultural beliefs and practices were coded into categories. Only factors mentioned by at least five persons were retained. Quantitative data were analyzed using descriptive statistics on SPSS 20.0.

**Results:** Qualitative data revealed the following: Notions of the disease were in 2 domains - socio-cultural and spiritual (outbreak believed to be caused by angry gods, evil spirits and witchcraft affliction. These notions initially affected receptivity to health promotion messages and treatment but within 3 weeks many said they realised "this is no ordinary disease that sacrifice to the gods can control"

Naming the disease: Ebola is called 'touch and die' disease or 'virus of quick death'

Beliefs that may impede Ebola control: "Not performing traditional burial rites is dishonouring the dead and may bring repercussions". Because of this some said they would rather hide and bury their dead in the "evil forest" than hand them over to health workers. "Not touching or caring for sick relatives means abandonment and is culturally wrong", so they touch and care for the sick, even if they have Ebola. "Family members should be in close contact with one another"

Social and cultural practices that may impede control measures: culture that is heavily reliant on close physical contact, especially during illness; traditional greeting which includes hugging, touching and shaking hands; funeral/burial rites where family members touch, kiss, wash and dress the corpse; family members sleeping on same bed or mat; hunting and eating of "bush meat".

Behavioural responses that enhance control: taking personal responsibility for self protection; suspension of traditional way of greeting and following the "no touching" rule; suspension of public funerals and traditional funeral rites; use of strategically placed public hand washing kits & hand sanitizers; carrying hand sanitizers in handbags and pockets to enhance accessibility.

Issues of Concerns: stigmatization of infected people and their families; burial of the dead in "culturally unacceptable manner"; isolation/quarantining of contacts ("they just take you away to an unknown place and your family cannot visit"; so people generally run away to avoid being quarantined)

Quantitative data: results showed that nurses of varying levels of education and years of experience and 92.9% were female. Only 41.2% nurses (especially younger nurses and those qualified within the past five years), were able to identify the Ebola- related socio-cultural factors; 55.3% did not see socio-cultural factors as playing any important role in Ebola care. Only 22.4% agreed that they needed training in socio-cultural care of Ebola patients. These results reveal low level of preparedness of nurses to deal with the socio-cultural issues of the Ebola epidemic and provide relevant socio-cultural care.

**Discussion:** Effective control of EVD does not only involve screening, isolating and treating cases but also requires an understanding and consideration of the psychological, socio-cultural and behavioural responses to the disease in the general population. Lack of knowledge of these factors hinders the ability of nurses to give effective health promotion and provide culturally-relevant care to Ebola patients and psychosocial counselling to family members. In the face of socially and culturally complex impacts of Ebola disease, the explanatory model is valuable in describing people's views of the course of illness and developing a framework for culturally capable care by the nurse (Hewlett & Amola, 2003).

**Conclusion:** Certain socio-cultural beliefs and practices may influence Ebola control in Nigeria but nurses working in the community do not have adequate knowledge of these and this affects their preparedness for culturally capable Ebola care.

## A 08 - Altering Nurses' Perspectives through Evidence

### Supporting Nursing Research: Mentors' Perspectives on a Research Training Program for Point-of-Care Nurses

---

*Agnes T. Black, BSN, MPH, RN, Canada*  
*Candy Garossino, MSN, BSN, RN, Canada*  
*Lynda Balneaves, PhD, RN, Canada*

#### Purpose

This presentation will describe a research training program for point-of-care nurses and the mentors' perspectives on that program. The program aimed to promote nurses' engagement in research and evidence-informed practice. The mentors' views of the program were explored using a survey with both closed and open-ended questions.

#### Target Audience

The target audience for this presentation is both point-of-care nurses who are looking for ways to be involved in research, as well as nursing leaders who are looking for successful models for promoting evidence-based nursing practice.

#### Abstract

**Introduction.** Research shows that patient outcomes improve when nurses have an evidence-informed practice, yet nurses have identified many barriers to their engagement with research at the bedside, including lack of research methods knowledge, limited organizational support and insufficient time to implement new ideas (1). Mentorship in healthcare settings has been shown to be valuable in furthering evidence-informed practice (2, 3). Leaders at Providence Health Care in Vancouver, BC, developed a point-of-care research-training program that included support from mentors and was aimed at reducing nurses' barriers to research utilization in clinical settings and promoting engagement in research. Mentors for the research-training program were asked to be available as a resource to team members at various points throughout the research process; and to assist the teams to refine research areas or questions; choose research methods/study design; develop appropriate timelines; and prepare research project proposals for submission. For those teams receiving funding, the mentors were asked to assist with the ethics application process and continue to meet with teams to conduct all phases of the research project, including data collection, analysis and the final report.

**Methodology.** The research-training program was initiated in 2011 and has involved 300 clinicians and 50 mentors to date, with 43 research teams funded. All mentors who worked with funded teams in the first three cohorts of the research-training program (N=30) were invited to participate in an evaluative survey at the conclusion of their team's one-year research project. Mentor survey questions included both Likert scale questions and open-ended questions. Likert scale questions focused on perceived benefits to research team members from participation in the research-training program, perceived increase in evidence-informed practice and perceived increase in job engagement. Open-ended questions solicited suggestions for improvements to the program and suggestions for improved support for mentors. Survey results were tabulated and organized by research team members.

**Results.** Fourteen mentors completed the survey, for a response rate of 46%. In response to Likert scale questions, 93% (N=13) of mentor respondents agreed or strongly agreed that participation in the research-training program was beneficial to their team members. Additionally, 93% agreed or strongly agreed that participation led to an increase in research methods knowledge, attitudes or practice among their team members. Sixty-five percent (N=9) of mentor respondents believed there was an increase in job engagement associated with participation in the research-training program, and 86% agreed or strongly agreed that participation in the research-training program led to an increase in evidence-informed practice.

In response to open-ended questions about suggestions for improving the research-training program, mentors recommended the following: offer additional support for teams during the ethics application process; more clearly define the mentor role and expectations; promote previous teams' successes to encourage more participation from point-of-care nurses; offer end-of-grant knowledge translation support; and extend the time-frame to provide funded teams more than one year to complete their projects.

When asked how the research-training program organizers could better support mentors, responses included: offer clearer expectations of the goals of the research-training program; clarify time commitment for mentor role; organize regular check-ins between mentors and training program organizers; and offer additional resources for mentors as they support their teams move through the ethics applications. One mentor commented, "I felt well supported and appreciated as a mentor" while another noted, "I think success as a mentor is most directly influenced by the research team you are assigned to, and there appeared to be lots of keen research teams."

**Conclusion.** Mentors enthusiastically supported the research-training program, which was perceived to be beneficial to team members and enhance evidence-informed practice. There is compelling evidence from around the world that some of the best care is delivered in health care environments where active research is taking place, including settings where point-of-care providers are seeking to improve health care through research. The role of the mentor in promoting both practice-based research and evidence-informed practice has been shown to be instrumental. The research-training program, with a structure that supports novice researchers from the idea stage through to broad knowledge translation, including ongoing support from a mentor, is a promising initiative for health care organizations seeking to enhance evidence-informed practice and engage point-of-care nurses in the creation and implementation of new evidence.

## A 08 - Altering Nurses' Perspectives through Evidence

### Nurses' Perspectives on Flexible Visitation in Adult and Neonatal Critical Care Units

---

*Alina Pedchenko, MSN, BSN, RN, USA*  
*Joanne Eckert, MSN, RNC, USA*

#### Purpose

The purpose of this presentation is to identify nurses' perspectives on flexible visitation in adult and neonatal ICUs and describe nurses' suggestions for successful implementation of flexible visitation in the adult and neonatal NICUs.

#### Target Audience

ICU Nurses, NICU Nurses, Nurse Managers, Hospital Administration, Nurses

#### Abstract

**Learner Objectives:** Attendees will identify and describe nurses' perspectives on flexible visitation in the adult and neonatal ICUs and suggestions on how to incorporate them into nursing practice.

**Significance:** Although flexible visitation practices have been found to promote critical care patients' psychosocial, emotional, and spiritual well-being, the American Association of Critical Care Nurses confirmed that only 14% of adult ICUs allowed flexible visitation at all times. Family centered care is commonly promoted in neonatal intensive care units (NICU), but the few studies found on visitation practices in NICUs noted that few actually practice flexible visitation.

**Purpose:** The purpose of this study was to identify nurses' perspectives on flexible visitation in adult and neonatal ICUs and describe nurses' suggestions for successful implementation of flexible visitation in the adult and neonatal NICUs.

**Methods:** A comparative descriptive design was used. The Theory of Reasoned Action guided the development of a questionnaire and data collection. A total of 62 nurses (31 from the adult ICU and 31 from the NICU) in a 255 bed community hospital participated in the study.

**Results:** Perspectives among ICU and NICU nurses regarding appropriate visitation policies and obstacles to flexible visitation policies differed significantly. Nurses from both units agreed on many suggestions for successful implementation of flexible visitation policies. Significant relationships among years of critical care experience, perceived obstacles to flexible visitation, and suggestions for implementation of flexible visitation policies were identified.

## A 09 - Clinically Relevant Risks

### Sensitivity and Specificity of Edmonson Psychiatric Fall Risk Assessment Tool in an Adult Inpatient Psychiatric Unit

---

Jordon Bosse, MSN/ED, RN, USA  
Constance LaPointe, RN, BC, USA

#### Purpose

The purpose of this presentation is to describe the process for determining whether the Edmonson Psychiatric Fall Risk Assessment Tool was more appropriate for use than the John's Hopkins tool in an adult psychiatric unit given a fall rate higher than all medical units combined.

#### Target Audience

The target audience of this presentation is staff nurses who work with adult psychiatric patients and administrators who oversee inpatient psychiatric units.

#### Abstract

**Background:** Falls are an important issue in hospitals as they can lead to increased lengths of stay, increased cost related to the stay, or increased chance of unplanned admission. The limited literature available about the fall risk for psychiatric patients indicates that they are at a higher risk of falling than medical patients due to unique risks of both their condition and the psychiatric in-patient environment (Allen, de Nesera & Robinson, 2012).

**Purpose:** The goal of this project was to determine whether Edmonson, Robinson & Hughes' (2011) Edmonson Psychiatric Fall Risk Assessment Tool (EPFRAT) was more sensitive and specific than the Johns Hopkins Hospital Fall Risk Fall Assessment Tool when assessing psychiatric patients for risk for falls in a small community based hospital.

**Methods:** In Phase I, a small sample of patient records were reviewed and EPFRAT was used to calculate fall risk score by the two authors to establish inter-rater reliability. In Phase 2, a retrospective chart review of all patients who had experienced a fall during their admission in 2012 was conducted and the EPFRAT score was calculated for the patient in the shift prior to the fall and compared with the Johns Hopkins Score for the same shift; a comparison group was established by matching patients who did not fall and who were similar in age and diagnosis. In Phase 3, staff nurses completed usual Johns Hopkins assessment in the electronic record, and the EPFRAT on paper. The scores were then compared. Staff response regarding ease of use was also considered.

**Results:** Inter-rater reliability for EPFRAT was 83.3%. EPFRAT proved to be more sensitive and specific than the Johns Hopkins. EPFRAT identified twice as many patients who were at risk for falls that the Johns Hopkins during the pilot, and correctly identified 96% of people who did not fall as low-risk. Nurses who took part in the pilot evaluation deemed the EPFRAT to be user-friendly.

**Implications:** Utilization of the EPFRAT fall assessment of behavioral inpatients each shift, when it follows appropriate training on completion of the tool and is combined with evidence-based fall prevention interventions, may help reduce the fall rate in the acute psychiatric in-patient setting.

## A 09 - Clinically Relevant Risks

### Nurses Taking the Lead in Healthcare Teams: The SBIRT Model - Integrating Evidence-Based Screening, Brief Intervention, Referral and Treatment for Persons at Risk for Substance Use and Mental Disorders

---

*Pamela G. Lusk, DNP, MSN, PMHNP, BSN, RN, PMHNP-BC, FAANP, USA*

#### Purpose

demonstrate how nurses can take the lead in establishing and sustaining an evidence-based model of care with an interdisciplinary team. The SBIRT model of Screening, Brief Intervention, and Referral & Treatment has demonstrated effectiveness for getting populations with developing disorders, identified and started into an active plan of intervention/ treatment.

#### Target Audience

Nurses, advanced practice nurses, and nursing faculty - who wish to develop the skills necessary to provide evidence-based screening and brief intervention and referral to treatment for at risk populations.

#### Abstract

Nurses are often the first line healthcare providers for persons entering a healthcare setting. There is strong evidence to support a model of screening all persons who enter the healthcare setting for risky behaviors- behaviors that put them at risk for developing a substance abuse or mental disorder. An evidence based model, promoted by SAMHSA – the U.S. Department of Health and Human Services – Substance Abuse and Mental Health Services Administration, for identifying persons at risk, and then providing active early intervention is **SBIRT** – Screening, Brief Intervention, and Referral to Treatment. Nurses can take the lead in championing and integrating models such as the SBIRT – model into many healthcare settings, thereby improving outcomes for those persons at risk of developing substance dependence, or serious mental health disorders. Nurses can promote evidence-based screening tools, deliver and supervise early interventions such as motivational interviewing, and facilitate referral to specialty substance-abuse, psychiatric treatment when indicated. As critical members of the interdisciplinary healthcare team, they can also play a key role in sustaining the **SBIRT** protocols, and measuring outcomes in their setting. Lessons learned from the author’s experiences integrating the **SBIRT** model into a community primary care clinic will be shared, including barriers to implementation and response from patients and staff once the **SBIRT** approach was fully part of everyday practice in the clinic. Also experiences teaching this model to nursing students, advanced practice as well as pre-licensure will be shared. Nursing is one of the key health professions adopting this model, and collaborative learning communities with other healthcare professions are ongoing. Opportunities to join these collaborative initiatives will be shared.

## A 09 - Clinically Relevant Risks

### Interprofessional Evidence-Based Care of Hospitalized Patients with and at Risk for Sleep Apnea Improves Care Quality

---

*Lisa A. Kuhen, DNP, MSN, BSN, APRN-BC, Adult CNP, USA*

#### Purpose

to increase awareness of the critical safety concerns for hospitalized patients with and at risk for sleep apnea, and to disseminate evidence based solutions for an always event to improve patient outcomes and care quality while reducing healthcare costs and litigation risk.

#### Target Audience

all hospital nurses involved in patient care quality, safety, and outcome measures who are interested in implementing evidence based nursing care measures shown to reduce patients' vulnerability to adverse events, improve patient care quality, and reduces healthcare resource utilization.

#### Abstract

**Purpose:** The project goal was to enhance healthcare outcomes for hospitalized patients with and at-risk for sleep apnea (SA) by increasing the ability of hospital nurses to assess for known SA, identify SA risk, and design appropriate nursing care management using an inter-professional care guideline.

**Background/Significance:** Hospital prevalence of SA is estimated to be 80%, yet only 6.8% are reported, and 5.8% of patients on home therapy continue treatment during hospitalization. Adverse hospital outcomes including increased length of stay, cardio-respiratory failure, and death are associated with untreated SA. Validated SA screening tools and care guidelines are available but have not been widely adopted. Educating nurses on SA assessment, screening, and evidence-based care guidelines can improve patient outcomes.

**Methods:** An educational intervention to the care team of a monitored care unit at a community hospital consisted of an a) overview of SA diagnosis, treatment, impact on patients' health, and hospitalized patient outcomes, b) rationale for screening for SA diagnosis and continued hospital use of home PAP, c) use of the STOP-Bang questionnaire, and d) use of an inter-professional evidence-based SA care management guideline. The Obstructive Sleep Apnea Knowledge and Attitude (OSAKA) assessment was administered to the care team pre/post intervention and 30-days post implementation of the care guideline. Patient length of stay, unplanned transfer, death, and 30-day readmission were monitored for 90-days.

**Results:** The intervention was attended by 41 care team members, 30 completed the Pre/Post OSAKA. Paired t-test showed significant increase in OSAKA scores post educational intervention for knowledge, attitude and confidence that was retained 30-days post implementation of the care guideline. One-way ANOVA showed no correlation between staff type, years of practice or education level and OSAKA scores. Of the 104 patients screened, 67.8% were identified as high SA risk, (21% with known SA), and 32% low SA risk. PAP therapy was received by 100% of those identified on home PAP compared to 5.5% prior to the intervention. The ALOS was shortest for the SA group (2.6 days), compared to 3.28 days (high risk) and 2.74 days (low risk). The 30-day readmission rate for the SA group was 0%, high risk/10%, and low risk 14%. No unplanned transfers to higher acuity of care or death occurred during the 90-day pilot. Identification of known SA pre-intervention was 5.5% and 21% post.

**Conclusions and Implications for Practice:** Implementing and sustaining quality improvement changes designed to improve SA patient outcomes will require inter-professional collaboration led by the hospital nurse. Education provides a means to bridge the current care gap and enhance healthcare outcomes in this vulnerable patient population. National and local policy directing the care of this vulnerable population is recommended.

## **B 07 - Nurses' Perception and Education of Evidence-Based Practice**

### **A Formative Program Evaluation of Electronic Clinical Tracking System Documentation to Meet National Core Competencies**

---

*Lynette Smith, PhD, PMHNP-BC, FNP-BC, USA*  
*M. Laurie Branstetter, DNP, APRN, FNP-BC, USA*

#### Purpose

The purpose of this presentation is to present a formative evaluation study supporting the use of electronic clinical tracking system documentation in meeting national core competencies. The study's significance is that it provides novel evidence to support the use of an electronic clinical tracking system in advanced practice nursing education.

#### Target Audience

The target audience of this presentation is clinical nursing faculty.

#### Abstract

Electronic clinical tracking systems are used in many educational institutions of higher learning to document advanced practice registered nursing students' clinical experiences. Students' clinical experiences are constructed according to the National Organization of Nurse Practitioner Faculties core competencies. These competencies form a basis for evaluation of advanced practice registered nursing programs. Healthcare clinicians and educators are expected to provide evidence-based clinical practices for students. No previous studies have evaluated the use of electronic clinical tracking systems to validate students' clinical experiences in meeting national core competencies. Medatrax, an electronic clinical tracking system, is evaluated using a formative program evaluation approach to determine if students' clinical documentation meets Family/Across the Lifespan Nurse Practitioner Competencies in a mid-southern family nurse practitioner program. This formative program evaluation supports the use of Medatrax in facilitating accreditation and program outcome goals. The significance of this study is that it provides novel evidence to support the use of an electronic clinical tracking system to assist a mid-southern school in meeting national core competencies.

## B 07 - Nurses' Perception and Education of Evidence-Based Practice

### A Survey of Nurses' Knowledge, Attitude, and Skills with Evidence-Based Practice in the Practice Setting

---

*Kathleen Williamson, PhD, MSN, RN, USA*

#### Purpose

Share the results of the study on nurses' knowledge, attitude & skills with evidence-based practice. The research will highlight how nurses can best be supported in their practice, which may lead to interventions to address barriers and explore the effects of organizational interventions aimed at improving adoption of EBP.

#### Target Audience

Academic leaders, clinical leaders & nurses, Nurse leaders & administrators, nurse educators and clinical educators

#### Abstract

This research project was a collaborative descriptive comparative self-report survey with a sample of nurses from a large health system. The purpose of the study was to identify nurses' perceptions of their practice, attitudes, and knowledge/skills associated with evidence-based practice (EBP); to identify barriers, facilitators, and successes that nurses face when utilizing and implementing EBP; and to identify if there are differences in nurses' perceptions of their knowledge, attitudes, and skills associated with EBP and demographic variables, such as job title, highest educational qualifications, and nursing clinical specialty. Competency in EBP, therefore, requires nurses to be able to frame an answerable question from the clinical environment (i.e. representing a gap in knowledge), effectively search relevant literature and resources, evaluate and appraise research evidence and incorporate findings effectively and appropriately into practice. It is therefore crucial that nurses in the practice setting are provided with the strongest foundation possible in EBP through organizational interventions that meet the needs of the nurses'. This study aimed to provide insight into nurses' patterns of adoption and implementation of EBP, barriers and facilitators for improving EBP competency. The use of the Evidence-based Practice Questionnaire (EBPQ) provided data on the practice of, attitudes toward, and knowledge/skills in EBP. The patterns of adoption and implementation of EBP while highlighting how nurses' can be supported in their roles will be explored. Examining the clinical contexts in adopting and implementing EBP will be discussed. In combination, this presentation will highlight how clinical educators and academic faculty can best be utilized to help nurses' advance the uptake of EBP in practice, and help to identify areas that need a particular focus to ensure nurses' learning needs are met by educational provisions.

## B 07 - Nurses' Perception and Education of Evidence-Based Practice

### Multi-Method Critical Care Orientation Improves Critical Thinking, Skills and Confidence

---

Marie Wolfer, BSN, RN, USA  
Corinne Lee, DNP, RN, USA  
Sharon L. Smith, PhD, MS, RN, USA

#### Purpose

The purpose of this presentation is to share the implementation of the evidence- and competency-based re-designed multi-methods learning Critical Care Orientation education at a Midwestern academic medical center.

#### Target Audience

The target audience of this presentation is those involved in critical care nursing education, especially those in leadership (unit, clinical, administrative)

#### Abstract

**Background:** Traditional didactic educational strategies have not been efficient or effective in preparing critical care nurses to care for moderately complex patients with confidence and competence.

**Objective:** Utilize an evidence-based, multi-method approach that is individualized and flexible to improve the knowledge, skills, critical thinking and confidence of critical care nurses in a large academic medical center.

**Methods:** More than 300 nurses attended the re-designed Critical Care Orientation (CCO), including nurses from adult and pediatric intensive care units, emergency and telemetry units. Multiple tools were used to provide education: The American Association of Critical-Care Nurses ECCO on-line modules<sup>1</sup>, on-line programming, didactic presentations, case studies, skills lab, and simulation. Pre- and post-tests measured knowledge acquisition using the Basic Knowledge Assessment Tool (BKAT)<sup>2</sup>. Competency was assessed based on skills lab performance, case study analyses, and simulation performance. Post-education surveys measured participants' confidence and perceptions of the program. Data was collated and reviewed by a central committee, resulting in ongoing improvements in the CCO program and support from leadership.

**Results:** The overall mean of the BKAT scores increased from 71.80 to 84.42 ( $p < .000$ ) following CCO. Approximately 70% of the participants stated that the teaching methods were effective and created a positive learning environment. More than 92% reported the online modules were useful. Similarly, participants found that the skills lab (91-99%) and simulation (87-98%) were useful. The six-month follow-up survey showed greater than 70% were confident in mastering the content presented during the orientation. All of the participants (100%) were confident that they were developing the knowledge and skills required to provide care for moderately complex patients in the clinical setting. Furthermore, 100% of participants revealed that they were confident that they could assess the needs of their patients, interpret the findings, develop a care plan, and have the skills to deliver the planned care. More than 95% were confident that they could communicate their patient's needs to others on the healthcare team and collaborate with the team. Lastly, orientation was completed on time by 93.3% of participants.

**Conclusion:** The re-designed Critical Care Orientation is both efficient and effective in preparing nurses to provide excellent care to moderately complex patients. Utilizing a multi-method, flexible approach to learning accommodated individual participant's learning style and needs. Nurses were given the opportunity to assess their learning needs, to develop knowledge, skills and confidence through various methods, and to evaluate competency in a simulated and clinical setting. Participants increased their knowledge, skills, and confidence through the evidence-based orientation.

## **B 08 - Using Virtual Learning Techniques to Enhance Nursing Education**

### **Utilizing Case Scenarios in a Virtual Learning Environment to Assess and Refine Critical Thinking in Graduate Nursing Education Students**

---

*Lisa B. Robinson, DNP, RN, CCRN, CNE, NP-C, USA*

#### Purpose

The purpose of this presentation is to allow participants to explore critical thinking content in virtual environments. Participants will discover methods to evaluate and refine virtual world experiences to maximize those experiences. Resources will be provided for the participants to learn more about education in virtual worlds.

#### Target Audience

The target audience of the presentation is nurses, educators and learners, seeking methods effective and efficient educational experiences to promote critical thinking skills.

#### Abstract

Introduction: Developing critical thinking skills in learners is essential across all disciplines. Effective methods to teach critical thinking and evaluate the effectiveness of the teaching method are vital. Integrating multimedia into educational platforms has become common place. As learners present with a high degree of media literacy, educators can take this advantage and create virtual reality learning environments well suited to teaching critical thinking. Educators can utilize the malleable environment of virtual worlds to customize learning experiences more expansively than in a traditional classroom. Experiences play a vital role in learning, especially in areas which are context specific. Practiced decision making in a virtual world allows for reflection and discussion to enhance the learners experiences which can transfer to actual practice environments. Experiences can be designed with targeted activities which provide objective-based interactions. Depending on the design of the virtual world experience, learners can develop critical thinking skills, presentation skills, and business development skills.

Method: Case scenarios were developed for the virtual learning environment to evaluate and refine critical thinking skills. Objects and outcomes in addition to the case scenarios were provided to the students prior to the simulation.

Results: Evaluation of learning can come from learner feedback provided before and after the experiences in the virtual environment. Evaluation of virtual world educational experiences should include debriefing where learners can discuss the activity and opportunities to improve outcomes. Educators are able to evaluate if goals and objectives for the activity were met and revise further experiences based on learner feedback.

Discussion: Virtual learning environments allow students to participate in scenarios which may not otherwise be available, and allows learning in a non-punitive safe environment where practice and critical thinking skills can be honed. This allows faculty to explore implementation of critical thinking content in a virtual environment. Additionally faculty will discover methods to evaluate and refine virtual world experiences to maximize the benefits of the experience. Lastly, resources will be provided for the participants to learn more about the possibilities of education in a virtual world.

## **B 08 - Using Virtual Learning Techniques to Enhance Nursing Education**

### **An Organizational Approach to Adoption of Technology to Enhance a Nursing Evidence-Based Practice Culture**

---

*Leslie S. Norman, MPH, BSN, RN, NEA-BC, FACHE, USA*  
*C. Denise Neill, PhD, RN, CNE, USA*

#### Purpose

The purpose of this presentation is to describe the organizational approach used in a community hospital to utilize technology to promote and enhance a nursing evidence-based practice culture in order to improve quality patient outcomes and nursing satisfaction.

#### Target Audience

The target audience of this presentation is nursing leaders. These leaders include chief nursing officers, directors and managers, as well as staff nurses who are interested in learning more about how a grass root nursing practice council influences and leads in making practice decisions.

#### Abstract

Evidence-based practice (EBP) is a process nurses use to make clinical decisions that are supported by research evidence. The evidence-based nursing process has four distinct steps: 1) identify the problem, 2) search literature, 3) evaluate the evidence, 4) choose interventions and justify with evidence. Nurses and other professionals need data to support and sustain EBP decisions. Technologies are rapidly expanding to enhance the ability to easily include EBP findings in clinical decision support systems.

A review of the literature identified benefits and challenges associated with technology use for promoting EBP. Results concluded that the adoption of devices is dependent on type used and noted that EBP data was derived more frequently for medications and nursing searches. Use of hand-held technology improved nurse's awareness of resources for EBP. The literature also identified a cycle of learning in which nurses need data to support EBP. Technology provides a means to support data management and research provides efficacy of intervention. For example, technology can be incorporated into workflow via tasks and reminders. Technology can be used for screening and data collection as a way to minimize bias and standardize approaches to treatment. The consistent use of an intervention provides effectiveness data for determining whether or not to continue implementing EBP findings. For EBP to be sustainable, the facility must have an IT framework to guide information to the end user.

When selecting technology to support EBP, nurse leaders must consider barriers to adoption of technology and barriers to EBP. Many nurses express a lack of time to research/read the information and incorporate knowledge shared by others. Another issue with technology is related to lack of access and skills such as improper training on EMR; lack of computer literacy; not enough equipment; poor locations for access; and lack of research search skills. These limitations result in nurses relying on manual formats and non-scholarly sources such as Google or Wikipedia for information to guide clinical decisions. Because of the limited skill set and lack of EBP at point of care, nurses more apt to use sources imbedded within applications (i.e. EBSCO, Mosby).

One small community facility is combining the successful adoption of technology with two performance improvement (PI) methodologies to promote an EBP culture. Through adoption of the Banner Health/Cerner Corp- Care Transformation framework and implementation of the Baldrige Approach-Deploy-Learn-Integrate (ADLI) with Process Design Methodology (PDM), the facility is developing a strong culture of EBP.

The role of the chief nursing officer and other nursing leaders was to take responsibility for assuring a culture that supported EBP. Support was demonstrated through access to technology, supporting

educational advancement, both formally and informally, and ensuring that skills training was ongoing. Nursing leadership worked with leaders in other health related professions to set the organizational vision and expectations. The vision and expectations were communicated to nursing staff and direct care nurses were provided release time to participate in the Nursing Practice Council activities. One focus of the regular meetings was to provide the members with skills and knowledge to influence practice decisions using EBP data.

There are numerous ethical considerations when adopting technology to implement nursing evidence-based practice. Nurses must consider patient autonomy. Patients may not want to comply with EBP recommendations. When nurses and other health care professionals push technologies on patients, there may be a real or perceived loss of empowerment. The American Nurses Association Code of Ethics emphasizes the need to maintain privacy and security with all data.

Technology usage is not the ultimate goal. Technological and EBP implications for nursing include understanding that technology is a gift. The successful implementation of technology to support and enhance EBP requires a shared vision with colleagues. Technology must be intentionally designed to incorporate EBP. There are two key elements for success. Technology must be recognized by nursing in daily practice. Technology choices must support nurses' decision-making and workflow to improve quality and safety.

In an effort to increase recruitment and retention of quality nurses, this small facility began by evaluating the nurses understanding of EBP. The CNO restructured the nursing leadership and practice committees. The restructuring effort created a Nurse Practice Council where staff nurses actively participate in a grassroots efforts to promote an ever improving culture of safe, quality care based on current evidence. Nurses identify areas of practice concern. These nurses utilize technology in consultation with the data analyst, research consultant, and other members of the quality improvement team to evaluate the interventions. The facility has implemented several evidence-based clinical interventions. Direct care nurses are taking ownership of the patient outcomes and are involved in making decisions to promote quality care. The ultimate goal is to improve outcomes for the patients and families and the nurses to fulfill the mission of the institution to be a top community hospital.

## B 08 - Using Virtual Learning Techniques to Enhance Nursing Education

### Using the Tools of Technology to Increase Access to Doctoral Education: Best Practices in Distance Education

---

*Jeffrey A. Willey, PhD, MSN, MEd, RN, USA*

*Lisa A. Seldomridge, PhD, MSN, BSN, RN, USA*

#### Purpose

The purpose of this presentation is to discuss best practices in distance education, technologies used to engage DNP students, and lessons learned in delivery of a distance-accessible curriculum.

#### Target Audience

The target audience of this presentation is faculty, students, and administrators of doctoral education programs.

#### Abstract

In response to statewide, regional, and national calls to increase the number of doctoral-prepared nurses by 2020, Salisbury University, a small public university in the mid-Atlantic region, launched its first doctoral program, a post-MS to DNP in Fall 2012 and a post-BS to DNP in Fall 2014. As one of three DNP programs in Maryland and the only DNP in its region, offering the curriculum in a distance-accessible format was essential to its success. While distance education is an increasingly popular option for delivering advanced education to working professionals, the use of technology requires careful consideration and planning. Although the types of technologies available to faculty are numerous, faculty must make appropriate choices about which strategies to employ with consideration of cost, ease of use, interactivity and student engagement. It is important to recognize that overuse of technology can be detrimental to student learning as more time is spent learning to use the technologies rather than focusing on learning course material. Among the factors to consider in selecting technologies for distance education are the objectives of the course, faculty and student comfort with technology, the degree of technology support available, budgetary constraints, and adherence to quality standards in distance education, all while attending to the need for human connection. Applying the Quality Matters™ standards for online and blended education (2014), the technologies selected for use in each course demonstrated alignment between the learning objectives, learning materials, course activities, student-teacher and student-student interactions, assessment and evaluation measures, and achievement of learning outcomes. Consequently technology became another tool to facilitate learning that appealed to students with a variety of learning styles, but was not a replacement for the teacher. This presentation describes a multi-disciplinary team approach used to develop and deliver a DNP curriculum in conformity with AACN Essentials for Doctoral Education for Advanced Nursing Practice (2006), and NONPF Standards (2012). Since the start of the doctoral program in 2012, a variety of asynchronous and synchronous strategies have been used including faculty and student video-recording, discussion boards, assignments based on stories using avatars, web-conferencing, presentations with screen sharing, and voice-over technologies. Examples of several different approaches as well as the successes and challenges of using a variety of instructional software and technologies will be shared.

## B 09 - Using Teaching Strategies to Improve Student Outcomes

### If the Walls Could Talk: Student Perspectives on What Makes for a “Good” Teacher

---

*Theresa M. Valiga, EdD, RN, CNE, ANEF, FAAN, USA*  
*Ashley Munteanu, BSN, RN, USA*

#### Purpose

Present findings of a qualitative study of graduate students' discussion forum postings about their views of what teachers do that enhance their learning and development as scholars, leaders, and professionals.

#### Target Audience

Faculty teaching in schools of nursing, regardless of program type (pre-licensure or graduate), particularly those with responsibility for designing, implementing and evaluating teaching strategies and methods to assess/evaluate learning

#### Abstract

There is extensive literature regarding “what the best teachers do” and what makes for a “good” teacher. Some of this literature is based on research, and some is anecdotal in nature. Oftentimes, descriptions of “good teachers” are generated from an analysis of principles of quality teaching/learning or from an analysis of feedback from students. In most instances, however, the students interviewed or studied are undergraduates, the descriptions of “good teachers” relate to individuals teaching K-12 or undergraduate courses, and the subjects referenced are general in nature (e.g., Biology) rather than part of a professional education curriculum.

The study reported here examined discussion forum postings made by graduate nursing students in an online course about facilitating student learning to “surface” their descriptions of what makes for a “good” teacher. Substantial Forum postings on five learning-focused topics in each of five semesters of the course were analyzed, using qualitative methods, and themes emerging from those postings were identified. These themes will be identified and explained, representative quotes from students will be provided to illustrate each theme, and implications of the findings will be discussed. Additionally, participants will be invited to engage in discussion about the barriers that make excellent teaching difficult to achieve, as well as the knowledge, skill and support needed to achieve excellence as a teacher.

This study helps faculty teaching in a professional program such as nursing understand how those students define “good teachers,” compare those definitions with descriptions of “good teachers” found in the literature, and reflect on their own practices as teachers.

## B 09 - Using Teaching Strategies to Improve Student Outcomes

### Concept-Based Assignments Used as Study Guides: Facilitating Learners Input into Education

---

*Jennifer B. Drexler, MSN, RN, CCRN, USA*

#### Purpose

Share a student-centered instructional method for understanding the conceptual approach to teaching and provide resources for student self-examination of knowledge obtained through lecture and class-activities. Conceptual-based assignments were created to be used as student-generated study guides that produce student engagement in the classroom, student-centered learning, and student self-evaluation of learning.

#### Target Audience

Nursing educators and clinical faculty who seek evidence for the development of new teaching assignments to engage the learner, as well as provide additional study methods beyond the classroom that involves student-centered learning and student self-evaluation through classroom engagement.

#### Abstract

Through course evaluation and verbal feedback from students, evidence for implementation of new teaching practices and the development of new teaching assignments to engage the learner, as well as provide additional study methods beyond the classroom is needed. Conceptual-based assignments were created to be used as student-generated study guides that produce student engagement in the classroom, student-centered learning, and student self-evaluation of learning. These assignments go beyond typical homework and answering questions, by integrating classroom activities, lecture, and instructional information into assignments completed for a grade. Student generated learning through guided completion of assignments allows students to create their own study guides for exams. Evaluation of outcomes includes determining the effectiveness of the assignments and the students' perception of learning utilizing the assignments, as well as overall performance of exams.

The purpose is to provide students with self-directed, conceptual-based assignments to guide study for exams. The assignments are topic specific to the exams and are to be used to study and focus the learner's concentration on materials. Exemplars are used for the concepts with a review of anatomy and physiology with diagrams for self-directed study. The students did not receive feedback on assignments prior to exams. All students participated in the assignments and exams over the course of the 4 month semester. The dilemma was to provide a student-centered instructional method that would be helpful to understand the conceptual approach to teaching, as well as be a self-examination of knowledge obtained through lecture and class-activities.

Assignments were designed to guide the student through processing information being delivered in class and create a written tool to direct the student studying for exams. Four assignments were developed as study guides to be completed during off-class time, and to be submitted on the day of the exam. This was developed not to test the students learning, but to help distinguish important topics and facts they would later be tested on. The diagrams are discussed with classroom activities.

Topics were Type 1 & Type 2 diabetes and alterations in ventilation caused by COPD (including Asthma, Emphysema, and Chronic Bronchitis), using a Venn-diagram to distinguish differences and similarities. Alterations in perfusion related to the heart structure anomalies and alteration in pressure was another topic, provided in a chart format for students to determine where signs and symptoms would be presented based on a forward or backward flow problem. The final assignment was alterations in hormones, also presented in a chart format for students to first detail the hormonal pathway, and then distinguish signs and symptoms based on alteration in hormone levels (hypo- & hyper-).

The students were surveyed at the end of the semester using a 5-point Likert scale to determine the effectiveness of the assignments and the students' perception of learning utilizing the diagrams provided in the assignments. 99% of the students feel the assignments helped guide studying before the exam. 97% of the students feel that additional assignments ease anxiety of preparation for exams. 100% of the students felt that assignments help off-set test grades for overall achievement in the class. Based on feedback received the majority of the students found the assignments helpful in studying for the exams, and all students appreciated the off-set of the grade by inclusion of the assignments in the overall grade. Additional results to be provided from this Spring Semester as comparison.

Instead of structured and formulated learning methods, students are given a method to generate their own study guides based on materials knowingly to be tested on. The assignments were not meant to be graded for completeness or accuracy, but rather that effort in learning, researching, and generating all knowledge possible was included. Points were given based on the detail provided within the assignments, and that the assignments were completed based on the instructions provided.

## B 09 - Using Teaching Strategies to Improve Student Outcomes

### Comparison of Two Modes of Teaching Delivery in Graduate Nursing Education

---

Ronda D. Mintz-Binder, DNP, RN, CNE, USA

#### Purpose

The purpose of this presentation is to share findings of a longitudinal research study that compared students enrolled in 15 week semesters to students enrolled in the condensed and shortened Academic partnership program. Sense of Belonging and Stress were the two measures utilized.

#### Target Audience

The target audience of this presentation would be graduate level educators and administrators

#### Abstract

A longitudinal research study was conducted from 2013-2014 in which students enrolled in two different master's degree nursing programs were assessed using two scales as well as demographic and programmatic questions at two data points, after first course and one year later. Graduate students who were enrolled in an online Academic Partnership (A.P.) version of the program in a condensed format (courses 5 or 10 week long with one faculty and one academic coach per course) were compared to those enrolled in the traditional 15 week full semester format. Perceived Stress Survey (PSS) and Sense of Belonging (SOB) were the two quantitative repeated measure scales. At data point 1, 58 students (37 A.P. and 21 Traditional) completed the study. At data point 2, 40 (25 A.P. and 15 Traditional) of the same students completed the second survey. Within these two groups, 67.6% of A.P. and 71.4% of Traditional repeated the surveys. Within survey 2, an inverse statistically significant relationship was reached between PSS and SOB for the full group ( $= -.459, p=.003$ ). Statistical significance was also reached between PSS and SOB in the Traditional group ( $= -.657, p=.008$ ) but not so with the A.P. group ( $= -.339, p=.097$ ). Within the Traditional group, changes in PSS and SOB scores between survey one and survey two were both statistically significant (PSS :  $= .533, p=.041$ ; SOB:  $= .763, p=.001$ ). Within the AP group, changes in SOB were statistically significant ( $= .490, p=.013$ ). Within the Traditional model of course delivery, sense of belonging appears to modulate stress and over the course of the year, these students demonstrated scores that were fairly consistent. Students who are successful in the AP program appear to modulate their stress and use belongingness through online opportunities in a positive and productive way.

## C 06 - Measuring Student Educational Outcomes

### Comparing Grade Point Averages and Standardized Test Scores as Predictors of Successful Completion of Undergraduate Baccalaureate Programs

---

*Peggy (Margaret) Hernandez, MSN, EdD, APRN, PMHCNS-BC CNE, USA*

#### Purpose

to critically review data comparing grade point averages (GPA) and standardized testing as predictors of nursing school success in an undergraduate baccalaureate Schools of Nursing in the US. This presentation will review evidence and suggest methods for establishing policies and guidelines based on local evidence rather than tradition.

#### Target Audience

nurses working in academic settings who are involved in competitive undergraduate applicant comparison and selection processes. Predicting which applicants are most likely to succeed may be easier than previously thought.

#### Abstract

Intro: Aging population demographics contribute greatly to an unprecedented nursing shortage as many aging RNs are predicted to retire when the demand is highest (Buerhaus, Staiger, & Auerbach, 2000). Replacing those RNs will be very difficult because more than half of current nursing faculty will retire by 2021 (Aiken, 2011). Currently, nursing faculty members serving on admission committees struggle with deciding "how to" identify the best applicants who are most likely to graduate and achieve licensure-on time. This presentation will focus on sharing the quantitative data from one school collected over several years to highlight the importance of testing assumptions. Many surprise discoveries along the way were vital in informing admission policies and practices.

Background: In the past, Grade Point Average (GPA) was considered a good predictor of success but recent history has failed to uphold that assumption in many cases. Students with pre-admission GPAs of 3.5-4.0/4.0 were sometimes noted to be poorly prepared for the rigors of nursing education and were ultimately unsuccessful despite strong GPAs. Although GPA provides information about earlier academic success, it is not consistently reliable in predicting success in undergraduate baccalaureate nursing programs. In recent years, a number of proprietary companies have begun to offer standardized testing instruments as another quantitative method of predicting success. However, it was not always clear how and when to use the testing instruments or how the varied company products performed against one another. Schools of nursing developed relationships with testing companies in hopes of improving admission decisions and NCLEX readiness. Assessment Technologies Institute (ATI) was the company whose testing products were adopted at the study site.

Problem statement: During competitive applicant cycles, only about half of qualified students could be admitted due to capacity limitations including shortages of faculty, clinical sites, and classroom space. Despite a careful review of applicant academic history and entrance examinations, many students (up to 1/3) were not able to successfully complete the nursing program at the research site, a Midwestern US BSN program. Some schools report completion rates of only 50% (Peterson, 2009; Seago, Wong, Keane, & Grumbach, 2008).

Review of Literature: Although several qualitative and quantitative studies have been published about academic predictors of success in schools of nursing, little empirical research is represented (Kenny, 2010). We know that qualitative social factors such as stable emotional and financial support make a huge difference in educational persistence in college students of any major. The rigorous demands of the nursing major require these and more, including but not limited to skills in managing time, stress, studying, and test taking. Generalizability of predictive admission nursing education research has been very limited due to inconsistent definitions of terms and variations in pre-requisite course work, program length, content delivery methods, and overall curricula. Because most of the unsuccessful students will

exit a nursing program within the first year, and 83% of those will leave during the first semester, early predictors of persistence and success are needed (Peterson, 2009).

**Methodology:** A descriptive, non-experimental retrospective study of extant data compared admission GPAs against standardized test scores taken before and during the program of BSN study. Hypotheses were developed and data were collected at three data points in time on each student. Data collection points included the start of the program, halfway through, and finally at the end of the two year nursing program. Simple descriptive statistics, multiple regressions and T tests were run and analyzed.

**Results:** Grade point averages and standardized testing scores were both predictive of student outcomes. However, the significance of standardized test scores were statistically superior in contrast to GPA findings. The preadmission TEAS composite score, science, and reading scores were strong predictors of success but of these, TEAS science scores best correlated with positive and negative student outcomes. Supporting literature has been published by Wolkowitz and Kelley (2010).

**Discussion:** It's time to critically question the validity and reliability of grade point average as a quantitative variable. Because GPA is based on course grades and course grades are based on unlimited possible variations within and across schools, it becomes apparent that without valid and reliable components, GPAs are not the best predictors of nursing success. Although GPAs should be noted as measures of previous academic achievement, they are not reliable predictors of future academic success in nursing. Traditional measures such as grade point average (GPA) are not standardized and fail to capture the evidence of the students' competency with important pre-requisite content.

**Limitations:** Confounding variables included changes in leadership, faculty turnover, NCLEX test plan revisions, curriculum changes, and the availability of student support services over the time period covered by the study. No demographic or qualitative data were collected intentionally which may have influenced outcomes.

**Recommendations:** More quantitative studies are needed to provide the evidence base upon which to build admission policies. Replication studies will allow for greater generalizability and meaningful future meta-analyses. Each school of nursing should establish an ongoing local data base for primary and secondary analyses alone or in combination with similar schools. Graduation yields will likely improve through the use of data driven processes helping close the looming supply and demand discrepancies of RNs in the future.

## C 06 - Measuring Student Educational Outcomes

### Does the Use of Case Studies Impact Scores on Specialty Exams for Undergraduate Nursing Students?

---

*Claudine Dufrene, PhD, MSN, BSN, ASN, RN-BC, GNP-BC, USA*

*Pamela J. Hodges, PhD, MSN, RN, USA*

*Kelly Vandenberg, PhD, MSN, RN, USA*

#### Purpose

to present results on the use of standardized case studies to assist students in preparing for specialty exams.

#### Target Audience

nursing educators teaching in undergraduate nursing programs.

#### Abstract

Introduction: Whether used for readiness or high stakes testing, standardized exams provide valuable outcomes data on the effectiveness of nursing curricula. Many undergraduate nursing programs rely on commercially prepared standardized exams to determine undergraduate nursing students' readiness to take the National Council Licensure Examination-RN (NCLEX-RN) examination upon graduation. While some programs use the information to assist students in preparing for NCLEX-RN, others use these standardized exams for high stakes testing and graduation requirements.

Background : Our baccalaureate nursing program at a private, faith-based university in the southern United States began using commercially prepared, standardized specialty exams in some of the clinical courses, as well as using an exit examination to determine readiness for the NCLEX-RN. The specialty exams were not consistently used in courses throughout the program. Initially most students, as well as some faculty, did not perceive the successful completion of specialty exams as valuable preparation for NCLEX-RN which led to scores well below the national average on the specialty exams.

Methods: Case studies using the commercial package for the specialty standardized exams were implemented in the Fundamentals of Nursing and Health Assessment courses in summer 2014. Students in the courses the prior two years did not complete case studies in these courses. Additionally, the specialized fundamentals and health assessment exams were administered only to the students during summer 2012. Students who were enrolled in the foundations course during summer 2013 were administered the fundamentals specialized exam at the end of summer 2014, after completing four semesters of the nursing program.

Implementation: Students in the foundations and health assessment courses during summer 2014 were assigned specific case studies to complete as a requirement of the course. Students who had taken foundations the previous year were instructed to complete any three case studies in the foundations content. The foundations specialty exam was administered to both groups at the end of the summer semester 2014 and the health assessment specialty exam was administered to the first semester nursing students only.

Results: Mean scores of the second and third groups were similar and both groups had significantly higher mean scores than the first group for the fundamentals exam. The specialized health assessment exam mean score was significantly higher in the group who completed case studies than in the group who had not completed case studies.

Conclusion: The use of the case studies was perceived to have led to the difference in scores in both health assessment and foundations courses. As a result of these outcomes, case studies will again be required for students in health assessment and foundations for the summer 2015 semester. Scores from

this group will then be compared to previous cohorts for further analysis. This is a valuable ongoing strategy to improve educational outcomes.

## C 06 - Measuring Student Educational Outcomes

### Student Satisfaction to a Multimedia Approach to Engaged Learning

---

*Linda Eileen Wolf, PhD, MSN, BSN, RN, CNS, CNE, USA*

*Pamela K. Rutar, EdD, MSN, BSN, RN, CNE, USA*

*Cheryl Delgado, PhD, RN, USA*

#### Purpose

The purpose of this presentation will identify student satisfaction evaluation findings using multimedia teaching strategies implemented in a Fundamentals of Nursing Course. Curricula are challenged in increasing technology in the classroom. Multiple learning styles are addressed, students' attention during class is maximized, and active learning is promoted.

#### Target Audience

The target audience of this presentation is undergraduate faculty teaching in face to face classrooms.

#### Abstract

**Problem Statement:** Nursing curriculum is being challenged to increase the use of technology into the classroom. By incorporating technology into content delivery, multiple learning styles are addressed, students' attention during class is maximized, and active learning is promoted (Cavanagh, 2011). A learning strategy which combines lecture content with case studies and animation, changes the platform for course content delivery from that of passive (lecture) to active thereby engaging students in the learning process (DiLullo, McGee, & Kriebel, 2011). This strategy integrates real life scenarios demonstrating nursing care and assessment; animates difficult pathophysiological processes; integrates multiple forms of technology to present complex material to meet different learning styles.

**Methods:** A multimedia teaching strategy was developed by three faculty which integrates narrated case study, questioning and animation of skills and pathophysiology to promote engaged learning in the classroom. Implementation of this strategy was done during the class session on infection control specifically addressing tuberculosis. At the conclusion of class, questionnaires were distributed to collect evaluation data. Participants were 154 sophomore generic and accelerated BSN students enrolled in Fundamentals of Nursing at an urban university in the Midwest. Ninety-nine participants were female (66.9%) and 49 (31.8%) were male. Eighty-three percent were less than 20 years to 30 years in age.

**Evaluation Findings:** 120 students (77.9%) stated that the animated pathophysiology helped them understand the pathophysiological processes better than lecture alone. One student stated "I wish I had seen this presentation when I was taking microbiology or patho." When combined with lecture, 121 students or 78.6% reported a better understanding of the material than if presented as lecture alone. 123 (79.9%) of the students stated that watching the animated video improved their understanding of the lecture content. As stated by one student, "I liked the visualization because it helped me further understand the material." 104 (67.5%) stated that presenting course content from multiple courses into one format facilitated the importance of these courses; "I liked that different aspect[s] of nursing were brought together."

**Conclusions:** Use of multimedia in the classroom engages students in the learning process by actively involving students in the learning process. Overall, students voiced a preference for all instructional materials to be presented in an animated format. This is consistent with the literature which states that students are more successful when actively engaged in the learning process (Swanson, Nicholson, Boese, Cram, Stineman, & Tew, 2011).

## C 07 - Promoting Health through Evidence

### Evidence-Based Nursing Implementation: An Impact Study of a Short Formative Intervention in Northern Portugal

---

*Rui Pereira, MSc, BSN, RN, CNHS, Portugal*

#### Purpose

To present and analyze about the impact in terms of evidence-based nursing implementation of a short term educative intervention directed to Registered Nurses in the North of Portugal.

#### Target Audience

All nurses and nurse educators interested in improving and promoting an evidence-based nursing practice in their clinical practice work settings.

#### Abstract

**Purpose:** To conduct a baseline assessment of nurses' perceived attitudes, barriers and practices related to evidence-based nursing (EBN) and research utilization. Examine the effectiveness of a short formative intervention program on nurses' perceptions of practices, barriers and attitudes related to EBN and research utilization.

**Design:** A descriptive, quasi-experimental design with a one-group, pre-intervention survey, intervention, and post-intervention survey method was used. A convenience sample of 412 nurses working in several organizational settings (mainly hospital centers and primary health care services) was recruited. The study was conducted from September 2014 through January 2015.

**Ethical Considerations:** The research study was approved by the northern section of the Portuguese Nurse Association (Ordem dos Enfermeiros). To ensure the protection of human subjects all the participants signed a permission agreement using a cover letter that indicated the ethical responsibilities of the researchers and the rights of participants. All collected data were treated confidentially and anonymously. Completion of the surveys by the participants was acknowledged as consent to participate in the study.

**Methods & Tools:** Data collection instruments were a demographic data questionnaire and the Portuguese versions of the following instruments: Barriers to Research Utilization Scale (Funk, Champagne, Wiese & Tornquist, 1991), the Attitudes to Evidence-Based Practice Questionnaire (Mckenna, Ashton & Keeney, 2004) and the Evidence-Based Practice Questionnaire (Upton & Upton, 2006). An educative intervention on principles of EBN and research utilization was conducted using a training program which had a duration of one full day (7 hours) of direct contact between the trainer and the trainees and a total of six intervention sessions were replicated to the entire sample under study. The post-intervention evaluation was held two months after the training intervention and the pre-intervention assessment data collection was held using paper support while the post-intervention assessment was conducted with the help of an online form using the MedQuest application.

Quantitative data were analyzed using the Statistical Package for the Social Sciences (SPSS) for Windows (version 20). Descriptive statistics (percentages, frequencies, means, and standard deviations) and inferential statistics (dependent t tests) were used to describe demographic data and answer the research questions. A p value of  $\leq .05$  was considered statistically significant.

**Key-Findings and Implications:** Statistically significant differences in perceptions of practices, attitudes and barriers were found after nurses participated in the educative intervention. Although nurses indicated having positive attitudes about using research to support best nursing practice, gaps in knowledge and skills in retrieving research publications. In general nurses have positive attitudes towards EBN but still point several barriers both from personal, academic, professional and organizational etiology. Because of the degree of differentiation of our sample (specialization in nursing and post-graduate academic

education), there was a high perception of the use of EBN in daily practice. However, the estimated percentage of evidence-based practice throughout the day was situated at 63.9%. The study findings have implication for nursing practice in several dimensions: education and ongoing training, nursing accountability, and organizational support for EBN. Nurses' perceptions of barriers, attitudes, and practice level in incorporating EBN into their practice is crucial in ensuring positive patient outcomes. Although nurses have positive attitudes about using research to support best nursing practice, there remains a substantial gap in knowledge and skill level in retrieving research publications, evaluating the evidence, and incorporating evidence into practice.

Conclusions: Nurses in clinical settings need to be able to use research findings and incorporate the best available evidence into their nursing practice to promote positive patient outcomes. Although considering the complexity of the translational sciences and their role in closing the gap between research and practice, appropriate organizational infrastructures are essential for promoting EBN and research utilization in clinical settings. Diverse and effective methods are essential in educating and engaging nurses in EBN and research utilization. A short education programs is an effective approach that can be used by nursing leaders in health care organizations to educate and engage nurses in EBN initiatives and research utilization. Nevertheless and according to the evidence review, multi-mixed methods approaches are the most successful ones. Tailored interventions according to specific contexts, settings and staff should be considerate primarily.

## C 07 - Promoting Health through Evidence

### Health Risks for Nurses Working Night Shift

---

*Robie Victoria Hughes, DSN, RN, CNS, USA*

#### Purpose

The purpose of the presentation is to discuss health risks associated with nurses who work night shifts. The presentation will also discuss strategies for reducing health risks for nurse night shift workers.

#### Target Audience

The target audience for the presentation are nurses who work night shift and nurse administrators.

#### Abstract

**Aim and Purpose:** To identify health risks and strategies to reduce health risks for nurse night shift workers through a review of articles published during the last 10 years.

**Method:** An electronic literature search for “Health Risks Nurse Night Shift” was conducted using the Pubmed, CINAHL and Health Source: Nursing/Academic Edition databases. Inclusion criteria used was English language, full text available articles, and published dates between January 1, 2004 and December 31 2014. Based on the search criteria a total of 90 articles were identified. Abstracts for the identified articles were reviewed for relevance and duplicate citations were removed.

**Results:** Identified health risk factors related to night shift work included increased incidents of sleep disorders, fatigue, breast cancer, cardiac disorders, bone density reduction, infertility, overweight/obesity, and hormone disorders. Strategies for dealing with shift work included allowing napping on night shift, stability of continued shift work without rotations, considering “night and day” preferences for shift selection, auctioning off shifts, self-scheduling for shifts and strategies to improve sleep.

**Implication for practice:** The literature review revealed that the negative effects of nurse shift work are almost universal. Studies were reviewed from 18 countries. Repeated themes of sleep deprivation, fatigue and negative quality of life for night shift workers were found in the literature review. Some of the studies examined the age and stage of life factors in influencing the nurse coping with rotating night shifts. Most of the strategy ideas for coping with shift work came from non-research articles. There is a need to conduct future research to determine if the identified strategies are effective.

## C 07 - Promoting Health through Evidence

### Interprofessional Evidence-Based Solution for Alcohol Screening Using Technology

---

*Kathryn Puskar, DrPH, MN, MPH, FAAN, USA*

#### Purpose

The purpose of this presentation is to share results of an interprofessional evidence based practice solution for Alcohol Screening in rural areas using technology.

#### Target Audience

The target audience of this presentation is professional nurses, nursing educators, and nursing administrators.

#### Abstract

**Purpose:** Communication and coordination between clinical providers across all disciplines is needed to deliver efficient and effective care for patients with risky substance use, misuse, or substance use disorders. Universal screening identifies patients who may be at risk for problems related to substance misuse. Nurses receive limited content in nursing school curricula or continuing education about interprofessional education and evidence-based substance use screening or brief interventions. The purpose is to share results of an interprofessional evidence based practice solution for Alcohol Screening in rural areas using technology.

**Methods:** A mixed method design employing both quantitative pre-to post-survey and qualitative focus group and key informant interview methods was used. Measures: The Alcohol and Alcohol Problems Perceptions Questionnaire (AAPPQ), drug (DDPPQ), and the Interdisciplinary Education Perception Scale (IEPS) questionnaires were administered.

**Results:** Data demonstrates statistically significant improvement in confidence and competence. [Piper1] Two products resulted: online training module offering Continuing Education Units (CEU's) and a training manual titled Substance Use Education Manual for Nurses, both available online for distribution.

AAPPQ: Scores on both subscales of the AAPP questionnaire increased over time. The average score for role security, a measure on a 2 to 10 scale of self-perceived skill and legitimacy in working with problem drinkers, increased significantly from the pre-training period (M=7.5, SD=1.4) to the post-training period (M=8, SD=1) and to the follow up period (M=8.3, SD=1.7),  $F(2,65)=6.24$ ,  $p<.01$ . The average score for Therapeutic Commitment to working with problem drinkers, measured on a 3 to 15 scale, increased significantly from the pre-training period (M=10.7, SD=1.8) to the post-training period (M=11.1, SD=1.7) and to the follow up period (M=11.2, SD=2.4),  $F(2,64)=1.8$ ,  $p=.17$ .

DDPPQ: Scores on both subscales of the DDPP questionnaire increased over time. The average score for role security increased non-significantly from the pre-training period (M=7.5, SD=1.3) to the post-training period (M=7.8, SD=1.1) and to the follow up period (M=8, SD=1.7),  $F(2,64)=2.36$ ,  $p=.1$ . The average score for therapeutic commitment also increased non-significantly from the pre-training period (M=10.7, SD=2.2) to the post-training period (M=11, SD=2.1) and to the follow up period (M=11.45, SD=3),  $F(2,65)=1.77$ ,  $p=.18$ .

IEPS: The average score for perceived autonomy of one's profession measured on a 1 to 6 scale increased significantly from baseline (M=4.7, SD=.81) to the post-training period (M=4.9, SD=.8) and to the follow up period (M=5.1, SD=.82),  $F(2,139)=4.08$ ,  $p=.02$ . The average increase (0.36) in Autonomy between pre training and follow up was statistically significant ( $p<0.01$ ).

Average Actual Cooperation scores increased from baseline (M=4.9, SD=.7) to post-training (M=5.1, SD=.75) and to the follow-up assessment (M=5.3, SD=.7),  $F(2,143)=6.21$ ,  $p<.01$ . The average increase (0.39) in Actual Cooperation between pre training and follow up was statistically significant ( $p<0.01$ ).

**Conclusions:** Our findings have implications for nursing and healthcare systems and policy. Integration of substance misuse screening throughout the lifespan of patients into all nursing curricula is essential to address substance use as a domestic and global public health issue using interprofessional and technology focus.

## C 08 - Applying Theories and Frameworks to Impact Care

### Developing a Framework and Inventory of Instruments to Measure Team-Based Primary Care

---

*Richard Ricciardi, PhD, NP, FAANP, FAAN, USA*

#### Purpose

The objectives of this AHRQ funded project were to collect, evaluate and catalogue instruments to measure team-based care in a manner that would serve the needs of individuals engaged in quality or practice improvement in primary care settings, as well as researchers and evaluators.

#### Target Audience

All nurses engaged in research and quality improvement involving teams and team-based care.

#### Abstract

**Background:** Team-based care holds promise to improve patient outcomes, care processes, and patient and provider experiences of care. However, the understanding of how care teams should function and ways to improve care teams is hampered by a lack of a strong theoretical conceptual framework and validated measures, specific to the primary care setting, which can be used for research, evaluation, and quality improvement purposes. Successful primary care redesign efforts such as the Patient-Centered Medical Home require a “high-functioning” primary care team that delivers “team-based care.” Thus, having a robust measure or measures of team-based care appropriate for the primary care setting is of utmost importance in order to evaluate and improve team functioning and patient outcomes. The objectives of this Agency for Healthcare Research and Quality (AHRQ)-funded project were to collect, evaluate and catalogue instruments to measure team-based care in a manner that would serve the needs of individuals engaged in quality or practice improvement in primary care settings, as well as researchers and evaluators.

**Methodology:** To develop a conceptual model and identify measures of team-based care we explored several sources, including: measure databases (e.g., NQF, Nat'l Quality Measures Clearinghouse, HHS Measure Inventory, NIH GEM database), Measures Application Partnership, and CAHPS. We also sought input from experts in team care, examined reviews of team care measures, and completed a review of the peer-reviewed and grey literature on both teamwork and team-based primary care.

**Findings:** The conceptual framework presents 4 domains that are mediators of high-functioning teams: cognitive (sense-making, continuous learning, shared explicit goals and accountability, and evolving mental models of roles), affective/relational (trust, respectful interactions, heedful inter-relating, and commitment), behavioral (communication, adaptable to context and needs, and conflict resolution) and leadership. After reviewing over one hundred different measures of teamwork, we identified 57 instruments of relevance to team-based primary care. Thirty-five instruments were from health care. Some instruments will require adaptation (e.g., wording changes) in order to use in primary care settings. Most instruments were surveys (n=48); a few were observational checklists and other types of instruments. Most instruments address multiple conceptual framework constructs, but with differing degrees of emphasis. Among the most common domains or attributes of teamwork and team-based primary care identified in the instruments include: communication, coordination, collaboration, respect, use of all team member's expertise, conflict management, group cohesion or shared identity, shared workload, and role responsibility and understanding.

**Conclusions and Implications:** There are many instruments available to measure team-based care; however, further work is needed in the guidance that accompanies these instruments to support use, analysis and interpretation of results by individuals involved in practice improvement. The forthcoming web-based Inventory of instruments will be a valuable resource to support measurement of the requisite attributes of effective teamwork to ultimately advance and improve team-based care delivery in primary care.

## C 08 - Applying Theories and Frameworks to Impact Care

### Applying Caring Theory Guided Leadership to Inspire, and Improve Quality

---

*Marlienne Goldin, MPA, BSN, AAS, RN, CNML, USA*

#### Purpose

to illustrate how application of the Caring Theory can increase staff satisfaction and improve patient outcomes.

#### Target Audience

nurse, nurse managers and other nurse leadership

#### Abstract

**Objective:** To demonstrate how Caring Theory guided leadership can improve staff satisfaction and patient outcomes.

**Key Words:** caring, caritas, staff satisfaction, quality outcomes

**Intro:** Can implementing Watson's Caring Theory in an ICU increase nurse staff satisfaction, create a healthy work environment, and improve patient outcomes? The ANCC's Magnet program promotes theory-guided leadership. When loving kindness, Watson's 1<sup>st</sup> Caritas Process, is practiced, departmental goals cannot only be reached, but exceeded.

**Methods:** Using the ANCC's National Database of Nursing Quality Improvement Survey, (NDNQI), and Press Ganey Employee Partnership Survey, as measurement tools, we found that applying Watson's Caring Theory, and Caritas Processes, at the managerial level, resulted in a marked increase in RN work environment satisfaction scores. Our department achieved a Professional Environment Score of the 95% on the NDNQI.

**Results:** Nurses' responses to all questions on the NDNQI Survey scored in the 90<sup>th</sup> percentile or above. In addition to a T score of 70 in response to the Job Enjoyment question, increased RN satisfaction scores related to better quality outcomes. Applying Caritas Process #4, the Director developed caring trusting relationships with all staff, not just knowing staff names and faces, but knowing the spirit filled person behind the face. These trusting relationships led to the structural empowerment of staff. Once the staff felt trusted and empowered they set about searching for ways to improve care on the department. Through staff nurse driven research activities, the staff has cut Foley days by more than 50%, and decreased the VAP rate by 74%. Four research abstracts were accepted for presentation at national, and international, conferences in 2014. Another abstract, regarding the effects of nurse workplace satisfaction on patient safety was accepted for presentation at the 2015 American Association of Critical Care Nurses National Teaching Institute and Exposition.

**Conclusion:** Caring Theory guided leadership has resulted in structural empowerment, and the implementation of new knowledge and practices. Financial resources were saved by improved retention and recruitment. Improved clinical outcomes, improved work environment, and improved patient outcomes, have led to meeting organizational goals.

## C 08 - Applying Theories and Frameworks to Impact Care

### Aristotelian Philosophy of the Human Person, the Theory and Conceptual Framework of Imogene King Expanded to a Global Perspective

---

*Beverly J. Whelton, MSN, MA, PhD, RN, USA*

#### Purpose

to display the integration of an Aristotelian-Thomistic understanding of being human and nursing practice within Imogene King's Theory of Mutual Goal Attainment. This presentation will also extend King's conceptual systems from personal, interpersonal and social to include worldwide global systems.

#### Target Audience

includes scholars, educators, leaders, researchers and practitioners of nursing in the fullest sense of the discipline.

#### Abstract

The Aristotelian philosophy of the human person places the individual as one of the human kind having unique natural capacities of conceptual knowledge and freedom of choice within this knowledge base. This philosophical perspective (moderate realism) considers the world intelligible as the human intellect grasps formal conceptual properties of the world of experience, frames propositions and is able to reason to new understandings. Earlier publications (Whelton, 1996, 1999, 2007) showed that Imogene King was grounded in this realist perspective. Aware of these capacities of knowledge and choice, King (1971, 1981) saw that when patients become active participants in identifying needs and transacting health related goals they more actively chose to achieve these goals whose achievement becomes evidence for evidence-based practice (King's theory of Goal Attainment).

The individual and his or her physical capacities is King's personal system. Additional detail on nature and the capacities of living beings is provided by the contemporary philosopher William A. Wallace (1996). Whelton (2002a, 2002b, 2008, 2011, 2012, 2013) applies these to nursing and health-care decisions. Using the insights of phenomenology, Norris Clarke (1999) adds that human persons transcend their substantial being (material and formal existence) to enter into relationships. Human transcendence is the matrix of King's interpersonal system, the space within which patient and nurse interact in the therapeutic relationship. Clarke will say that transcendence is both the source of community and human fulfillment. Nurses transcend themselves in the care of other persons. What is being provided is that humanity is the heart of health care within the personal existence of the nurse and the patient. This is a global phenomenon that unites all health care. Particular physical, social, economic, cultural and spiritual circumstances individualize both nursing needs and nursing care provided. This language seems to overlook Public Health and organizational system concerns. This is not the case. All of these services are for care of patients and the provision of nursing. By addressing individuals and families, one is addressing organizations through which individuals and families receive care.

Most health care is provided within an organized delivery system that is represented by King as the social system. Social systems are complex interactive human communities. They have formal and informal mission statements, goals and policies. There are leaders, managers and staff. In our emerging world culture, nurses are called to assess not only individual physical, social and spiritual capacities and needs (including cultural contributions), family ability to care for the patient, social and economic stability of the family within the community, but the impact of political, economic and technological developments within the patient's global geographic region. This assessment with strengths and problem identification, subsequent interventions and evaluation of effectiveness extends from individual and their family to their community, state and country. The provision of health care is impacted by the socio-political system, economics and technology available within the patient's global system. King did not write about a global system but she worked within one in her outreach to nurse educators in Japan and other parts of the world. Nursing today provides health-care to individuals in a global community and must have conceptual

tools for structuring data, processes and stabilities within global systems. The intent of this presentation has been to contribute to these understandings.

## D 06 - EBP Implementation for Kids

### Caring for Patients Diagnosed with Concussions at an Urban Level 1 Trauma Children's Hospital: Development and Implementation of a Standard of Care

---

*Susan C. McInerney, BSN, RN, CPN, USA*

#### Purpose

The purpose of this presentation is to identify the baseline knowledge level of pediatric nurses' related to current best practices of concussion care, and to demonstrate the process and outcome in the development and implementation of a Concussion Standard of Care

#### Target Audience

The target audience of this presentation is any member of the healthcare team who provides care to concussed patients. Our standards are adaptable and applicable in caring for patients locally, nationally and globally.

#### Abstract

Much attention has been given to the developments surrounding concussion identification and treatment. Translating that body of knowledge to the direct care nurses' everyday practice is paramount in providing appropriate patient care. Converting research into evidence based practice is a highly accepted standard of nursing practice. The goal of our project was to identify a baseline knowledge level of nurse's working on an urban pediatric medical-surgical/trauma floor related to current best practices for concussed patients. We hypothesized that nurses are not cognizant of the currently recommended best practices for treatment of concussions. We anticipated that this study would demonstrate an improvement in pediatric nurses' knowledge of best practices in the treatment of patients with concussions. A pilot study was conducted in which nurses were given a survey to complete followed with a lecture presentation; both of which focused on current concussion identification and treatment. A repeat of the survey was given after the lecture comparing results both pre and post educational intervention. After completion of a formal educational presentation, data supports an improvement in the knowledge level of pediatric nurses' identification of and current best practices in the treatment of patients diagnosed with concussions in an urban pediatric level 1 trauma center. Fifty-seven participants completed the baseline survey, while 33 participants completed the endpoint survey. At baseline, 39% of participants recalled receiving formal education related to concussions within the past 2 years. The percentage of participants who answered all 3 knowledge questions correctly more than doubled from baseline to endpoint, with 18% of participants answering all the questions correctly at baseline compared to 39% of participants at endpoint. Participants were more able to accurately identify interventions for a concussed patient at endpoint, with 74% of participants correctly identifying appropriate interventions at baseline compared to 88% of participants at endpoint. Attitudes and beliefs about having skills and abilities to care for concussion patients increased over time. At baseline, 65% of participants felt comfortable with their ability to care for a patient with a concussion, while that number increased to 79% at endpoint. Eighty-one percent of participants reported at baseline that a standardized set of orders for patients with concussions would be helpful; this increased to 88% of participants at endpoint. The belief that having support from other departments would be beneficial increased over time, with 88% of participants agreeing with this statement. At endpoint, 94% of participants agreed that participation from other departments would be beneficial. From these results we identified that a need existed for the development and implementation of a comprehensive standard of care for our concussed pediatric patient population. As nurses we assembled an interdisciplinary team to create a concussion standard of care. We worked collaboratively with physicians and other key departments to develop and implement a set of standardized order sets. Leading this team was a pediatric medical-surgical nurse. This nurse organized a team that consisted of direct care nurses, nurse educators, a surgical nurse practitioner and child life therapists. Our physician representation brought together trauma, orthopedic, neurosurgery and pediatric hospitalists. Converting current research findings into a uniform nursing plan of care, we are able to provide evidence based interventions that aim to minimize the impact concussions can have on an individual.

## D 06 - EBP Implementation for Kids

### Are Our Babies Cold? Using Unit-Based Research to Promote Adoption of an EBP Practice Change

---

*Rhonda E. Maneval, DEd, RN, USA*

*Deborah Schafer, MSN, RNC, USA*

*Erin Anderson, BSN, RN, USA*

*Yovanka Hoover, BSN, RN, USA*

#### Purpose

to share how one nursing unit engaged in a unit-based research project to address concerns resulting from an EBP practice change. Skin to skin care was expanded to the operating room causing concern that neonates were experiencing hypothermia. A study of neonate temperatures and strategies for adoption will be shared.

#### Target Audience

The target audience of this presentation is nurses interested in EBP and unit level research, along with those nurses who support EBP and research at patient care facilities such as clinical nurse specialists, nurse educators, and nurse leaders.

#### Abstract

The purpose of this presentation is to share the experience of one maternal-child unit as it transitioned skin to skin care from the post-operative anesthesia unit (PACU) to the operating room (OR) for infants delivered via cesarean section. The desire to change the protocol to begin skin to skin care in the OR was the result of a unit-based EBP project. The new protocol called for the infant to be placed skin-to-skin with the mother in the operating room provided both mother and neonate were stable. The practice follows the procedure described by Haxton, Doering, Gingras, & Kelly (2012) by "placing the naked newborn prone on the mother's bare chest at birth or soon afterward".

After this change was instituted some nurses began anecdotally reporting perceived higher rates of neonate hypothermia. Although currently published literature supports early skin to skin care as safe, there was continued concern from some nurses. In response to these concerns a team was assembled to investigate and develop a plan. The team included two experienced BSN staff nurses, the department's clinical nurse specialist (CNS), and an academic nurse researcher. The clinical issue of newborn hypothermia as a result of early skin to skin after cesarean delivery was challenging for the team, since an EBP project had already addressed the issue of safety, including temperature regulation of the newborn. The first option considered by the team was to provide additional education to nurses on the evidence supporting the new protocol. However, informal discussions with nurses revealed that some were not convinced by this evidence primarily because their own experience with low newborn temperatures. It did not appear that more education would be enough to change opinions on the safety of the new protocol; however, the team did not want to dismiss the nurses' concerns, since doing so might be detrimental to the culture of inquiry that had been established on the unit. It was decided that the best course of action would be to systematically investigate the concern by undertaking a study involving newborns cared for on the unit. The team felt that by performing the study on the unit the results would be more meaningful to the nurses since it would involve newborns to whom they had provided care.

A retrospective descriptive study was proposed and received IRB approval prior to initiation. The goal of the study was assess maternal and neonatal body temperature postoperatively while skin-to-skin care was being performed. A sample of 201 healthy, uncomplicated cesarean delivery mother-baby dyads, who were patients during the previous 12 months, was included in the study. Data were collected through retrospective electronic chart review. A data collection tool was utilized and inter-rater reliability was established. Data included demographic information, BMI, gestational age, gravidity and parity, number of cesareans, co-morbidities, IV fluid, EBL, spinal medications, OR case time, use of pressers by

anesthesia, L&D admission temperatures, PACU temperatures, and the first 3 neonatal temperatures obtained at 30, 60, and 90 minutes of age, respectively.

The results of the study related to newborn temperature suggestion that only a very small number of infants, less than 5 percent, experienced hypothermia within the first hour and half of life. Of these infants only four (4) had temperatures less than 36.0° C, while the others temperatures ranged between 36.1° and 36.4°. Over eighty percent (80.1%) of newborns had a normal temperature (36.5° to 37.4°) at the first reading (30 minutes), by the second reading (60 minutes) ninety-one (91%) were normal, and by the third reading (90 minutes) over ninety-five percent (95.3%) were normal. Additionally, the mean newborn temperature at all three measurement points was the same at 36.7°. Additional analysis is underway and will be shared at the conference.

The team is working on strategies for dissemination of results to unit nurses. Part of this planning process is to meet with the informal nurse leaders on the unit and share results directly with them in a small group setting. This will allow for questions and an opportunity for the team to address any continuing concerns. Other strategies will include the creation of a poster about the study so that it can be displayed on the unit. An added benefit of this strategy is that patients and their families will also have an opportunity to view the poster and learn about the study and the protocol. A one-page informational flyer will also be created and distributed to staff as a way of communicating the study results directly with them. This will be placed in their physical mailboxes as well as delivered via their hospital email account. An additional strategy we will employ will be hosting information sessions that will offer continuing education credit. This will provide an opportunity for nurses to hear the information and to discuss and engage openly with their peers.

There are three main outcomes we hope to achieve as a result of this project. One is to develop informal unit leaders as early skin to skin champions. We believe they will be critical to the success and sustainability of the early skin to skin practice in the OR. We also hope that this project communicates the value and respect the organization has for the expertise of the nurses and that this will further the cohesiveness of the unit. Lastly, it is the hope of the team that this project will result in a renewed spirit of inquiry on the unit, with nurses feeling supported and engaged. It is our goal that they continue to ask questions about their practice and bring forward issues that may impact patient outcomes negatively. It was because of this culture of inquiry that nurses felt comfortable questioning the new skin to skin practice. It was critical to the team that this questioning be supported, so rather than attempt re-education or otherwise convince nurses that the new protocol was safe the team decided to undertake a research study to directly address their concerns. We believe this was a positive and respectful response to the issue and perhaps a strategy others might choose to use.

## D 07 - Measuring Success: Course and Curriculum Assessments

### Development of Curriculum Assessment Template for Targeted Student Outcomes in a BSN Program

---

*Erin E. Killingsworth, PhD, MSN, BSN, RN, USA*  
*Cynthia Gurdak Berry, DNP, MSN, BSN, RN, CNE, USA*  
*Jennifer Jeames Coleman, PhD, MSN, BSN, RN, CNE, USA*  
*Geri W. Beers, MSN, BSN, EdD, EdS, RN, CNE, USA*  
*Tracey Dick, MSN, RN, CNE, USA*  
*Vicki W. Rochester, DNP, RN, WHNP-BC, USA*

#### Purpose

The purpose of this presentation is to describe the process used to develop a curriculum assessment template to map the integration and student assessment activities of targeted student outcomes in one institution's traditional and accelerated BSN curriculum schemas as part of the STTI Nurse Faculty Leadership Academy.

#### Target Audience

The target audience of this presentation are nurse educators from a variety of educational programs.

#### Abstract

To be accredited, nursing education programs in the United States are required to be in compliance with designated accreditation standards including pertinent nursing standards and guidelines. These guidelines, such as the American Association of Colleges of Nursing's (AACN)(2008) The Essentials of Baccalaureate Education of Professional Nursing Practice, outline what are expected outcomes of graduates from the program. One of the challenges for nursing education programs seeking accreditation is to track and measure the required student outcomes.

One nursing baccalaureate (BSN) program in conjunction with the Sigma Theta Tau International Nurse Faculty Leadership Academy conducted a team project to support the development and evaluation of student progression toward safe nursing practice in regard to targeted student outcomes identified from the AACN's (2008) Baccalaureate Essentials. The purpose of the pilot project was to create a comprehensive evaluation plan for targeted student outcomes in the BSN curriculum. The objectives of the project were to analyze the integration of the student outcomes throughout the traditional and accelerated BSN programs and to map current assessment activities designed to evaluate the outcomes including the assessment type and level of Bloom's cognitive taxonomy, ensuring progressive student development. The project was conducted over the 2014-2015 academic year. The team members analyzed course materials and assessment activities from the 16 undergraduate nursing courses from both the traditional and accelerated programs with input from the course coordinators of those nursing courses. One of the outcomes of the project was the development of a curriculum assessment template that was used by the team members in evaluating the BSN curriculum. This template can serve as a guide to help nursing education programs track targeted student outcomes, identify areas for restructuring, and show progressive development of the student in regard to targeted student outcomes.

## D 07 - Measuring Success: Course and Curriculum Assessments

### Use of Objective Structured Clinical Examination in a Senior Baccalaureate Nursing Course for Assessment of End-of-Program Outcomes

---

*Diane Lynett Marcyjanik, EdS, MSN, RN, RN, USA*  
*Nita L. Johnson, MSN, RN, USA*

#### Purpose

The purpose of this presentation is to increase faculty knowledge regarding the use of Objective Structured Clinical Examination (OSCE) for end of program outcomes. Results from a descriptive study on the effectiveness, efficiency, and nursing students' perceptions; along with recommendations regarding the use OSCE will be offered.

#### Target Audience

The target audience is nurse educators and administrators who are involved in determining end of program outcomes. Nursing faculty throughout the curriculum are crucial in deciding placement of Objective Structured Clinical Examination (OSCE) as a course or program advancement benchmark

#### Abstract

Faculty continue to acknowledge the challenges associated with evaluating students in the real life clinical arena (Meechan, Jones, & Valler-Jones, 2011; McWilliam & Botwinski, 2010). Identification of alternative assessment measures must be utilized in order to provide a standardized format in which to evaluate and measure clinical competence and integrated knowledge for end of program outcomes. Objective Structured Clinical Examination (OSCE), has been defined as an observed examination of clinical skills in a controlled simulated environment, with the utilization of structured checklists (Jones, Pegram & Fordham-Clark, 2010; Meechan et al., 2011; McWilliam & Botwinski, 2010; Paul, 2010). Predefined tasks, time limits, and standardized patients are a requirement of OSCE, in order to regulate the assessment environment for each student (Mitchell, Henderson, Groves, Dalton, & Nulty, 2009; Oranye, Ahmad, Ahmad, & Bakar, 2012; Rentschler et al., 2007). By ensuring these elements are present, external factors are eliminated, maintaining strict control and standardization in the testing environment. A descriptive study was conducted regarding the development and evaluation of OSCE for second semester senior nursing students for assessment of end of program outcomes. Two pilot groups were tested in three stations including knowledge application, psychomotor skills, and patient teaching. The stations included standardized patients and mannequins as patients. Examiners were not present in the stations during testing and observed via one-way glass and cameras. Although the pass rate was lower than expected, student evaluations were unanimous for including OSCE in the undergraduate curriculum. The OSCE was perceived by students as less subjective than current clinical evaluations and an opportunity to self-evaluate clinical skills as they began their last semester.

*Connie Uhlken, MS, RN, USA*  
*Bradley Peters, PhD, USA*  
*Patricia Paramore, USA*

#### Purpose

to describe actions taken and changes made to the portfolio assessment process in efforts to assess program outcomes after a major curriculum change that resulted in lowered portfolio scores. The importance of developing a rubric that coincided with the new program outcomes will be highlighted.

#### Target Audience

those who take part in nursing program assessment and evaluation of program outcomes.

#### Abstract

Identifying undergraduate nursing program outcomes to be attained by students is a critical task of any nursing program. The demonstration of the attainment of curricular outcomes is mandated by accreditation bodies and nurse educators need to be supported by evidenced based practice in this challenging endeavor. Faculty must determine what students have learned; how they have changed academically, professionally, and personally; and if program outcomes were met as they complete the nursing program. The portfolio assessment process at one Midwestern School of Nursing was moved from mid program to end of program coinciding with the full implementation of a new undergraduate curriculum including new terminal program outcomes geared to meet the Essentials of Baccalaureate Education. Prior to this change, benchmarks in portfolio assessment were consistently met. However, after the move to end of program with new terminal outcomes, portfolio scores have declined and failed to meet the benchmark. This presentation will describe actions taken and changes made to the portfolio assessment process in efforts to accurately assess program outcomes including the importance of developing a rubric that coincided with the new program outcomes. Specifics related to portfolio assessment and rubric development will be highlighted in this presentation and offer nurse educators tangible evidence of how to assess the meeting of program outcomes.

## D 08 - Implementing Peer Groups in Nursing Education

### Implementing Change: Social Justice as a Platform for Nursing Education

---

*Katrina Einhellig, PhD, MSN, BSN, RN, CNE, USA*

*Faye I. Hummel, PhD, RN, CTN-A, USA*

*Courtney E. Gyskiewicz, BSN, ADN, BS, RN, USA*

#### Purpose

The purpose of this session is to outline strategies to integrate the concept of social justice within undergraduate nursing curriculum. We will provide a variety of activities that can be implemented while emphasizing the ease of facilitation as well as the value of this endeavor in nursing education.

#### Target Audience

The target audience for this session will be nurse educators that understand the importance of a social justice agenda in the nursing profession, and are invested in the implementation of new teaching strategies that foster professional growth for students.

#### Abstract

Although the AACN Baccalaureate Essentials (2008) have identified social justice as one of five professional values, the development of curricula that fundamentally supports this value have been slow to develop. There currently exists a lack of information in the literature that establishes best practice for educational strategies that effectively integrate social justice into nursing curriculum.

It is not enough to integrate the concept of social justice in nursing curriculum in order to achieve knowledge development by nursing students; we must focus on the acquisition of thinking and the progression toward skills by which students identify the myriad of variables that exist to prevent social justice within healthcare.

Inequities in the current healthcare system are well documented. Nurses serve as the largest group of healthcare providers, and the preparation they receive in their nursing education creates the foundation to assist patients toward equitable care, often nurses make the difference between a positive and negative outcome for the patient (Mill, Astle, Ogilvie, & Gastaldo, 2010). It becomes critical for nursing educators to ensure that graduates have been exposed to all aspects of the construct of social justice and the various ways that they can provide advocacy for the marginalized.

Based on a needs assessment, a school of nursing has identified potential for growth in the curricular thread of social justice. Nursing students must be educated on their role in creating a social justice agenda in healthcare. The purpose of this presentation is to discuss strategies used in the integration of social justice content across an undergraduate nursing curriculum, emphasizing strategies that enhance the affective learning of the student.

Nursing faculty used learning strategies designed for each semester of the undergraduate nursing curriculum that is interactive in nature as well as enhancing the affective learning for the students (Ondrejka, 2014). Focus of the presentation will be on the integration of these strategies in a way that does not create further burden for faculty, yet creates an environment that enhances the understanding of social justice.

## D 08 - Implementing Peer Groups in Nursing Education

### Value of Online Group Reflection Following International Service Learning Experiences: I Never Thought of That!

---

*Eileen M. Smit, MSN, RN, FNP-BC, USA*

*Mary Jane Tremethick, PhD, RN, MCHES, FAAHE, USA*

#### Purpose

The purpose of this presentation is to discuss an exploratory descriptive research study comparing individual and online group reflections following an international service learning program. Students participating in an online group reflection were more likely to critically reflect upon their experiences and the impact of these experiences on future practice.

#### Target Audience

The target audience of this presentation is nurse educators and others interested in clinical education strategies

#### Abstract

Reflection, defined as reviewing what one has experienced and its meaning, is widely accepted as a learning tool and is considered an essential component of competent professional practice (Plack, 2005). Providing students with the opportunity to reflect on their clinical experiences promotes and increases experiential learning (Benner, Sutphen, Leonard, & Day, 2010) and the process of reflection has the potential to change practice (Taylor, 2000). Identifying teaching strategies that promote students' thoughtful consideration and reflection on their experiences facilitates the development of students into competent practitioners (Schuessler, Wilder & Byrd, 2012).

Reflecting on one's experiences is particularly important after an international service learning program in which students have experiences that may challenge some of their previously held ideas and practices. Lipson and Desantis (2007) note that international experiences can lead to increased student self-awareness of their own health care preconceptions and how their own beliefs, values, practices, and behaviors affect care, interactions with patients, and health teaching.

In this presentation the authors describe an exploratory descriptive study in which students who participated in a cultural immersion service learning program in Honduras reflected upon their experiences after returning to the United States. The program included a 10 day trip to a rural area of Honduras where students worked in clinics, schools and participated in community activities that helped them experience the day to day life of families in Honduras. The students were divided into two groups. The first group consisted of students who traveled to Honduras in 2008 and 2009 and wrote individual papers reflecting upon their experiences and learning after they had returned to the United States. The second group consisted of students who traveled to Honduras in 2011 and 2012 and participated in an online group reflection discussion of their experiences and learning after they returned to the United States. The level of reflection of each group was compared using the four category scheme developed by Kember, McKay, Sinclair and Wong (2008). This scheme provides a means to measure the level of reflective thinking found in writing. The four levels of reflection are 1. Non- reflection in which the student shows no evidence of attempting to reach an understanding of his/her experiences in relation to concepts or values; 2. Understanding in which there is evidence of understanding a concept but the understanding does not relate to personal experiences; 3. Reflection in which situations encountered personally are considered in terms of values and personal insights; and 4. Critical reflection in which there is evidence of a change in perspective.

The students who participated in the online group reflection discussion were more likely to critically reflect upon their experiences and the impact of these experiences on future practice than the students who wrote individual reflection papers. The students participating in online group reflection also demonstrated an awareness that other students shared similar responses to their experiences.

Online group discussion of reflections following experiences that may challenge students' beliefs, values, practices, and behaviors is an effective teaching/learning strategy that promotes critical thinking. The online discussion of experiences among students following an international service learning program encourages meaningful dialogue and promotes clarification of values. Using online group discussion as a teaching strategy can facilitate critical thinking that will promote the development of students into competent practitioners.

## D 08 - Implementing Peer Groups in Nursing Education

### Can Group Scenario Exercises in Fundamental Nursing Using Process Oriented Guided-Inquiry Learning (POGIL) Affect National Test Scores

---

*Maureen C. Roller, DNP, RN, ANP-BC, USA*

#### Purpose

to evaluate the effectiveness of participation in the Process-oriented guided inquiry learning (POGIL) method in a fundamental nursing class on the final grades and ATI nursing grades (national exam) of groups of students who participated in (POGIL) compared to students who did not participate in group scenario work in class.

#### Target Audience

nurse educators, researchers and clinicians who are interested in an innovative approach to teaching strategies that improve learning and outcome scores utilizing a comparative quantitative design to measure the relationship of grades in two fundamental nursing classes taught by the same professor.

#### Abstract

**Background:** Measuring the effect of a Process-Oriented Guided-Inquiry Learning (POGIL) implementation in a fundamental nursing course is one way to determine its effectiveness. Utilizing the POGIL method may be beneficial in nursing courses. The purpose of the study was to measure the effects of participation in the POGIL process in Fundamental Nursing classes on the final grades and ATI grades (Assessment Technologies Institute®, LLC., national exam) of groups of students who participated in group scenario work compared to students who did not participate in group scenario work in class. A comparative quantitative design measured the relationship of grades in two fundamental nursing classes taught by the same professor. The results demonstrated a small sample of one participating class of 25 and a non-participant group of 25 subjects. Final exam data revealed no significance in grade performance between groups. Quantitative measures demonstrated effectiveness of the POGIL intervention on a national standardized exam.

Process-Oriented Guided-Inquiry Learning (POGIL) is a student-centered pedagogy that supports group activities. Students interact and are given the opportunity to construct knowledge. Learning is a shared responsibility of faculty and students. Educators developed POGIL in 1994 as a student centered general chemistry strategy. This pedagogical method encourages cooperative and collaborative classroom learning. Comparing the results of standardized exams has demonstrated improvement in grades in the POGIL classes' verses the traditional lecture approach (Hanson & Moog, 2010). POGIL allows students to think about their learning, their performance and how to improve and develop problem-solving skills. Students work in teams with group guided learning exercises to encourage active learning (Bransford, Brown, & Cocking, 2000).

The POGIL method uses activities to teach content and encourage analytical critical thinking and teamwork. POGIL activities are implemented in groups of 4 students. The instructor is a facilitator moving between the groups and listening to the student discussion and intervening when necessary with guiding questions. The roles include four different ones for each student in the group: Manager keeps everyone on task. Recorder keeps records of the names, roles and discussions of the group. Presenter or team leader presents an oral report to the class. Reflector observes and comments group behavior and dynamics in learning process (Moog, 2012).

The ability for nursing students to work effectively in a team through the POGIL process may help to prepare future nurses for a work environment that requires multidisciplinary teamwork. Health care future improvements will need to promote teamwork and excellent communication skills (Frankel, Leonard, & Denham, 2006). Safe patient care is an essential factor identified by the Joint Commission (TJC) (2014) through teamwork in the work environment. Providing students the opportunity to work as teams and communicate in a basic nursing course may better prepare them for transitioning to the work

environment. It is imperative to continue to develop and test alternative methods in education that will lead to improved learning and will lead to improved test scores as well, there is a need to explore the POGIL approach in nursing education as a valuable tool for both. The author adopted the POGIL in a fundamental's class and used a control group section in the same semester to evaluate the effect on course grades and a standardized test.

In nursing, due to the complex nature of its curricula, innovative pedagogy should be explored to present this complex material. Published reports on the POGIL method of delivering science courses have documented success of students. For example a study of 200 undergraduate students investigated whether POGIL use affected grades, retention, self-efficacy, attitude and learning environment in a first semester chemistry course. Grades had some positive results in the POGIL group versus the control (non-participant group). Retention rates varied, however emotional satisfaction and attitude toward chemistry was lower in the control population. Overall the POGIL approach had minimal impact on the results. No difference was revealed in self-efficacy between groups. The most positive result was the attitude toward learning environments of the POGIL students (Case, Pakhira & Stains, 2013). Undergraduate biomechanics courses traditionally were taught by lab and lecture method. Students reported that lectures were not engaging and learning was not enhanced. POGIL (N=64) and traditional instruction methods (N=52) were compared. Quiz, tests and course grades were reported to be higher in the POGIL group (Simonson & Shadle, 2013). Many studies have documented the POGIL method in general chemistry. One author compared the final exam scores on a national standardized exam of organic chemistry with a participant and control group to evaluate the effectiveness of POGIL pedagogy. Analysis indicated that 72% of the POGIL students scored higher than the control group (Hein, 2012). In summary, following a review of the literature POGIL has been documented as an effective approach in a variety of disciplines. Much of the research is centered on chemistry and other science courses. Studies have not included nursing courses utilizing the POGIL method. Although it is a useful strategy POGIL has not been effectively documented in nursing courses. Therefore the aim of this study was to evaluate would POGIL group scenario exercises improve test scores in a fundamental nursing course.

**Methods:** The study used a comparative quantitative design. Two sections of undergraduate students in a fundamentals didactic nursing course with the same professor were given the opportunity to volunteer to participate in the research. One class participated in six group scenario exercises and the control non-participant group was given the scenarios on an individual basis. Purposive sampling of was used. Group one (experimental) was offered the opportunity to participate in POGIL exercises during class time. The professor assigned 4-5 students to each group in the participation class. After lecture the participants completed in 45 minutes intervals 6 group case scenario exercises. A team leader of each group presented the information to the class. The professor throughout the exercise encouraged critical thinking and communication skills. Roles of reflector, recorder, presenter and manager were chosen by the students and rotated each group exercise. Group two (control) of another Fundamentals class of nursing students was given the opportunity to complete the same 6 case scenario exercises individually on-line after the lecture. This group had the opportunity to individually submit the work to their professor.. The scenarios for both groups were the same non-credit assignment.

**Results:** Demographic variables were analyzed descriptively to determine the comparison of the two groups (POGIL and Non-POGIL) in the course using SPSS version 21. The participant experimental group age range of students was 19 – 40 years with a mean age of 23.4 years old. Included in the data were three males and 22 female subjects. Non-participant control group in the study age range of student's was 19-26 years with mean age was 20.6 years. Included in the data were two males and 23 female subjects.

The mean 3.6 GPAs of participant and non-participant groups mean 3.5 GPA prior to the study were compared for consistency and no significant differences were found. The mean final grade (B) of the participant POGIL group was higher than the mean (B-) of the non-participant group although not significant. The participant POGIL group mean (C+) national standardized test scores were higher than the (C) non-participant group. The 2-tailed t-test ATi standardized test equality of means revealed a significance of  $p=0.032$  with  $\alpha=0.05$ . Distribution of the ATi was measured with a Mann-Whitney non-parametric test. The analysis was 0.28, which the data revealed reject the null hypothesis, which

demonstrates significance at 0.05. There is a difference between ATi groups across the categories of treatment. The numerical final grade for the course between participant (B) and non-participant groups (B-) was not significant 2-tailed t- test=. 199.

**Limitations:** This study had some limitations. Participants were not randomly assigned to the two groups. A small sample of 50 participated in the study. Students did not participate in the same number of scenarios; some participated in five and some in six. Also, not all students participating in the online scenarios completed them. The study was conducted at one site with one professor and one course in one semester.

**Conclusions:** Although the final grade for the participating and non-participating group was not significant, the participating group had higher national test scores. The POGIL methodology enhances the use of teamwork, which may help prepare students to meet an essential competency for professional nursing. Exploring POGIL as a teaching strategy is in alignment with goals to promote evidence-based teaching. A priority in nursing education is to enhance the development of analytical critical thinking and teamwork, which is encouraged through use of POGIL methodology. Pedagogy, such as POGIL in nursing education has been shown to improve learning.

## E 06 - Pain Reduction and Management

### Quality of Life in Thai Patients with Low Back Pain Undergoing Epidural Steroid Injection

---

*Bencharat Somgiat, RN, MS, Thailand*

#### Purpose

The purpose of this research was to describe and compare pain, functional ability, and quality of life before and after epidural steroid injection (ESI) in patients with low back pain.

#### Target Audience

to prepare a nursing guideline for patients who require treatment of low back pain by epidural steroid injection (ESI). The guideline can help patients to appropriately self care before and after ESI.

#### Abstract

The purpose of this research was to describe and compare pain, functional ability, and quality of life before and after epidural steroid injection (ESI) in patients with low back pain. The subjects included 25 patients with low back pain at the orthopaedics operating room, Police General Hospital, Bangkok, Thailand. They were selected by purposive sampling. Data were collected from December 2014 to February 2015. The instruments used included the Numeric Rating Scale to measure pain score, the Modified Oswestry Low Back Pain Disability Questionnaire (Modified ODQ) to measure the functional ability, and the WHOQOL-BRIEF-THAI to measure quality of life. Data were analyzed in terms of descriptive statistics, inferential statistics including one factor repeated measure ANOVA, and McNemar's test. Findings of this study showed that after epidural steroid injection (ESI) at one and four weeks, the subjects' pain scores significantly decreased. In addition, the subjects' functional ability after ESI was significantly higher than that before ESI. The quality of life of the subjects also significantly increased after ESI. Findings of the study revealed the effect of ESI on pain reduction, functional ability improvement, and promotion of quality of life in persons with low back pain, and provided useful data to guide healthcare service of patients with low back pain.

## E 06 - Pain Reduction and Management

### Evidence-Based Education Intervention to Improve Knowledge and Attitudes of Nurses' Postoperative Pain Management for Improved Patient Satisfaction

---

*Gayle Ridgway, DNP, RN, APRN, CRNA, USA*

#### Purpose

The purpose of this project is to improve acute care nurses' knowledge and attitudes regarding postoperative pain management and to improve patient satisfaction and outcomes.

#### Target Audience

The target audience of this presentation is for nurse managers, nursing staff, staff educators.

#### Abstract

The purpose of this presentation is to demonstrate how to select and generate an evidence based education intervention for acute care nurses regarding postoperative pain management using a pretest-posttest design. The low scoring questions of the pretest were categorized into appropriate content areas using evidence-based practice (EBP) relating to postoperative pain management for the education intervention. Patient satisfaction was monitored during the same timeframe of the pretest and posttest and assessed for trends.

The Agency for Healthcare Research and Quality (AHRQ, 2012) recommends ongoing educational interventions for pain management that must be accomplished in order to maintain high standards of care for patients. Evidence-based practice (EBP) models, including clinical practice guidelines, offer a framework for nurses to use when assessing and managing pain (Newhouse, Dearholt, Poe, Pugh, & White, 2007; Samuels & Fetzer, 2009). The Johns Hopkins evidenced-based practice model provided the framework for this translational research project by guiding the identification of the necessary individual behaviors required to enhance pain management practices (Newhouse, Dearholt, Poe, Pugh, & White, 2007).

Since pain management was recognized as a specialty in the 1980s, patients continue to be undertreated for pain with only one in four patients reporting their pain is under control (IASP, 2013; Wu & Raja, 2011). Nurses' knowledge and attitudes concerning postoperative pain management may be a barrier to adequate treatment. Pain that is not well controlled can have physiological and psychological effects delaying or worsening patient outcomes. The Center for Medicare and Medicaid (CMS) is now expecting patient satisfaction to impact the ratings that regulates reimbursement. Patient satisfaction is reported through the Hospital Consumer Assessment of Healthcare Providers and Systems (HCAHPS) surveys.

A review of the literature dating back to the 1970's reveals a persistent need to improve postoperative pain management. Historically, nurses' knowledge, attitudes, and beliefs have significantly impacted the effectiveness of pain management. A comparison of the practices from the 1970s to the present decade revealed contemporary pain management includes innovative multimodal therapies and advanced analgesics (White & Kehlet, 2010; Wu & Raja, 2011). Yet the need to improve postoperative pain management and patient satisfaction continues to be documented in the literature (Wu & Raja, 2011). Pain management has evolved to include guidelines to assess pain, recommendations on when to assess pain, the proliferation of various pain scales, and specific protocols to guide healthcare professionals, with the hope that these actions will capture and decrease any pain that patients are experiencing (Wells, Pasero, & McCaffery, 2008; Institute of Healthcare Improvement, 2013). Even with all these recommendations, it has been noted that a major barrier with pain management stems from the nurses' attitudes and knowledge in dealing with patients' pain, subsequently impacting the delivery of adequate care (Clarke, French, Bilodeau, Capasso, Edwards, & Empoliti, 1996; Erkes, Parker, Carr, & Mayo, 2001; Young, Horton, & Davidhizar, 2006; Wang & Tsai, 2010; Schreiber et al., 2013).

There have been many changes recently in postoperative pain management to include new multimodalities and advanced analgesics (Rognstad, et al., 2012). As a result of their presence on the surgical units there is an increased demand for nurses to have greater proficiency in assessing and regulating these multimodalities. Nurses are at the bedside assessing and managing patients and interpreting patient responses to pain (Ene, Nordberg, Bergh, Johansson, & Sjostrom, 2008; McHugh & Stimpfel, 2012). These nurses are the ideal group of healthcare professionals to make the biggest difference on pain management, patient outcomes, and patient satisfaction (McNamara, Harmon, & Saunders, 2012; Rugari et al., 2012).

Following IRB approval, this evidenced based education intervention was implemented on two surgical units using a pretest-posttest design to assess knowledge and attitudes of nurses' postoperative pain management. All questions that scored below 75% correct (n = 16) on the pretest were selected for inclusion in the education intervention. These sixteen low scoring questions were examined and placed into three categories that corresponded with three objectives for professional nurse behavior regarding pain management by the International Association for the Study of Pain (IASP, 2012). These three categories: pharmacology, pain assessment and management, and misbeliefs of drug seeking behaviors became the basis for the educational intervention and CEUs were applied for and offered to the nurses. Additionally, qualitative data was collected to better understand nurses' perceived barriers for effective pain management. The nurses' responses were coded and categorized into patient, provider, and systems factors. Three most significant factors were identifying unrealistic pain expectations and knowledge deficits on the part of patient and providers, lack of time to assess pain properly, and cultural competence of providers as their perceived barriers. Patients were interviewed about their pain and were administered the HCAPHS pain questions. The nurses' pretest-posttest results were analyzed using group means and paired t-tests, which showed a statistically significant increase in knowledge and attitudes on the nurses' posttest ( $p \leq .05$ ). It was also noted that patients reported less pain and had a longer mean timeframe between medication dosing when multimodal pain management was used. One of the survey units demonstrated an increase in patient satisfaction in their three HCAPHS pain questions with the use of these multimodalities.

As a result of the findings of this study, recommendations were made to continue this educational intervention to all healthcare professionals in all units and continue to measure the impact on patient outcomes and satisfaction. A recommendation was made and later implemented to have a "medication of the week" program on the units for the nursing staff. Medication deficiencies that were identified in the pretest were converted into posters and placed on the units. There were discussions of their pharmacodynamics and pharmacokinetics, clinical applications, and issues. What this study has done differently from many other studies documented in the literature is to utilize the evidence-based model to categorize and build an educational intervention specifically targeting the low scoring questions.

The results from the quantitative data generated by the pretest/posttest from the nurse participants combined with the data collected from the patient participant interviews increase the strength of the findings. The research in pain control is ever evolving with new advances in pharmaceuticals, technology, and genetics research that demand a constant evaluation and re-evaluation of the literature and implementation into practice (Allegri, Clark, Andres, & Jensen, 2012).

## E 06 - Pain Reduction and Management

### Evaluating the Use of a Topical Vapocoolant to Reduce Pain during Intravenous Insertions: The Patients' and Nurses' Perspectives

---

*Cecilia M. Inman, BSN, RN-BC, USA*

*Jennifer M. Bisson, BSN, RN, USA*

#### Purpose

The purpose of this project was to compare the patients' perceptions of pain and the nurses' experience during intravenous insertions, with and without the use of a topical vapocoolant; and to evaluate patients' and nurses' feedback with the application procedure.

#### Target Audience

The target audience of this presentation is clinical nurses and nurse administrators in patient care settings where intravenous insertions occur.

#### Abstract

**Background:** Intravenous (IV) catheter insertion is a common procedure performed by health-care providers. Unsuccessful peripheral line attempts cause increased pain, anxiety, and dissatisfaction for patients. IV catheter insertions can also increase stress and anxiety for the nurse, which may unfavorably impact peripheral venous access attempts (Page & Taylor, 2010).

**Evaluation of current research:** A topical vapocoolant spray, ethyl chloride, has been used to produce an immediate analgesic effect on the skin. Ethyl chloride, when applied to a procedure site evaporates rapidly and decreases the skin temperature resulting in a temporary interruption of pain sensation (Page & Taylor, 2010). Earlier studies have shown that topical vapocoolants reduce pain and increase patient satisfaction during intravenous insertions in dialysis and in pediatric patient populations (Celik et al., 2011; Shah, Taddio, & Rieder, 2010). However, there is not sufficient evidence supporting the use of topical vapocoolants in adult patient populations and also evaluations from a nursing perspective are missing in the literature.

The purpose of this project was to compare the patients' perceptions of pain and the nurses' experience during IV insertions, with and without the use of a topical vapocoolant and to evaluate patients' and nurses' feedback with the application procedure.

**Method:** Following the institutional protocol for initiating an IV insertion, data were collected on patients who had IV insertions without the use of the topical vapocoolant (n=50) and those who had insertions using the vapocoolant (n=51) from March 26, 2014 through September 14, 2014. Patients were surveyed about their level of perceived pain, their assessment with the skill level of the nurse and their satisfaction with the IV insertion procedure using a pain rating scale (0 = no pain, 10 = worst pain). Nurses were surveyed about the IV insertion procedure with and without the vapocoolant.

**Results and Key Issues:** Descriptive statistical analysis demonstrated that patients who did not receive the vapocoolant prior to the IV insertion reported significantly higher levels of pain (M=3.8) compared to patients who received the vapocoolant (M=2.2,  $z=-2.25$ ,  $p=.024$ ).

There were no significant differences found for the patients' assessments of the nurses' skill level ( $p=.102$ ) or patients' perceived satisfaction with the IV procedure ( $p=.438$ ), as patients rated nurses very high for skill and satisfaction in both groups. The size of the IV catheters (M=20.7 vs. 20.4), number of IV attempts (M=1.7 vs. 1.4), and number of RNs attempting insertions (M=1.3 vs. 1.2) were the same, regardless of insertions without or with the topical vapocoolant, respectively. Importantly, nurses voiced application safety concerns (e.g. medication stream diverting unexpectedly away from the intended site) that were not addressed in earlier studies. The nurses experiences and feedback were collected using open-ended questions related to the application process.

**Conclusions/Implications:** This project showed a significant decrease in pain scores during IV insertion in the topical vapocoolant group compared to patients who did not receive the vapocoolant. However, on-going nursing safety concerns related to the application process forced us to re-assess whether routinely using this topical vapocoolant for IV insertions was best practice. Our project demonstrates the importance of nurses' clinical expertise and feedback when implementing evidence-based practice. Even though some evidence was available from earlier studies, our findings related to the patients' pain experience as well as the nurses' clinical expertise were important to consider before making a decision regarding a practice change.

## E 07 - Evidence-Based Solutions for Vulnerable Populations

### ED Community Placement Project (EDCPP): “Right Service-Right Venue”

---

*Karen Elizabeth Mitchell-Keels, MSN, CMCN, RN,, USA*

#### Purpose

The purpose of this presentation is to explore concepts of a nurse-led, innovative, evidence based project (EBP) designed to reduce ED revisits, avoidable admissions and improve quality outcomes. The ED Community Placement Project (EDCPP) bridges homeless ED frequent user to community partners, by using a “right service-right venue” model.

#### Target Audience

The target audience of this presentation is healthcare system administrators, clinical educators and frontline clinical staff, social workers who are interested in managing creating solutions to the reduce ED frequent users while improving quality outcomes.

#### Abstract

**Background:** San Diego has the 3rd largest homeless population in the United States, second only to New York and Los Angeles. Nearly one-third of all visits to the emergency room are made by people who struggle with chronic homelessness coupled with co-occurring disorders. Emergency departments (ED) are not equipped to meet the psychosocial needs of homeless community members and do not have the capacity to assist them with housing, substance abuse treatment, and mental health care.

**Goal Statement:** The goal for this project was to identify the costliest and in need patients, then provide resources to address their substance abuse, homelessness and mental health issues and to reduce recidivism among this population by 20%.

**Description of Innovation:** The “Emergency Department Community Placement Project” (EDCPP) is designed to bridge the highest ED users into community based homeless prevention services, substance abuse treatment, and intensive case management. Upon discharge patients meeting inclusion criteria are screened, refereed and placed upon discharge into contracted community partners to receive unique services fitted to meet their psychosocial needs.

**Participants: Nurse-Led multi collaborative project between hospital and community.**

- ED Outreach Manager
- Community Partners: St Vincent de Paul, San Diego Rescue Mission, and Volunteers of America
- ED Social workers
- ED Staff

**Outcomes: Phase II of project has shown a continued downward trend in reduction of ED revisits and inpatient visits.**

**Implications:** Cost benefits savings of \$168,231 (based on program expenses, of \$38,234 (6mos) = 4.4 (ROI)). Among EDCPP placed patients a 78% reduction in recidivism was seen. Press-Ganey patient satisfaction scores increased by 3.8%.

**Recommendations for future projects:** Acquire additional community partners and expand project throughout the UC System.

**Outcomes: Phase II of project has shown a continued downward trend in reduction of ED revisits and inpatient visits.**

**Implications:** Cost benefits savings of \$168,231 (based on program expenses, of \$38,234 (6mos) = 4 .4 (ROI)). Among EDCPP placed patients a 78% reduction in recidivism was seen. Press-Ganey patient satisfaction scores increased by 3.8%.

**Recommendations for future projects:** Acquire additional community partners and expand project throughout the UC System.

## E 07 - Evidence-Based Solutions for Vulnerable Populations

### Formulating a Best Practice Statement for Prison Parenting Programs: A Program Evaluation Project

---

*Donna M. Zucker, PhD, MS, BS, RN, FAAN, USA*  
*Christine Beatriz, BS, RN, USA*

#### Purpose

to describe a program evaluation of a prison parenting program in a western Massachusetts correctional facility.

#### Target Audience

nurses who work in correctional nursing, substance abuse treatment, psychiatric mental health nursing or family nursing.

#### Abstract

Background : A Healthy People 2020 goal is to increase the proportion of parents who use positive parenting. By promoting good parenting techniques, children of incarcerated parents may experience a better relationship with their parent, which could potentially lead to reduced rates of depression, aggression, and intergenerational incarceration. This paper describes a program evaluation performed in a Massachusetts correctional facility's parenting program.

Purpose: The goals were to review the literature about best practices in prison parenting programs and to evaluate a prison parenting program in a Massachusetts correctional facility.

Methods: This three month project had two components: 1) reviewing the literature on existing parenting programs, their outcomes, and their applicability to the prison setting, and 2) completing a program evaluation of an existing parenting program in a county correctional facility. This assessment reviewed program content, delivery and evaluation. Data were collected in the form of journaling and shared through debriefing.

Results: The outcome was the creation of a "Best Practice Statement" for prison parenting programs that included a list of recommendations shared with facility staff. The following recommendations were made: to adopt an evidence-based program; to use adult learning theory strategies; to expand the curriculum to include more concrete information about parenting skills, to begin data collection of parenting program participants and create a summative evaluation.

Conclusions: Assessment of current practices and programs are essential to achieve and maintain high quality. Outcomes provided support for adopting an evidence basis for the prison parenting program, and recommendations for program improvement.

Implications for Nursing Practice and /or Future Research: Through a critical review of existing literature and assessment of current programming, this project helped to confirm that nursing has the requisite skills, knowledge and attitudes to provide an evidence-based parenting program for incarcerated fathers and their children. Evaluation data is essential to document the impact of such a program on the mental health of both inmates and their families.

## E 08 - Attitudes and Practices Regarding Emotional Health

### Know Your Tools: Improving Nurses' Use of the Confusion Assessment Method (CAM) to Detect Delirium

---

*Julie Plagenhoef, BSN, BS, MPH, RN, CMSRN, USA*

#### Purpose

The purpose of this presentation is to provide an important example of an evidence-based practice change acceleration process to nursing professionals. The presentation will show that a targeted education improves clinical nurses' ability to use CAM assessments to detect delirium, which is an important first step in improving patient outcomes.

#### Target Audience

The target audience of this presentation is acute and intensive care clinical nurses, nurse managers, psychiatric and occupational therapy professionals, and nurse educators.

#### Abstract

**Background:** Delirium is a serious illness that increases patient morbidity and mortality during and after hospitalization (Maclulich et al., 2013). Early identification of delirium is an important step to improve patient outcomes (Holly, Cantwell, & Jadotte, 2012). Although the Confusion Assessment Method (CAM) has been validated as a useful instrument to assess for delirium in the acute care setting, anecdotal experience indicates bedside nurses do not always use it effectively. The aim of this project is to provide targeted education to clinical nurses to improve their ability to use CAM assessments to detect delirium in the acute care trauma setting.

**Purpose:** The purpose of the presentation is to describe how the change acceleration process was used to design and implement a targeted education approach to improve CAM scoring.

**Methods:** A change acceleration process of preparation, assessment, diagnosis, planning, treatment, and evaluation was used to achieve improvement in staff nurses' use of the CAM tool on a 21-bed acute care trauma unit. During preparation, the project leader mobilized commitment for the project from the unit manager, staff educator, clinical nurses, professional practice leaders, and data experts. Baseline data on CAM completeness was assessed via chart review of patients admitted to the unit over a period of one month. Baseline reliability of the CAM was determined by measuring the agreement between two expert CAM users and clinical nurse CAM assessments. All clinical nurses on the unit were surveyed to assess their current state of knowledge of the CAM and to determine barriers to CAM completion and reliability. This informed the development of the intervention, a targeted, 40-minute education session, which was given to all 34 nurses on the unit over a period of 2.5 weeks. Post-intervention completeness and reliability of CAM assessments was measured directly after the education.

**Results:** Thirty-nine patient CAM assessments were assessed pre-training and 39 different patient CAM assessments were analyzed post-training. There was a significant increase in CAM completeness between pre and post-training (73% vs. 85%,  $Z=2.36$ ,  $p < 0.009$ ). Inter-rater reliability also increased pre and post-training. Pre-training agreement on whether a patient was CAM positive was 84%, while post-training agreement rose to 97% ( $K= .059$ ,  $p= 0.102$ ). The cost to implement this project was \$3,925, including staff time for educating 34 nurses and chart auditing.

**Conclusion:** This project improved the completeness and reliability of nurses using the CAM tool to assess for delirium in the acute care trauma setting. Early interventions and improvement in patient outcomes is the ultimate goal of improving staff nurse assessment of delirium. In order to sustain this change, follow-up target education must be continued through designated nurse in-service days, updates in newsletters, and one-on-one coaching. In order to achieve improvement in patient outcomes, further projects must focus on intervention strategies to prevent and mitigate the effects of delirium.

## E 08 - Attitudes and Practices Regarding Emotional Health

### Changing Registered Nurses' Attitudes Regarding Delirium Assessment in a Military Community Hospital

---

*Nancy Ann Westbrook, MSNA, BSN, CRNA, CCRN, CEN, USA*

*Jeffery Wade Forehand, DNP, RN-BC, USA*

*Shellye A. Vardaman, PhD, RN-BC, CNE, USA*

#### Purpose

The purpose of this presentation is to disseminate results of an evidence-based DNP synthesis project focused on the attitudes of registered nurses to the application of a standardized delirium assessment tool in a rural community hospital serving a large military veteran population.

#### Target Audience

Clinical nurses working in community hospital settings  
Military nurses working in military or community hospital settings  
Civilian nurses working in military healthcare settings

#### Abstract

**Purpose:** The purpose of this presentation is to discuss the attitudes of registered nurses to the application of a standardized delirium assessment tool in a rural community hospital serving a large military veteran population.

**Background:** Delirium in the hospitalized patient can be a life-changing and highly stressful experience for the patient, the family, and for the nurse resulting in long-term life changes for the patient and family. It is estimated that a majority of patients hospitalized in medical/surgical units and ICUs experience symptoms of agitation and delirium during their hospital stay. The military combat veteran has a 10-20% higher risk of delirium events during acute hospitalization. Delirium is commonly undetected by nurses in upwards of 80% of all ICU patients and this rate may be significantly higher across all hospital nursing units. The attitudes of nurses towards use of detection tools may be one factor in the under-recognition of delirium. There is evidence that standardized assessment tools can assist nurses to identify patients at risk and identify early symptoms for delirium.

**Project Description:** The project utilized a pre- and post-survey design. The project was completed between October-December 2014. IRB approval was granted. A convenience sampling method was used to recruit participants who were registered nurses, employed by the rural community hospital, had a minimum of 1 year work experience, demonstrated the ability to read and write the English language. A total of 58/154 community hospital nurses were recruited with only 29 fitting the inclusion criteria that included completion of both the pre- and post-intervention survey. The project setting involved a small rural community hospital in Alabama with a maximum bed capacity of 120. The hospital provides a full service, 24-hour, 12-bed Emergency Department, an 8-bed Intensive Care Unit, one 29-bed surgical floor, one 29-bed medical floor, a 6-bed Labor unit, and a 12-bed Post-partum unit. Hospital admissions average 284/month. This facility is located near a large active-duty military installation and serves a diverse military and veteran population. Approximately 78% of the nurse employees had personal connections to a current or former military service member.

**Methods:** A nurse attitudes survey was adapted for this project. Data collection included completion of pre- and post-intervention surveys. The survey instrument included self-report measures through Likert scales, choice completions, and narrative comments. The internet-based program, Survey Monkey®, captured participant responses. The project provided an educational-training intervention (ETI) session with embedded video-scenario examples of patients experiencing delirium events during acute hospitalization. Participants, who attended the training session, utilized the delirium assessment tools (B-CAM or CAM-ICU) to practice scoring patients seen in the video-scenarios.

Results: Descriptive statistics were used to describe data related to the specific goals of this study. Three open-ended questions were analyzed to identify themes signifying other knowledge gaps related to delirium assessment. Inferential statistics were used for both paired samples t-tests and Chi-square calculations in order to examine for significant differences in study outcomes prior to and post intervention. While there were modest clinical differences in study outcomes, there were no statistically significant results. These results could be attributed to the small sample size.

Conclusion: Participants reported a positive attitude when given the opportunity for education and clinical application of standardized delirium assessment tools. Participants reported feeling more confident in completing delirium assessments. They indicated increased recognition of the risk factors for and symptomatology of delirium in hospitalized patients age 65 and older. A strong willingness to continue to utilize the standardized tools to perform delirium assessments on their patients was reported. Anecdotally, the nurses felt delirium assessment should be added to their electronic health record (EHR) system as part of the nursing assessment records. Specifically, the participants recognized that their high military veteran population was at great risk for delirium events. Many nurses indicated that they did not previously investigate their patient's military background during their admission nursing assessment and now see the need to include that information in the EHR.

## F 06 - Evidence-Based Nursing Outcomes

### Clinical Supervision: Predicting Best Outcomes

---

*Edward White, PhD, MSc (SocPol), MSc (SocRes), RMN, DipCPN, RNT, PGCEA, FACN, FACMHN, MICR, FIBMS, CSci, United Kingdom*

#### Purpose

The purpose of the presentation will be to heighten an awareness of Clinical Supervision with an international nursing audience and to outline a new method by which CS can be introduced and constantly reviewed for optimal efficacy.

#### Target Audience

This presentation will be of broad interest and relevance to conference delegates drawn from health policy, clinical practice, education, management and research, whose brief it is to engage an informed and critical discourse about the future of Clinical Supervision, as an integrated component of modern health care delivery systems.

#### Abstract

Clinical Supervision [CS] has an increasingly established role in the working practices of human service agencies and, in particular, has been widely introduced into public and private health systems across the world. It has shown increasing international promise as a positive contribution to health governance agendas. The continuous measurement of CS efficacy, therefore, has become one of the most important contemporary challenges. The Manchester Clinical Supervision Scale<sup>®</sup> [MCSS<sup>®</sup>] has been adopted as the leading outcome measure of the effectiveness of CS in ~115 licenced Clinical Supervision evaluation studies, in 13 countries, and has been translated into seven languages other than English.

This presentation will report the latest progress of an ongoing program of Clinical Supervision research. It will draw on three recently completed interrelated research studies conducted by the authors, towards establishing an evidence base for policy and best practice development and robust evaluation of Clinical Supervision outcomes.

The first study was a large pragmatic randomised controlled trial of Clinical Supervision. It represented a rare attempt to establish an elusive set of demonstrable causal relationships between Clinical Supervision, the well-being of nurses, the quality of care they provided and the effect on patient-reported outcomes.

The second study will describe the process by which the original 36-item version of the Manchester Clinical Supervision Scale<sup>®</sup> re-tested the original factor structure and response format for goodness of fit to the Rasch Model, using the latest RUMM 2030 software. Findings re-confirmed the validity of the response format of the 36-item version. They also indicated that original version could be reduced to 26 items, with increased structural integrity and result in improved fit statistics for six subscales, rather than the original seven. Thus, the Manchester Clinical Supervision Scale<sup>®</sup> was transformed into the present version; the MCSS-26<sup>®</sup>.

The third study used real MCSS<sup>®</sup> evaluation data and applied Classification and Regression Tree [CART] analyses; a relatively new statistical procedure which, to date, remains somewhat unknown. In operational terms, the output can be followed with little or no understanding of statistics and, to some extent, follows the decision process that nurses use to make decisions. For example, triage rules are now widely used in clinical settings to classify patients into various risk categories, so that appropriate decisions can be made regarding treatment.

Given the infinite range of international practice environments, health service organisations now have the opportunity to harvest measurement data using the Manchester Clinical Supervision Scale<sup>®</sup> (MCSS-26<sup>®</sup>) and to conduct CART analyses, that take account of particular local circumstances to model a range of

delivery permutations which will predict the likelihood of the most effective arrangement for the delivery of Clinical Supervision.

The presentation will link these three completed empirical studies within the context of the so-called Proctor framework of Clinical Supervision. It will identify fresh theoretical insights, directions for policy development and professional practice, and future research possibilities.

## F 06 - Evidence-Based Nursing Outcomes

### An Evidence-Based Practice Outcome Measure: Analysis of Nurse Authored Hospital Policy and Procedure Documents

---

*Kathy J. Fatkin, PhD, RN, AHIP, USA*

*Mary Anne Hales Reynolds, PhD, RN, ACNS-BC, USA*

#### Purpose

The purpose of this presentation is to discuss the use of citations in hospital policy and procedure documents as a means of evaluating the use of evidence based practice resources.

#### Target Audience

The target audiences of this presentation are nurse educators, leaders, and practitioners interested in the utilization of EBP in acute care settings.

#### Abstract

**Background:** Evidence Based Practice (EBP) is an approach to making health care decisions that integrates best evidence from research with the provider's clinical expertise, the patient's preferences and values with available resources within a health care system. Evidence from current research is considered the primary basis of EBP and the strength of the evidence varies depending on the quality, quantity, and consistency of the available research. When EBP directs decision-making, the quality of patient care improves and health care costs decrease (Melnyk, 2012). It is expected that hospital nurses utilize current research-based evidence to guide patient care decisions (IOM, 2001).

Patient care within a health care system is often directed and communicated by written protocols for managing various patient care needs. These documents describe the standards and expectations for nurses in performance of particular nursing activities along with the nurse's roles and responsibilities. Written policy and procedure documents ensure safe and consistent care to patients around the clock (Long, Burkett, & McGee, 2009). These documents may reflect generic policy and procedure manuals or may be created or updated by nurses within the organization. Nurse authors are often directed to cite the "source of information at the end of the policy" (Pape, 2003, p. 154). There are very few studies that specifically look at the sources of evidence, in this case, policies and procedures, nurses use to support patient care decisions.

The purpose of this study was to investigate the use of EBP through an examination of nurse-authored hospital policy and procedure documents. This study answered the following questions: 1. What are the information sources nurses cite when creating or updating nursing policies and procedures? 2. Are there variations of source citations between rural and urban, and small and large hospitals?

**Methods:** This bibliometric study used citation analysis of nursing policy and procedure documents from full member National Network of Libraries of Medicine (NN/LM) hospitals with staffed medical libraries in the intermountain west region of the U.S. A purposive sample of 22 hospitals was selected for the study. Ten hospitals voluntarily shared their nursing policy and procedure documents; seven of the hospitals were located in Idaho, and three were located in Utah. Seven of the participating hospitals were located in urban (>50,000 population) centers and three were located in rural areas; three participating hospitals were small (under 100 licensed beds) and seven were considered large (100 or more licensed beds). 1,581 policy and procedure documents that had been updated or created by a nurse over the previous 12 month period were examined. References to published literature were collected by printing or recording the list of citations from these documents. These citations were the major units of analysis.

**Results:** Of the 1,581 documents examined, 1,172 (74%) had no citations. The 409 documents with citations yielded 1,285 individual citations. These citations were evaluated based on the types of sources and year of publication. Analysis of the data found that citations came from the following sources: 27% books, 26% journals, 20% websites, 19% government documents, and 8% from other resources including

product manuals, point-of-care summary databases, and meeting minutes. Each type of resource was further analyzed to determine the type of evidence represented. Textbooks, many available electronically, were frequently written by nursing specialty groups publishing their standards of practice and reflected current copyright dates. Journal citations reflected primary research articles, systematic research reviews from medical and nursing journals and clinical practice articles. High quality websites and links to reliable government agencies or well-recognized professional organizations were also cited. EBP summary databases such as the Cochrane Library which is considered the highest level of evidence for practice were rarely cited.

Variations between hospitals, specifically urban and rural, and small and large were determined. It was found that citation types varied between large and small hospitals. Small hospitals cited government documents more often than the larger hospitals. Larger hospitals cited more websites. When compared to urban hospitals, rural hospitals cited more books and the average age of the cited resources was older compared to urban hospitals.

**Conclusion:** It is recognized that this study looked at a small and unique population of documents, yet it provides an important “snap shot” of information sources as a measure of the utilization of EBP. Important findings from this study include: first, the majority of the initially reviewed nursing policy and procedure documents did not include any citations to any published sources (74%). This study did not look at nor can it speculate about, the preparation of the nurses or the process used in developing the policy and procedures, yet if nursing practice is to be based on “evidence” that evidence needs to be documented. Second, of the resources cited, there was a large variation of type of resources being used, as well as strength of the evidence within individual documents and between hospitals. Finally, it is important to note that all of the hospitals in this study had on-site medical librarians. Medical librarians are educated in evidence based practice principles and process, and also have access to most published sources. They have the expertise in finding and evaluating the evidence and are important resources to other health care providers in using EBP.

**Nursing Implications:** EBP is foundational for quality nursing care (Melnyk, 2012) and policy and procedure documents require current, research-based evidence (Pape, 2003; Turkel, 2004). It is well documented that hospital nurses are utilizing EBP based on measurable patient outcomes, however, this study clearly shows that in this population, policy and procedure documents are not reflecting the best evidence. There is clearly a need for nursing curriculums in practice, education, and leadership to revisit evidence based practice concepts in terms of strength of the evidence or best sources, where to find the evidence, and finally, how to document the sources of evidence. There is also a need for nurses in hospitals to work as a team with medical librarians. Medical librarians bring to the table important knowledge about evidence based practice as well as the expertise to the access and evaluate many different resources. This study is important to nursing in that it has looked at the application of EBP from a unique perspective and has identified the need to document what sources of evidence support care decisions detailed in nursing policy and procedure documents.

## F 06 - Evidence-Based Nursing Outcomes

### Integrating Evidence-Based Practice in a Nursing Curriculum Based on the RNAO Guidelines Using Action Research

---

*Christa Van der Walt, PhD, MSocSc, MEd, BEd, BArtSc, RN, RM, South Africa*

*Sharon Vasuthevan, PhD, MCur, BCur Hons, BCur, RN, RM, R Psych N, Community Nurse, Nurse Educator, South Africa*

*J. C. (Irene) Lubbe, PhD, MSocSc, RN, RM, South Africa*

*P. J. Smith, BCur, letA, RN, RM, South Africa*

#### Purpose

The purpose of this presentation is to provide an overview and our experience to plan for the integration of evidence-based practice in a nursing curriculum based on the RNAO BPSO Guidelines.

#### Target Audience

primarily educators, leaders in evidence-based nursing and midwifery, researchers and other stakeholders such as representatives from clinical practice.

#### Abstract

Problem statement: Evidence-based practice (EBP) is increasingly emphasized in healthcare, nursing practice and nursing and midwifery curricula. The same applies to South Africa. Nursing Education Institutions in South Africa need to provide evidence of how EBP is integrated throughout their curricula during accreditation visits from the South African Nursing Council, peer and external reviews. The past three decades much has been invested in research and implementation exercises to close the practice theory gap and to answer to the quest for excellence and accountability. Although a wide vocabulary is used, best practice guidelines (BPGs) or evidence-based guidelines are continuously developed. The BPGs developed by the Registered Nurses Association of Ontario (RNAO) is an example of the commitment to EBP. Nurse educators should foster the use of Best Practice Guidelines in nursing and midwifery education and take the lead in integrating the principles of EBP and best practices in their curricula, teaching and learning strategies. This paper provides evidence of the first phases of integrating EBP in the undergraduate nursing curriculum using an action learning action research approach and the methodology recommended by RNAO.

Methods: An Action Research approach (McNiff & Whitehead 2011) was used to describe the integration of EBP in the nursing curriculum of the participating Nursing Education Institution. We used Action Research to comply to the requirements of RNAO for BPG integration in the nursing and midwifery curriculum. RNAO Guidelines and Toolkits and the implementation drivers described by the NIRN (National Implementation Research Network) were utilised. We followed the typical cyclic process of planning, action and reflection whilst continuously capturing data, validating the data and making knowledge claims, and modifying practice. We will share the lessons we learned and our experience of the conceptualization and integration of EBP in the nursing curriculum of the participating Nursing Education Institution.

Conclusions: The Guidelines and Toolkits of RNAO and the NIRN provide valuable planning, monitoring and assessment framework for the integration of EBP in a nursing curriculum. Using implementation drivers to assess the implementation of EBP in the nursing curriculum was a useful way to identify areas that need additional attention and provided valuable process and outcome data.

## F 07 - Implementing Evidence-Based Practices

### An Evidence-Based Roadmap to Healthy Work Environments for Nurses: Closing a Gap in the Literature through Development of a Toolkit

---

*Alissa Samoya, DNP, RN, CPN, CNE, USA*

#### Purpose

The purpose of this presentation is to share an evidence-based toolkit I created for nursing leaders to use when implementing changes aimed at creating or maintaining a healthy work environment for nurses, based on the AACN's six essential standards.

#### Target Audience

The target audience of this presentation is nursing leaders who are interested in creating or maintaining healthy work environments within their respective organizations.

#### Abstract

**Aim:** The aim of this pilot study was to evaluate the effectiveness of an evidence-based toolkit aimed at improving the health of nurses' work environments.

**Background:** Unhealthy work environments contribute to medical errors, ineffective care delivery, conflict, and stress. As a result, the American Association of Critical Care Nurses established the six essential standards required for healthy work environments to exist. However, no step-by-step guide exists to assist leaders with implementing each of the standards required for a healthy work environment. The lack of guidance for implementing the standards has led to a small percentage of hospital leaders reporting that healthy work environments have been created within their respective organizations.

**Theoretical Framework:** The Path-Goal theory was used as the theoretical framework for this project, and is based on the foundational belief that a leader has the ability to adjust his or her style and behaviors to influence employees and the work environment.

**Data Collection:** Nursing leaders used the toolkit to address the health of the critical care work environment in a Magnet organization. The leader completed a Likert questionnaire to evaluate the toolkit. Staff perceptions of the environment were also assessed using a validated web-assessment tool.

**Data Analysis:** The leader rated the toolkit's usability, clarity, and applicability as "very good" or "good" for each standard, and reported that she would be very likely to utilize the toolkit for future change implementation and to recommend the toolkit to other nursing leaders. The leaders concentrated on the standard of meaningful recognition since this was the only standard that fell below the national benchmark in the Time 1 assessment. The Time 2 data revealed a score of 3.31, which was higher than the national benchmark of 3.23.

**Conclusions:** Providing nursing leaders with evidence-based resources to guide change implementation is vital to the success of creating healthy work environments in hospitals across the United States. Dissemination of this toolkit will provide step-by-step, evidence-based guidance and support that has been unavailable up to this time, which could lead to increased adoption of the standards and improved organizational cultures that support nurses with a healthy work environment.

**Implications for Nurse Management:** Nurse managers are fundamental to promoting change and ensuring positive work environments exist, but need resources to guide their efforts. This toolkit closes a gap in the literature and augments leaders' efforts to create HWEs.

**Keywords:** healthy work environment, toolkit, staff perception, nurse leader, evidence-based practice

## F 07 - Implementing Evidence-Based Practices

### Disaster Preparedness: A Template for Saving Lives

---

*Catherine A. Marcum, DNP, MSN, BSN, RN, APN, AGACNP-BC, USA*

#### Purpose

Demonstrate how nursing can impact a national and international issue of global significance through collaboration with non-nurses in an effort to raise awareness and educate.

#### Target Audience

Nurses in every sphere of practice - from acute care to public health, from the bedside to advanced practice and academia.

#### Abstract

Disaster has almost become a household word in America and around the world. Disaster preparedness provides some control over the effects of disaster, however small that may be. The National Response Framework provides the structure under which all disasters are managed domestically (Veenema, 2013). It is scalable and flexible – having the ability to accommodate any disaster, from the smallest incident to a disaster of national proportions (<http://emilms.fema.gov/IS700aNEW/index.htm>; <http://emilms.fema.gov/IS800B/index.htm>). Preparedness determines the degree of service disruption regardless of the nature of the disaster. The goal of preparedness within any entity is to expect the unexpected, prepare beforehand, and integrate this preparedness within the context of the community disaster plan. Only when this is accomplished will losses be mitigated.

In the spring of 2011, the United States experienced the largest tornado related event in our Nation's history. During that three-day period and across five states, the Centers for Disease Control confirmed that 58% of the fatalities were female (MMWR, 2012). Aware of these statistics, the Federal Government views populations comprised of women and children as high-risk, high-vulnerability (Veenema, 2013). Under ordinary circumstances in a disaster, the special needs of pregnant women and infants should be addressed in order to minimize excess neonatal and maternal mortality (Veenema, 2013). Disaster compounds its effects on an already marginalized population – crisis pregnancy with its social, emotional and physiologic components.

High-risk, high-vulnerability populations refers to people who have both a higher probability of being exposed to disaster and face challenges to anticipate, cope with, resist, and recover from a disastrous event (Veenema, 2013). Included among those most at risk to adverse impacts and disaster are women and children. The United Nations International Strategy on Disaster Reduction states that, in both developing and developed nations, women and children are fourteen times more likely to die than men during a disaster (<http://www.unisdr.org>). At risk people generally have reduced access to vital economic and social resources, limited autonomy and power, and have low levels of social capital (Barnshaw & Trianon, 2007; Morrow, 1999). Historically, disaster exacerbates existing social, political, historical, and economic circumstances that marginalize populations – those often unaccounted for in disaster preparedness and mitigation efforts (Runkle et al., 2013). Disparities in healthcare system access during the recovery phase may contribute to inequities in health outcomes in those populations affected by disaster, which further marginalizes vulnerable subgroups. Excess patient demands on the healthcare system after disaster promote lack of continuity and disruptions in access to primary care and make the system vulnerable to a separate public health emergency (Manley et al., 2006; Gursky, 2004; Schur, 2004).

Vulnerability of people and places is a complex phenomenon. Vulnerability can be defined as the inner conditions of a society that make it liable to experience harm and damage (Birkman, 2005). The ability to measure vulnerability is an essential component of risk reduction and the promotion of a culture of disaster resilience (Birkman). Disaster can be defined as the complex interaction that exists between a

potentially damaging physical event and the vulnerability of a society – its infrastructure, economy, and environment that are determined by human behavior (Birkman). According to the United Nations (2005), the starting place for preparedness lies in the knowledge of hazards and the physical, social, environmental, and economic vulnerabilities to disaster that most societies face. Villagran de Leon (2001, 2004), places vulnerability within a “risk triangle” framework, thereby viewing risk as a relationship between vulnerability, hazard, and disaster preparedness. It is through this process of identifying vulnerabilities, prioritizing hazards, and addressing deficiencies in preparedness that risk can be mitigated, response can be appropriate, and recovery can occur (Veenema, 2013).

Community resilience is a key component of national preparedness (Plough et al., 2013). Resilience as defined within public health emergency preparedness is the ability to mitigate and rebound quickly. The absence of sustainable engagement with community-based organizations, faith-based organizations, and other neighborhood-level organizations creates significant disparities in population health outcomes following disasters (Plough et al.). Resilience before, during, and after an adverse event can be attributed to collective identity, prior experience, and social support networks (Nuwayhid et al., 2006). Community resilience literature strongly advocates a sustained commitment to improving connectedness (both social and informational linkages) between individuals, organizations, and formal governmental agencies (Nuwayhid et al., Bava et al., 2010; Landau, 2010).

Coordination is a central component to the National Response Framework’s goal of saving lives (Uddin et al., 2011). Based on research findings – a lack of coordination preparedness for an extreme event results in greater loss of life and economic impact regardless of whether the disaster is naturally occurring or man-made (Ussin et al.). An emergency disaster preparedness plan is considered a necessary precondition for appropriate response. Networking among organizations provides opportunities to share information across organizational boundaries and these relationships play into how emergency preparedness plans are rehearsed. Therefore, establishing relationships with the emergency disaster community (“tie strength”) allows an organization to rehearse emergency protocols more regularly and accurately, thereby increasing success in real-life situations.

Disasters may be caused by a variety of man-made or natural events; however, it is not the type or magnitude of the event, but its impact on human populations, that makes an event a disaster (Veenema, 2013). Disasters are not measured by hurricane category, seismic intensity, or bioterror agent category, but by the constellation of actual harm sustained by individuals and community. Empowerment systems for human services in disaster are designed to promote stabilization and viability on the community as well as self-sufficiency and human security at the individual and family level. It is necessary that nurses predict potential human services issues and develop and implement (when needed) the community’s emergency management plan related to human services.

As national disasters continue to impose difficulties nationwide and as disaster becomes a visual image (i.e. 911; the Boston Marathon bombings), the pressing need for preparedness will become increasingly evident. Addressing preparedness in a vulnerable population can only be positive – if one agency is prepared, or one group of agencies within a community is prepared, or perhaps one target group within a region – then lives will be saved. It is the desire that this project, though just one small segment of a population within a community, will provide a catalyst for realization that it is the responsibility of society at large to meet the needs of the vulnerable among us.

## F 07 - Implementing Evidence-Based Practices

### Using Evidence-Based Teaching to Support an Innovative Teaching Strategy in an Undergraduate Research Course: A Longitudinal Study

---

*Astrid H. Wilson, PhD, RN, USA*

#### Purpose

The purpose of this presentation is to describe a longitudinal study aimed at providing evidence-based teaching for an innovative teaching strategy in an undergraduate research course. The innovative teaching strategy, the Evidenced-Based Group Project Assignment survey, the methodology, results, and implications for education and practice will be shared.

#### Target Audience

The target audience of this presentation is nurse educators in academia and in the clinical setting. Also, educators who are interested in engaging in evidence-based teaching practice to support innovative teaching strategies.

#### Abstract

**Purpose:** This longitudinal study was aimed at providing evidence-based teaching for an innovative teaching strategy in an undergraduate research course.

**Method:** A longitudinal survey design was used to elicit students' responses about an assigned group project. The instrument used was the Evidence-Based Group Assignment Survey, a 21 item Likert type survey developed by the author. The responses were strongly disagree (1), disagree (2), somewhat agree (3), agree (4), and strongly agree (5) thus a summated score could be obtained between 21 and 105. The items related to how the assignment helped students gain knowledge, skills in critiquing research articles, making decisions related to evidence-based practice, and confidence in themselves to be better prepared to participate in evidence-based activities as an RN. The survey was administered at the end of eight separate research classes from 2008 to 2014. IRB approval was obtained for this research study. The innovative teaching strategy will be described so it can be used by other educators.

**Results:** The sample consisted of 225 undergraduate nursing students who were predominately traditional students, with some accelerated students and few RN-BSN students. The majority of the participants were female (96%) and 90% were traditional students. The mean summated score for all groups (225) ranged from 78 to 93. The mean scores on each item on the instrument ranged from 3.89 to 4.62 (out of 5) indicating that no means were in categories of disagree or strongly disagree. Internal consistency of the instrument was established using a Cronbach's Alpha for each group. The alpha score for the entire sample was .94 (very high).

**Implications:** There is a continuous need to determine teaching strategies that have an evidence-based teaching practice. The Evidence-based Assignment in this study has empirical support for its use. Students can gain more knowledge of evidence-based practice in nursing courses with innovative strategies with evidence support. With evidence-based teaching practice clinical settings will have new graduates who are better prepared to identify clinical problems needing evidence, locate, understand, and critique research articles and systematic reviews. Students also will be better able to participate in evidenced-based projects in the clinical setting which is especially important in agencies seeking Magnet status.

## F 08 - Supporting Family Health through Evidence

### The Lived Experiences and Support Needs of the Postpartum Primiparous Women in Tshwane, South Africa

---

*Mmajapi Tshidi Elizabeth Chokwe, MTech (Nsg), BACur (Adm/Edu), RN, CNM, South Africa*

#### Purpose

Is to give report about the section of the main study about lived experiences and support needs of post partum primiparous women after discharge at Ga-Rankuwa

#### Target Audience

the midwives who are working at clinics and those working in hospitals who discharge post partum primiparous women.

#### Abstract

**Research purpose:** Is to give report about the section of the main study about a community-based support programme for early discharged postpartum women in Ga-Rankuwa, Tshwane. The presentation is based on the 1st phase of the main study and is about the lived experiences and support needs of post partum primiparous women after discharge at Ga-Rankuwa. Although scientific evidence does not indicate increase in maternal and neonatal mortality and morbidity after discharge postpartum, concern for possible complications exist among health care providers and the primiparous post partum. Although the general expectation is to emphasise and counsel the postpartum primiparous about the wellbeing of herself and her newborn, it is observed that they are discharged from clinics and health institutions before they can master and understand the changes and the care expected.

**Objective:** To explore and describe the lived experiences and support needs of the primiparous women who are discharged postpartum at Ga Rankuwa clinics.

**Methods and design:** A qualitative exploratory and descriptive study was used to explore the lived experiences and support needs of post partum primiparous women from health clinics at Ga-Rankuwa. The context of the study was three Ga-Rankuwa clinics providing maternity care services to postpartum primiparous women.

**Data gathering:** Data were gathered from the post partum primiparous women by conducting an in-depth individual interview using an interview schedule. A central question was asked: "Please tell me your experience of being discharged from hospital or clinic, your support needs and your experience of taking care of yourself and newborn baby at home". Saturation of data was reached at the 12th participant. Data analysis was done using Hermeneutic interpretive approach.

**Findings:** Although almost all participants had a tertiary education, most of them were unemployed. Three themes emerged from the data analysed. Themes emerged were the need for support, knowledge and skill deficit, and cultural beliefs and practices.

**Conclusion:** Postpartum primiparous women expressed the need to be supported post partum and they mentioned the cultural practices of which some were unsafe to the newborn.

## F 08 - Supporting Family Health through Evidence

### Physical Activity, Prevention of Functional Decline and Support of Mobility in Older Hospitalized Patients: A Literature Review

---

*Iris Tamara Schneider, MSc (Nsg), RN, Germany*  
*Gabriele Meyer, PhD, RN, Germany*

#### Purpose

to show an overview how mobility in older hospitalized people can be promoted and functional decline can be prevented.

#### Target Audience

the clinical practice, working with older patients and scientists, research in this field

#### Abstract

**Purpose:** Physical activity is the basis for participation and social life. Older hospitalized patients are prone to decline of physical activity and functional status. Mobilization and activation of older patients are mandatory in order to avoid loss of independence and admission to residential care. As first step of an own empirical study, this literature study aims to overview the current state of knowledge about mobility in older patients in acute hospitals. We reviewed papers on nurses' knowledge, risk assessments, and interventions on prevention of functional decline and sustaining of mobility.

**Methods:** A systematic literature search in PubMed, CINAHL and Cochrane has been conducted using MeSH terms and keywords. All study designs were included. Publication period was limited to the last 35 years; English and German language papers were included. A hand search in three German nursing journals and citation tracking were conducted. A search for guidelines is ongoing. Data were charted and extracted with a standardized extraction sheet by one reviewer.

**Results:** The search revealed 211 studies after title screening. Duplicates were removed and 187 abstracts were screened. A total of 36 full-text articles were assessed for eligibility, and 15 articles were excluded. The remaining 21 papers reported about research conducted in the United States, Australia and four European countries. The qualitative studies (n=7) used a phenomenological approach or grounded theory dealing with changes in mobility in older patients, barriers in ambulation of patients reported by nurses, and assistance in ADLs and care dependency reported by patients and nurses. Observational studies (n=11) reported on risk assessments, preventive measures, and on frequency and duration of mobilizing. The RCT (n=1) included in this review dealt with promoting mobility. The reviews (n=2) outlined positive outcomes of promoting mobility through interdisciplinary interventions.

**Conclusion:** Our review revealed that little research has been conducted during the last decades in the field of mobility in older patients in acute hospitals. The identified papers and own experience suggest insufficient mobility offers and a lot of potential for improvement in order to enhance and preserve older patients' mobility in the acute hospital environment. Therefore, in a next step, mobility patterns during nursing situations will be observed in two German acute hospitals. We aim to generate a better theoretical understanding and to explore the need for intervention development.

## F 08 - Supporting Family Health through Evidence

### Loneliness, Quality of Life, and Health-Related Hardiness among Older HIV+/AIDS Farmers in China

---

Janet F. Wang, PhD, RN, FAAN, USA

#### Purpose

This study investigates loneliness, quality of life, and health related hardiness among 64 HIV+/AIDS older farmers in Hubei, China.

#### Target Audience

The target audience is registered nurse, nurse researcher, nurse epidemiologist, administrator and policy maker related to infectious diseases.

#### Abstract

**Purpose and Backgrounds:** This study investigates loneliness, quality of life, and health-related hardiness among 64 HIV+ older (49 - 67) farmers in Hubei, China. HIV infection is a chronic disease that can be managed with evidence-based intervention. In Central China in the mid-1990s, plasma donation was promoted by collectors among poor rural farmers as an easy way to supplement meager income. More than 50,000 former plasma donors (FPDs) are now living with HIV+/AIDS in China and mostly in four Provinces, including Hubei, where this study was conducted. Recently advanced treatment of HIV+/AIDS patients resulted in the pooling of large numbers of older farmers who contracted HIV during the 1970s. These farmers face not only economic, but social, psychological, and physical problems associated with the aging and HIV+/AIDS processes. Data have suggested that reducing HIV+/AIDS-related stigma and loneliness may improve the health of HIV+/AIDS patients. Researchers describe the older HIV+/AIDS p as the “graying” of the HIV epidemic.

In 2006, almost 38% of HIV-positive persons were between the ages of 40–49. Receiving treatment allows these farmers with HIV+/AIDS to live longer. It is estimated that the number of HIV-positive persons over 50 will increase by 67% in the next decade. In addition, the association between HIV+/AIDS and depression has been attributed to multiple factors, including poorer cognitive and physical function due to HIV+/AIDS progression or treatment side effects. Depression and stress are inextricably linked to physical as well as social health outcomes, especially for individuals with HIV+/AIDS.

**Design and Methods:** A sequential transformative design in mixed methods was used. Sequential transformative design in mixed methods research is guided by an advocacy lens where the quantitative and qualitative components of the study vary in terms of order and priority weighting. Mixed methods is where the researcher mixes or combines quantitative and qualitative research techniques, methods, approaches, concepts or language into a single study (Creswell et al. 2011).

We considered five attributes in designing mixed methods studies, they are: (a) Rationale: Our rationale for mixing methods was to allow participants to respond to objective questionnaires with self-report answers, respond to subjective open ended questions, or share with the research team their thoughts, feelings, and ideas about their IPV experience unencumbered by filling-in or checking space limitations, (b) Data collection and data analysis paradigm: We used phenomenology as a mixed methods paradigm to integrate not only specific quantitative and qualitative data collection and analysis procedures but also the social construction of multiple phenomena understood as valid realities in the mind of the participant, (c) Priority: We gave priority to quantitative data collection and analysis by first collecting and analyzing quantitative data. Qualitative data collection and analysis came second, (d) Concurrent or sequential implementation: We used a sequential implementation and integration plan for data collection and data analysis techniques, and (e) Phase at which time mixing methods were done: Mixing of data collection and data analysis was planned at the proposal stage of the research and implementation occurred first at the data collection phase (combining objective items with subjective open-ended items in one

questionnaire) and continued to the data analysis phase (Ponterotto et al. 2013). A cross-sectional survey using four questionnaires and 1:1 interviews were used to collect quantitative and qualitative data.

**Settings:** Four townships located about 5 hours from Wuhan (airport) where the participants lived near the mountains.

**Participants:** Sixty four (64) older HIV+/AIDS farmers (age 49 - 64) participate in the study. They are from four townships located near the mountains in Hubei Province. The Institutional Review Board (IRB) affiliated with the Wuhan Branch of the Association of Preventive Medicine of China approved the study.

**Data Collection:** A team of 5 researchers along with 5 local health care workers interviewed 64 (male = 36, female = 28) HIV+/AIDS participants for qualitative data. Four questionnaires: (a) demographic, (b) loneliness, (c) quality of life, and (d) health-related hardiness were used to collect quantitative data.

**Results:** A total of 64 HIV+/AIDS older farmers, from four townships participated in the study. Their ages ranged from 49 to 67; 36 males and 28 female in total. Forty eight (48) are married, 5 are single (never married) and 11 are divorced or separated. As to education received, thirty two (32) have primary school education and 16 have middle school education, one has a high school education and 14 have no education at all. Only one has a college education. The infectious routes for 43 HIV+/AIDS farmers are mostly through blood selling; 15 via blood transfusion (not blood selling), 4 through sexual contacts and 2 did not know how they contracted with the HIV virus. Average yearly income ranged from 0 to 40,000 Chinese Yen. Forty six (n = 46, 71%) stated that they have family members who care for them or live with them, thus, family members care for them as they cope with their HIV+/AIDS illness.

Participants residing in more developed areas showed higher quality of life (mean = 80.7,  $p < 0.01$ ) and higher health-related hardiness (mean: 134.9,  $p < 0.00$ ). Those with higher education showed significant higher hardiness than those who have no education (mean = 134.5,  $p < 0.008$ ). Married participants showed less loneliness (77.08,  $p < 0.018$ ) and higher hardiness (mean = 125.1,  $P < 0.038$ ). Variables such as higher income were related to higher quality of life (mean = 77.0,  $p < 0.013$ ) and having family members care for them are related to less loneliness (mean = 77.02,  $p < 0.012$ ). The qualitative data was collected via 1:1 interview with a researcher and a participant. A brief report of the qualitative data collection and analysis will be included in this presentation.

**Conclusions:** Participants in the study need evidence-based intervention and social support in understanding HIV+/AIDS as a chronic disease. Nursing care that integrates cultural diversity, evidence-based practice specifically in the area of hardiness and resilience is needed to understand the uniqueness of each participant's response to their HIV+/AIDS status. The Chinese philosophy that says "It is better to have a 'difficult' life than a 'good' death" exemplifies the concepts and ingredients in hardiness and resilience. Chinese philosophers taught the Chinese to be hardy and resilient. Resilient individuals are capable of adjusting and coping successfully in the face of adversity and successfully use social support systems to prevent the escalation of such adversity. Resilient individuals in various life spans possess the capacity to assert control and decision making processes in de-escalating or preventing adversity. Petros et al. (2013) and Bowes et al. (2013) discuss resilience as an important attribute in overcoming stress, depression, adversity, or enduring environmental and social risks and challenges into opportunities.

Furthermore, studies show resilience is a protective factor and that it could be developed in individuals; however, it can also be depleted through repeated unabated or unresolved stress, anxiety, or assault and lack of social support. We plan to develop, optimize and implement a "Hardiness, Resilience, and Social Support" care to a larger group of HIV+/AIDS farmers in our future study.

## G 06 - Examples of Doctoral Education in Nursing

### Teaching EBP Strategies to Students in a Doctor of Nursing Practice Program

---

*Barbara Ann Graves, PhD, RN, USA*  
*Linda Ann Roussel, DSN, RN, NEA, BC, USA*  
*Pamela V. O'Neal, PhD, RN, USA*  
*Shea E. Polancich, PhD, MSN, BSN, RN, USA*

#### Purpose

focused on teaching evidenced based practice (EBP) strategies to students in a Doctor of Nursing Practice (DNP) program. This session will describe a required core DNP course, which expands on foundational EBP concepts to refine a problem statement and derive a searchable and answerable clinical question toward an improvement project.

#### Target Audience

administrators, graduate faculty and DNP students.

#### Abstract

This session will focus on teaching evidenced based practice (EBP) strategies to students in a Doctor of Nursing Practice (DNP) program. Selected examples of teaching strategies used to teach EBP and improvement science in one selected DNP course will be included.

Sigma Theta Tau International continues to advocate for the use of evidence-based nursing (EBN). Professional nurses across the world are called to provide nursing care from an EBP approach. Rising health care cost and the need to improve practice and health outcomes are driving the current health care environment. Using the “best evidence available” with “nursing expertise” and “patient values and preferences”, can improve health outcomes and reduce healthcare spending.

The DNP is a practice focused doctorate designed to position nurse leaders to apply evidence-based knowledge to real practice problems. EBP from a perspective of improvement science can be used by the DNP to improve practice and health outcomes through the development and application of improvement models, tools, and techniques.

This session will describe a required core DNP course, which expands on foundational EBP concepts to refine a problem statement and derive a searchable and answerable clinical question toward an improvement project. Course assignments include problem identification and clinical question (PICOT) development, conducting a systematic review of the literature to guide the selection of methods, strategies, tools and metrics needed to complete a successful scholarly project and targeted strategies for disseminating evidence associated with scholarly projects.

Participants will see actual course content, objectives, and activities used by the faculty to advance students' understanding of practice improvement through the lens of EBP translation and strategies.

## G 06 - Examples of Doctoral Education in Nursing

### Academic/Clinical Partnerships and the Team Approach to DNP Practice Improvement Projects

---

*Rona Levin, PhD, RN, USA*

#### Purpose

To describe the win-win situation of partnering with clinical agencies for Doctor of Nursing Practice (DNP) capstone projects, which focus on an improvement theme related to agency priorities.

#### Target Audience

Faculty and students from DNP programs, and manager, administrators and DNP prepared nurses from healthcare agencies

#### Abstract

This presentation will focus on the win-win situation of partnering with clinical agencies for DNP Capstone Projects and five necessary components of such an approach. First, the philosophical and academic approach to capstone projects at New York University is to mimic the evidence-based practice improvement (EBPI) culture that graduates will be expected to facilitate/lead upon graduation. There is a clear differentiation between research and EBPI, which will be delineated. Implementing this approach in practice necessitates partnering with clinical agencies for improvement efforts. Key is focusing on the themes for improvement identified by the clinical agency. Second, students are placed in clinical agencies where they are not employed in order to avoid conflicts of interest related to student vs. employee performance. Three, teams consist of 2 to 3 students, a faculty mentor from the University and clinical mentor from the agency where students are placed. Fourth, teams are configured at the beginning of the first semester of study so that there is sufficient time (2 ½ years) for students to conduct an in depth assessment and become integrated into the agency culture. Fifth, most courses in the DNP curriculum have assignments related to the capstone project so that course content is immediately applied to development, implementation, and evaluation of projects. The first cohort to experience this team approach is completing studies in December 2014 and so data on their experiences and projects will be available for presentation as well as their overall program evaluation data.

## G 07 - How Can We Increase Patient Safety?

### Driving Patient Outcomes through Clinical Decision Support Systems and Nurse-Directed Protocols

---

*Amy Glasofer, DrNP, MSN, BSN, RN, USA*

#### Purpose

to review findings of a mixed-method study examining the effect of a clinical decision support system (CDSS) on nurse-directed urinary catheter removal. Discussion will focus on qualitative findings suggesting that nurses' comfort with autonomy must be addressed to maximize the potential for nurse-directed protocols and CDSSs to impact patient outcomes.

#### Target Audience

The target audiences of this presentation are nurse leaders responsible for implementation of information systems and evidence-based practice changes.

#### Abstract

Background: Nurse-directed catheter removal protocols (NDCRPs) are a recommended strategy to promote prompt removal of unnecessary urinary catheters, thus reducing patient risk for catheter associated urinary tract infection (CAUTI). However, implementation of NDCRPs has not been widespread, and adoption of protocol recommendations is even lower. Clinical decision support systems (CDSSs) have the potential to improve patient outcomes by delivering evidence-based guidance to frontline nurses in the course of their workflow. This study explored the effect of a CDSS promoting NDCR on the rates of NDCR, CAUTI, and urinary catheter utilization at a mid-sized community hospital. Additionally, data from open-ended questionnaires and individual interviews were analyzed to understand why nurses might not remove a urinary catheter despite meeting NDCRP criteria, and factors limiting the impact of the CDSS.

Sample: patients with urinary catheters eligible for NDCR for 4 months before and 4 months after implementation of a CDSS linked to the protocol for NDCR (Phase 1 n=103, Phase 2 n=100); Nurses on inpatient units who responded to an open-ended questionnaire (n=30) and participated in validation of the analysis (n=7). Data Collection/Analysis: 1)Retrospective comparison of NDCR (chi-square analysis), CAUTI, and urinary catheter utilization rates (comparison of rates) before and after implementation of a CDSS linked to the NDCR protocol 2)Thematic analysis of open-ended questionnaire responses describing nurses' experiences with the protocol for NDCR, and CDSS.

Results: Implementation of the CDSS resulted in significantly increased NDCR (Phase 1=42%, Phase 2=76%,  $X^2=19.6$ ;  $df=1$ ,  $p<.001$ ) but no significant difference in catheter utilization rate (Phase 1=.26/patient day, Phase 2=.26/patient day;  $p=.953$ ) or CAUTI rate (Phase 1=.69/1,000 catheter days, Phase 2=.25/1,000 catheter days;  $p=.362$ ). Analysis of the open-ended responses resulted in identification of 3 main themes which both enhance and detract from the capacity of a NDCR protocol and CDSS to impact patient outcomes: (a) professional values with the subthemes of autonomy, accountability, and high-quality care; (b) avoidance of conflict in professional relationships; and (c) ease of workflow.

Discussion: This presentation will be concentrated on findings of the qualitative component of this study offering insight into why the protocol and CDSS did not result in improved patient outcomes. Specifically, discussion will focus on nurses' comfort with autonomy granted by nurse-directed protocols and how this may limit the efficacy of such protocols. In this qualitative sample, half of respondents commented that they were not comfortable to remove the catheter without minimally consulting with the provider, or even having a provider order. The discomfort seemed to stem from the overriding belief that nurses need an order for everything, despite knowledge of the standing protocol. Additionally, there was fear that a catheter would have to be re-inserted in which case the patient or physician might be angry with them. While other research has indicated that discomfort with autonomy may be a limiting factor in

nurse-directed protocols, this study generates an understanding of the underlying issues. The discussion will offer recommendations for addressing the culture of safety to promote nurse autonomy in order to increase adoption of evidence-based practice and improve patient outcomes.

## G 07 - How Can We Increase Patient Safety?

### Safety Auditing as a Nursing Accountability Measure for Hospital Fall Prevention

---

*Nicole Huntley, BSN, RN, USA*

*Johanna Crock, MSN, AGNP-C, OCN, USA*

*Kaycee Shiskowsky, BSN, MBA, RN-BC, USA*

#### Purpose

To decrease our hospital's inpatient fall rates below the accepted benchmark by ensuring intervention compliance and adherence by all staff.

#### Target Audience

The target audience of this presentation is clinical staff who work with patients and have a desire to prevent inpatient falls.

#### Abstract

Preventing falls is important to patient safety. Despite 15 years of focused, evidence-based efforts our hospital was not consistently reducing falls to desired benchmarks. Decreasing falls through a sustainable culture change where healthcare providers are held accountable for intervention compliance was instituted. Institution of a baseline then quarterly Safety Audits by Fall Unit Peer Leaders in every hospital area. The Safety Audit Form is a visual representation of evidence and hospital policy based intervention requirements based on a patient's Fall Risk Assessment Score. The Safety Audits were performed from the Form and afforded direct remediation and correction of staff shortcomings in fall prevention by the unit peer leader immediately, increasing knowledge and awareness of all staff. At timed intervals Unit Fall Peer Leaders (UFPL) audit their units and turn in the Safety Audit Form to one of the hospital's Fall Committee Co-Chairs for Audit Evaluation. Audit Evaluations were compiled and returned to the UFPL and manager that day for sharing with unit staff and development of action plans to correct issues and knowledge deficits in real time. Audit results were shared at Fall Committee meetings, Risk and Quality Committee meetings, and Shared Leadership meetings to address compliance and accountability by all hospital staff. There were 8 fall prevention interventions that were routinely audited. From baseline to most recent audit (July 2014) each area showed a percent increase in compliance. In Critical Care areas there was an 81% increase in compliance with correct documentation, 48% increase in compliance with bed in lowest position, and 171% increase in bed/chair alarm compliance. In Floor Areas there was a 50% increase in compliance with correct documentation, 20% increase in compliance with having non-skid footwear available, and 33% increase in bed/chair alarm compliance. Within the first three months of Safety Audit institution falls decreased from 3.41 to 3.05 falls/1000 patient days. The overall annual benchmark goal of 3.17 falls/1000 patient days was achieved. Fall rates continued to decrease; at the 11-month mark post culture change the average was 2.76 falls/1000 patient days. Fall prevention is important for patient safety and satisfaction. Our hospital needed a sustainable culture change to ensure patient safety and reduce patient fall rates. Safety Audits as part of a culture change and as an accountability measure has proven a marked increase in intervention compliance and decrease of hospital fall rates.

## G 07 - How Can We Increase Patient Safety?

### Improving Transitions of Care with Bedside Report

---

*Joshua S. Lehmer, MSN, RN, CNL, PHN, USA*

#### Purpose

The purpose of this presentation is to outline the results of a Clinical Nurse Leader project to increase the consistency of bedside reporting at change-of-shift to improve patient safety, staff satisfaction, and protect financial assets of a Northern California acute care hospital.

#### Target Audience

The target audience of this presentation is the inpatient and outpatient registered nurse, nurse management and financial officer, and quality improvement staff.

#### Abstract

The goal of this project was to improve consistency of bedside reporting (BsR) at change-of-shift on a 34 bed Medical-Surgical unit of a prestigious Northern California acute care hospital. Through unit microsystem assessment and interviews with key stakeholders, it was determined there were three root causes implicated in decreased BsR consistency; the first cause concerned an aspect of the microsystem's physical workflow that did not support BsR, the second cause concerned negative staff habits that impeded BsR as perpetuated by certain negative RN perceptions of BsR, and the final cause concerned a lack of BsR accountability. These foundational weaknesses were respectively confronted with evidence-based interventions encompassing (a) a physical workflow modification recommended to unit management; (b) using staff meetings to address certain negative RN perceptions of BsR using specific, positive BsR knowledge already possessed by staff; (c) creation of a network-based BsR digital resource folder to reinforce these BsR specifics; (d) establishment of an accountability system with motivations to foster development of all RNs into BsR champions. Post-intervention assessment showed an average BsR consistency improvement of 22.2 percent with largely positive RN perceptions of BsR. Extended success of the project would conceivably improve patient satisfaction ratings, decrease nursing overtime expense, and avoid potential litigation, thereby positively impacting hospital financial yields for a period of at least six months.

## G 08 - Evidence-Based Practices to Promote Quality of Life in Patients with Chronic Diseases

### The Impact of Peritoneal Dialysis on the Family Life of Children with Chronic Kidney Disease

---

*Maria Lurdes Lomba, PhD, RN, MSc, PhD, Portugal*

*Alexandra Lameirinhas, RN, England*

*Ana Margarida Silva, RN, Portugal*

*Juliana Brito, RN, Portugal*

#### Purpose

Identifying the difficulties felt by the parents/care providers, while taking care of the child on peritoneal dialysis, and the strategies adopted by nurses to minimize these difficulties.

#### Target Audience

Paediatrics Nurses and General Nurses from the clinical practice who work with children with chronic kidney disease and their families.

#### Abstract

Background: Children with chronic kidney disease and their families have to deal, on a daily basis, with various medical procedures and a life of uncertainty. Renal replacement therapy with dialysis and kidney transplantation made survival possible, but caring for these children is complex, with a great impact on family's well-being and life quality.

Aim: Identifying the difficulties felt by the parents/care providers, while taking care of the child on peritoneal dialysis, and the strategies adopted by nurses to minimize these difficulties.

Method/design: Systematic review of literature without meta-analysis study carried through an on-line literature research from different search engines and databases. 7 articles were selected to build up the research sample: 5 from MEDLINE with Full Text and 2 from CINHALL Plus with Full Text.

Results: The family dynamics is negatively affected by the changes imposed from the disease. Parents and particularly the mothers are the main care providers for these children and the greatest difficulties mentioned are maintaining a steady employment and the financial constraints regarding the unemployment status and the increased costs of looking after a peritoneal dialysis dependent child. Although none of these articles focus on results from the implementation of specific nurse interventions, they suggest that the nurse's role is to identify the family's main difficulties, to facilitate the adaptation process and to develop interventions that promote the family's biological, emotional, physical and spiritual well-being.

Conclusion: Taking care of a child on peritoneal dialysis affects adversely the family unit, specially the main care provider. The changes imposed are significant and require constant adaptations on the daily routines. It is highlight the significance of the nurse's role on supporting and promoting these families well-being but further studies shall be developed to measure the efficacy of the suggested nursing interventions.

## G 08 - Evidence-Based Practices to Promote Quality of Life in Patients with Chronic Diseases

### Changing the Behavior of the Caribbean Immigrants in Toronto

---

*Khelesh Persaud, PhD, MSN, BSN, RN, Canada*

#### Purpose

The purpose of this study was to evaluate the efficacy of the Canadian diabetes health education program in changing the behavior of Caribbean immigrants in Toronto with Type 2 diabetes using the health belief model. This quasiexperimental study shows there is an overwhelming desire for culturally-sensitive diabetes self-management education

#### Target Audience

The target audience of this presentation is practitioners and educators who are treating Caribbean immigrants with Type 2 diabetes and academic researchers wanting to improve the quality of life, self-care, knowledge and understanding of disease process by creating evidence for the inclusion of culturally sensitive education tailored to diabetic population.

#### Abstract

The purpose of this study was to evaluate the efficacy of the Canadian diabetes health education program in changing the behavior of Caribbean immigrants in Toronto with Type 2 diabetes using the health belief model. There is limited information in the literature about this topic. Previous studies conducted on the Caribbean population's Type 2 diabetics did not include sufficient educational information to meet the needs of the Caribbean people to decrease further health complications. This quasiexperimental study built upon existing research that suggested there is an overwhelming desire for culturally- sensitive diabetes self-management education. The sample consisted of 128 adults between the ages of 35 to 60 years with a history of Type 2 diabetes in the Scarborough community in Toronto. Participants were randomly assigned to the intervention or control groups by recruitment number to assess the effect of education using a pretest and posttest design. Data were analyzed via t tests, which showed significant differences between the intervention and control groups. The implications for social change included practitioners working with the Caribbean immigrant population for the reduction of total national health care expenditures through improved diabetes health care education, particularly in handling culturally-specific cases. Providing culturally-tailored education to the diabetic Type 2 population will not only decrease acute and chronic complications but will also promote a better quality of life, self-care, knowledge, and understanding of the disease process.

## H 06 - Educating Nurses Online

### A Transformative Model of Caring and Quality in Online Nursing Education

---

*Anna M. Waterman, PhD, RN, USA*

*Therese A. Snively, PhD, MS, BSN, RN, USA*

*Tara Lynn Spalla, PhD, RN, USA*

#### Purpose

The purpose of this presentation is to explore the impact for faculty and nursing students when caring and quality intentionally intersect in online education. Current evidence will be shared that underpins this work to identify best practices in online education.

#### Target Audience

This presentation is designed for the nurse educator who desires to transform the online classroom into a place of caring and high quality for both educators and students alike.

#### Abstract

With the surge in online education and the growing numbers of faculty teaching nursing courses online across the globe, the ways of knowing and enacting online caring and quality need to be identified, explored, and defined. Learning to create high quality, excellent online courses can be considered part of caring within the curriculum. Both faculty and students can be assured of excellence in the teaching/learning process by utilizing a model combining the culture of caring and quality in online nursing education.

One of the indicators of quality in online education is peer review of individual courses with the Quality Matters™ (QM) Rubric that is evidence-based. It is different and distinct from other benchmarking in higher education and online education because it is situated from the lens of the student. This willingness to look at the online educational environment from the vantage point of students can be considered a caring action directed at providing excellent online education. The other quality indicator used for the model is the Online Learning Consortium, formerly Sloan-C, a premier online learning society dedicated to providing quality in all aspects of online learning. A new model created through synthesizing the concepts of caring and quality to transform online nursing education will be presented. This intersection of caring and quality leads to improved outcomes for both students and faculty.

Examples of strategies used to foster a caring and quality online environment include: new student online orientation, online faculty orientation, online faculty mentoring program, and personal student advisement utilizing technology to reduce the geographic distance between students and advisors. In the Online RN-BSN Completion Program, online faculty members demonstrate caring and quality by developing and following academic policies created specifically for the working nurse, as well as utilizing multiple strategies to engage distance students and promote success.

Strategically planning online excellence for all learners has international implications. Examples of strategies include using face-to-face real time web-chats so that teachers and learners can see body language, hear voice tone and inflection; integration of international literature within learning modules demonstrating value of multiple perspectives; flexible deadlines in assignments; academic support strategies to meet individual student needs; and nurse educator leadership to model and promote a positive and respectful learning environment for all.

The outcomes from using this “Transformative Model of Caring and Quality in Online Nursing Education” include the following: learning, growth and development; reciprocal connection; student and faculty satisfaction; increased student retention rate; increased student completion rate; and decreased time to graduation.

## H 06 - Educating Nurses Online

### Civility 101 in the Online Classroom: De-Stress for Student Success

---

*Diane B. Monsivais, PhD, RN, CNE, USA*

*Leslie Robbins, PhD, RN, PMHCNS-BC, PMHCNP-BC (NM only), FAANP, USA*

*Ryann D. Fierro, BSN, RN, USA*

#### Purpose

The purpose of this presentation is to describe the use of focused strategies that promote civil and supportive behaviors in the online classroom. As online students bring civil and supportive behaviors learned in the classroom to the workplace, practice and education can be transformed regionally and globally.

#### Target Audience

The target audience of this presentation is faculty and administrators involved with online education.

#### Abstract

**Problem/Background** Online learning opportunities are expanding rapidly in higher education, but are often accompanied by pedagogical and technological challenges that create stress for both faculty and students. Without proper management of online stressful challenges, rising stress levels have the potential to deteriorate into uncivil behaviors that can easily have a negative impact on student success.

Currently available best-practice guidelines for online education provide general guidance regarding the development and management of the online classroom. However, it is often necessary to consider institution-specific data along with best practice guidelines in order to develop focused, instead of general, strategies for managing the stressful challenges inherent in online education. With the rapid expansion of online programs across the nation, focused strategies will allow faculty and administrators to more effectively manage those challenges that may lead to uncivil behaviors and interfere with student success.

Students bring behaviors they learn in the classroom into the workplace. As students carry civil and supportive behaviors learned in the online classroom to the workplace, they have the potential to transform practice and education both regionally and globally.

**Objective** The qualitative results of the Incivility in Online Learning Environment (IOLE) survey<sup>®</sup> (Clark, 2012) at UTEP School of Nursing were used to gain an understanding of faculty and student perceptions regarding the greatest challenges to online learning.

**Methods** The Incivility in Online Learning Environment (IOLE) survey (Clark, 2012) is a descriptive tool that measures perceptions and frequencies of uncivil behaviors by faculty and students in the online learning environment (OLE), perceptions surrounding challenges and advantages in the OLE, and ideas for promoting civility in the OLE. After IRB approval, a link to the consent form and the self-administered IOLE- 45 item survey was sent by email to all UTEP School of Nursing faculty, graduate nursing students and RN-BSN students. Data was analyzed using descriptive statistical analysis for frequency of responses for faculty and students using SPSS software. Qualitative description was used to analyze the narrative responses to the qualitative questions.

**Results** The survey was completed by 100 participants (Faculty (n=23) and students (n=67)). For students, the most common stressful challenges for students were related to faculty response time, lack of clarity, and group work issues. For faculty, the most common stressful challenges included creating a sense of community and supportive learning environment, lack of face to face time to address issues, and the intense time commitment and constant attention to online courses.

**Implications/Application to Educational Practice** Using the Education Evidence Interaction Framework, examples of adapting best practices and research evidence to the local setting will be discussed. By effectively managing challenges, stress levels and potential uncivil behaviors may decrease, resulting in increased chances for student success. Through both University and School of Nursing sponsored orientation and faculty development programs, faculty are being educated regarding focused strategies for managing the challenges related to online learning.

## H 06 - Educating Nurses Online

### Designing 3D Virtual Simulations in Nursing Education: The Rest of the Story

---

*Tona L. Leiker, PhD, MN, BSN, RN, APRN-CNS, CNE, USA*  
*Karen R. Whitham, MSN, MS, RN, CNE, USA*

#### Purpose

The purpose of this presentation is discuss the design, development, implementation, and evaluation of 3D virtual simulations in undergraduate and graduate nursing education. The focus of the presentation will be on use of metrics to assess the effectiveness of internally developed and externally purchased simulations used within one nursing program.

#### Target Audience

The target audience of this presentation is undergraduate and graduate nursing faculty, academic nursing leaders, simulation and assessment coordinators of nursing programs.

#### Abstract

The changing landscape of academia with tightening clinical access for nursing students has led to innovation in nursing programs worldwide. One form of innovation has been the development of virtual simulations for both undergraduate and graduate nursing students. In addition, nursing education continues to transform to greater online and hybrid classroom formats from the traditional face-to-face classroom environment.

Designing innovative and engaging classroom and practice experiences for nursing students to meet this changing landscape was achieved through the development of five virtual simulation learning experiences. Undergraduate and graduate nursing students experience virtual simulations within the classroom. 3D virtual learning simulations were designed to meet student practice experiences in community health, leadership and management, and health assessment. Ongoing design work is supporting nursing student exploration of nursing theory and research in a virtual nursing museum. In addition, virtual simulation bots (a) support the student services experience, and (b) the students' academic learning experience.

All of these virtual simulations, except the health assessment simulation, were designed and built by the University's interprofessional group of committed academicians, instructional designers, and 3D virtual world multi-player, multi-user simulation experts. The goal was to create immersive and realistic simulation experiences for nursing students in a private and secure academic learning environment. Each new virtual simulation was imagined, designed, developed, beta tested and then introduced into the online classroom. Following initial classroom launch, metrics have been gathered to continuously improve the student learning outcomes and faculty experience.

Student and faculty feedback and course metrics assess the effectiveness of developing and implementing virtual simulations for use in nursing education. Pre and post – assessments within courses provide measurement information to support continued use of these various virtual simulations. Finally, use of metrics provide data to support changes within the 3D worlds and course designs to improve course delivery and learning outcomes.

Benefits of virtual simulation achieved include innovation in the nursing curriculum with value added learning for nursing students. Students are able to meet practice experience requirements with expanded flexibility via the virtual simulations. Each student has access to the simulated environment 24 hours a day, seven days a week, with requisite technical support. The virtual environment, hosted by the University is private and, therefore, a personally safe learning environment for students and faculty.

All virtual practice experiences are logged in real time using the student's name. Each student has a unique login and password protected access. These accesses are logged such that the faculty of record

is able to assess time in location, repeated attempts to competency, and assess or compare student documentation to student interaction in the 3D virtual world. As these learning experiences are real time during the enrolled course, students' ability to fabricate practice experiences are minimized.

This session will conclude with next steps in the design, use, and evaluation of 3D virtual simulations in online education. Discussion topics will include use of formative and summative assessments within virtual simulations; and use of assessments to document achievement of program learning outcomes.

## H 07 - Evidence-Based Strategies to Provide Quality Care

### Continence Behavioral Rehabilitation Program

---

*Phyllis A. Heintz, PhD, RN, CTN-B, USA*  
*Audrey Cochran, MSN, RN, GCNS-BC, USA*

#### Purpose

The purpose of this presentation is to explore the public health and economic impact of the stigma surrounding lack of bladder control. Biofeedback and non-pharmacologic strategies will be presented and practiced.

#### Target Audience

The target audience of this presentation is nurses caring for older adults, primary care nurses, and rehabilitation nurses.

#### Abstract

This presentation will discuss the public health impact and the economic costs of ineffective management of bladder control. Participants will learn strategies to teach bladder and bowel control; evaluation, analysis, and plan of treatment for a continence behavioral rehabilitation program; and have the opportunity for a demonstration and practice of pelvic floor exercises. Additional nursing implications for the presentation include developing a sensitivity to urinary incontinence to earn and maintain patient trust.

## H 07 - Evidence-Based Strategies to Provide Quality Care

### A State School Nurse Initiative that Could Transform Healthcare Globally

---

*Teena Byers Darnell, MSN, BSN, RN, USA*

*Kathy Hager, DNP, MSN, BSN, APRN, FNP-BC, CDE, USA*

*Paul D. Loprinzi, PhD, MS, BS, USA*

#### Purpose

to describe a state-wide initiative that would culminate in legislation mandating nurses in all Kentucky schools. With stakeholder involvement including nursing educators, nursing organizations, the department of education, the public health department, and youth advocates, data was compiled, and strategies devised, for providing support of population health beginning in childhood.

#### Target Audience

any person interested in delivering population health, using the school system model - nurses, teachers, counselors, administrators - integrating health care initiatives, disease prevention, well child checks at the onset of a child's education.

#### Abstract

The long-range purpose of this project is to legislate school nurses in all Kentucky public schools. The short-range outcomes are to provide data supporting the value of the school nurse, suggest models for funding the school nurse, and provide strategies for garnering support among all stakeholders. National data suggest that school nurses decrease absenteeism and increase graduation rates, important motivators for mandated legislation. A state-wide initiative that involved youth advocates, nursing organizations, the state department of education, and county health departments, surveyed the school nurses to determine which counties had school nurses. A follow-up IRB-approved project involved a telephone survey to determine the numbers of schools that had employed a nurse over the past five years and those that had not. Graduation rates, ACT scores, and absenteeism for schools with full time nurses were compared to those schools with no access to a nurse. Findings noted that 42.3% of Kentucky schools had a full time nurse. When compared to schools without access to a full time nurse, those with daily nurses had a significantly lower absence rate (6.3 vs. 6.8, with a p value of 0.05). Graduation rates were also higher in the schools with access to a daily nurse (83 vs. 78%, with a value of 0.0002). There was no significant difference in ACT scores for the two comparison groups. The next phase in supporting the value of school nurses will be to provide data related to chronic condition outcomes, as well as measures for health and wellness outcomes. Research related to alternative methods for funding school nurses, especially as the Accountable Care Act has emphasized the importance of health promotion and disease prevention, will be presented to the legislators.

## H 07 - Evidence-Based Strategies to Provide Quality Care

### Searching for Clinical Guidelines, Algorithms, and Mixed Methods Studies: What's Wrong with PICO?

---

*Janice M. Jones, PhD, RN, CNS, USA*

#### Purpose

The purpose of this presentation is to suggest methods of EBP retrieval using a non-PICO format most appropriate to the clinical issue, study design, and level of the student or practicing clinician. The tendency to default to PICO may result in difficulty locating guidelines and algorithms for specific patient populations.

#### Target Audience

Nurse clinicians, nursing students, and nurse educators who teach or engage in the retrieval of or monitor the process of locating evidence-based practices.

#### Abstract

**Background Information:** The Population-Intervention-Comparison-Outcome (PICO) format has often been promoted in nursing as the best method to formulate a clinical question in seeking evidence-based practices for specific patient problems and populations. Although helpful in determining best interventions based on quantitative research, the PICO format less readily lends itself in projects or papers involving quality improvement, the search for clinical guidelines or algorithms, mixed methods studies or qualitative research. The PICO framework also assumes the comparison of two interventions rather than three or four.

**Description:** PICO questions should be well defined with specific populations described, focused interventions with their comparative groups, and the outcomes of interest. Interventions are compared with either an active or inactive control intervention (Cochrane, 2011). No treatment is an example of an inactive control intervention. Comparison of meditation compared to no meditation as a method of lowering blood pressure would be an example of inactive control. An active control measure would be the comparison of interventions, for example, the use of meditation compared to yoga as blood pressure reduction interventions. The PICO framework also assumes the comparison of two interventions rather than three or four. Continuing with this example, how effective is meditation compared to yoga compared to prayer. A three or more comparison group is rarely found in most evidence-based practice textbooks or the nursing literature when it may very well be an appropriate format in initial attempts to locate evidence.

Huang and colleagues (2006) identified several challenges in using the PICO structure format. They discuss the difficulty in representing some clinical questions using a PICO framework. The practice that a well focused clinical question using well-articulated PICO elements is the sole key to efficiently locating high-quality evidence and also central to making evidence-based clinical decisions is debated. Clinical questions that are focused with known interventions and a clear outcome lend themselves best to the PICO format. They argue that the PICO question framework appears to be best suited for therapy or intervention clinical questions that are focused or specific in nature. In support of PICO, specific components of this framework do provide the key word search strategy that can yield more precise results when used correctly and appropriately. However, a different search strategy must be used in order to locate various forms of research and evidence-based clinical practices.

To date, evidence-based guidelines are becoming more prolific in the literature. Guidelines are generally comprised of a variety of evidence-based resources. These may include meta-analyses, randomized controlled trials, and experimental and quasi experimental studies. These guidelines are published by notable medical and nursing organizations such as the American Heart Association, Society for Gastroenterologists and the American Association of Critical Care Nursing and provide a high level of evidence as they form the basis of total patient care for a specific practice or disease entity. The PICO format may lend itself to one or two aspects of these guidelines but may not address the guidelines in

total. Therefore, valuable evidence may be lost in the search process unless one is already aware that such guidelines exist. Evidence-based bundles and algorithms are increasingly used in clinical settings where appropriate. These comprise evidence-based practices that are bundled together to assist in the decision making process. Bundles such as that for ventilator-associated pneumonia are the gold standard in caring for patients on mechanical ventilation. Medication algorithms for the initiation and maintenance of glucose control are now considered evidence-based standard practice. The initiation, diagnosis, and management of acute coronary syndrome and stroke are other examples of lengthy evidence-based guidelines found in the literature and online. A search strategy for the location of such guidelines and algorithms will be proposed in the presentation.

Although the PICO format may be modified to include qualitative research, other formats such as Sample-Phenomenon of Interest-Design-Evaluation-Research Type (SPIDER) as proposed by Cooke, Smith & Booth (Qualitative Health Research, 2012) are being published. The authors devised the SPIDER method to better ascertain metasynthesis studies and mixed methods studies which are difficult to find under the PICO format. Specific search strategies for qualitative studies will be discussed in the presentation as well as how mixed methods studies may be located.

Students or practicing nurses initially learning the evidence-based retrieval process may find that the PICO framework is best suited to understanding this process and its basic premise. Once the student or nurse has enough background information or has an understanding of guidelines and algorithms, then the search strategy may need to change in order to locate evidence-based bundles, guidelines, and algorithms. These summarized evidence-based practices are often included in the electronic medical record for purposes of implementation and documentation and also in the computerized provide order entry. Implementation of the bundle or algorithm may then also be monitored and assessed as aggregate data for various reporting organizations and quality improvement or quality control.

Summary Recommendations: Leveling of the evidence-based process within the undergraduate curriculum should occur as the student advances from specific patient care to a population of care for patients with common clinical problems. It is debatable whether clinically-focused Undergraduate and Masters' level projects or papers and clinicians new to the evidence-based retrieval process should first focus on the search process for evidence-based guidelines and algorithms which are considered filtered sources of evidence. Or should the PICO approach initially serve this purpose? A non-PICO approach may be best suited for advanced practice nurses responsible for diagnosing and treating patients in the in-patient or out-patient setting. If a guideline or algorithm cannot be located via the traditional search process, then the use of the PICO format would be more appropriate in locating evidence-based practices and answering clinical questions.

The pros and cons for using the PICO format for clinically-focused papers and projects will be presented along with exemplars. Alternatives to PICO will be used as a focus for discussion. It is important for both educators and clinicians to recognize when the PICO format is the appropriate tool to use when searching for research studies and evidence-based practices and to recognize that other search strategies may need to be utilized and/or developed to account for other sources of evidence. Nurse educators and clinicians, along with professional librarians who have expertise in the literature retrieval process, may well develop different retrieval formats for evidence-base practices in the future.

## H 08 - Education Strategies in Undergraduate Nursing

### Impact of Multicontextual Teaching/Learning on Minority BSN Student Engagement: A Qualitative Research Study

---

*Scott C. Dolan, PhD, RN, USA*

#### Purpose

To examine the impact of using multi-contextual teaching/learning on minority pre-licensure nursing students and to provide methods for adopting this pedagogy. Qualitative research outcomes utilizing multi-contextual pedagogy will be discussed.

#### Target Audience

The nurse educator who wishes to increase minority student engagement, self-efficacy, and appreciation of student-centered pedagogy.

#### Abstract

Lack of diversity among nursing and student nursing populations is not a new issue. As early as 2004, the Sullivan Report called on the healthcare professions to increase the number of minorities within the ranks. Many healthcare professions, including nursing, answered this call by focusing efforts on increased minority student recruitment. However, despite the increased focus on recruitment, numbers of ethnically diverse healthcare professionals still remain low. Statistics provided by the Budden, Zhong, Moulton, and Cimiotti (2013) indicated that only 19 percent of registered nurses were of a racial or ethnic background. In light of the continued lack of diversity within the ranks of the registered nursing population, the National League for Nursing (2009) cited the measurement of academic outcomes of diverse nursing student populations as a priority research area.

Despite attempts to increase enrollment of minority nursing students, retention while in the traditional pre-licensure nursing programs remains a problem. Increased rates of minority student attrition have been attributed to several factors. Multiple research studies that cite lack of academic preparation as a key factor contributing to increased rates of attrition among minority (Martinez, Sher, Krull, & Wood, 2009; The Sullivan Commission, 2004). Additionally, researchers from Brown and Marshall (2008) noted poor test taking skills caused increased levels of attrition among minority baccalaureate nursing students. Lofton, Newman, Dumas, Gilden, and Bond (2012) reported that a lack of consistent documentation regarding attrition rates and that some have estimated attrition rates for minority nursing students to as high as 85%. Clearly, the learning needs of minority baccalaureate degree nursing students are not being met. It is evident that nursing educators need to focus more on retention strategies for minority student populations.

One method of increasing minority student retention is a shift in pedagogical approach away from the traditional nursing education of low-context pedagogy: reading assignments, lectures, and examinations. This approach may not meet the needs of minority student populations (Bednarz, Schim, & Doorenbos, 2010). Research conducted by Giddens (2008) cited that the creation of a student-centered pedagogy based on Ibarra's Theory of Multi-Contextual Learning may be one means of addressing minority student retention. This theory purports that the incongruence between student learning preferences and faculty teaching methods is problematic. Students from diverse cultural backgrounds typically prefer high-context learning environments, such as telling stories, using case studies and simulation, and opportunities to learn together in groups.

A qualitative study was designed to assess minority students' perceptions of learning in a multi-contextual teaching/learning environment. Minority was defined as someone who is a member of an ethnic or racial minority group and enrolled in a baccalaureate program of nursing. The study took place in a single-purpose, private, Catholic nursing college in a single academic semester. Appropriate IRB approvals were obtained. Six minority students were recruited and completed a semi-structured interview of their perceptions of the multi-contextual teaching/learning environment. Some of the qualitative data themes

arising from the student interviews were: (1) preference for group work, (2) appreciation of personalized, student-centered, active teaching/learning strategies, and (3) preference for rapid application of knowledge. This data points to the positive impact of multi-contextual teaching/learning environments on pre-licensure minority nursing student perceptions of learning.

## H 08 - Education Strategies in Undergraduate Nursing

### A Baccalaureate Weekend Program: Teaching/Learning Strategies

---

*Susan Chaney, EdD, RN, FNP-C, FAANP, USA*  
*Susan Sheriff, PhD, RN, CNE, USA*

#### Purpose

Describe teaching/learning strategies of a weekend/online baccalaureate nursing program.

#### Target Audience

The target audience of this presentation is nursing faculty members and nursing administrators of baccalaureate nursing programs.

#### Abstract

One of the most pressing problems facing health care today is the current and future nursing shortage. Texas Woman's University (TWU) has developed a model to reinvent nursing education through offering baccalaureate nursing education via a weekend/online program to individuals who already have earned a non-nursing baccalaureate degree. The innovative partnership between TWU and the hospital practice partners offers a six semester (including summers) upper division nursing program to individuals with a baccalaureate degree in another discipline. All didactic courses are offered via distance education with 100% of course content online. Clinical nursing courses are offered on weekends and the TWU nursing professors teach the didactic portion of the course on Friday evenings. Clinical experiences are offered at the partnership hospitals on Saturdays and Sundays with nurses functioning as clinical associates to preceptor the students.

The goals of this project were to increase the number of registered nurses available for employment in Texas. The Texas Higher Education Coordinating Board awarded TWU \$330,000 to implement this new program. Twenty students were admitted in May 2008 and completed the Weekend/Online Nursing Program May 2010. The program was further expanded when TWU received a \$744,422 Health Resources and Service Administration (HRSA) grant to expand the program over three years from 7/1/2010 through 6/30/2013. A one-year extension was given so that the program ended June 30, 2014. There were a total of 77 graduates from the program and currently 31 new students are beginning the program September (fall) 2014. The program is now funded by Texas Woman's University (TWU).

This project offers three unique purposes for the future of nursing education:

1. Create and implement an innovative model for undergraduate nursing education through distance education and weekend scheduling to increase nursing school enrollment with emphasis on recruitment of racial and ethnic minority students and students from underserved areas.
2. Develop partnerships between a nursing program and health care organizations that would provide nursing students opportunities to serve vulnerable underserved populations in the clinical setting.
3. Provide didactic nursing courses 100% online and schedule clinical experiences on weekends to extend educational opportunities for disadvantaged, unemployed, and underemployed citizens to achieve a baccalaureate nursing degree.

## H 08 - Education Strategies in Undergraduate Nursing

### Teaching Undergraduate Nursing Students: An Innovative Approach to Answering Clinical Questions Utilizing Current Evidence-Based Practice

---

*Jene' M. Hurlbut, PhD, MSN, MS, BSN, RN, CNE, USA*

*Judith Carrion, EdD, MSN/Ed, MSHS, RN, RN-BC, CRRN, USA*

#### Purpose

The purpose of the presentation is to share lessons learned during the re-design of an undergraduate nursing research course. The course redevelopment used traditional activities, levels of evidence based practice, and unique learning activities to teach research concepts. The motivation for the re-development was related to past course evaluations.

#### Target Audience

The target audience of this presentation is nurse educators, students, administrators of both hospital based and community health care services.

#### Abstract

Teaching Undergraduate Nursing Students: An Innovative Approach to Answering Clinical Questions Utilizing Current Evidence Based Practice

We were challenged with the redevelopment of a 3 credit undergraduate nursing research course into a two week time frame. This approach was supported by the University's block curriculum based on mastery content learning. The course redevelopment used traditional learning activities, levels of evidence based practice, and unique learning activities to teach research concepts. A primary motivation for the re-development of this course was students past evaluations of the overall relevance of the course to "real" nursing.

The re-design of this research course enabled students to develop research skills through the generation of their own research questions based on clinical experiences. The use of evidence based practice was taught through a systematic review process. This pedagogical approach is supported by a number of organizations and accrediting bodies that assert, professional nursing practice be grounded in research that will ultimately impact patient outcomes and ensure the delivery of safe care.

An important feature to this course included collaborative learning. Students worked in groups to develop a unique PICO question (population, intervention, comparison, and outcomes). This included critically appraising and synthesizing the current literature related to the PICO question.

Our strategies challenged the nursing students to apply research concepts to further explore and elucidate solutions to clinical concerns experienced in the care setting. These innovative strategies included: collaborative learning and group work; the generation of a unique PICO clinical question; orientation to various search strategies provided by a library expert; a student activity entitled "what is in the box"; attendance at a research center where current health related studies were in progress; a professional poster presentation, and other creative presentation methods.

Significant outcomes that supported the changes and innovative strategies used in this course, was validated in the students' end of course evaluations. Overall the evaluation results were very positive. The curricular redevelopment of this course proved to be successful for undergraduate students.

## H 09 - Transforming Professional Practice through Evidence

### Evaluation of an Athletics Model to Develop Values for Professional Practice

---

*Amy C. Shay, MS, RN, CCRN, CNS, USA*  
*Karen Beckstedt Montoya, MS, RN, USA*

#### Purpose

This presentation describes an athletics-inspired professional values education program for nursing students at the University of Cincinnati. The theoretical framework for this athletics model includes team-based learning and behavior-modeling techniques. The presentation will describe the current research study of the program and preliminary results of this innovative athletics-inspired approach.

#### Target Audience

The target audience of this presentation is baccalaureate nurse educators and hospital administrators with an interest in strategies that influence professionalism among new nurse graduate hires.

#### Abstract

**Purpose:** The American Association of Colleges of Nursing (AACN) has identified values and ethics as a competency for interprofessional collaborative practice and the education of baccalaureate nursing students. Yet the abstract nature of values and the lack of emphasis and example in modern culture make professionalism education in nursing very challenging. Students must learn to demonstrate values that are essential for effective coordination of care, improved patient outcomes, and for continued representation as the nation's most trusted profession. This research study, currently in progress, describes an innovative athletics-inspired approach to the professional values development of baccalaureate nursing students through a combination of team-based learning and behavior modeling techniques. This strategy has been in practice for four years at the University of Cincinnati with positive preliminary evaluation data but requires a more sufficient measure of the effectiveness of this educational approach. This study seeks to determine if an athletics model approach to professional values education in nursing affects the development of professional values in the baccalaureate nursing student as measured by the Healthcare Selection Inventory tool and to evaluate student satisfaction with this professional values education approach. This study will contribute further to knowledge regarding the effectiveness of teaching strategies for professional values development and lays the foundation for future research describing the long term effects of professional values education upon the post-graduate baccalaureate student in terms of performance, healthcare team collaboration, retention, and transition to practice.

**Methods:** While preliminary evaluations of student and faculty perceptions of the PVPN have been positive, they do not provide a sufficient measure of the effectiveness of this approach to professional values education. A tool designed to measure individually held values and associated behaviors is needed to measure outcomes of the program. **The Healthcare Selection Inventory** (HealthcareSource, 2012) is a behavioral-based survey tool designed to identify values that healthcare organizations have deemed critical to successful job performance and patient care. The Healthcare Selection Inventory uses a nursing norms scale addressing a series of values (work ethic, energy, teamwork, patient focus, compassion, adaptability, multi-tasking, valuing diversity, openness to learning) closely aligned with the goal values of the PVPN. The Healthcare Selection Inventory has been designed to tap into the set of Big Five personality constructs, which have been shown to be related to job performance. The Big Five personality dimensions provide a solid framework for testing hypotheses relating personality to job performance (Barrick & Mount, 1991; Hertz & Donovan, 2000). HealthcareSource also utilizes a framework based on critical values and nursing competencies identified by healthcare organizations for assessing job performance one year post-hire. Such an assessment would lend itself to future research related to the long term effects of professional values education upon graduate nurse behavior and performance of patient care.

This study will employ a pre-post test design. The Healthcare Selection Inventory tool was administered to participating incoming sophomore nursing students at the start of the fall semester of 2013 prior to introduction to the PVPN intervention. The PVPN is implemented with all nursing students on a voluntary participation basis as has been the custom. The Healthcare Selection Inventory tool will then be administered at the end of the sophomore year, following spring semester 2014 and again at the end of the junior year following spring semester 2015.

**Results: Preliminary Data:** Prior to implementation of the research study, preliminary outcomes data were obtained following determination by the University of Cincinnati Institutional Review Board that this educational strategy and evaluation did not constitute human subject research. An investigator-developed evaluation tool was administered to the sophomore students following one full academic year of exposure to the Professional Values Program for Nursing. Forty-four students responded for a response rate of 92%. The survey consisted of five Likert scale questions. Content validity of the tool was established by having three faculty and content experts evaluate the survey. The items were determined to be both clear and relevant with all items but one scoring very clear and very relevant. One item, This program increased my potential for success in the College of Nursing, was determined to be somewhat relevant.

The majority of students (84 to 88 percent) agreed or strongly agreed that the program improved their understanding of the expectations of the college of nursing related to professional behaviors, enabled them to better recognize professional behavior in themselves and others, and improved their ability to work as a team. Eighty percent of students agreed or strongly agreed that the program increased their potential for success in the college of nursing or could help them succeed in the workplace following graduation.

Five faculty and educational staff members were administered a five point Likert scale tool for program evaluation following two terms of experience with classes at the sophomore level. Faculty and staff identified improved ability to work as a team and improved potential for success in the BSN program as the two greatest strengths of the PVPN followed by increased student engagement, professional communication, and improved compliance with professional behaviors. The Professional Values Program for Nursing was offered to students as a voluntary experience, with no effect upon course grade, yet one hundred percent participation was elicited. There have now been seven academic terms of experience with the PVPN program with a total of 155 sophomore and junior level students participating.

**Conclusion:** Preliminary outcomes related to this program have been positive. The initial round of pre-intervention data has been collected from the first cohort with post-intervention data and results anticipated in April of 2015. This study seeks to utilize the Healthcare Selection Inventory, a behavioral-based survey tool, to examine values and associated behaviors necessary to measure program outcomes. This study will contribute further to knowledge regarding the effectiveness of teaching strategies for professional values development and lays the foundation for future research describing the long term effects of professional values education upon the post-graduate baccalaureate student in terms of performance, healthcare team collaboration, retention, and transition to practice.

## H 09 - Transforming Professional Practice through Evidence

### Evidence-Based Practice Fellowship Immersion: Transforming Staff Nurse's Professional Practice

---

*Tom Christenbery, PhD, RN, CNE, USA*  
*Nancy Wells, DNSc, RN, USA*

#### Purpose

The purpose of this presentation is to describe the professional and personal changes that staff nurses experienced during a 1-year evidenced-based practice fellowship program.

#### Target Audience

The target audience of this presentation is both nurse educators and nurse administrators who oversee evidence-based practice nurse fellowships.

#### Abstract

Background: Evidence-based practice (EBP) fellowship programs have been shown to decrease barriers to EBP and promote professional growth. Nurses at one organization described their EBP fellowship program as “life-changing”, prompting nursing leaders and educators to examine what intrinsic changes might have occurred as a result of participation in the program.

Purpose: The purpose of this qualitative study was to explore the professional and personal changes that occurred in staff nurses during and following a 1-year EBP fellowship program

Materials & Methods: Focus groups were conducted with staff nurses in an academic medical center who completed the fellowship program from 2007 to 2011. Six questions with predetermined probes were asked during the focus group. Focus Groups were audiotaped and transcribed for content analysis using Atlas TI. Three focus groups were conducted before saturation was reached. A total of 12 nurses participated.

Results: Five themes were identified from the data: support, resources, knowledge, confidence/self-actualization, and empowerment. Within each focus group, there were multiple examples of changes that occurred in these nurses in terms of their confidence in their ability to seek evidence, apply it to their practice, and make a change based upon it. The sense that “I can make a practice change” reflects the sense of empowerment these nurses described.

Discussion: The participants in the focus groups described a transformation in their professional and personal development as a result of the fellowship program. The themes that emerged were consistent with Kanter’s definitions of the elements of structural empowerment. Each nurse gained knowledge, confidence, and the firmly-rooted sense that he/she can make a real difference in patient care through practice change.

Conclusion: We observed differences in staff nurses’ commitment to nursing and an enthusiasm for research that was not evident prior to the fellowship program. Our data suggest that a 1-year program on research and EBP may provide all of the essential elements needed for structural empowerment. Ultimately, this sense of empowerment will lead to better patient outcomes.

## A 11 - Developing Leadership Skills in New Nurses

### Transition from Student Nurse to Professional Nurse: Induction and Professional Development Support of Newly Qualified Professional Nurses

---

*Memme Girly Makua, BCur, MCur, RN, South Africa*

#### Purpose

To share with the audience the findings upon exploring the induction and professional development support given to newly qualified professional nurses during compulsory community service in the public healthcare institutions of SA; as well as to highlight the importance of a smooth transition from student to professional nurse.

#### Target Audience

Employers of nurses; Nursing education - faculty members; Nursing practice – nurse managers, nursing human resource development personnel and professional nurses; Policy makers and Research – academia and evidence based practice researchers

#### Abstract

**Background:** There is poor retention of graduates by the Public Health Sector in all health disciplines in South Africa (SA). Compulsory community service was introduced to curb the shortage of personnel. This forms the first formal work experience for the newly qualified health professionals, including newly qualified professional nurses. The compulsory community service is served for a period of one year in public healthcare institutions, before the graduate can obtain final registration with the respective health professions council, like the South African Nursing Council (SANC) for nurses and midwives.

In order for this first impression to have good memories and a positive impact for these nurses, the healthcare institution has to provide a structured formal transition program that will significantly improve retention and productivity. To undergo a smooth transition, newly qualified professional nurses need clinical learning support from the organization. Organizational support influences their effectiveness and job satisfaction. The first three to twelve months of employment is stressful and the experiences of this period profoundly influence the careers of the newly qualified professional nurses.

For the first six months of practice, newly qualified professional nurses mostly focus on learning their new roles, the policies and procedures of the practice setting. Induction and professional development support facilitate the transition from being a student nurse to a professional nurse, as well as to enhance clinical competence and professional socialization.

**Objectives:** To describe the induction and professional development support given to newly qualified professional nurses during the compulsory community service in South Africa.

To describe the ideal but practical induction and professional development support suggested by operational nurse managers to enhance the role transition of newly qualified professional nurses.

**Methodology:** The study design is a mixed method of concurrent triangulation approach. The presentation is from part of the qualitative findings, the focus groups. Six focus group discussions consisting of five operational nurse managers per group, from various levels of health care institutions of South Africa, were held to explore the experiences of the operational nurse managers during their supervision of the newly qualified professional nurses serving the compulsory community service.

**Findings:** The induction has been reported as not being standardized in the healthcare institutions and professional development support ranging from 'on the spot teaching', to 'pairing of novice with expert' where possible due to the shortage of personnel.

Some operational nurse managers expressed the view that, it is a waste of patient care time to mentor the newly qualified professional nurses during community service as they might not apply for a permanent post with the same institution on completion of the community service

Operational nurse managers agreed unanimously that they should create supportive practice environments that facilitate newly qualified professional nurses' integration into the healthcare institutions, and ensure a smooth transition from student to professional.

**Conclusion:** A formal structured induction and professional development support for newly qualified professional nurses can be a positive professional socialization experience that can lead to confident, competent, independent as well as safe nurse practitioners. It might even reduce the high attrition rate of newly qualified professional nurses that is facing communities globally.

## A 11 - Developing Leadership Skills in New Nurses

### Life Experiences of a Newly Graduated Nurse Working Under Supervision of a Mentor

---

*Nisa Tamarpirat, MSN, RN, Thailand*

*Areewan Oumtanee, PhD, MS, RN, Thailand*

#### Purpose

To describe experiences of being a newly graduated nurses working under supervision of the nurse mentorship at a private hospital in Thailand by using qualitative research based on Hermeneutic phenomenology.

#### Target Audience

Understanding on a newly graduated nurse's experience upon the supervision of the nurse mentor.

#### Abstract

The purpose of this research is to describe experiences of being a newly graduated nurses working under supervision of the nurse mentorship at a private hospital in Thailand by using qualitative research based on Hermeneutic phenomenology. Ten novices were participated in this study while data were collected by using in-depth interviews with audio-recorded and field observations. Data were transcribed verbatim and analyzed by using content analysis of Diekelmann's method.

The result was found by following issues

1) Before working with a mentor, a novice nurse felt 1.1) Fear of incompatibility, most of novices are fear of incompatibility which cause them stomachache, Anorexia and hard to sleep 1.2) Worried that mentor will stern, from the experience of being a novice found out that mostly mentors often stern and annoy when novice inquires because it causes them more works

2) During working with a mentor, a novice nurse had of positive and negative experiences 2.1) Feel comforted and happy working with mentor, while working together, mentor always encourage novice by advising, giving knowledge, take good care and not let them be isolated. Moreover, when mistake happened, the mentor will protect and speak up for them from being blame by the doctor or patient 2.2) Feel uncomfortable working with mentor, the mentor blame when novice cannot work like they expected and annoying to repeat teaching work plus sometimes being stern at the front of patient which cause them scurry, scare, and feel diffidence to work because afraid that they will gain no trust from patient and relatives

3) After end of mentoring period, a novice nurse could adjust themselves and understand why the mentor had to be strict which help reducing the conflict while increasing the relationship and feels great to each other.

From the results of this study, it provided a significant understanding on a newly graduated nurse's experience upon the supervision of the nurse mentor. It is recommended that the administrators should develop an effective strategy to strengthen and facilitate the transition process of novice nurses, in adjusting to the new environment and be a professional nurse under the mentorship system.

## **A 11 - Developing Leadership Skills in New Nurses**

### **New Graduate Nurse Perception of Competence Compared to Nurse Leadership**

---

*Nancy S. Goldstein, DNP, MS, BSN, RNC-OB, ANP-BC, USA*

*Michelle D'Alessandro, DNP, MS, RN, NEA-BC, USA*

*Alexandra Sussman, BS, USA*

*Jeremy Brown, MBA, BS, CNA, GNA, USA*

#### Purpose

The purpose of this presentation is to examine new graduate nurses' perception of competence in comparison to nurse leadership (preceptors/nurse managers) perception of new graduate nurse competence in clinical settings. This presentation will also discuss the roles of nursing educators and preceptors in the new graduate nurses' transition to practice.

#### Target Audience

The target audience of this presentation is graduate nurses' and preceptors, nurse educators, charge nurses and nurse managers in leadership roles.

#### Abstract

New graduate nurses (NGN) face stress and challenges as they progress through the rigors of orientation and acclimation to the first year of clinical nursing. Health care organizations and academic institutions have significant roles in preparing competent entry-level nurses. However, previous research suggests that only 10% of hospital and health system nurse executives perceived their new graduate nurses as fully prepared to provide competent patient care. In this current research, we are examining the new graduate nurses' perception of competence in comparison to the mid-level nurse leadership (preceptors and nurse managers) perception of new graduate nurse preparedness. Data is in the collection phase via an anonymous web-based questionnaire and will be completed by March 15, 2015. The sample size is expected to be minimal 75 nursing leaders (nurse managers, charge nurses, and preceptors) and 75 new graduate nurses (novice nurses). Data analysis will be completed by beginning of April, 2015 and incorporate recommendations for healthcare organizations and academic institutions. These recommendations will focus on strategies for preceptor role modeling and training and nurse educators for preparation of nursing students in clinical experiences for entry into practice at the nursing program level. Results of this study will elucidate areas for both immediate and long-term implementation to improve new graduate nurse orientation programs and preceptor engagement.

## A 12 - Unproven Nurses in the Workforce

### A Grounded Theory Study of Nurse Manager's Preferences in Hiring Newly Licensed RNs

---

*Susan C. Adamek, MSN, RN, NEA-BC, FACHE, USA*

*Lori Candela, EdD, MS, BSN, ADN, RN, FNP, BC, CNE, USA*

*Carolee Dodge Francis, EdD, MA, BS, USA*

#### Purpose

The purpose of this presentation is to describe the hiring preferences of nursing leaders who hire newly licensed RNs, including their attitudes toward the prelicensure degree. These preferences are discussed within the context of the IOM recommendation to achieve 80% BSN preparation among nurses by 2020.

#### Target Audience

The target audience of this presentation is faculty in prelicensure nursing programs and nursing leaders who hire newly licensed RNs in acute care hospitals.

#### Abstract

**Purpose/Aims:** The purpose of this research study was to explain how acute care nurse managers select the newly licensed RNs (NLRNs) they hire.

**Rationale/Background:** A good process for selecting NLRNs can reduce expensive employee turnover and improve teamwork on units. There has been extensive research regarding interventions that improve the retention of NLRNs after they are hired, such as residency programs, preceptors, mentors and support groups, but there is very little in the literature about nurse managers' preferred applicant attributes or the processes used by nurse managers to select the right candidates for hire.

**Methods:** A qualitative, constructivist approach was used to construct a substantive grounded theory regarding how acute care nurse managers select the newly licensed RNs (NLRNs) they hire. Eighteen acute care nurse managers who had hired NLRNs within the past year were recruited to participate in semi-structured interviews. Participants also submitted forms or tools used in the NLRN selection process to be examined. Fifteen different acute care hospitals were represented in the sample, including a variety of sizes, for profit or not for profit status, and geographic location within a Southwestern state. Using constructivist grounded theory processes including constant comparison, transcribed interviews were coded in three stages: initial, focused and theoretical. The qualitative data analysis package QSR NVivo 10 was used to assist in the organization, storage and analysis of data.

**Results:** Together this researcher and the 18 participants constructed a substantive theory explaining the processes and preferences used to select NLRNs for hire. Five theoretical concepts were identified: Developing Beliefs and Preferences, Expressing Beliefs and Preferences, Gathering Information Throughout the Process, Finding the Fit and Making a Decision. Participants expressed preferences in the categories of NLRN work and life experiences, school factors, gender, personality/attitude, skills and applicant behaviors during the selection process. About half of the participants expressed no preference between NLRNs with a BSN and those with an associate degree. The others expressed a preference for hiring BSN graduates, but qualified that preference by stating that the applicant's fit for the position was more important than the degree. All but two participants stated that they would hire a NLRN with an associate degree if they felt they were the best fit for the position. The initial or current educational level of the hiring nurse manager did not appear to be associated with their NLRN degree preferences.

**Implications:** This study examined NLRN hiring preferences and processes, including the current attitudes of hiring nurse managers toward the recommendation from the Institute of Medicine (2011) to reach 80 percent BSN preparation in the nursing workforce by the year 2020. Most participants in this study did not demonstrate that they strongly preferred BSN preparation among their new hires, at least at

the prelicensure program level. The findings of this study may be used to inform additional research directed to improving selection processes, and to further examine the hiring preferences expressed by participants.

## A 12 - Unproven Nurses in the Workforce

### Newly Graduated Registered Nurses' Perception of Psychiatric Nursing

---

*Avni Cirpili, DNP, MSN, BSN, AD, RN, NEA-BC, USA*

*Jennifer K. Barut, MSN, BSN, AD, RN-BC, USA*

*Jana M. Briggs, BSN, RN, USA*

*Nichole M. Taylor, BSN, RN, USA*

#### Purpose

to discuss perceptions of newly graduated RN's towards psychiatric nursing. We will describe potential factors influencing negative perceptions and discuss actions that can be taken to avoid potential workforce shortage in this subspecialty.

#### Target Audience

nurse leaders, educators, and undergraduate faculty.

#### Abstract

In 2009, Hanrahan raised the concern of a potential shortage of psychiatric nurses since fewer new graduates are choosing this subspecialty of nursing as a career choice. Nurse leaders and educators need to understand why newly graduated registered nurses (GRNs) are not choosing psychiatric nursing as a career path. There is little evidence examining nurses' perceptions of psychiatric nursing within the United States. In order to develop a strategy to increase RN entry into this subspecialty nurse leaders must understand how perceptions are influenced by nursing education.

A survey was conducted with newly GRNs who were admitted to a nurse residency program in a large academic medical center to examine perceptions of GRNs towards mental illness, psychiatric nursing and their psychiatric nursing education programs. Participants were asked to rate the value of psychiatric nursing as a subspecialty and rate statements in the following subject groups: Perception of Psychiatric Nursing (PPN), Perception of Undergraduate Psychiatric Experience (PUPE), and Perception of Mental Illness (PMI). The project also examined relationships between the GRN's rating of the subspecialty of psychiatric nursing and their perception of psychiatric nursing, undergraduate psychiatric nursing educational experience and mental illness.

Based on the research hypotheses, a multiple regression was conducted to determine factors influencing PPN. Seven potential covariates were included in a multiple regression and accounted for 36% of the variance in PPN (adjusted  $r^2 = .323$ ). Participants perception of their undergraduate psychiatry clinical experience per the PUPE ( $p=.004$ ), and their perception of mental illness per the PMI ( $p=.023$ ), and their overall ranking of psychiatric nursing was statistically significantly correlated to their PPN at an alpha significance level of .05.

This presentation will highlight the above and additional findings, the creation of three subscales about perceptions of psychiatric nursing and proposed actions to combat negative perceptions of psychiatric nursing.

## A 12 - Unproven Nurses in the Workforce

### A Study Examining Senior Nursing Students' Expectations of Work and the Workforce

---

*Deborah Saber, PhD, RN, CCRN, USA*

#### Purpose

The purpose of this study was to explore traditional and accelerated Bachelor of Science nursing students' expectations of nursing work and the workforce. Focus group interviews found two overriding themes: Stressors and Coping Strategies. Students believed stressors will affect their transition into the NLRN role and have developed coping strategies.

#### Target Audience

The target audiences are hospital/nursing and academic administrators. Both healthcare organizations and academic institutions will benefit from the knowledge of this study. Knowledge about student expectations can promote academic and workplace changes aimed at improving newly licensed nurse retention rates.

#### Abstract

**Background:** Nursing is considered fast-paced, labor intensive work with cyclical shortages. To ensure that patients receive a consistently high level of care, hospitals have increasingly relied on schools of nursing to rapidly prepare newly licensed registered nurses (NLRNs) to function with high competence. Educational pathways resulting in a BSN degree include traditional 4-year and shorter accelerated nursing programs. The accelerated program provides an expedited alternative (i.e., 11-18 months) to a BSN degree for students who have achieved a previous bachelor's degree. Kramer (1974) described the stressful transition from nursing education to practice as "Reality Shock," and Duchscher further defined the early student to RN period as "Transition Shock" (Duchscher 2009). This role transition difficulty is blamed for much of the 15-60% NLRN turnover in their first 3 years of employment.

**Aim:** This study explored traditional and accelerated Bachelor of Science in Nursing (BSN) students' expectations of nursing work and the workforce.

**Method:** This qualitative study of 14 focus groups (N = 98) is phase 1 of a 3-phase longitudinal study comparing senior student expectations of the workforce and workplace to their perceptions as newly licensed nurses. Phase 1 examined student nurses expectations of the workforce and workplace.

**Results:** Participants included 98 (74.8%) BSN students enrolled in their final semester of school. Ages ranged from 20-57 in accelerated (n=39) and traditional (n=59) programs, representing members from the Baby Boomer, Generation X, and Millennial generations. Ages significantly differed between traditional (m=23.1; SD=3.5) and accelerated (m=27.9; SD =6.4; p<.001) students. Accelerated students were more likely to be married (16.9%) than traditional students (2.6%; p <.01).

Two overriding themes for accelerated and traditional students emerged: Stressors and Coping Strategies. Four Stressors were described: 1) "role transition" was the greatest stressor that students reported as they prepared to enter the workforce; 2) "contagion" concerns were expressed as students felt comfort in their knowledge of infectious processes and personal protective equipment (PPE) use, yet feared contamination with pathogens; 3) "personal life impact" concerns were expressed by traditional and accelerated students when nursing schedules, such as working holidays and weekends, long hours, and nights, were expected to impact their lives and require family support; and 4) "fear of violence" was expressed when students realized that the work environment would be socially and psychologically challenging with emotional, verbal, and physical abuse from physicians, coworkers, patients, and family members.

Student nurses were acutely aware of stressors in clinical environments and expressed fear and anxiety with transition to practice. To succeed as a NLRN in this challenging environment, students developed Coping Strategies. Four general categories of Coping Strategies were described: 1) "fitting in as a real nurse" was described as students discussed two common strategies to cope with role transition that included establishing and maintaining good working relationships, and finding a supportive environment for successful transition to the NLRN role. To improve the likelihood of support in the clinical environment, students planned to seek out a mentor, act exceptionally nice to people in the workplace (e.g., make coffee, buy gifts), and exhibit authentic willingness to help (e.g., help certified nurse aides [CNA]); 2) "taking precautions" was described as student nurses identified strategies to thwart risk from contagious diseases. They planned to wash their hands and take the highest precautions to protect themselves (e.g., always wear gloves with patient care). However, they expressed the importance of remaining compassionate to patients and ensuring these precautions do not impede patient care; 3) "taking care of myself" was described by both accelerated and traditional students as they discussed strategies for combating the anticipated stress to themselves, family, and friends caused by the NLRN role; and 4) "staying physically and psychologically safe" was described because violence was viewed as part of the job and students related strategies for self-protection while working. In dealing with colleague or physician violence, some students expressed a strong desire to advocate for themselves to curb any misuse or abuse. Others planned to keep quiet, respond kindly to a rude or discourteous colleague, walk away, or talk to the nurse manager.

**Conclusion:** This study suggests students have experienced stressors in the clinical environment and anticipate them in the NLRN role. During transition, strategies such as "fitting in" and "staying safe" will be employed to ensure work success.

**Implications for Nursing:** For decades, there has been discussion of transition shock for students as they leave the educational system and join the workforce as NLRNs. Today, Generation Xers and Millennial students have access to an increased speed of communication within a healthcare environment with growing budgetary constraints, high acuity, advanced technology, and physiological dangers. Consequently, nursing students are keenly aware of the workplace challenges that consist of stress caused by a strained workforce, unique work schedules, families and patients experiencing the most fragile life experiences, and exposure to dangerous transmittable diseases. These students have observed the "real world" and are savvy; they have developed strategies to overcome transitional barriers and realize that they must actively participate in a successful transition process.

## A 13 - Cultural Competency in Nursing Education

### Measuring Cultural Competency: One-Year Post Immersion Experience in Costa Rica

---

*Maureen C. Roller, DNP, RN, ANP-BC, USA*

*Helen C. Ballestas, RN, PhD, ANP-BC, USA*

#### Purpose

The purpose of this presentation is to determine the effects of a study abroad program on cultural competence one-year post experience compared to immediate post experience. One method of teaching cultural diversity is experiential. Study abroad programs offer students an experience working with individuals from other diverse cultures.

#### Target Audience

nurse clinicians and educators interested in methods to develop cultural competency. Strategies for nurses and students to best deliver care to our diverse client populations may include using study abroad experiences and immersion courses. This presentation will discuss cultural competency research one-year post immersion course in Costa Rica.

#### Abstract

**Background:** According to the United States Census Bureau (USCB), over 37% of the US population is non-white. The Hispanic population grew by 43% and individuals who identify themselves as belonging to two or more races increased by 33% between 2000-2010. Minority residents of the United States are estimated to be as one in three with the population reaching 101 million (United States Census Bureau (USCB), 2010a; USCB, 2010b & Humes, Jones & Ramirez, 2011). Nurses need to provide culturally competent care for our diverse population. According to the American Association of Colleges of Nursing (2008) it is important to serve our diverse patient populations by facilitating the education of baccalaureate nurses who are culturally competent.

Offering immersion courses have been described in the literature as a method of developing cultural competent nurses. Positive quantitative results have been described in study abroad programs to improve cultural competency and personal growth with undergraduate baccalaureate nursing students (DeDee & Stewart, 2003; Carpenter & Garcia, 2012; Downing, Kowal & Paradies, 2011; Ballestas & Roller, 2013). The short-term study abroad program can foster long-term global engagement in students (Fisher, 2009). Preparing students and faculty to deliver culturally competent care has been described in study abroad programs (Bentley & Ellison, 2007).

However, little is known about the long-term effects of study abroad programs in nursing and more research has been indicated in the literature (Read, 2011; Edmonds, 2012; Kelleher, 2013). This abstract describes the results of a one-year post experience in Costa Rica of baccalaureate nursing students who had an increase in cultural competence scores immediately following the one-week immersion course. The study purpose was to determine if initial competence scores were maintained one year following the experience.

**Purpose:** The purpose of this presentation is to determine the effects of a study abroad program on cultural competence one-year post experience compared to immediate post experience. One method of teaching cultural diversity is experiential. Study abroad programs offer students an experience working with individuals from other diverse cultures.

**Design:** Quantitative comparison design measured cultural competency based on an immersion program utilizing an instrument completed at conclusion of program (N=18) and one-year (N=15) after participating in the one-week program in Costa Rica. The study design was a pre-test post tests one utilizing the instrument: Inventory for Assessing the Process of Cultural Competency among Healthcare Professionals-Revised (IAPCC-R) with permission of the author, J. Campinha-Bacote. The subjects

completed the 25 questions Likert scale instrument answering strongly agree (4points), agree (3points), disagree (2 points) and strongly disagree (1 point). The point scale total equals 100 points. The higher score indicates an increase in cultural competency. Cultural proficiency is scored 91-100, culturally competent is scored 75-90, culturally aware is scored 51-74, and culturally incompetence is scored 50-25 (Rollo, 2014). Scores one-month after initial immersion experience in Costa Rica were compared to scores one-year post experience utilizing the same instrument (IAPCC-R). The effectiveness of the initial immersion program has been reported elsewhere (Ballestas & Roller, 2013). IRB was obtained from authors' university.

**Theory:** Cultural competency is defined as a “process, not an end point, in which the nurse continuously strives to achieve the ability to work in the cultural context of an individual, family or community from a diverse cultural/ethnic background” (Campinha-Bacote, 1994 pp. 1-2). The framework chosen for this research study was the model: The Process of Cultural Competency in the Delivery of Healthcare Services. This theoretical model follows a fluid process that spans cultural awareness, cultural desire, cultural skill and cultural knowledge. The study fits the theoretical model in unique ways because cultural competency begins during the process of acquiring awareness, knowledge, skill and desire (Campinha-Bacote, 2002).

**Results :** Demographics for the 15 subjects were an age range of 21-41 years. The mode was 22 years of age (38.9%). Gender was predominately female (93.3%). Race /Ethnicity was self-reported as Black/African American N= 2, (13.3%); Asian, N= 1(6.6%); Caucasian N=8, (53.3%); Hispanic/Latino N=1, (6.6%); and Other N= 3, (20%). The initial immediate post immersion overall increase in total scores from the pre-experience to immediate post Costa Rica study abroad experience was an 89% improvement in cultural competency (Ballestas & Roller, 2013). The mean scores from the immediate post experience t-test (78.83) (Time 1) and the one year post experience t-test (78.80) (Time 2) were similar. Students increased their scores one year post experience to culturally proficient N=2 by 13.3%. Cultural proficient scores decreased; this was because 2 students originally culturally proficient were now scored in the higher category. Three students could not be contacted and thus not included in data. The cultural aware category scores remained unchanged for the N=4 at the year follow up. The initial post experience scores and the one-year post experience scores from the groups were compared using a t-test= .012 There was no significant difference between the students' (N=18) one-year scores and the one-year after experience scores (N=15). Although some students increased or decreased their score, the group's overall cultural competency was maintained one-year post immersion course.

**Study Limitations:** Limitations of this study were its small sample size and that students in this study were primarily seniors in a four-year program and thus may have gained cultural competency from courses completed in the nursing curriculum. Three subjects from Time 1 did not participate in Time 2 data collection because they could not be contacted. The (IAPCC-R) instrument has been reported to be validated and reliable. However, there is now a student version of the instrument available (Rollo, 2014) which may have been more appropriate for the study.

**Conclusion:** Cultural competency that increased at the conclusion of a study abroad program was maintained one-year post immersion experience for baccalaureate nursing students. Few past research reported have described cultural competency post one-year immersion course outcomes. The comparison of the two groups revealed no significant differences between them. This confirmed that at the post one-year immersion, subjects maintained the gains in cultural competency they achieved by attending a one-week immersion experience in Costa Rica. Nurse educators have a challenge to provide opportunities for nursing students to gain and maintain skills of cultural competence. Assisting nursing students to learn about and provide culturally competent care can be achieved through a short-term immersion program. Culturally based experiences should be available in the curriculum to offer all students the possibility to participate in study abroad courses. This study's findings although using a small sample indicate further research is needed to measure the effectiveness of the program such as with a control or comparison group.

## A 13 - Cultural Competency in Nursing Education

### Nursing Education in Jordan: A Fulbright Scholar's Perspective

---

*Susan A. LaRocco, PhD, MS, MBA, BS, RN, CNL, FNAP, USA*

#### Purpose

to describe nursing education in Jordan and to discuss challenges that nurse educators there are facing as viewed through the lens of an American nurse educator who taught at the University of Jordan for one year under the auspices of the Fulbright Scholars program.

#### Target Audience

nurse educators; nurses interested in global nursing; nurses interested in the Fulbright program

#### Abstract

In Jordan there are 15 universities that award a baccalaureate degree in nursing. One of the largest nursing programs is at the University of Jordan (UJ) in the capital, Amman. UJ was the first university based nursing program in Jordan. When the program started in 1972 female and male students matriculated, but then male admissions were halted until 1982. Masters education began in Jordan at UJ in 1986 and the first PhD program in nursing started at UJ in 2005. Prior to 2005 many of the nursing faculty received their doctoral education in the US; others went to the UK. Since 2005 there have been 48 doctoral graduates and 39 doctoral students are currently matriculated. Currently there are 51 full time nursing faculty at UJ.

Associate degree nursing education is offered in about 29 colleges throughout the Kingdom. Graduation from either program allows the nurse to be registered, without requiring a licensure examination. The two categories of nurses are distinct, each with their own job title and responsibilities.

Major issues in nursing education include:

- Lack of clinical experience of some of the faculty. Many of the doctorally prepared faculty have limited clinical experience prior to their advanced studies
- Discrepancy between the English language (mostly US) textbook view of nursing and the culturally different environment that the students find in the hospitals
- Large clinical groups (8-10 is common)
- Lack of available clinical sites for students and lack of student access to electronic records
- Entrance to the nursing program is based on the composite score of general national exams given during secondary education
- The need to limit the number of male students because of female patients' preference for female nurses

Strengths in the nursing educational system include strong support from Her Royal Highness Princess Muna, the King's mother, who was honored by STTI in 2009 for her contributions to the profession. A strong research ethic with many studies focused on nursing practice and education in Jordan helps to advance nursing science. Collaborative agreements and scholarly exchange with universities outside Jordan also enhance the perspectives of the nursing faculty.

As a Fulbright Scholar, I had the opportunity to fully participate in the academic life of the Faculty of Nursing. I taught qualitative research methods and professional writing to doctoral students as well as guest lectured in various undergraduate classes. I also worked closely with the faculty at UJ as they formed the first nursing honor society in Jordan. This society was created with guidance from STTI and will petition to become a chapter of STTI after the required one year waiting period. The cultural and educational exchange that occurs as a result of the Fulbright Scholars program provides many benefits to the host institution as well as to the institution where the scholar normally teaches.

## A 13 - Cultural Competency in Nursing Education

### Understanding the Lived Experience of Nursing Practice in Haiti

---

*Lorraine Emeghebo, EdD, MSN, BSN, RN, USA*  
*Judith C. James-Borga, PhD, MS, BSN, RN, USA*

#### Purpose

The purpose of this presentation is to describe the current lived experience of nursing practice in Haiti.

#### Target Audience

Nurse leaders, nursing educators, practicing nurses, funders and policy makers who are interested in understanding and enhancing global health care and nursing education.

#### Abstract

With 80% of its population living below the poverty line, Haiti remains one of the lowest resource countries in the Western hemisphere. Compounding the high morbidity and mortality rates is the shortage of all levels of healthcare personnel including nurses. Most of the health care in Haiti is delivered by Registered Nurses (RN), the overwhelming majority of whom are diploma educated. Research shows that better nursing consistently leads to better outcomes for patients. Increasing the number of nurses with the Bachelor of Science in Nursing (BSN) degree is central to reducing morbidity and mortality rates. The World Health organization (WHO) and the International Council on Nursing (ICN) recommend global strengthening of nursing services by improving the educational level of nurses. Effective January 2014, the entry level for nursing in Haiti has been upgraded to a baccalaureate level. There is a need for pathway programs that will facilitate the transition of the current diploma graduate nurses to BSN status. This researcher is partnering with the Ministry of Haiti, and the University of Haiti to provide a program of nursing education that will allow RNs educated at the diploma level to obtain a BSN. This program would address the need for high quality nursing care in Haiti and provide a smooth transition from RN to BSN. There needs to be buy-in by the nurses currently in practice in Haiti. The research questions are: what are the perceptions of diploma prepared nurses of their nursing education and how do nurses perceive the mandate to make the BSN the minimum level for entry into practice in Haiti. This research project explores the views of nurses in practice in Haiti who are currently enrolled in the RN to BSN program in Haiti

## B 11 - Developing Nurse Leaders

### Creating Nurse Leaders through a Senior Leadership/Management Immersive Learning Capstone Experience

---

*Cynthia M. Thomas, EdD, MS, BSN, ASN, USA*  
*Constance E. McIntosh, EdD, MBA, BSN, USA*

#### Purpose

The purpose of this presentation is to highlight a nursing programs' immersive learning capstone experience to help students transition to the professional nurse role. This is accomplished through an intensive capstone experience where students are paired to work with a registered nurse preceptor to enhance skills and develop leadership qualities.

#### Target Audience

The target audience of this presentation is all nurse educators, nursing students, and practicing registered nurses seeking to serve as preceptors, mentors and coaches.

#### Abstract

The transition from student to professional practice can be difficult for new registered nurses since nurse managers have high expectations for performance (Thomas, Bertram & Allen, 2012, Thomas, Ryan, Hodson-Carlton, 2011). In addition to the didactic requirements, the clinical experiences are developed to gradually prepare students for professional practice. Traditionally, nursing students are closely monitored during their clinical experiences by a registered nurse faculty. The main purpose for the clinical experience is to enhance the relevance of theoretical knowledge gained in the classroom. In addition, the development of the Quality, Safety, Education for Nurses (QSEN) essential core competencies of patient centered care, teamwork and collaboration, evidenced based practice, safety, quality improvement, and informatics are critical to the development of every new nurse in professional practice (Dolansky & Moore, 2013; Joint commission, 2013).

Generally, nursing students are focused on applying technical skills learned in a laboratory or simulation setting and acquiring new skills under the supervision of the course faculty. The immersive learning capstone experience is different because the course faculty is not usually present, but rather the student is paired with a registered nurse preceptor to meet course objectives and personal goals. The faculty at a midwestern university sought to have students meet the QSEN core competencies and to develop leadership attributes. Once students are assigned a registered nurse preceptor, the students become responsible to make contact with the preceptor, obtain the work schedule, and complete and submit all required clinical paperwork prior to starting the capstone experience. Students develop two long-term goals and six short-term goals to be completed during the capstone experience focusing on skills and leadership qualities. Throughout the capstone experience students must demonstrate leadership skills through professional behavior, communication, role-modeling, delegation and supervision, and team work. Additionally, the students are required to complete an immersive learning project. The quality improvement evidenced-based project is identified by the student along with preceptor (and clinical managers) as a process in need of improvement. The entire project is student driven. A component of the immersive learning project is that the students, in groups of two or more, must produce a product for the nurses such as a brochure, power point presentation, and/or fact sheets. Students complete the immersive learning capstone experience with not only greater skill acquisition, but also having developed and demonstrated leadership qualities.

## B 11 - Developing Nurse Leaders

### Fostering the Integration of the Clinical Nurse Leader Role in Japan through a Multidisciplinary Clinical Immersion Program in the United States

---

*Gordana Dermody, MSN, RN, CNL, USA*  
*Asako Katsumata, PhD, ME, BA, RN, CNL, USA*  
*Shannon, K. Lizer, PhD, FNP-BC, USA*

#### Purpose

The purpose of this presentation is to describe how Nursing leaders in the U.S. collaborated with Japanese nursing leaders to promote qualified Japanese nursing faculty to gain in depth understanding of the assumptions of the Clinical Nurse Leader role in theory and clinical practice through a clinical immersion experience.

#### Target Audience

The target audience of this presentation includes clinical and academic nursing leaders who envision international collaboration toward the advancement of nursing leadership, and advanced nursing practice.

#### Abstract

**Background:** The Clinical Nurse Leader's (CNL) role is increasingly valued and desired in U.S. healthcare systems, and abroad (Murphy, 2014). This is primarily due to the ability of the CNL to transform healthcare delivery, and improve outcomes (Harris, Roussel, & Thomas, 2014). However, there is a shortage of qualified CNL faculty and the Commission on Nurse Certification (CNC) has extended the faculty certification deadline through 2016 (AACN, 2014). The purpose of this project was to promote qualified nursing faculty to gain in depth understanding of the assumption of the CNL role in theory and clinical practice.

**Program:** A seven-day CNL certification review seminar for qualified nursing faculty was developed in partnership with Saint Anthony College of Nursing and Saint Anthony Medical Center in Rockford, Illinois, and Saint Joseph Mercy Hospital in Ann Arbor, Michigan. The theoretical components of the curriculum included nursing leadership, clinical outcomes management, care environment management, evidence-based-practice, and case studies. The clinical immersion experience was coordinated through nursing administration at Saint Joseph Mercy Ann Hospital.

**Outcome:** A total of 10 participants joined the CNL immersion and certification seminar. This included seven qualified nursing faculty from Japan, one nursing faculty from the U.S., and two CNL students. 2) The clinical immersion experience occurred in a mature location where the CNL role had been fully operationalized. 3) The immersion created opportunity for CNLs to disseminate critical outcomes achieved through microsystem leadership at Saint Joseph Mercy Ann. 4) A total of 21 Continuing Education credits were provided to the seminar participants. 5) Strong collaborative partnership development between two different health systems served to promote and facilitate faculty CNL certification, implementation, integration, and clinical practice.

**Recommendation:** CNL faculty preparation for CNL certification should involve clinical immersion with an institution where the CNL role is fully incorporated. This fosters deeper understanding of the integration and clinical practice of CNL's at the microsystem level through clinical immersion. Partnerships between higher education and clinical settings are imperative to enhance the understanding of content delivered didactically.

## B 11 - Developing Nurse Leaders

### Promoting Inclusion of Diverse Students into Nursing Education for Leadership Development

---

*Sharon Elizabeth Metcalfe, EdD, MSN, RN, USA*

#### Purpose

The purpose of this presentation is to showcase the NN-CAT Nursing Network-Careers and Technology program, which is a nursing mentoring program that has as its goal to help guide underrepresented students and impoverished students into applying successfully to nursing school and potential roles as nurse leaders.

#### Target Audience

The target audience of this presentation is for faculty, educators, and administrators that are actively seeking new and innovative ways to improve the diversity issue in professional nursing and to increase the number of future nursing leaders from a multitude of ethnic and rural backgrounds.

#### Abstract

**Purpose:** The purpose of the Nursing Network: Careers and Technology Program as authorized in Title VIII, Section 821 of the Public Health Service Act is to increase nursing education leadership opportunities for individuals from disadvantaged backgrounds (including racial and ethnic minorities under-represented among registered nurses). The NN-CAT (Nursing Network-Nursing Careers and Technology) program is designed to provide student stipends, scholarships, and opportunities for mentorship through three innovative sub-programs focusing upon increasing cultural inclusivity in nursing education.

**Methods/Clinical Research Expertise Area/Pedagogy:** The NN-CAT Mentoring Program was established in 2013 at Western Carolina University whose faculty were concerned about the shortage of a diversity of nursing students and nurses in the Western North Carolina region. The nursing mentoring program was established to provide individualized nursing mentors to guide minority and rural students to success in their pursuit to enter nursing school and become future nursing leaders in practice. The nursing mentoring program provides nursing mentors from both the community as well as the School of Nursing. Mentors are university prepared nurses that are trained to provide comprehensive individualized mentoring to prenursing students from rural counties in Western North Carolina.

The second NN-CAT sub-program is the WCU School of Nursing (SON) and the MedCat Academy Program of Wake Forest University which partners to offer a summer collaborative in exploring health careers to promote academic success. The program features enhanced science preparation for high school students preparing to enter nursing school. The focus is upon encouraging students from disadvantaged and diverse backgrounds to pursue nursing and strive to become leaders for their profession.

The third NN-CAT sub-program consists of an enriched virtual Second Life science curriculum that is being developed by both the IT department of WCU and the science teachers in Cherokee, Graham, Swain, and Jackson counties and the Cherokee Indian Qualla Boundary. The purpose is to increase interest in both science and the nursing profession for high school students from diverse and disadvantaged backgrounds.

The program strives to increase the leadership goals of young students who are completing high school and hoping to enter college.

**Results/Findings:** Preliminary educational program progress and results will be presented for each of the three programs. The three programs are individual educational research studies that have been funded by the HRSA division of the nursing government.

**Conclusions/Recommendations:** Preliminary conclusions and recommendations based upon the progress of the three programs will be presented to the participants. Recommendations for other educators will be presented to help foster similar programs with the overarching goal to increase inclusion of diverse students both into applying and being accepted into nursing schools, as well as increasing the multicultural heritage of nurses entering the profession for future leadership development.

## B 12 - Caring for the Public's Health

### Integrating Population Health into Primary Care APRN Practice to Improve the Health of the Public

---

*Pamela F. Levin, PhD, RN, APHN-BC, USA*  
*Susan Swider, RN, PhD, APHN-BC, FAAN, USA*

#### Purpose

To engage the learner in describing curriculum approaches in graduate nursing education that enhance the ability of primary care APRNs to integrate population knowledge and skills into their practice.

#### Target Audience

nurse educators, primary care APRNs, and employers of primary care APRNs.

#### Abstract

Nationally, numerous agencies now call for the integration of primary care and population health, including the Centers for Disease Control and Prevention and the Institute of Medicine. This integration is critical to forward the nation's health agenda, build healthier communities, and reduce health care costs. The emphasis on enhancing the numbers of primary care APRNs is necessary to increase access to care, but unless primary care APRNs gain population health knowledge and competencies, they will not be instrumental in developing and implementing the necessary population-focused strategies to meet the Healthy People 2020 goals. Recognizing the challenge, the American Association of College of Nurses (AACN) and the Centers for Disease Control and Prevention launched an initiative to enhance the integration of population and public health content into nursing curricula, as well as to advance the public health nursing workforce. However, current primary care APRN programs are challenged to incorporate the necessary population health content to affect population outcomes into DNP curricula and remain competitive in program length.

This session describes the innovative efforts of faculty at one university in designing a post master's DNP curriculum that expands the role of the primary care APRN by incorporating population health content towards developing the necessary competencies to meet the health needs of populations and communities across diverse settings. Primary Care APRNs in the post-master's Leadership to Enhance Population Health Outcomes program focus on developing population-based knowledge and skills to enhance clinical health outcomes for patient aggregates and populations. This knowledge and skill set can be used across specialty areas to assess the health and illness needs of clinical populations and develop, implement and evaluate population-focused interventions to address these needs. The program is on-line, with three required on campus visits. Students apply course content through a structured clinical experience in their work site or community setting, gaining valuable skills in developing, implementing and evaluating a program for a vulnerable population.

Building on the DNP core courses in leadership and healthcare economics, the curriculum includes courses in policy, finance, advanced nursing roles in population health, population health assessment, and population intervention planning, implementation, and evaluation. Students gain skills in assessing a population for the most prevalent risks and health needs, develop evidence-based interventions or programs to address unmet needs, and engage in sustainable health promotion and disease intervention planning for vulnerable groups. DNP project examples and student and faculty feedback on the project development process to date will be shared along with lessons learned. Curricula suggestions and recommendations are provided for other programs looking to integrate population health content into DNP curricula, to help assure primary care APRNs are prepared to effect change in the nation's health.

## B 12 - Caring for the Public's Health

### Barriers to the Development of a Public Health Initiative with a Coalition of Community and Neighborhood Resources Using Community-Based Participation

---

Wendy S. Clark, DNP, RN, FNP-BC, CNE, USA

#### Purpose

The purpose of this presentation is to identify barriers in implementation of the Patient Protection and Affordable Care Act, revealing interprofessional dynamics as a major contributor to achieving population health outcomes.

#### Target Audience

The target audience includes nurses, community leaders, and healthcare professionals with an interest in understanding and acting to improve population health in their community. Nurses empowered with interprofessional contacts will find the data in this presentation of interest as they plan to impart positive changes within their community.

#### Abstract

Influence of social determinants of health on health is essential to reducing health disparities. Each community strives to improve public health. Imparting change takes many years. The Patient Protection and Affordable Care Act includes the removal of barriers to providing home and community-based services<sup>1</sup>. The World Health Organization's Commission on Social Determinants of Health has acknowledged, "measuring the problem" as one of three principles of action to achieve health equity<sup>2</sup>. In order to recognize inequities in a community, it is necessary to approach the disparities from multiple perspectives. Barriers to the development of a healthy neighborhood initiative are described.

The process of improving the health of a community has many positive outcomes. The white paper "Healthy People, Healthy Lives", stressed "the importance of local innovation to reduce inequalities and improve health at key stages in people's lives." This included "the empowerment of local government and communities to shape their environments and tackle local problems"<sup>3</sup>. Community-based participation includes reflection of the community's values, beliefs, and vision. This practice empowers the community members. Empowerment is a viable public health strategy to improve the health of the residents<sup>4</sup>. Using a bottom-up approach enabled the residents to have more control over and improve their health<sup>4,5</sup>. Empowering the residents to participate in the assessment and development of a public health initiative remained an essential component of the project.

Community participation is a key to empowerment. There are several barriers to community participation that are established in the literature. These barriers are a lack of community skills, dominance of professional culture, lack of organizational abilities, and local political dynamics<sup>6</sup>. Lack of community leadership supporting collaborative partnerships with involvement from outside support organizations, the influence of a neighborhood leader, and the community perception of local government involvement impacted the overall success of the initiative<sup>7</sup>.

There are many challenges to using a community-based participation approach. In developing the coalition, a group of interested persons took a giant step backward to become unaffiliated with the group. In the individual meetings with the local pastors, this topic was discussed. The shifting of power from the leaders and professional partners was uncomfortable to the group members. No singular reason was cited as a cause for lack of participation. Instead of looking at the 46808 community as a whole, focus groups were held within each faith congregation to solicit specific health issues to address in smaller groups. The pastors were amenable and offer to share resources. A rippling effect was expected.

The barriers identified in the literature rang true with the development of this initiative. Barriers included lack of community skills, dominance of professionals, lack of organizational abilities, and the state of local

political dynamics. A community member could not be forced to become empowered to take action regarding the health of their community. There was a disconnect between the goals of community leaders and residents. The social determinants of health remained unclear for this community.

The impact of acknowledging the barriers to a healthy neighborhood initiative could resurrect its momentum. Evaluating the perspective of each set of participants, the community and organizational partners, and the residents, was instrumental in maintaining forward progress. Using evidence-based practice was foundational in the development of a healthy neighborhood initiative. Comprehending principles that influence social change was paramount to effectively anticipate and reduce barriers. Levels of understanding, intimidation, and previous experiences all contributed to the influence on community participation. The ability to go back and clarify, revisit goals and barriers that arise, tenacity, and patience were useful lessons to take forward as new projects are written as part of implementation of the Patient Protection and Affordable Care Act.

## B 12 - Caring for the Public's Health

### **Leadership in Nursing Education: The Development of a University-Based, Interprofessional, Chronic Wound Clinic Model that Provides Clinical Leadership, Evidence-Based Healthcare and Excellence in Clinical Education**

---

*Eleanor S. Horton, RN, ADN, BHlthSc (Nsg), MHlthSc (Nsg), PhD, Australia*

#### Purpose

To present evaluation data from our Wound Solutions Clinic which models a different process of placement development and engagement. Clinical leadership and responsibility for clinical expertise reside with the community service provider while the university partners with them providing clinical placements and cutting edge research into wound healing and management.

#### Target Audience

clinical nurses, academics, nurse leaders and other professionals interested in positive practical learning opportunities for students in an interprofessional environment.

#### Abstract

Many clinics develop as student placements across a variety of disciplines on university campuses usually run by students and facilitated by staff. This presentation describes our Wound Solutions Clinic Model, which is a different process of placement development and engagement. The Wound Solutions Clinic is a joint venture between the University of the Sunshine Coast (USC) and community care service provider Blue Care, in Queensland, Australia. The clinic is staffed by an interprofessional team of Blue Care employees. It is located on the university campus and provides educational placements for USC nursing, occupational therapy, nutrition and exercise physiology students. In other models, campus-based clinics are managed by university faculty and students. Clinical leadership and responsibility for clinical expertise reside with the service provider (Blue Care) while the university partners with Blue Care to provide clinical placements and cutting edge research into wound healing and management. The objectives of the clinic development were to: increase the number of nursing and allied health student placements in the community; provide high quality learning experiences in a supportive inter-professional environment; improve patient outcomes; establish an interprofessional research community and contribute to the University commitment to community engagement. Aspects of academic and clinical leadership that have ensured the sustainability of this joint venture and data examples from the evaluation project that have been collected from client and student feedback will be presented in detail. This model aims to provide excellent local clinical care and student educational experience but also through the healthcare provider/university partnership it seeks to transform regional approaches to clinical education and provide robust clinical trial evidence to support the healing and management of chronic wounds globally.

## B 13 - Developing Nurse Leaders through Service Learning

### Service Learning in RN to BSN Leadership Service Learning

---

*Cheryl Moseley Conway, MSN, RN-BC, NE-BC, USA*

#### Purpose

The purpose of this presentation is to share a service learning education strategy implemented in the RN to BSN leadership practicum.

#### Target Audience

The target audience of this presentation is educators, academic partners, and RN to BSN students interested in learning more about service learning opportunities in RN to BSN leadership education.

#### Abstract

According to the Institute of Medicine (IOM) Future of Nursing Report, there need to be innovative strategies to meet the goals to attain the education percentages set forth by 2020. The Western Carolina University RN to BSN Program includes a leadership practicum in which the student spends 60 precepted hours with a preceptor with his/her BSN or higher nursing degree in a nursing leadership role.

Background: The leadership practicum has a dual course component which includes a professional synthesis project that is an approved service learning course by the University and completed during the semester. Miller and Anderson (2007) describe service learning as a student educational experience with participation in community partnership for academic credit. The model is based upon transformational leadership and the facilitation of the relationship between the preceptor and the student during the semester. The leadership professional synthesis project focus is a leadership topic that is both needed by the site and a learning opportunity for the student.

Description of Innovation: The RN completing the RN to BSN program engages in the experience of collaborating with his or her preceptor to establish a leadership project topic that is of service to the site and a learning opportunity. This experience provides the opportunity to build skills in finding evidence-based resources, communicate, and foster time-management. The student documents weekly field notes toward completing the project and shares experiences during the semester.

Implications for Practice: The leadership practicum experience creates a new awareness for many students. During synchronous sessions, students share comments about presenting for the first time, seeing leadership roles "from a new perspective", enjoying the work on projects, and a feeling of empowerment that was not felt previously. During the semester, there are emerging leadership skills that develop as students seek information and present findings. Previous project topics have included: seeking evidence-based information for a grant; participating on a role-description planning team; gathering evidence-based data for a new orientee guide; finding evidence-based information for policy revisions/guideline revisions; participating in audits/preparation for accreditation; preparing for Magnet designation; gathering information for Beacon Award preparation; education RNs about nursing incivility, and many other ideas. These emerging BSNs have shared comments about being empowered through the process of being precepted/mentored and creating a project that would be used in the practice setting.

## B 13 - Developing Nurse Leaders through Service Learning

### A Global Health Project to Engage Nursing and Elementary School Students: Developing Future Leaders through Service-Learning

---

*Deby E. Tyndall, MSN, RN, USA*

*Wendy Sullivan, MSA, BS, USA*

#### Purpose

to discuss the planning, implementation, and evaluation of a service-learning, global health project between East Carolina University College of Nursing and Wells Elementary School.

#### Target Audience

students, faculty, and administrators who are interested in collaborating with community partners for the purpose of service-learning and global awareness.

#### Abstract

**Background/Purpose:** A partnership between East Carolina University (ECU) College of Nursing and Wells Elementary School in Wilson, North Carolina began in the Fall 2013. A global health project to develop future leaders aimed to provide a service-learning experience to enhance global awareness for both elementary school students and nursing students.

**Methodology:** A service-learning model was used to engage students at Wells Elementary in a global health project to benefit children in Guatemala. The project began with ECU nursing faculty/students using the Global Awareness Standards for North Carolina Public Schools to teach 3 lectures: 1) information about the country of Guatemala, 2) lifestyle and children health issues in Guatemala, and 3) service learning/purpose of project. Designated as the project leaders, the 2nd grade class created broadcasting commercials to be aired on the school's "Beaver News" network. The broadcasts educated students throughout the entire school as well as the local community of the supplies needed for nursing students to conduct charlas (health talks) for Guatemalan children. Various phases of the project were featured in the local newspaper on three different occasions to inform the community.

**Results:** Wells Elementary collected over 2,100 donations (toothbrushes, toothpastes, soaps, washcloths, crayons). Nursing students used these donated items to provide health charlas to more than 200 children at four Guatemalan schools in May 2014. Nursing students shared the results of the project during a follow-up visit to Wells in September 2014. Excitement from the success of the project sparked interest to continue the partnership for the upcoming 2014-2015 school year. The school has begun these efforts by collecting new and used books for Guatemalan children in recognition of International Literacy Day.

**Discussion:** Schools of nursing should identify innovative approaches to emphasize the value of service-learning to develop future leaders in a global society. Partnering with community agencies can provide a platform to mentor students and develop leadership skills. This project facilitated a collaborative leadership experience between elementary school students and nursing students.

## B 14 - Discussing Nurses' Attitudes and Actions

### Attitudes of Nurses and Student Nurses toward Self-Care

---

*Kathleen Cino, PhD, MS, BS, RN, CNE, USA*

#### Purpose

The purpose of this presentation is to report the findings from an educational research study with nurses and student nurses. The study investigated self-care practices before and after an academic semester of mind-body and self-care education.

#### Target Audience

The target audience of this presentation are nurses, nurse educators, nurse researchers, and student nurses.

#### Abstract

**Study Aim:** The purpose of this study is to assess the impact of classroom learning/experiencing of mind-body therapies on the attitudes of nurses and student nurses with regard to mind-body therapies and self-care.

**Background:** Stress is expected among student nurses and decreased stress coping is evident in poor academic performance, student attrition, and suboptimal professional identity formation (Galbraith & Brown, 2011; Hensel & Laux, 2014). For nurses and student nurses learning healthy stress coping is part of the development of self-care. Self-care promotes health and is a core value in the American Holistic Nurses Association Scope and Standards of Practice (Mariano, 2013).

The mind-body therapies increase self-awareness of body sensations (i.e. muscle tension), all or nothing thinking, and negative emotions as experienced in the stress response. Examples of mind-body therapies are mindfulness, yoga, journaling, guided imagery and hypnosis, progressive muscle relaxation, and meditation. Using mind-body therapies is one way of improving healthful stress coping. The effectiveness of these therapies increases with practice and genuine interest. Mind-body therapies may even help change self-defeating behaviors.

This study will determine attitudes of study participants to these concepts at the beginning and end of the semester. The results of this study will contribute to further development/refinement of those mind-body therapies which nurses and nursing students determine support their self-care.

**Method:** Participants: RN-BS completion students and prelicensure student nurses enrolled in a baccalaureate program at a college in the northeast United States.

**Measures:** Mind-body Skills Attitudinal Scale (MBSS) (Tractenberg, Chaterji & Haramati, 2007) is 21 item seven point likert scale designed to measure changes in classroom attitude in medical students for mind-body therapy after course work in the subject area. The scale has also been used with nursing students enrolled in that mind-body medicine course (Karpowicz, Harazduk & Haramati, 2009).

**Procedure:** Once the Institutional Review Board at the college approves the study all participants will sign informed consent and complete the MBSS survey.

The educational activity is focused on self-care for health promotion. After a self-assessment, a plan for care of self is created. Course readings and activities on a variety of mind-body experiences including progressive muscle relaxation, meditation, laughter, chair yoga, and touch therapy provide the educational component on mind-body skills. Throughout the semester, the participants will evaluate progress on self-care behaviors. At the semester end, a final evaluation of self-care activity earns the project grade. In addition, all participants will complete the post test MBSS survey. Analysis of data for change in participant attitude toward Mind Body Skill will be done at study end.

## B 14 - Discussing Nurses' Attitudes and Actions

### Nurse Attitudes toward Patient Advocacy in the Long-Term Acute Care Hospital Setting

---

*Carole D. Liske, PhD, MSN, BSN, RN, USA*

#### Purpose

The purpose of this presentation is to disseminate findings of a quantitative, descriptive, cross-sectional study about LTAC nurses' attitudes toward patient advocacy and relationship with education. This presentation may help inform nurse leaders to identify educational strategies that promote development of professional advocacy behaviors and skills in LTAC nurses.

#### Target Audience

The target audience of this presentation would include both clinical and academic nurses and nurse leaders interested in advancing the essential role of nurses as patient advocates for vulnerable populations.

#### Abstract

Advocacy is the essence of nursing's professional commitment to preserving human rights, protecting patients from harm, and providing quality care. In this dynamic healthcare environment with increased patient complexity and clinical acuity, sub-acute transitional care settings flourished. Given the vulnerability of patients in transitional settings such as long-term acute care (LTAC), the essential role of nurses as patient advocates emerged as a cornerstone of nursing practice. Despite the universally recognized importance of nursing advocacy in maximizing patient safety and delivery of quality care, no consensus existed about the concepts comprising nursing advocacy actions. To explore nurses' attitudes toward advocacy in LTAC, a quantitative, descriptive, cross-sectional study was conducted with two specific aims: to measure nurse attitudes along three core attributes of advocacy (safeguarding patients' autonomy, acting on behalf of patients, and championing social justice in the care of vulnerable patients) and to determine if levels of nursing education influenced attitudes toward advocacy. The Attitude toward Patient Advocacy Scale employed in this study demonstrated high internal consistency at 0.94%,  $p = 0.05$ , study sample size  $n = 108$  (67% response rate), and confidence interval of 95%. ANOVA analysis indicated no statistically significant association between educational levels and advocacy attitudes in LTAC nurse respondents. Findings also indicated the majority of nurse respondents disagreed that it was their role to mediate when the patients' wishes were in conflict with the physician or family. The study findings have important clinical implications for LTAC nurses and nurse leaders in the LTAC setting.

## B 14 - Discussing Nurses' Attitudes and Actions

### Gratitude in Action

---

*Jennifer Graber, EdD, MSN, BSN, APRN, CS, BC, USA*

*Jennifer Saylor, PhD, RN, APRN-BC, USA*

*Cynthia A. Diefenbeck, PsyD, MSN, RN, PMHCNS-BC, USA*

#### Purpose

The purpose of this presentation is to discuss the process of activating gratitude in action in a chapter. The desire to promote the welfare of others can be expressed through fundraising in local communities as well as celebrating member successes while remaining socially conscience of global needs.

#### Target Audience

The target audience of this presentation includes all members of STTI from new members to retirees and across all areas of nursing. All members will become engaged in the chapter and new inductees will benefit from current leaders to develop an avenue that effectively addresses activating gratitude in action.

#### Abstract

Innate to the culture of our chapter is the spirit of giving and promoting philanthropy through gratitude in action. Our desire to promote the welfare of others is expressed through fundraising and monetary donations in our local communities as well as celebrating member successes while remaining socially conscience of global needs. Our chapter is committed to demonstrating altruistic and compassionate values in our chapter, community and global initiatives.

Our chapter holds an annual Membership Appreciation night to celebrate our active, inactive and potential members. The opportunity to newly form and reignite collaborative relationships, offer appreciation, and embrace the spirit of giving is cultivated in this informal gathering. For the past four years, our chapter has collaborated with the University's Nursing Alumni Network to bring together former graduates, members and promote munificence. This past appreciation celebration, our chapter celebrated its' fortieth anniversary. Our current and past presidents were honored for their dedication and contributions to the chapter. One past president has started a new journey for our chapter in recognizing and renewing our livacy. Creative writings on individual thoughts, feelings and vision for the future of our chapter, STTI and the nursing profession were collected. Individuals were encouraged to think about what their legacy would be and were then challenged to actively participate and live that journey. Members were also asked to bring personal hygiene items for a future donation to a local community center, which supports those who are in need.

Our chapter has a long-standing history of embracing service and showing gratitude as a core strategic value. Our service initiatives respond to the needs of vulnerable populations both locally and globally. The outreach endeavors are initiated and coordinated by and include a variety of our members. Members have formed strategic alliances with numerous community agencies to conduct these efforts, which help publicize the unique contributions of STTI. Community collaborations also help to increase the impact of our service efforts and ensure the sustainability of efforts over time.

Our chapter shows gratitude in action by supporting area hospitals by providing annual grant support of \$1,000 as well as mentorship to nursing staff to bridge the gap between research and practice. The financial support may be used for the direct costs incurred for research projects (e.g., survey materials, equipment, printing, statistician, etc.) or research dissemination (poster or podium preparation).

Our chapter recognizes the challenges members of our communities face with chronic mental illness. Members of the chapter, in collaboration with local mental health clinics, have developed a continuing program for our Annual Holiday Outreach. The local mental health clinic determines holiday wish list items and then the wish lists are disseminated among members who may purchase items from the list to be presented during the holiday seasons. These gifts are often in the form of everyday necessities such as

clothing and personal hygiene items. This collaborative effort culminates in an annual Holiday Party for the residents.

In response to the president's call to action, our members were challenged to provide 90 Minutes of Service during the week of Founders Day. The act of giving is contagious when the outcomes and personal enjoyment in providing service is displayed to others. With this in mind, members were asked to share services completed during this time on social media platforms promoting paying it forward. Members participated in a local 5K run to support safe driving habits following the death of a local nursing student in a tragic car accident.

We also express our gratitude to chapter members who have demonstrated selfless behaviors going above and beyond expectations and providing inspiration to others by presenting them the annual Florence Nightingale Award. The recipient of this award is selected by the chapter president and presented a certificate during our fall membership induction ceremony. In addition, the recipient is highlighted in our chapter newsletter. Our chapter has also made a concerted effort to include newly inducted members or those in their first year feel appreciated for their efforts. In addition to the Membership Ambassador efforts to stay connected with newly inducted members, times were offered at meetings for networking. These informal but planned times were appreciated by the members and led to increasing active members. Our chapter also shows appreciation to mentors and colleagues by awarding full and partial travel for the STTI Leadership Conference. The chapter continues to support members to attend the local consortium brunch.

Two years ago a Wine Tasting Benefit Event was designed to raise money for expanding our philanthropy efforts. The chapter provides food and members can attend to support the event and our outreach initiatives. The chapter receives money that is used to complete over 60 hygiene packs for a local charity. Our chapter has also been involved with Stockings for Soldiers, Books for Uganda, Hygiene packs for Haiti, Flip-Flops for Haiti, a UNICEF Water pump for Africa, and the Red Cross Hurricane Sandy Relief.

Our chapter's support of showing gratitude also extends to its own members. Student scholarships are provided each year. In addition, new member subsidies are available if invited candidates are unable to join due to financial barriers. The chapter works with these students to help them complete the Edith Anderson subsidy application. The chapter agrees to finance the remainder of the membership and induction fees not covered by the Edith Anderson subsidy.

A strong foundation for gratitude in action is a chapter that engages members to share information and work towards common goals. Our chapter encourages members to connect at board meetings, through newsletters, online through social media and email, and more. To keep members connected and updated with real-time information, our chapter is actively utilizing The Circle, Sigma Theta Tau's professional networking site, to post information about member activity, chapter achievements, and upcoming events. On this site, members have the ability to participate in discussions, personalize their profile, access chapter news and much more. The Circle is one of many ways to introduce our newest members to networking and becoming involved in events and activities. In addition to The Circle, Our uses social media to build an involved network and expand collaboration on Flickr, LinkedIn, Twitter, and Facebook.

Our chapter reaches out to chapters across STTI networks and creates collaborative initiatives by networking at conventions and conferences. Our chapter attends two local Consortiums, as well as the Leadership Connection Conference. Our chapter joined the region by serving on the planning committee to develop the conference about providing veteran care into the community with a focus upon behavioral health. Our chapter also served on the donation committee of the other local consortium. The international Leadership Connection Conference was attended by four of our members and in an effort to enhance professional and chapter leadership goals, and our members attended sessions on strategic planning, advancement of technology and the Circle, member recruitment and retention, board management, leadership in mentoring, outreach, workplace violence, and developing global leadership. This chapter also has an active member on the STTI international governance committee.

Our ability to maintain a vibrant service outreach orientation that responds to the needs of vulnerable populations locally, regionally, and internationally, is directly related to the passion, dedication, and enthusiasm of our members and shows our gratitude in action. In addition, our chapter maintains a vibrant Philanthropy Committee which supports these efforts through a variety of fund-raising activities. A strong foundation of our chapter is our continued dedication to involvement and outreach initiatives for nurses as demonstrated by member collaboration and networking locally, regionally, and globally. Our chapter demonstrates strong leadership qualities and is committed to the mission and goals of Sigma Theta Tau International. As a chapter, we believe our efforts to give and display gratitude towards others not only in our professional but personal lives, is exemplary. However, we are constantly evaluating and modifying our approaches on how best to remain magnanimous in our local, state and global efforts.

## B 15 - Role Delineation of Nurse Scholars

### Creating a Culture of Clinical Inquiry: The Role of the Scholar in Residence

---

*Ruth A. Bryant, MS, BSN, RN, CWOCN, USA*  
*Martin Schiavenato, PhD, MS, BSN, BS, RN, USA*

#### Purpose

to explicate the current opportunities and challenges facing clinical systems to build and sustain a culture of inquiry evidence based practice.

#### Target Audience

nursing leadership and management.

#### Abstract

Integration of research and EBP into clinical practice are deemed a core competency by the IOM and required for Magnet Recognition by the American Nurses Credentialing Center (ANCC). Education and support of the nursing staff, administrative support mechanisms and infrastructure are critical to build and sustain EBP. The Scholar in Residence (SIR) illustrates a viable approach for healthcare institutions to partner with PhD prepared nursing faculty to facilitate clinical inquiry and EBP utilization.

This presentation highlights the experience of two individuals serving as Scholar in Residence over a two year period at a major non-profit hospital system in a joint academic/clinical appointment. That personal experience reveals unique issues pertinent to promoting a culture of inquiry as well as essential supportive infrastructure. Methods of communicating with direct care providers will be discussed. Significant positive outcomes include building interdisciplinary relationships in a clinical setting, establishing rapport and credibility and creating an ongoing reliable structure to facilitate clinical inquiry and EBP. Nursing staff respond positively to coaching and mentoring through the EBP steps and often express insecurities in their EBP and research knowledge and skills. Challenges include clarifying the roles of leadership, direct care nurses, the Scholar in Residence and employee-nursing students in structuring and conducting EBP projects. It is also challenging to access nurses to identify individuals interested in participating in EBP or research activities and to maintain contact with project leaders. Additionally, authority in this clinical setting is indirect so that the avenues to influence change among nursing leadership, staff nurses and administration will differ. From the academic perspective, challenges for the Scholar in Residence includes interpretation of this position as scholarly engagement for tenure-track faculty and adopting a generalist versus focused area of research.

The SIR role potentially yields synergistic and mutually beneficial outcomes at both academic and healthcare institutions seeking collaborative work in EBP and research. However, challenges implicit with the new role and predictable changes to the culture of nursing highlight a need for further professional discussion and research into this and similar roles. Integration of the role of the Scholar in Residence into the culture and organizational structure of the clinical setting will increase the ability to effect change through the application and utilization of EBP and research at the bedside.

## B 15 - Role Delineation of Nurse Scholars

### An Analysis of Nursing Preparation to Meet the Demands of the Largest U.S. Patient Population

---

*Kim K. Kuebler, DNP, MN, APRN, ANP-BC, USA*

#### Purpose

Provide an overview of three research studies that evaluated undergraduate and graduate nurses self-perceived knowledge with actual knowledge of common chronic disease, symptom and self-management and, review the startling results of a systemic review of graduate nursing curriculum content on chronic symptomatic disease.

#### Target Audience

Undergraduate and Graduate nursing educators, nurse clinicians and nursing students. Editors and authors of nursing educational content.

#### Abstract

Americans aged 65 and older compared to people aged 20-64 is expected to rise by 80% over the next decade. The oldest of the 80 million baby boomers reached age 65 in 2011 and, more than a quarter of all Americans – or three out of four are estimated to have at least two or more chronic conditions or behavioral health problems. Currently 75% of the American population is living with and dying from symptomatic chronic conditions contributing to the costliest health care in the US. The Affordable Care Act has provided funding and direction by the US Department of Health and the Health Services to promote initiatives from the Institute of Medicine, the Agency for Health Research and Quality, the National Institutes of Health and the Health Resources and Services Administration among other federal agencies to demonstrate innovation and initiatives targeting patients with multiple chronic conditions (MCC) and implementing self-management practices This presentation will provide an overview of the current federal initiatives and describe three research projects that highlight the need for undergraduate and graduate nursing education in the clinical management of common chronic disease, symptoms and self-management.

## C 10 - Are There Plans for the Nursing Workforce?

### Fostering Workforce Development through Meaningful Experiences: Pathways to a Nursing Degree Program

---

*Erin M. Robinson, EdD, MSN, RN, USA*  
*Catherine G. Tagher, EdD, MSN, RN, APRN, USA*  
*Julie Hart, MSN, BSN, RN, CNE, USA*  
*Adele DiMinno, MSN, BSN, BSW, RN, USA*  
*Marilyn Schleyer, PhD, ARNP, USA*

#### Purpose

As the largest group of health care professionals, registered nurses will be fundamental to a more comprehensive form of health care provision. The purpose of this presentation is to describe the creation of one program to interest young students in careers in nursing through experiential learning opportunities.

#### Target Audience

Nurses, nurse educators, nurse administrators, nurse recruiters, nurse academicians

#### Abstract

The RN workforce is projected to grow from 2.71 million in 2012 to 3.24 million in 2022, creating a 19% increase in the need for nurses. The Bureau of Labor Statistics projects the need for 525,000 replacement nurses in the healthcare workforce generating over one million nursing jobs by 2022 (Bureau of Labor Statistics, 2012). As the demand for nurses increases, the profession of nursing must employ innovative approaches to foster an interest in a nursing career.

In response to the national healthcare mandate, the program Pathways to Nursing (PTN) was started in 2006. The PTN was an innovative partnership between the area healthcare agencies, county schools, and the regional university to expose high school students to the profession of nursing. In 2009 the program was expanded to include middle school students and was renamed Pathways to a Nursing Degree (PTND). The expanded program included two unique learning opportunities: (a) Nurse Summer Camp for high school students, and (b) Nurse Career Day for middle school students. Currently, the program is a partnership between a regional university and the area regional medical center.

Summer camp high school participants spend two days on the university campus, including an overnight in the dorms and an additional two days in shadowing experiences with registered nurses in a myriad of specialties throughout the medical center. While the high school students are on campus they engage in a variety of nursing related activities, and a “meet and greet” with academic advisors about the requirements for the baccalaureate nursing program. They participate in the skills lab performing skills such as vital signs, tube feedings, IV flushes, and dressing application. Additionally, students participate in the assessment of a high fidelity simulator and have the opportunity to play a role in a faculty led simulated code. Additionally, students engage in experiential opportunities such as the cadaver lab, a medical therapy dog, the digital planetarium, and campus wellness.

Experiential learning continues at the regional medical center through the shadowing experience. Eight shadowing opportunities are provided to the students. These opportunities include experiences in medical-surgical areas, the emergency department, labor and delivery, and surgery.

Based on program exit surveys from 2009 supported by k-12 educational literature, PTND faculty identified that middle school students, especially “at risk” students who become involved with collegiate activities and opportunities as early as 6<sup>th</sup> grade are better prepared for future career selections. The measured outcomes from college readiness programs implemented in the middle school grades include academic motivation, increased classroom participation, willingness to take on more work, and improved career maturity levels (Standing, Judkins, Keller, & Shimshak, 2008).

Therefore, a second educational component was created for 6<sup>th</sup>, 7<sup>th</sup> and 8<sup>th</sup> graders entitled Nurse Career Day. This component provides middle school students a one day on campus exposure to the profession of nursing. According to Kenny, Blustein, Haase, Jackson, and Perry (2006), students entering high school with previous exposure to career planning tend to place a higher value on their education, thus becoming more engaged in the schooling process which ultimately impacts career choices.

Based upon the standards established within the national GEAR UP model, the PTND program partnered with area middle schools demonstrating 50 percent or greater student population on free or reduced lunch to bring middle school students to campus for a Nurse Career Day. While on campus the students participate in a skills lab, an assessment of a high fidelity simulator, and interactive scavenger hunt. Additionally, students are given the opportunity to meet with an advisor regarding the academic requirements needed in high school to be successful in nursing.

Since 2009 the PTND program has had contact with 190 high school students through Summer Camp and 59 middle school students through Nurse Career Days. Through program exit surveys students indicate an overall positive experience. For both middle and high school students the number one reason for what influences their interest in a career in nursing is attending PTND camp or career days. The second highest category for influencing their interest in nursing is their parents and the third, which is meaningful from a health provider stand point, is a "health issue that either you or someone else has dealt with".

Of those students completing the exit survey, both middle and high school students indicate they plan to attend a four year college. High school students identified money as an obstacle to higher education. The middle school students did not identify any obstacles for attending college. Because middle school students did not identify any obstacles, this becomes a pivotal time for college and career planning.

Data collected also demonstrate that the majority of both middle and high school students attending the PTND program reported that no immediate family members are nurses. Through the PTND program students are exposed to many meaningful aspects of modeling and role-modeling that are associated with professional nursing behaviors. According to Erickson (2014), role modeling is often embedded in nurturing and facilitative behaviors. In a proactive attempt to contribute to a strong nursing work force it is important to give students an image of the nursing profession early in their educational development. Additionally, connecting with students early allows for a sense of affiliation thereby contributing to the perception that he or she has some control over the direction of his or her life (Erikson, 2014; Frisch & Bowman, 2011). These connections foster students' transformations in the direction of their hopes and dreams. Parse believed that nurses, in their presence with others, help to support clarification of this new direction (Parse, 1999).

The Pathways to a Nursing Degree program is the focus of a longitudinal study which is investigating the impact of the program on the selection of a nursing or healthcare career by those students who have attended this program. Longitudinal data will begin to be collected in the Spring of 2015. Although longitudinal data is pending, the current program evaluation data supports the continuation of this unique opportunity.

## C 10 - Are There Plans for the Nursing Workforce? Understanding Burnout among Oncology Nurse Practitioners

---

*Barbara B. Pieper, PhD, MN, BS, RN, USA*

### Purpose

The purpose of this presentation is to offer a starting place for understanding the current workforce needs among oncology nurse practitioners, an understudied group. The prevalence of burnout, psychological morbidity, job satisfaction and stress based on a survey among members of the Oncology Nursing Society are presented.

### Target Audience

The target audience of the presentation is administrators, nurse leaders, workforce planners, and the nurse practitioners themselves. Nurse educators can also use the findings of this study to support instructional strategies for needed self care for nurses in this field.

### Abstract

As 10,000 baby boomers reach the age of 65 each day, the incidence of cancer is estimated to increase by 67% between 2010 and 2030. The IOM predicts that since the entire oncology workforce, including nurse practitioners, is not growing at the rate of expected need, there will be a serious shortage of oncology physicians, nurse practitioners and nurses by 2020 (Institute of Medicine [IOM], 2008). The American Society of Clinical Oncology (ASCO) workforce suggests that increasing the role of nurse practitioners and physicians assistants in an oncology practice is one effective way to address the projected oncology workforce shortage and to ensure continuous delivery of high-quality cancer care (Erikson, Salsberg, Gaetano, Bruinooge, & Goldstein, 2007). Health care providers in oncology are considered to be at risk of a work-related stress syndrome, termed 'burnout,' due to the constant and sometimes overwhelming emotional stress resulting from issues of patient death and dying. Among oncologists/hematologists, 61.7% report feelings of burnout, with the top three signs being frustration (78%), emotional exhaustion (69%), and lack of satisfaction with their work (50%) (Allegra, Hall, & Yothers, 2005).

Approximately 40% of oncology/hematology nurses experience burnout (Aiken, et al., 2001). Burnout can lead to decreased job satisfaction and depersonalization of patients, as well as changing professions (Dougherty, et al., 2009; Spinetta, et al., 2000).

Burnout in oncologists/hematologists and oncology/hematology nurses has been well documented, however there is paucity of information regarding burnout in oncology/hematology nurse practitioners. In order to retain experienced oncology/hematology nurse practitioners, burnout needs to be identified and addressed. Given the magnitude and the potential severity of nurse practitioner shortage in this field, determining the burnout prevalence, psychological morbidity, and job satisfaction and job stress is urgently needed. The purpose of this study is to measure the prevalence of burnout, psychological morbidity, job satisfaction and job stress in oncology/hematology nurse practitioners.

Using the data base obtained from Oncology Nursing Society (ONS), emails with a link to the surveys were sent to members with a forward link to other oncology/hematology NPs who may not be ONS members. The initial email included the introductory letter and the link to the survey. A follow-up email was sent 8-10 days after the initial mailing. A final personalized and signed letter was sent three weeks after the first notice. The survey period was 8 weeks in total.

Data collection instruments included the 22 item, 3 factor structure Maslach Burnout Inventory, the General Health Questionnaire (GHQ) to measure psychological morbidity, Hospital Consultants Job Stress and Satisfaction Questionnaire ( HCJSSQ) to measure job satisfaction and job stress, and finally and the investigator developed Intent to Leave instrument, along with demographic data.

A sample of 350 members received emails with 143 respondents after 8 weeks.

Early findings suggest participants indicated a moderate level of exhaustion and sense of personal accomplishments with a low sense of personal accomplishment. These are coupled with a high number of responses indicating a plan to remain in the field, working for prolonged periods of time, and many don't have time to do the work that must be done. Recommendations include exploration of factors which support the high retention rate in this field when compared to other groups.

## C 10 - Are There Plans for the Nursing Workforce?

### Transformational Leadership and Intent to Stay: Moving Research Into Nurse Leaders' Practice

---

*Christine T. Kovner, PhD, RN, FAAN, USA*

*Carol S. Brewer, PhD, RN, FAAN, USA*

#### Purpose

to describe the relationship between transformational leadership and intent to stay in one's job.

#### Target Audience

nurse leaders and policy makers.

#### Abstract

**Research Background:** High turnover of staff nurses is a persistent problem for healthcare systems in the United States and globally. It negatively impacts patient outcomes and has high organizational costs estimated at \$1.4-2.1 billion per year based on 2006 RN salaries (Brewer, Kovner, Greene, Tukov-Shuser, & Djukic, 2012). Although turnover is a complex phenomenon with many precursors at play, poor management by nurse leaders is one of the top reasons staff nurses leave their employers (Kovner et al., 2007). In a 2011 systematic review of 53 studies, (Cowden, Cummings, & Profetto-Mcgrath, 2011) only three studies showed that a transformational leadership style had a direct positive significant relationship with intent to stay. Since then Laschinger et. al (Laschinger, Wong, Grau, Read, & Pineau Stam, 2012) found a similar relationship, however Abualrub (Abualrub & Alghamdi, 2012) found no relationship.

**Objective:** The purpose of our study was to examine the relationship between transformational leadership style and intent to stay, a direct antecedent of actual turnover, in a nationally representative sample of early-career nurses from the U.S. using multiple covariates.

**Methods:** This was a cross-sectional, correlational study of nurses who had been licensed for 7.5 to 8.5 years. We used data collected in 2013 as part of a large longitudinal study begun in 2006. Our nationally representative sample of RNs licensed between August 1, 2004 and July 31, 2005 is from 51 metropolitan statistical areas and 9 rural areas in 34 U.S. States and the District of Columbia. The analytic sample in 2013 was 1,375. The response rate for the sample used here was 69%. After removing nurses who did not work with physicians, and those who did not work in a job that required an RN license or in a health related field, the analytic sample was 1,198 RNs. After removing cases in which critical data were missing, we analyzed data from a sample of 1,173. We collected data using a survey with a \$5 incentive and a maximum of five contacts for non-responders. Data were collected from both a mailed survey and an internet based survey. We used an expanded Price Model of Turnover (Price, 2001) to guide inclusion of survey questions, which comprised four domains: demographics (e.g. age, race), 2) work setting (e.g. position, shift), 3) attitudes about work (e.g. satisfaction, work group cohesion), and 4) availability of work in other organizations. Attitudes were measured using instruments that had good reliability and validity and that had been used in previous published research. Bass (Bass & Steidlmeier, 1999, p.11) notes "Transformational leadership refers to the leader moving the follower beyond immediate self-interests through idealized influence (charisma), inspiration, intellectual stimulation, or individualized consideration. It elevates the follower's level of maturity and ideals as well as concerns for achievement, self-actualization, and the well-being of others, the organization, and society." TL was measured with a 6-item scale (e.g. "My manager develops a team attitude and spirit in the staff in the department") with possible response options ranging from strongly disagree to strongly agree and mean scores ranging from 1 to 7 (Hammer, Ommen, Rottger, & Pfaff, 2012). ITS was measured using a scale with 4 items (e.g. I plan to stay with my present employer as long as possible.) Mean scores ranged from 1 to 5.

Covariates included: job tenure, months worked as RN, work status, setting, unit type, overtime, highest nursing degree, age, gender, ethnicity, children at home and marital status, autonomy, MD-RN

collaboration, job-family conflict, organizational constraints, promotional opportunities, quantitative workload, and local and nonlocal job opportunities, all of which have been reported in the literature and/or found in our own research to be related to ITS. We used ordered probit multivariate regression analyses (Greene, 2008) and STATA to model the relationship between TL and ITL.

**Principal Findings:** The nurses in our sample were married (74%), white (86%), women (90%) with a mean age of 40 who had worked on average 7.5 years. Transformational leadership was not significantly related to intent to stay ( $p < 0.275$ ). It was correlated with supervisor support (.801,  $p < .000$ ) and mentor support (.583,  $p < .000$ ). Neither TL nor supervisory support, entered separately into the models, directly impacted ITS. Both job satisfaction ( $p < 0.000$ ) and organizational commitment ( $p < 0.000$ ) were positive, significant predictors of ITS.

**Conclusions:** Transformational leadership is not directly related to RNs' ITS, nor is a related concept, supervisory support. Our findings are in contrast to what others have found for transformational leadership. Differences include using a different sample, including different covariates, and measurement differences. Because of our large sample size we are confident that our study was sufficiently powered to find a relationship if one existed. It may be that a "fully specified" model (or one that has a sample large enough to include many covariates) provides more accurate findings than those with fewer covariates and/or smaller samples. Further, our measurement of transformational leadership may be different from how others have measured the concept. We treated ITS as an ordinal variable, while others have treated it as a ratio or interval variable.

**Implications for Policy, Delivery, or Practice:** Having nurse leaders who are knowledgeable about evidence-based practices for staff retention is critical to ensure a stable nursing workforce and optimal patient outcomes. Leadership development is costly; therefore leadership education and practice must be informed by research in order to be effective. Our study does not lend support for transformational leadership style as an important competency for leaders in reducing ITS. Yet, organizations invest in TL training. Based on our findings, leaders who want to increase ITS need to focus on job satisfaction and creating good work environment. Because our findings are not consistent with many other TL findings reported in the literature, further study of both transformational leadership and other concepts of leadership is warranted.

## C 11 - Developing Online Nursing Education

### Aligning Outcomes, Assignments, and Assessment in Designing an Effective Online Program

---

*Melissa Ann Popovich, DNP, MSN, BSN, RN, CNE, USA*

#### Purpose

to present the logic model concept and the potential to: show the alignment of program mission, vision, and goals with the organizational mission, vision, and goals, as well as professional standards and guidelines, connect important resources to particular courses or assignments, identify critical benchmarks, individual and aggregate outcomes for learning.

#### Target Audience

the nurse educator, academically or practice- based, wanting to learn more about designing learning materials in a systematic manner through the incorporation of the logic model.

#### Abstract

Higher education institutions are increasingly expected to link the academic pedagogies in a manner that facilitates the application of practice-level skills. In an effort to develop high-quality and effective online learning environments which prepare the student for immediate contributions in the workplace, this college developed a strategy for the development of a completely online program to ensure quality and increase learning in the courses and program. By using a logic model framework and methodology, program, course, and student learning outcomes, assignments, and assessment of learning can be easily organized to flow in a cascading manner. Through the use of this “curricular logic model”, nursing programs can have a platform that assists in evaluation, assessment, and revision of the curriculum in chart form. This visual representation of the nursing curriculum provides the nursing faculty the opportunity to use creativity in design so that the various levels of outcomes are easily identified. For example, color-coded program, course, and individual assignment outcomes make distinguishing them from one another more expedient. This method also highlights how the outcomes flow from general to specific. The overall document can be designed to be as simple or complex as the user desires. For example, a general logic model that only includes organizational, program and course outcomes could be developed, or a complex model could even include weekly learning outcomes for each particular course and, or, outcomes for specific assignments.

The logic model concept has the potential to: show the alignment of program mission, vision, and goals with the organizational mission, vision, and goals, as well as professional standards and guidelines, connect important resource availability to particular courses or assignments, identify critical benchmarks, individual and aggregate outcomes for learning throughout the program (clinical courses, capstone course) and to highlight consistencies or inconsistencies in curricular design and outcome achievement.

## C 11 - Developing Online Nursing Education

### Fostering Retention: A Success in Transitioning a RN-BSN Program to Online Delivery

---

*Cynthia Rubenstein, PhD, MSN, BSN, RN, CPNP-PC, USA*  
*Nena Powell, PhD, MSN, BSN, ADN, RN, USA*

#### Purpose

The purpose of the presentation is to provide an overview of strategies and associated outcomes of an innovative approach to improving retention rates of RN-BSN students enrolled in a distance education program.

#### Target Audience

The target audience includes nurse faculty and nursing program administrators seeking innovative, successful strategies for retention of RN-BSN students in distance education programs. The session also targets nurse administrators in health systems to assist nurse employees in identifying student-centered BSN distance education completion programs.

#### Abstract

**Background Information:** Poor student retention with online courses has been documented. The Allen and Seaman (2013) survey noted that although higher education had rapidly embraced online education, there is a noted trend downward with student retention with online course delivery. There is a dearth in the nursing literature related to retention rates for RN-BSN students enrolled in distance courses and/or programs. Distance education for RN-BSNs does demonstrate the need for student-centered strategies to promote retention of this diverse student population. The literature clearly articulates that RN-BSN students also have unique challenges related to time constraints, work-life balance, personal issues, financial constraints, fear and motivation (Romp, et al., 2014; Gillespie & Langston, 2014). Transitioning the JMU RN-BSN hybrid program to an online delivery format required specific attention to ensuring retention and graduation of admitted students. This was accomplished with an emphasis on seamless progression and an academic success course that included an onsite orientation.

**Description of program practices:** A needs assessment with rural RNs in the state of Virginia was conducted to ascertain specific information related to program delivery as well as barriers to enrollment. This data, in conjunction with an analysis of the literature and input from community and state partners, provided the foundation for innovative strategies integrated into the curriculum to promote student retention in the RN-BSN program. Variables deemed critical to the success of students included connections/relationships, academic/technology support and strong faculty advisement. Articulation agreements were developed with several associate degree programs to promote seamless progression towards BSN completion. This collaboration supported students in actively completing general education and prerequisite coursework required by the university while enrolled in their associate degree programs. The specific strategies integrated into the RN-BSN curriculum included an academic success course incorporating onsite orientation, relationship building with peers/faculty and technology support.

**Summary of recommendations:** With the transition of the RN-BSN to online delivery in August 2013 and the subsequent admission of a second cohort in January 2014, the retention rate was 97% for the first year of the online program delivery. Enrollment in the program increased by 343%, from 2012 to 2014. A survey of enrolled students identified that the mandatory onsite orientation was an effective strategy for socializing students to the university, RN-BSN program, technology support services and peers/faculty. Designing an onsite orientation that provides opportunities to employ all technology and software that will be used in the online delivery of the program enhances students' confidence and skills once participating in the program from a distance. The online JMU RN-BSN program demonstrates that with a student-centered focus on the needs of this diverse student population, retention rates can exceed national standards for both undergraduate nursing programs and online programs in general.

### Collaboration between Faculty, Instructional Design and Technology Services in Development of a Course Template for Online Learning Environments

---

*Denise K. Gormley, PhD, RN, USA*  
*Matthew C. Rota, MA, USA*

#### Purpose

to demonstrate partnerships between faculty, ID, and IT in the development of a LMS course template for online content delivery improves communication and engagement with students; improves faculty and student satisfaction, technology tools are leveraged; and ultimately, innovation is maximized to improve outcomes.

#### Target Audience

nurse faculty, staff and administrators involved in online course delivery in nursing programs interested in developing strong partnerships to leverage technology and innovation to improve student outcomes.

#### Abstract

**Background:** Nationally, 7.1 million students are now taking online courses, and 77% of academic leaders rate student learning outcomes as the same or superior to face to face instruction. Technological Pedagogical Content Knowledge (TPCK) is a framework that identifies the knowledge faculty need to teach effectively online with technology. This was our model for creating a course delivery template in the Course Management System (CMS) that could be flexible enough to be used across colleges and programs. To that end, we worked with instructional design (ID), faculty, IT, and administrators to develop a common template for course delivery. Collaboration occurred to identify features of a template that would span colleges/programs and be learner-centered, streamline course design, include intuitive navigation and a logical presentation, and encourage student engagement and improve student and faculty satisfaction. Included in the development of the new course template was faculty input, instructional design, technology resources and support, our CMS platform and Quality Matters. Faculty partnered with the instructional design team and college technology services to develop a course template that contained standardized functionality but allowed for customization as needed for particular courses.

**Discussion:** Faculty develop course syllabi including learning outcomes, textbook choice, content and assignments/assessments. Instructional Designers identify flow and learning patterns, and integrate CMS tools to enhance student learning. Instructional Technology serves as the liaison between faculty and CMS support, and identifies new technologies to support course teaching. Major focus areas for the template included: streamlined content presentation, technology support, and academic support, and allows for development of course objectives and module level objectives for weekly content areas.

**Report:** Once the template was developed, ongoing workshops occurred with full day, half day and targeted hour long training sessions to facilitate use of the template and comfort with educational tools. Takeaways from this endeavor included: clearly identify stakeholders and include in planning and implementation, establish core principles and design the template using the core principles identified, collect data, and continuously improve.

**Conclusions:** With the partnership between faculty, ID, and IT, there is more effective communication with students, students feel more engaged, questions directed to faculty are reduced, technology tools are leveraged to enhance teaching and learning, improve efficiency and save time, and innovation is maximized.

## C 12 - Developing Nursing Leaders

### Essence-Driven Leadership: Illuminating the Lived Experiences of Chief Nursing Officers

---

*Kathleen Flores Eviza, MSN, RN, Philippines*

#### Purpose

The purpose of this presentation is to give light to emerging strategic experiences (e.g. the social processes, psychological disposition and leadership perspective) which impinged on CNOs decision making, leadership style, organizational culture and climate.

#### Target Audience

The target audience of this presentation are aspiring chief nursing officers, nurse executives, nursing practitioners, hospital administrators, nurse educators, nursing leaders and future researchers.

#### Abstract

**INTRODUCTION:** This paper embraces the lived experiences of selected ten Chief Nursing Officers (CNOs) in tertiary hospitals within the Philippine's National Capital Region. The study gave light to emerging lived experiences (e.g. the social processes, psychological disposition and experiential perspective) which impinged on CNOs decision making, leadership styles, organizational culture, climate and transformation.

**METHOD:** Individualized in-depth, unstructured interviews with field notes were used as consented among ten selected CNOs in tertiary hospitals within NCR. Consent from the colleges and all affiliating institutions were sought prior to data gathering procedure. Written consent for each co-researcher was secured before interview process began. Anonymity and confidentiality was observed all throughout the research process to address ethical concerns of the participants.

The research design rested on the Heideggerian and Gadamerian hermeneutics combined with Giorgi's method of qualitative content analysis. Constant comparative technique further degraded emerging themes which embodied the phenomena conserving the perspective of ontological objectivity with an intricate degree of reductionism. It lies in the premise of naturalism and object relativism which resonates the reality of facts as embodied, perceived and interpreted.

**RESULTS:** The essence-driven leadership framework elucidated leadership essentials necessary to cultivate and sustain organizational success. Elements of CNOs lived experiences were exhibited in the continuum of highlighted personal and organizational transformation, as follows: (1) Self-mastery; CNOs understanding of sense of self (control and awareness) either personal or interpersonal processes which allow them to have a realistic perspective of themselves in interaction with the environment; (2) Environmental mastery, is characterized by CNOs instinctiveness of perception. It details the experiential expertise amongst CNOs that make them intuitive of future occurrences in an ever changing healthcare milieu; (3) Grounding, on the other hand is the fusion of self and environmental mastery to construct a holistic perspective of the organization in interaction with the external forces (4) Essences, is the fuel of CNOs sense of purpose, which is found in three dimensions (workforce, executive role, and clients) which sustain motivational momentum and leadership drive (5) Organizational transformation through adaptive change is achieved when there is clarity of direction, sense of purpose, esprit de corps and ultimately, the renouncement of status quo through (6) Transcendence is communicated in the organization.

**IMPLICATIONS:** Leadership through strategies isn't formulaic. Sheer figures and numbers are insufficient to become a transformational and transcendental chief nursing officer. Leaning on the soft science of leadership and structure from strategies, the Essence-driven leadership resonate from chief nursing officer's sense of organizational purpose. The elements of the framework blend in variable degrees,

which is refined through time and experience. With this model, leaders not only provide mere vision but bring purpose to impact.

**Keywords:** Chief Nursing Officer, Essence- Driven Leadership, Strategic Lived Experiences, Transcendence, Transformation.

## C 12 - Developing Nursing Leaders

### Authentic Work Experiences of Chief Nursing Officers: A Phenomenological Inquiry

---

*Charlene M. Ingwell-Spolan, PhD, MSN, BSN, RN, USA*

#### Purpose

The purpose of this presentation is to describe the results of a qualitative study of Chief Nursing Officers (CNO) within the Southeastern United States; exploring their work experiences, dynamics and environments as the lead voice for nursing. These results will help CNOs sustain and further enhance high quality patient care.

#### Target Audience

The target audience of this presentation is CNOs and Administrators. Advancing the Registered Nurse (RN) into a professional, guaranteeing consistent quality patient care is one of many responsibilities of the CNO. CNOs must think differently, removing barriers in the hospital setting, providing effective practice and patient care at bedside.

#### Abstract

**Background:** Studies have shown that job dissatisfaction, increased workload demands, poor working conditions and high patient acuity (overload) are among the challenges facing the registered nurse (RN) today. These challenges are also being faced by the Chief Nursing Officer (CNO), the leader of the professional nurse, in advancing the RN into a highly functioning professional practice guaranteeing, daily, the delivery of quality patient care. Today's CNO must think differently to remove the barriers in the acute care setting, providing effective practice at the point of care.

**Purpose:** The purpose of this study was to explore the work experiences of the CNO as the leader, voice and advocate for the professional nurse in the acute care setting. This information may help determine how future CNOs will be even more successful in the leadership role for the professional nurse to provide even more consistent, quality patient care.

**Methods:** Guided by the naturalistic inquiry paradigm, this qualitative, phenomenological inquiry (Moustakas, 1994) yielded an understanding of the human experience of the CNO as the leader for the RN. This approach determined textural-structural, "what" and "how" composite descriptions through the lens of the participants, conveying an overall essence of the CNOs' work experience as the leader of the RN.

**Results:** The CNOs in the study experienced bullying and unwritten hierarchy in the corporate suite. They were not fully prepared to communicate in financial/business terms and, therefore, were not heard and understood by the other members of the executive team. As a result, the CNOs engaged in many battles and decisions were often made regarding nursing and patient care issues without the full and adequate input of the CNO, all affecting quality patient care.

**Conclusions / Implications for Practice:** This study was the first to investigate and explore the work experiences of the CNO as the leader for the professional nurse. One of the themes that emerged from this study was "battling", primarily caused by the CNOs' expertise in clinical matters and not high level business and financial expertise. The CNO is the professional nurse's leader and must communicate total, net worth impact for both the nursing and organizational areas in order to be heard. Evaluation of nursing curriculum is needed to ensure that future leaders of nursing have all the knowledge and skills necessary to be dynamic, innovative leaders, establishing a lasting impact on the healthcare industry.

## C 12 - Developing Nursing Leaders

### Voice Behavior of Clinical Nurses and Leadership Behavior: Finding the Connection

---

*Gina D. Aranzamendez, PhD, RN-BC, USA*

*Robin Toms, PhD, MN, BSN, RN, NEA-BC, USA*

*Rae W. Langford, EdD, MS, BS, RN, USA*

*Lene Symes, PhD, RN, USA*

*Debora Simmons, PhD, RN, USA*

#### Purpose

The purpose of this presentation is to share the result of the study that explore the relationship of direct supervisors leadership behavior and the clinical nurses voice behavior. Understanding the elements that promote and support nurses' voice behavior has a grave implication to our patient safety and overall healthcare quality.

#### Target Audience

The target audiences in this presentation are healthcare clinicians in different roles, from leadership to frontline staff, including nursing educators and administrative leaders.

#### Abstract

**Problem of study:** Quality improvement is at the heart of patient safety. Nurses, who act as front line staff, are in the best position to identify issues and concerns that affect the care of their patients. They have firsthand knowledge of what works and what does not work. Their reluctance to voice concerns and issues has grave implications with regards to patient safety and on the organization's ability to learn from error. Further investigation of the front line staff's concerns can prevent errors and provide resolution leading to greater safety for patients. This study explored the relationship of leadership style and the quality of leadership affiliation to the voice behavior of clinical nurses. The outcomes from this study may influence healthcare organization in promoting voice behavior to staff.

**Theoretical framework:** Two leadership theories, Full Range leadership theory and Leader-Member Exchange theory, were used to guide the study. It was conceptualized that leadership style defined by specific leadership behaviors and the high quality of leadership affiliation has impact on clinical nurses' voice behavior. In addition, clinical nurses' perceived psychological safety mediates the relationship between leadership characteristics and the nurses' voice behavior.

**Methodology:** This study is a non-experimental, correlational research design developed to examine the relationship between clinical nurse's perception on their direct supervisor's leadership style, their leader-member affiliation, and their voice behavior. A cross-sectional survey was conducted after the Institutional Review Board (IRB) approval from the Texas Woman's University was obtained. There were 154 total responses but only 146 responses were used in the analysis due to set criteria. Hierarchical regression analysis was employed to explore the relationship between variables. Participants' age, tenure, gender, and work shift were used as control variables. Preliminary analysis was conducted to ensure that no assumption was violated.

**Result:** The full regression model accounted for 26.4% ( $p < .0001$ ) of the total variance in voice behavior. The introduction of the socio-demographic variables explained 1% of the variance ( $F = .339$ ,  $p = .851$ ). Adding leadership affiliation and leadership styles, the model explained 24.4% of the variance ( $F = 5.664$ ,  $p < .0001$ ) and indicated that leadership behaviors do affect voice behaviors. After entry of the PS at step 3, the variance explained by the model as a whole was 26.4%, ( $F = 5.258$ ,  $p < .0001$ ). In the final model, only leadership affiliation, ( $\beta = .262$ ) and transformational leadership ( $\beta = .229$ ) showed any strength of contribution.

**Conclusion:** The study findings indicate that contextual leadership characteristics are a significant contributing factor in the clinical nurses' decision to engage in speaking up regarding their issues and concerns. Leaders play an important role in employees' decisions to voice work related ideas and concerns. Creating an environment where ideas for improvement are respected and supported is a step towards higher quality care.

## C 13 - Exploring Strategies to Promote Leadership Growth

### Could Critical Thinking Help Create Nurse Managers Who are Transformational Leaders?

---

*Susan Zori, DNP, MA, BSN, RN, NEA-BC, USA*

#### Purpose

The purpose of this presentation is to share implications of research that explored the relationship between nurse managers' dispositions to use critical thinking (CT) skills and RN staff nurses' perceptions of the practice environment.

#### Target Audience

The target audience of this presentation is nurse managers and directors in a variety of inpatient and ambulatory health care settings as well as nurse educators and graduate students in nursing administration.

#### Abstract

The front-line nurse manager of a patient care unit, is expected to function as a transformational leader. Effective nurse leaders are capable of creating an environment that supports nurse empowerment, through open communication, and shared decision-making. Achieving goals that align the organization with quality outcomes is essential to survive in today's transformational health care environment (Kelly, Wicker, & Gerkins, 2014).

The purpose of this presentation is to share findings and implications of research that explored the relationship between nurse managers' dispositions to use critical thinking (CT) skills and RN staff nurses' perceptions of the practice environment and its applicability to transformational leadership behaviors.

This descriptive study used a convenience sample of 12 nurse managers who completed the California Critical Thinking Disposition Inventory (CCTDI) and 132 of their respective staff nurses who completed Practice Environment Scale (PES).

An analysis using an independent sample t test revealed significant differences at the ( $p < .001$ ) level between specific nurse managers' mean CCTDI scores for open-mindedness, analyticity, and critical thinking confidence and significant differences at the ( $p < .01$ ) level for systematicity when compared to their respective RN staff nurses' mean PES scores. There was no statistical difference in the nurse managers' scores on the CCTDI when tested for the influence of the demographic variables of age, education level, and years of experience.

Results indicated nurse managers with a stronger disposition to use CT skills were linked to staff nurses' more positive perceptions of the practice environment. Transformational nurse leader competencies have been established by various professional organizations such as American Organization of Nurse Executives ([AONE] 2005) and the Oncology Nursing Society ([ONS], 2012). Both organizations specify that communication and relationship management are key competencies required by transformational leaders. Nurse managers with strong CT dispositions may have strength in the development of transformational leadership competencies especially those that influence satisfaction of staff RNs with the practice environment. Including educational strategies that enhance the development of CT dispositions may be helpful as programs to develop transformational leaders are created. Additional research to explore the link between nurse managers' CT dispositions and development of transformational leadership competencies would be beneficial.

## C 13 - Exploring Strategies to Promote Leadership Growth

### The Role of Ethnic Nursing Organizations in Developing Future Nurse Leaders

---

*Maria Matza, PhD, RN, PHN, USA*

*Maryanne Garon, DNSc, MSN, RN, PHN, USA*

#### Purpose

The purpose of this presentation is to share information from a qualitative research study on the role of ethnic nursing organizations in developing nurses for leadership. Additionally, the presenters will discuss ways to increase diversity in nursing, including leadership and academic roles

#### Target Audience

The target audience of this presentation is all nurses interested in encouraging diversity and mentoring in nursing. It should appeal to faculty, educators, nurse managers and administrators, as well as staff nurses.

#### Abstract

**Purposes/Aims:** The aim of this qualitative descriptive study was to explore the role of ethnic nursing organizations in developing their members for leadership.

**Rationale/Conceptual Basis/Background:** There is a disparity between the ethnic makeup of the US population, and those of nurse, nurse leaders and nursing faculty members. While the US population is 63% non-Hispanic whites and California only 42% non-Hispanic whites (US Census Bureau 2012 statistics), the nursing profession is more than 83% non-Hispanic white (HRSA report, 2010). Amongst nursing leadership and nursing faculty members, the disparity is even greater. "Only 12.3 % of full time nursing faculty members are coming from minority backgrounds" (AACN report). In order to foster diversity amongst nursing leaders and nursing faculty, it is desirable to encourage minority nurses to develop for these roles. One source of mentoring and development might be found in the ethnic or minority nurse organizations. Since this has not been the focus of research in nursing to date, a qualitative study using content analysis method was conducted.

**Methods:** The research team conducted in depth interviews of nurses who held membership for at least 3 years in one of the ethnic nursing organizations. Focus of these interviews was aimed at discovering how the organization helped them develop in their career, provided mentorship or encouraged them in continuing education or seeking leadership. Qualitative content analysis methods was utilized to analyze results. Transcribed interviews were analyzed by the team and initial coding done, identifying specific words and phrases. The research team then grouped together the words and phrases into categories of data. From the review of the emerging categories, themes were found and a model was created.

**Results:** Fifteen participants were interviewed. Four participants interviewed were members of their local Philippine Nurses Association, six were from the Black Nurses Associations, and five from the Hispanic Nurses Association. Three male and 12 female nurses participated, with ages ranging from 32 – 65 and years in nursing from 15-33. Education levels range from BSN to Ph.D.

Analysis indicates that these organizations provide opportunities for leadership, mentoring and encouragement to the members. The participants noted comfort and a sense of community and "home" from being with persons from similar backgrounds. "You don't have to explain where you come from" one participant reported. However, others noted that it is "not enough" and mentors are found in other professional organizations, also. A key finding is the importance of community and "giving back" to their communities as strength of these organizations.

**Implications:** It is important to understand factors that help to both retain and develop nurses as leaders. Many factors have been considered, but thus far, no one has looked at the ethnic nursing organizations as a potential source in contributing to this development. As noted, this is an area with

virtually no research. The ethnic nursing organizations play an important role in developing nurse leaders. Understanding and disseminating the role of these organizations might lead to future considerations of they can contribute to increasing the diversity of nursing leadership and faculty.

## C 13 - Exploring Strategies to Promote Leadership Growth

### The Role of Coaching in the Development of Nurse Managers

---

*Liz Westcott, DCM, MSc, RN, RNT, United Kingdom*

#### Purpose

This purpose of this presentation is to share the results of empirical research undertaken into the role that coaching is playing in the development of nurse managers.

#### Target Audience

The target audience of this presentation is senior nurses, nurse managers, coaches, policy makers

#### Abstract

This presentation will share the results of empirical research undertaken into the role that coaching is playing in the development of nurse managers.

Background: The role of the nurse manager is pivotal to maintaining good patient care. The term nurse manager is being used to denote first level line managers such as ward sisters, charge nurses, ward managers and community leaders. Health care managers currently face pressure from the public, professional and regulatory bodies, advances in technology, reductions in public funding and an ever-increasing and aging population. Within this pressured environment, nurse managers have a pivotal role in the management and leadership of staff and the quality of patient care.

Nurse managers manage very complex settings and their leadership and management is essential to the maintenance of high standards and patient safety. However, they usually undertake this position as their first line management role and often have very little training before they are appointed and little when they are in post.

It has been identified that the style and qualities of the nurse manager will have a considerable influence on team ethos and behaviour. It has also been suggested that leadership style influences the culture of a practice area and therefore, has an effect on the quality and standard of care. Additionally studies by the RCN report that nurse managers have been found to be unclear about what is expected of them in their leadership and management role; with this lack of clarity being compounded by time pressures, lack of resources and complicated lines of authority.

It has been well documented that nurse managers feel inadequately prepared for their line manager role and that this hinders their ability to perform their roles effectively. The importance of some preparation prior to a manager being appointed has been identified, so they can be better prepared to succeed in their new role. If this pre-preparation is in place it is suggested that managers can then better contextualise the learning they undertake once in post.

Coaching is one of the key approaches through which leadership within organisations can be developed. Effective coaching can be used by employers to retain key employees and helps to create a cohesive workforce, which will work effectively even when under pressure.

Coaching has undergone a major change and is now actively sought by employees rather than being seen as a remedial process for underperformance. Coaching is also now seen as one of the most effective methods for managing talent and is seen as an opportunity for leaders to have insightful conversations and reflect on their performance.

In the public services, coaching has been offered to executive management and high potential level staff for a number of years but is still only just emerging as an option for middle managers and nurse managers.

**Aim:** To explore the role that coaching is playing in the development of nurse managers.

**Methods:** This mixed methods research used a pragmatist paradigm and gathered data from a quantitative survey of 100 healthcare providers and qualitative interviews of nurse managers, coaches and directors of nursing during 2013. A probability, stratified sampling approach was used to recruit directors of nursing to the survey. For the qualitative interviews, a 'non-probability approach' to sampling was used. Sampling was purposeful with an element of snowballing and convenience sampling methods. The nurse manager group comprised staff who had been nurse managers for between two and five years when they received coaching. This study adhered to the three dimensions identified for ethics in research; procedural, ethics in practice and professional codes. Thematic analysis was the framework used for data interrogation. Once cross-cutting themes were identified, the interviews were re-analysed, using pattern coding, to identify how each group viewed these and what patterns had emerged.

**Results:** The survey results appeared to suggest that a development programme was offered to NMs within 6 months of appointment in only 50% of the organisations. This suggests from this sample that development is still not widespread and mandatory.

The interview analysis showed that coaching developed resilience, leadership and a coaching culture in health care settings as well as improvements in patient care.

**Discussion:** Coaching is not widespread for nurse managers in many organisations but may have a big impact on nurses, patients and organisations if adopted.

The importance of the first line managers having development and adopting a coaching style of management. Coaching helps with difficult decision making, 360-degree line management and project management. The value of a coaching style in clinical supervision and mentoring to develop skills and performance was identified. Coaching leads to transformation of the nurse manager and their team but needs to be accessible to all and can be introduced as part of a development programme.

It was found that there is a perceived added value that a nurse as a manager brings to a management role in terms of reflection ability and the natural caring style that comes from being a nurse. Organisations other than health care could learn from the caring side of nursing as a useful asset and is reflected in the value of using a coaching style of management. In essence, using a coaching style isn't being a soft manager but is getting the best out of staff.

Coaching improves and maximises resilience, self-efficacy, self-confidence, and self understanding and can help in the very difficult transition to NM role. It was identified the line manager should not be the nurse manager's coach but should have a coaching style of management

There appears to be an unrecognized, 'by-product' link, between support for coaching NMs – transformative leadership – improved patient care. Coaching can help in a shift to problem focused coping and can help with moving from vulnerability to resilience

**Conclusions:** Coaching of nurse managers and developing a coaching culture gives clear benefits to themselves, their patients and the organisation. All nurse managers should be advised to have coaching when they take on the new role, when they move into any subsequent role or when they embark on major projects. Organisations should ensure that formalised coaching is not undertaken by the nurse managers' line manager. Nurse managers should be encouraged to use a coaching style of management with their direct reports and peers.

Organisations should ensure that any coaches used for nurse managers have undergone training and undertake supervision. There should be an Identification in the UK, of the differences between coaching, mentoring and clinical supervision and develop a clear framework to show this. Finally all health care organisations should engender a coaching culture in their staff.

## C 14 - Nursing Education Leadership Competencies

### Nurse Educator Leadership Competencies: Instrument Development and Testing

---

*Barbara J. Patterson, PhD, RN, ANEF, USA*  
*Anne Marie Krouse, PhD, MSN, MBA, BSN, RN-BC, USA*  
*Karen H. Morin, PhD, RN, ANEF, FAAN, USA*  
*Mohammed Almaskari, MSN, RN, USA*

#### Purpose

The purpose of this presentation is to describe the leadership competencies of nurse educators in academia and establish the psychometric properties of a newly developed instrument.

#### Target Audience

The target of this presentation is nurse faculty, administrators, and nursing students.

#### Abstract

Leadership is an essential element of the role of the nurse educator. Many nurse faculty leaders find themselves in administrative positions in higher education with insufficient leadership education and/or experience. Leadership succession planning in nursing education is often overlooked. This is of great concern in nursing education because leadership in academia has been associated with organizational outcomes, faculty satisfaction, and a healthy work environment. Organizational success is dependent upon the competency of its leaders. The development of nurse faculty who have the leadership skills that are essential to take on these challenging roles is critical. This study builds upon two previous studies conducted by the authors examining the leadership competencies of nurse educators and to develop an instrument to measure these leadership competencies.

The Competencies for Leaders in Nursing Education Instrument (CLNEI) was developed based on four competencies and task statements that emerged from a qualitative study with nurse educator leaders and a follow-up national Delphi study to confirm the results. The four core competencies are: Articulate and promote a vision for nursing education, Function as a steward for the organization and nursing education, Embrace professional values in context of higher education, and Develop and nurture relationships. The data were used to create the items and subscales of a self-report instrument to assess leadership competencies in nurse educators. The 24-item instrument uses a 7-point Likert scale rating the frequency (never to every time) in which the nurse educator perceives he/she engages in the leadership activity. Therefore, the purposes of this descriptive study were to describe the leadership competencies of nurse educators in academia and to establish psychometrics for a newly developed instrument.

All participants were nursing faculty members teaching in programs in a Commission on Collegiate Nursing Education (CCNE) member school of nursing, and were recruited using proportionate random sampling of schools from the nine US regions determined by the US Census Bureau (N = 84 nursing schools). An email was sent to all potential participants from the schools (n = 2400) via Survey Monkey® from the study investigators.

All data were downloaded to SPSS. Demographic data were analyzed using descriptive statistics. Psychometric evaluation of the instrument was conducted to determine reliability and validity including determination of Cronbach alpha coefficients for the instrument overall and subscales, as well as confirmatory factor analysis. Qualitative comments from the findings were analyzed using in-vivo coding and analysis for similarities among participants. Findings and demographics of the sample will be presented.

Nurse educators are challenged to become leaders, using innovation and creativity to create a more efficient and effective learning environment for students. As members of the academic community, they must become leaders in university governance to proactively address increasing regulation in higher education and threats to academic freedom. This study contributes an instrument for the science of

nursing education that can be used to assess leadership in nurse educators. It may be used in conjunction with leadership development programs for nurse educators to identify areas for development or to assess program outcomes. It may also be used to evaluate relationships between leadership competencies and organizational outcomes in higher education. The findings of this study contribute to best practices for leadership in nursing education.

## C 14 - Nursing Education Leadership Competencies

### Preferred Educational Methods of RN's With More Than Ten Years of Inactive Patient Care

---

Annette A. Cannon, PhD, MA, MSN, RN, USA

#### Purpose

The purpose of this presentation is to further define competency through testing RN's with inactive patient care of more than 10 years, who are enrolled in an online program that contains a hands-on skills lab, compared to those who are enrolled in the online program only.

#### Target Audience

The target audience of this presentation is nursing educators and nurses who have been out of the "direct patient care" nursing workforce for more than 10 years, who wish to return to the workforce.

#### Abstract

The Colorado State Board of Nursing rules and regulations provide a policy that states that "if you do not have an active license in another state and all of your licenses have been expired two (2) years or more, you must demonstrate competency to practice by successfully completing refresher courses as defined in Nursing - Board Rule 5.6" (CSBON, 2015). According to this policy, the competency is derived from completing an RN refresher program. The objective of this paper is to further define competency through testing RN's with inactive patient care of more than 10 years, who are enrolled in the online program that contains a hands-on skills lab compared to those who are enrolled in the online program only. This proposal, through solution and problem description, implementation, evaluation and monitoring, will present three levels of testing. These exams are given to gain baseline knowledge from students, knowledge after the online learning portion is finished and knowledge after the skills lab and online are finished. A comparison study of sample students will be reviewed as part of the decision-making. The results of the study and its outcomes will be shared with other educational institutions and state boards of nursing throughout the United States. The desired outcomes are to develop guidelines within Colleges and Universities for admission to the RN refresher program and to implement this evidence-based proposal as a nursing policy within the Colorado State Board of Nursing.

The implementation of this study consists of four main steps. "These organized methods will follow a specific procedure to study the issues, therefore lending to the idea that the results will be more accurate and are not influenced by opinion or belief" (Potter, 1995, p265). First, the specific population will be identified. The study will be conducted over one year time. Second, the nurses will be divided into two sample groups, for comparison purposes. Third, the demographic data of participants will be identified and posted as student plus their zip code. The variables will include age, sex, years since graduation, years since last practiced, total years of practice prior to inactivity, level of nursing degree, ages of children at home, and other non-nursing work that will be reviewed to see if there are other variables that need to be considered. Fourth, the instrument will be a pre-refresher test given to all participants at the beginning of the program, with the same test given mid-way through and then another test as the final. Other methods of data collection may be reviewed for use in future research.

Proposed study in progress, with results pending.

In conclusion, continued nursing research is a critical component to the survival of the nursing profession. According to IOM report (2011), "nursing education must be fundamentally improved both before and after nurses receive their licenses". The influence of research on nursing education and nursing practice is immense and will forever change the overall advancements of the nurse. Conducting studies will allow the use of evidence-based research to make the needed adjustments and changes necessary for the ongoing improvement of nursing. This study will address the preferred learning needs of nurses who are returning to nursing practice after being inactive more than ten years. By sharing these learning experiences with others, changes and improvements can be made to nursing education. By sharing the

outcomes, the opportunity is set forth for further research and to eventually make a difference in the nursing profession as a whole.

## C 14 - Nursing Education Leadership Competencies

### Informatics Competencies: Transition from Classroom to Bedside

---

*Katherine A. Kelly, BSN, MSN, DNP, RN, FNP-C, USA*

*Kathleen M. Guiney, MN, MS, RN, USA*

#### Purpose

To create educational strategies to build regional informatics competency. 2. Review assessment findings and identified gaps in informatics knowledge/skills facing graduate nurses integrating into the nursing workforce. 3. Apply survey results to determine sequencing and core content of nursing informatics competencies. 4. Present educational tools to facilitate learning.

#### Target Audience

Nurse educators in academia as well as clinical agency. Clinical nurse leaders Informaticists Hospital Administrators

#### Abstract

Gaps in the integration of informatics into nursing curriculum and development of informatics competencies continue to exist (Hunter, 2013). Current and future nurse leaders are responsible for integrating extensive and variable patient information and making clinical decisions using multiple sources of data. Many of these nurse leaders have had little or no training in the area of informatics, yet are required to function in the digital age with expertise. While there is credible work by the National League of Nursing, the Robert Wood Johnson Foundation (QSEN) and Technology Informatics Guiding Education Reform (TIGER) Initiative; there remains a critical need to identify specific gaps in informatics competencies necessary for graduate nurses entering the workforce.

Clinical and academic partners joined forces to form an informatics leadership collaborative. The purpose of this collaborative is to explore the perception on the part of fourth semester nursing students and their preceptors regarding informatics competencies as described above. The Informatics Leadership Collaborative of Health Communities Forum for the Sacramento Region has set as a goal to advance bedside nursing to a level of practice in which the knowledge, skills and attitudes identified in QSEN Essentials of Baccalaureate Nursing Education, TIGER Initiative and the NLN are integrated into a standardized and coordinated program for all bedside nurse clinicians practicing in the region. The collaborative effort includes academic and service partners in a complex and well-developed healthcare community.

The Informatics Leadership Collaborative designed a descriptive study with the purpose of providing an analysis of the gaps in informatics knowledge, skills and attitudes of baccalaureate graduate nurses. The study participants consist of a purposive convenience sample of subjects recruited from five schools of nursing and four hospital agencies. Criteria for inclusion in the study is students in the final semester of nursing school and their preceptors. The participants completed a survey of 37 questions focused on the participant's perception of informatics skills, knowledge and attitudes.

Three semesters of data collection and analysis has provided data to guide the development of a standardized curriculum for health informatics technology. Healthcare redesign is dependent on the appropriate and effective integration of healthcare technology and informatics. A partnership between academia and the clinical agencies is essential to this goal. The QSEN competencies are all dependent on the comprehensive knowledge of informatics by the nursing student, bedside nurse and nurse mentor or preceptor. Studies (Bakken et al., 2004; Conors et al., 2002; Fetter, 2009a; Lucas, 2010) have concluded that it is necessary for schools and clinical agencies to collaborate on an effective integration of healthcare informatics competencies into the nursing curriculum. Through ongoing communication and partnership between academia and clinical agencies, it is possible that a solid foundation of informatics principles and competencies can bridge the gap for new nurses as they enter the clinical settings.

## D 10 - Developing Shared Governance: Does It Have an Impact?

### Measuring Shared Governance in Acute Care Hospital Settings Using the Index of Professional Nursing Governance (IPNG)

---

*Evette M. Wilson, DNP, RN, USA*

#### Purpose

The purpose was to evaluate shared governance (SG) in three acute care hospitals in Nevada. The goal was to obtain a baseline measurement of shared governance using the Index of Professional Nursing Governance (IPNG) to determine if the hospitals had achieved SG following six years of implementation.

#### Target Audience

The target audience of this presentation is Nursing Managers, Nurse Directors, and Nurse Administrators

#### Abstract

**Purpose:** The purpose of the study was to evaluate shared governance in three acute care hospitals. The goal was to obtain a baseline measurement of shared governance using the Index of Professional Nursing Governance (IPNG) to determine if three Las Vegas area hospitals had achieved a state of shared governance following six years of implementation.

**Background/Significance:** Employers are becoming more creative in their strategies to improve the work environment decrease turnover, and retain nurses within their organizations by implementing management strategies such as shared governance models. Shared governance models focus on creating a satisfying practice environment that empowers employees in the decision-making of nursing practice. The challenge nurse leaders face with the implementation of these models is measuring the outcomes and determining when shared governance has actually been achieved.

**Methods:** This was a descriptive study using the Index of Professional Nursing Governance (IPNG) survey tool to obtain a baseline measurement of shared governance. After obtaining IRB approval, which deemed the study exempt, the survey was distributed via interoffice mail and online via SurveyMonkey® to 1418 registered nurses employed at SRDH. The IPNG tool measured overall governance, in addition to six subscales of professional nursing governance: personnel, information, resources, participation, practice and goals.

**Results:** After 30 days, 342 surveys were returned for an overall response rate of 24%. However, only 207 surveys were useable in the analysis, due to the removal of incomplete surveys and outliers in the data. Demographically, the sample consisted of full-time, part-time nurses, and per diem nurses. The number of years in nurses' current position ranged from 3 months to 31 years ( $M = 5.27$ ,  $SD = 5.57$ ). The results of the survey indicate that all three acute care hospitals measured, although having shared governance structures in place since 2007, remains in traditional governance, with decisions being made primarily by management and administration.

**Conclusions and Implications for Practice:** Overall, the IPNG survey tool provided nurse administrators with a baseline measurement of shared governance and a target goal for re-evaluation. The IPNG tool also provided nurse leaders with specific areas to focus improvement efforts. The IPNG survey tool can be used in the future as an outcome measure for the implementation of strategies to address overall governance and subscales that scored below the shared governance range. Findings from this study will guide the leadership team in developing strategies and recommendations to support shared governance improvement initiatives.

## D 10 - Developing Shared Governance: Does It Have an Impact?

### An Academic Shared Governance Model for Leadership in an Academic Setting

---

*Ruth Ann Bridges, PhD, RN-BC, USA*

*Carol Boswell, EdD, RN, CNE, ANEF, USA*

*Patricia G. Francis-Johnson, DNP, RN, USA*

#### Purpose

The purpose of this presentation is to explain how a school of nursing faculty, following the ANCC Magnet Program model, transformed faculty governance to a shared faculty-staff governance model to improve communication and transparency. To facilitate transformation, faculty and staff were provided development opportunities needed to support the change.

#### Target Audience

The target audience of this presentation is academic faculty and administrators who are interested in a shared governance model for faculty and staff organization.

#### Abstract

A West Texas university school of nursing (SON) has experienced tremendous growth over the past 14 years in three strategic areas – student enrollment, geographic locations, and program offerings. Currently, the SON has students and program offerings in multiple locations throughout central and west Texas. The SON Leadership Team has committed to continued growth to meet the need for a highly educated and well-trained nursing workforce in Texas and the nation. This high level of organizational complexity has created challenges in communication and engagement of the faculty and staff.

As a result of these driving forces, a Faculty and Staff Shared Governance Taskforce was appointed to evaluate the school's process of faculty and staff governance. This task force was charged to ensure efficient and effective operations designed to support the principles of partnership, equity, accountability, ownership and self-regulation across a multi-campus system. This taskforce supported the belief that faculty and staff thrive in an organization where core values are agreed upon and a meaningful structure for communication exists. Taskforce members conducted an extensive investigation of shared governance, a review of the current/ideal state of governance, and an analysis of the work of the faculty and staff to develop a well-organized shared governance process.

Based on this investigation, the Faculty and Staff Shared Governance Taskforce developed 1) a process of shared governance to include faculty and staff; 2) a values statement from an engagement survey; 3) a professional practice model for nursing education; and 4) a seven-step implementation plan and timeline to operationalize the faculty and staff shared governance process. The model for shared governance was based on the Magnet Hospital model of councils as designed by ANCC.

Inherent in the process was the need to develop effective strategies to develop the leadership capacity of the individuals willing to serve as officers and members of the councils. Staff and faculty alike expressed the need for training and/or refresher courses in parliamentary procedure, conducting effective meetings, and successful strategies for working together. Staff members had no previous experience in governance in the school of nursing and were especially in need of leadership training and mentoring.

Strategies identified, such as training sessions, effective tools, and development opportunities, will be presented. Challenges encountered, barriers addressed, and opportunities for growth will be presented to showcase alternatives which could be used in other academic settings to advance transparency, leadership and shared governance.

## D 10 - Developing Shared Governance: Does It Have an Impact?

### To a Greater Influence of Nurses: Development and Implementation of a Professional Practice Model in the Netherlands

---

*Susanne Maassen, MSc, RN, Netherlands*  
*Gerard Brekelmans, RN, MSc, Netherlands*  
*Annelies Sandee-Laging, RN, Netherlands*

#### Purpose

To share results of a implementation study in a Dutch hospital on the implementation process of a professional practice model as base of a nursing shared governance structure to improve the influence of nurses on organizational level.

#### Target Audience

interested in shared governance structures, professional practice models, strategies for improving the nursing work environment, the implementation process of these structures and models and the effect on quality of patient care and nursing job satisfaction.

#### Abstract

Nurses are responsible for delivering patient centered qualified care. To provide this care professional nurses are needed. Working in a professional environment is an important influencing factor for nurses to fully professionalize (Laschinger, 2008). A professional nursing work environment is characterized by the following factors: (1) nurse involvement in organizational policy, (2) nurse vision and policy on quality of care, (3) nursing managers with appropriate skills, leadership style and support to nurses, (4) adequate policy in terms of staffing and resources, and (5) relationships based on equality between doctor and nurse (Lake, 2002; Arford & Zone-Smith, 2005; Laschinger, 2008).

In a university hospital in the Netherlands, with more than 2100 nurses, the employee satisfaction surveys of 2011 and 2013 showed that nurses feel less involved in the organization's policy in comparison with other care functions. After analyzing the surveys, we concluded that several factors for a professional nursing work environment were not present at the hospital. For example, there was no vision on nursing and nursing policy at the organizational level available. Also there is no central control on nursing principles and implementation of nursing innovations in the organization. When asked, nurses acknowledged these situation as undesirable for their own work environment and for quality of care. Nurses said that they did not feel involved in organizational policy. This feeling is confirmed in a study by Ten Holter (2011). Until the end of the twentieth century it was common that a hospital had a nurse manager and nurse leader. Through the development of hospitals into large health care organizations the position of nurse leader has been lost in favor of the managers of today. And thus also the direct influence of nurses at the administrative level (Ten Holter, 2011). Nurses in our hospital felt a great need to change this and gain more influence on their own discipline within the organization.

In 2013 the newly founded nursing council of the hospital started with forming a vision on nursing. From American example, the nursing council decided to start working on a Professional Practice Model. A Professional Practice Model (PPM) is a visible framework that describes the professional nursing care with the aim to achieve the highest possible quality of patient care (American Nurses Credentialing Center, 2014). According Hoffart and Woods (1996) a PPM is a system that supports nurses in getting control of the nursing care and the environment in which the care is provided. A system is defined by Hoffart and Woods (1996) as structures, processes and values. ANCC (2014) indicates that a PPM is an integration of the mission and vision of nursing and nursing theory with the nursing profession. A PPM allows nurses to decide what the activities and responsibilities of nurses are and what conditions are necessary to perform these activities safely (Arford Zone & Smith, 2005). Either, a PPM gives nurses control over the operational definition of nursing in their own professional practice. Working with a PPM has positive consequences for patients, organization and nurses (Chamberlain et al., 2013). For patients advantages in terms of recovery, comfort, wellbeing and better prevention are described. These factors

contribute actively to the quality and safety of patient care. Nurses themselves experience a better practice management, communication, more sense of autonomy and empowerment. Finally within organizations employee satisfaction of nurses improved and a higher level of commitment to the organization was measured (Chamberlain et al, 2013).

The development of the PPM was led by the nursing council. Input was gained by nurses from all over the organization. After creating the first concept, important stakeholders like the medical staff and the board were consulted for feedback. Also nurses reactions on the concept model were gauged. After this the model reached its final form.

The PPM consists of a core, five domains and two rings. The nurse is the core of the PPM model because the model is about the nursing profession. The five domains represent the different aspects of the nursing profession in the hospital: technical expertise, evidence based care, clinical reasoning, education and research. Nurses must have sufficient skills and competencies to perform their duties in these domains within the context of our university hospital. The inner ring, personal leadership, indicates that nurses are accountable for the operation of these domains properly. The outer ring, the professional care relationship, shows that it is necessary to establish a professional relationship with the patient. The outer ring represents also the face to the patient, communication and respect.

Working with a PPM has proven to have many advantages (Chamberlain, et al., 2013). In the Netherlands, however, it is new. Most Dutch hospitals have a vision on (nursing) care but such a concrete model that gives guidelines for a professional nursing practice environment is not being used yet. A PPM is part of the shared governance structure. These structures are currently being developed in more Dutch hospitals and the effect of shared governance on the nursing work environment and the quality of care needs a lot of research in our context. Berger, Conway and Beaton (2012) argue that nurses should use the PPM to help others understand their important and complex work. They also say that a 'PPM is a testament to nursing's growth and development as a profession, demonstrating increasing autonomy and control over practice...' (Berger, et al., 2012). If this is true than working with a PPM can be the solution for Dutch nurses in the process of gaining more influence on organizational level. Therefore there is a need to study the effect of the PPM in a Dutch context.

At this point in time implementation of the PPM is started in our hospital. Part of implementation will be the study on the effect of the PPM on nurses employee satisfaction, nursing work environment and quality of patient care. By the time of the conference in November we will have our first results of the study and lessons learned from the start of the implementation of the PPM in a Dutch hospital.

## D 11 - Encouraging Faculty Success through Mentoring

### Nursing Faculty Development: A System Change to Foster Mentoring and Training

---

*Nicole M. Giancaterino, DNP, MSN, RNC-OB, CNS/APN, USA*

#### Purpose

The purpose of this presentation is to share one nursing school's Faculty Academy and Mentoring Program that positively influenced measures of performance, faculty satisfaction, and supported career advancement.

#### Target Audience

The target audience of this presentation is Nursing Faculty/Instructors, Faculty Chairs, Deans, and Presidents, Mentors and Other Disciplines interested in staff development and mentoring.

#### Abstract

An Illinois suburban nursing school experienced a high faculty turnover and an influx of inexperienced faculty. To support the strategic goals to “build the infrastructure” and mentor and develop new faculty a Faculty Development program was created. The program had a two-pronged approach: development of a Faculty Teaching Academy and initiation of a Faculty Mentoring Program. The Mentoring Program and Faculty Academy were designed to develop supportive and encouraging relationships, provide a venue for communicating information about faculty expectations and provide learning opportunities and promote mutuality.

Results of the programs provide evidence that faculty benefited from the mentoring relationships and academy activities. They felt more prepared and supported in their roles as faculty, and they expressed a feeling of greater mutuality. Faculty also expressed a desire for continuation of these programs with greater inclusion of external speakers. As a result of the programs, faculty evidence a greater interest in publication opportunities and are pursuing these opportunities with greater frequency than in the past. One recommendation for improvement of the programs includes earlier designation of the mentor/mentee dyad. Poor communication about new faculty hires negatively impacted the mentoring process, since potential mentors were unaware of new hires until the weekend prior to their arrival. Much of this can be attributed to poor communication between the Office of Human Resources and the college. This resulted in missed opportunities to establish the mentor/mentee dyad well in advance of their initiation onto the campus.

Another recommendation includes the assignment of work load credit for faculty mentors. While serving as a faculty mentor might be considered a professional responsibility, there is considerable time and work investment involved. For example, some faculty mentors serve in this role throughout the academic year in addition to assuming heavier committee and teaching loads. In order to avoid mentor burn out, administration should consider strategies for imposing lighter teaching loads or providing work load credits.

A recognition process for the mentors should be established. National and local recognition supports the caring philosophy that the college has for its faculty. Emails, recognition boards, and newsletters highlights are examples of methods that could be used.

Many experienced faculty expressed a desire to also have a mentor. Their original, informal mentor had either left the college or transferred into a national position. While they still held relationships with those colleagues, faculty requested a campus-based mentor. In addition, faculty expressed a desire to create a process for experienced faculty to mentor each other.

The institution of a Teaching Academy and Mentoring Program proved to be a highly rewarding endeavor. The program will continue to evolve and be revised as needed.

## D 11 - Encouraging Faculty Success through Mentoring

### A Faculty-Based Mentorship Circle: Positioning New Faculty for Success

---

*Janice Waddell, PhD, RN, Canada*

#### Purpose

The purpose of the presentation is to report on the implementation and evaluation of a mentorship circle initiative aimed at socializing new faculty to their roles and the expectations of the academic environment, and to help them learn new skills to position them to be successful in their academic career.

#### Target Audience

The target audience of this presentation is university and school specific administrators, mid-late career faculty members who wish to support new faculty colleagues, faculty members within the first two years of their academic role, and graduate students who are seeking academic appointments.

#### Abstract

Multiple and competing priorities, within a dynamic and changing academic environment, can pose significant challenges for new faculty. Mentorship has been identified as an important strategy to help socialize new faculty to their roles and to the expectations of the academic environment, as well as help them learn new skills that will position them to be successful in their academic career. In this presentation, the authors will report on the implementation and evaluation of a mentorship circle initiative aimed at supporting new faculty in the first two years of their academic role. The mentorship circle had five meetings over the course of the academic year. During the initial meetings the group shared their hopes and expectations for their involvement in the mentorship circle, developed group norms, and generated a number of thematic areas they wished to discuss over the course of the academic year. Examples of themes included developing one's program of research, creating a teaching philosophy and dossier, preparing one's annual report, and building a tenure application. A portion of the meeting was also dedicated to a general check-in to allow members to share and consult with one another about their day-to-day experiences of their new role. Focus groups were used to gather evaluative data about the effectiveness of the mentorship circle in supporting their transition to their faculty role. All the mentorship circle participants were invited by a research assistant to participate in a focus group interview. Participants reported that the mentorship circle provided them with a culture of support, a sense of belonging, and a safe space to discuss their concerns and learn strategies from both mentors and fellow mentees as they accommodated to their new role. The interdisciplinary nature of the mentorship circle facilitated faculty members' capacity to navigate their role and foster collegiality.

### Mentorship and Novice Nursing Faculty: Working Together for Successful Role Transitioning

---

*Azizah Sculley, PhD, MEd, BScN, RN, Canada*

*Florence Myrick, PhD, MN, BSN, RN, Canada*

*Pauline Paul, PhD, RN, RN, Canada*

#### Purpose

The purpose of this presentation is to inform the audience of the findings from my doctoral research study that explored the process involved in mentoring novice nursing faculty in an undergraduate program in Western Canada. Additionally, four ambient conditions integral to the mentoring process will also be presented.

#### Target Audience

The target audience of this presentation is nursing faculty particularly novice nursing faculty who are transitioning into the educator role for the very first time and who are teaching in the classroom, laboratory, or at the clinical sites.

#### Abstract

In baccalaureate nursing programs in which context based learning (CBL) is used as a teaching-learning modality, it has been observed that there is a shortage of experienced faculty both in the classrooms and in the clinical settings. This shortage has led to an increasing number of clinicians, frequently with no formal teaching preparation and with little or no teaching experience being hired into the position of faculty lecturer or sessional faculty. Such hiring practices have led to concerns about the mentoring process of these faculty members and their transition to the academic setting. Role transitioning from that of experienced clinician to novice educator is often filled with trepidation and uncertainty. Effective mentoring is pivotal to successful role transitioning of novice faculty. To date, there is a lack of research regarding this mentoring process.

The purpose of this grounded theory study was to examine the process involved in mentoring novice nursing faculty in a large university in Western Canada. Data collection occurred via semi-structured interviews. In keeping with grounded theory, constant comparative analysis and theoretical sampling were used. Working Together emerged as a dynamic and interactive process that occurred during an effective mentor-mentee relationship. Fundamental to this process of Working Together which ultimately fostered successful role transitioning for the mentee were four inter-related ambient conditions that included: a) sharing; b) communicating; c) role modeling, and d) supporting. Findings from this study could serve to augment our understanding of the mentoring process and in turn contribute to the promotion of an academic milieu that is nurturing, encouraging, and supportive for novice faculty.

## D 12 - Nursing Professional Development

### Transformational Dialogue and Theory U: The Leaders Role in Guiding Emerging Change

---

*Vivian P. Dawkins, PhD, RN, USA*

#### Purpose

The purpose of this presentation is to offer a series of skills and tools that will encourage powerful dialogue among nurses and leaders designed to promote and support disruptive innovation and change in health care.

#### Target Audience

The target audience of this presentation is nurse leaders at all levels, advanced practiced nurses in DNP programs, and educators interested in teaching about new theories and practices that promote change.

#### Abstract

The purpose of this presentation is to offer a series of skills and tools that will encourage powerful dialogue among nurses and leaders designed to promote and support disruptive innovation and change in health care. Using a model developed by David Kantor (2012) for transformational dialogue, and the model of Theory U developed by Otto Scharmer (2009) on change and the social technology of presencing, participants will engage in group conversations designed to promote the leadership of teams through times of social change.

Kantor's model utilizes the concept of structural dynamics to outline an approach to transformational dialogue. The concept of structural dynamics has its roots in systems theory and proposes a theory of how face-to-face communication works and does not work in human systems. Kantor's model explores four specific kinds of activities that happen in face-to-face conversations. Scharmer's model proposes a deep dive by leaders to reflect and synthesize the need for changing social systems that will impact the leaders ability to engage in the emerging realities of healthcare reform and to guide their teams through change in authentic ways. The presentation will include a discussion of four skills essential to working within the transformational dialogue model and the 24 practices and principles of Theory U. Participants will be presented with examples of transformational dialogue and Theory U and guided through a series of group dialogues that will enhance their understanding of how these models can be used to change social systems in the health care community. Transformational dialogue enables the leader to untangle problems in communication in any situation. Theory U helps the leader understand and participate in the emerging realities of today's health care systems. Together, transformational dialogue and principles of Theory U support, promote, and enhance a leader's ability to guide teams through change.

## D 12 - Nursing Professional Development

### Transforming Your World: One Opportunity at a Time

---

*Sheila Montgomery, MSN, RN, USA*

#### Purpose

The purpose of this presentation is to cover goal setting, some of the different degrees available and de-code professional improvement so nurses can cultivate a career development plan.

#### Target Audience

The target audience of this presentation is nurses who are looking for improvements in their present career trajectories. This presentation is for new and experienced nurses.

#### Abstract

Do you want to transform your world? Do you want to lead globally? Nursing has many different career paths and professional development seminars available. Nurse Practitioner, Case Manager, Private Duty Nurse, Acute Care, Director, Professor - or- Seven Habits, Who Moved my Cheese, Advanced Computer skills- the list goes on and on. With so many different degree options and developmental seminars, picking the right career path, or advancing your present one can be a daunting task. This presentation will guide nurses through a strength and weakness assessment, defining the needed skills to move their career forward, how to outline opportunities, and evaluation strategies. Professional development and education are requirements for keeping up with changes in technology and research. Time is limited and picking the right development is crucial to meet the current career demands.

Enhancing clinical and educational outcomes by transforming your practice can be achieved with the right objectives. If you are a nurse who has ever wondered- can I really do that? No matter where you are or what you want to do this presentation will lead you towards transforming your practice. This symposium will cover goal setting, some of the different degrees available and de-code professional improvement so nurses can cultivate a career development plan.

## D 12 - Nursing Professional Development

### Using the Journey to Empowerment Professional Development Seminar to Enhance Nurses' Sense of Empowerment

---

*Denise M. McNulty, DNP, MSN, BSN, RN-BC, ARNP, USA*

#### Purpose

The purpose of this presentation is to demonstrate how professional development can be utilized to enhance nurses' sense of empowerment in the workplace.

#### Target Audience

The target audience of this presentation is any nurse who has an interest in enhancing nurses' sense of empowerment. Staff nurses, nurse leaders, nurse educators, and nurse researchers may find this presentation beneficial.

#### Abstract

Several studies have examined the effect of staff nurse empowerment on patient outcomes. Nurses who perceive themselves to be empowered are more likely to use more effective work practices resulting in positive patient outcomes. With the growing complexity and challenges of healthcare reform, nurses need to feel psychologically empowered so that they can effectively manage their nursing practice and improve patient care. In an effort to enhance nurses' sense of empowerment in the workplace, a professional development seminar entitled The Journey to Empowerment for Nurses was offered to nurses employed by a six Hospital Healthcare System in Southwest Florida. The effectiveness of the empowerment seminar in enhancing nurses' sense of psychological empowerment in the workplace was evaluated using a confidential survey. The measure, Dr. Gretchen Spreitzer's Psychological Empowerment Instrument, has been used and found to be valid in health care and specifically valid with nurses. A pre-survey was conducted at the beginning of the empowerment seminar. Each Instrument was assigned an identification number to protect the participants' identities. The nurses were invited to retake the Instrument three months after attending the professional development seminar. A criterion to participate in the study was that participants be employed by the Healthcare System as an inpatient or outpatient Registered Nurse or Licensed Practical Nurse. Findings revealed that the professional development seminar may be an effective intervention in enhancing nurses' sense of empowerment which may have implications for both practice and academic settings.

## D 13 - Leading Doctoral Education in Nursing

### Development and Evaluation of a Scholarly Writing Course in the Doctor of Nursing Practice Program

---

*Maria R. Shirey, PhD, MBA, RN, NEA-BC, ANEF, FACHE, FAAN, USA*

*David E. Vance, PhD, MGS, USA*

*E. Laura Wright, PhD, MNA, CRNA, USA*

#### Purpose

This presentation describes the development and evaluation of an innovative scholarly writing course in a DNP program with a diverse student population. The designed curriculum as well as related outcomes will be discussed.

#### Target Audience

Educators interested in developing student scholarly writing capacity

#### Abstract

**Background:** There is available empirical and anecdotal data to suggest that students in the Doctor of Nursing Practice (DNP) program lack scholarly writing proficiency. Although success in scholarly writing is essential for progression in the DNP program, few academic programs have available formal writing for publication courses.

**Purpose:** This presentation describes the development and evaluation of an innovative scholarly writing course in a DNP program with a diverse student population. The designed curriculum as well as related outcomes will be discussed. Information is presented within the context of doctoral nursing education accreditation standards and evidence-based strategies incorporating leadership development for scholarly writing skill set acquisition and influence beyond the classroom.

**Methods:** The authors used existing evidence from the literature to develop and evaluate a scholarly writing course using a model that translates research findings into instructional design. The course also addressed the DNP Essentials of the Commission on Collegiate Nursing Education (CCNE) with particular focus on clinical scholarship. Critical appraisal of the evidence produced a curricular organizing framework that consisted of five course modules: Overview, Foundations, Mechanics, Practice, and Products/Dissemination. Each module had distinct assignments consistent with course objectives and conceived to follow an incremental “build a scholarly paper” approach. A total of 64 students at a large southeastern university completed the 3 semester hour distance accessible writing for publication course. Three faculty members experienced in scholarly writing and publication taught the course. Although extensive faculty guidance was provided over the course’s 14-week semester, emphasis was given to teamwork for building community and emphasizing peer instruction. The course culminated in a Virtual Conference for Clinical Scholars, a venue in which all teams (maximum of 5 students per team) presented their scholarly work and faculty gave awards to recognize exceptional products. A compendium of abstracts was assembled to showcase student work and emphasize professionalism and potential leadership influence. Program evaluation consisted of quantitative and qualitative student evaluations of faculty teaching and course design. Manuscript completion, submission, and pending publication were also measured.

**Results:** The writing for publication course produced 14 team manuscripts and 64 guest editorials suitable for submission to publication. Although 10% of the students verbalized frustration with working in teams, in 100% of the 14 teams at least one team member expressed appreciation for their newfound confidence in developing a scholarly paper suitable for submission to a journal for publication. The majority of the student evaluations of teaching rated instruction as positive and the course as rigorous. Mostly the students reported the course was helpful suggesting the developmental approach to building scholarly writing capacity was effective. It was evident from student performance and feedback

that more foundational instruction in the American Psychological Association's (APA) standards for formatting was needed early in the course as well as didactic content on team dynamics.

**Conclusion:** Scholarly writing in nursing is a necessary skill set that can be cultivated. Implementation of a writing for publication course as a required core course in the DNP program provides a developmental “guide by the side” approach to instruction that facilitates student program progression and enhances confidence for potential leadership influence. Enlisting students to pursue a guided scholarly writing journey is more effective than merely providing didactic content and expecting dissemination results. Institutions wanting to build student scholarly writing skills and enhance leadership potential for broader influence must invest in capacity building to reap future benefits. Part of capacity building in scholarly writing entails developing student expectations of receiving feedback and acceptance to constructive professional coaching.

## D 13 - Leading Doctoral Education in Nursing

### Doctoral Programme in Nursing Science: Systematic Education for Future Researchers and Experts

---

*Katri Vehviläinen-Julkunen, PhD, RN, RM, Finland*

*Tarja Kvist, Docent, PhD, MSN, RN, Finland*

*Natalia Sak-Dankosky, MSc, RN, Finland*

#### Purpose

The purpose of this paper is to update the most recent developments in doctoral education in Europe and to describe the systematic development of PhD education in nursing in Finland, using the progress in the University of Eastern Finland as an example.

#### Target Audience

The target audience of this presentation are researchers and educators in doctoral programmes, those interested in doctoral education as a career path

#### Abstract

The need for PhD-prepared nurses has been globally evident. PhD-educated nurses with researcher training are needed in clinical practice, leadership positions and educational institutions as well as in research. The purpose of this paper is to describe the most recent developments in doctoral education in Europe as well as the systematic development of doctoral education in nursing in Finland.

In Finland, doctoral education has been offered in nursing and health sciences since 1979 and the first doctoral degree in the country was awarded in 1984 in Kuopio. Ever since a total over 100 PhDs completed their doctoral degree at the University of Eastern Finland (UEF).

In the University of Eastern Finland doctoral education in nursing science is arranged within the framework of the Doctoral Programme in Nursing Science provided by the Faculty of Health Sciences. The programme arranges PhD-courses and seminars in the field of nursing science and transferrable skills. The Doctoral Programme in UEF works in close cooperation with the Finnish Doctoral Education Network (a network of five universities). The Network coordinates doctoral courses in nursing science with the participating universities. Courses are held by international and national experts. The PhD students are supported to have an international exchange period in some of the collaborating universities and use special summer courses offered by e.g. European Academy of Nursing Science. The purpose of the Doctoral Programme in Nursing Science is to train excellent, internationally oriented researchers and experts with doctoral education for a variety of national and international duties. Other aims are to improve their research careers and to strengthen multidisciplinary research. The doctoral studies are supported by public funding and free of charge at the moment in all fields.

New candidates are selected to the programme twice a year through a systematic application process. Every year approximately 10-15 new students start their PhD degree. The programme attracts students from Finland as well as from other countries and continents such as Baltic countries, Africa, China, Germany, Greece, Italy, Poland, Sweden and Thailand. Postgraduate education is based on two parts: theoretical studies (50 credits) and a dissertation. The aim is to complete studies in four years. The programme offers courses on general transferrable skills, theoretical and methodological studies, research topic specific courses and research seminars. The degree includes a doctoral dissertation that is based on empirical research. Annually approximately 6-8 graduate. The doctorally prepared nurses work in clinical practice, educational settings, leadership positions in hospitals and primary health care, ministry of social affairs and health and in academic institutions as researchers and educators.

The purpose of this paper is

- to update the most recent developments in doctoral education in Europe

- to describe the systematic development of doctoral education in nursing in Finland, using University of Eastern Finland as an example.

Target Audience: The target audience of this presentation are researchers and educators in doctoral programmes, those interested in doctoral education as a career path

## D 13 - Leading Doctoral Education in Nursing

### The Doctoral Journey: Exploring the Relationship between Workplace Empowerment of Nurse Educators and Successful Completion of a Doctoral Degree

---

*Lisa Anne Burrell, PhD, MSN, BSN, RN-BC, CNE, USA*

#### Purpose

The purpose of this presentation is to present a quantitative, correlational study conducted to examine the relationship between nurse educators' perceptions of workplace empowerment and successful completion of a doctoral degree.

#### Target Audience

The target audience of this presentation includes nurses, nurse educators, graduate nursing students, deans/directors of nursing programs, other nurse leaders, and healthcare administrators.

#### Abstract

Nursing education and practice trends reflect an increasing need for nurse educators prepared with a doctoral degree. However, more than 50% of doctoral learners never complete the program. The purpose of the study was to examine the relationship between nurse educators' perceptions of workplace empowerment and completion of a doctoral degree. McClusky's Theory of Margin served as the theoretical framework to guide the investigation of empowerment as a predictor to doctoral degree completion. The research questions were used to guide the correlation between nurses' perceptions of empowerment while in a teaching position and completion of a doctoral degree. The study included nurses/nurse educators in two eastern states. A quantitative, correlational design was conducted. A convenience sample of 80 nurses/nurse educators who enrolled in doctoral studies while in a teaching position participated in the study. The Psychological Empowerment Instrument (PEI) was administered as an internet survey to collect the data. Descriptive statistics and logistic regression analysis were conducted to examine the data. Results of the study demonstrated no statistically significant relationship between workplace empowerment and completion of a doctoral degree or workplace empowerment and time to completion of degree ( $p > .05$ ). The lack of a significant correlation between the variables suggests that empowerment on the job is not a predictor of whether or not a nurse educator will complete a doctoral degree. Recommendations for further research include replicating the study using a larger sample, examining correlations between all but dissertation (ABD) status and empowerment, and conducting qualitative studies designed to examine motivating factors for enrollment in doctoral programs.

## E 10 - Being Aware of Cultural Differences in the Clinical Setting

### Changing Hospital Culture: Collaborative Response to Emergency Cesarean Sections

---

*Barbara C. Schuch, MSN, RNC-OB, C-EFM, USA*  
*Sally M. Krempel, MSN, RNC-OB, USA*

#### Purpose

Purpose This four part educational program aimed to change the culture and create an effective and collaborative response to emergency cesarean sections: I-NICHD Nomenclature: Speaking a Common Language When Interpreting Fetal Heart Rate Tracings II-Concepts for Teamwork Training in Obstetrics Background and Significance III-Neonatal Outcomes IV-Potential Postpartum Outcomes

#### Target Audience

The target audience for this presentation included physicians, residents, anesthesiologists, OB hospitalists, nursing staff, OB techs and patient care techs.

#### Abstract

**Problem:** Based upon the American College of Obstetrics and Gynecology's (ACOG) and the American Academy of Pediatrics (AAP) recommended standard (30 minutes from decision to incision for emergency cesarean sections) the "30-minute rule," a preliminary data review of "decision to incision" time audits, identified discrepancies in standardized communication and collaboration between medical and nursing staff.

**Purpose:** This four part educational program aimed to change the culture and create an effective and collaborative response to emergency cesarean sections:

- I-NICHD Nomenclature: Speaking a Common Language When Interpreting Fetal Heart Rate Tracings
- II-Concepts for Teamwork Training in Obstetrics Background and Significance
- III-Neonatal Outcomes
- IV-Potential Postpartum Outcomes

**Development/ Program Implementation:** By integrating Kurt Lewin's "Change Management Model," this educational program's aim was to change the culture and create an effective and collaborative response to emergency cesarean sections. The methodology of this interprofessional program incorporated a broad range of instruction (didactic lecture, fetal strip review & simulation). Focus was on standardized communication, interprofessional teamwork training, potential maternal/ infant outcomes and simulation of emergency cesarean section scenarios.

**Evaluation/ Results/Barriers:** Through implementation of this four part educational program, in conjunction with the development of departmental guidelines, ongoing data collection, and quality improvement review, this program was able to facilitate and sustain effective inter-professional collaboration and has made a significant impact on compliance with the ACOG "30-minute rule" standard, see (Table 1) Decision to Incision Data\*

Barriers to sustained culture change continue to be identified through the debriefing of each individual case and addressed through the provider and nurse "peer review process."

- Compliance with Standardized Nomenclature for Fetal Monitoring (NICHD language)
- Teamwork
- Following ER C/S Guidelines
- RN, Physician & Anesthesia Delays
- Improving patient safety and quality of care was the primary focus of the project.

**(Table 1) \*2013-2014 Decision to Incision Data**

Cases which met the “30-min. Rule” standard ACOG Benchmark (% Compliance)

**\*March 2013-December 2014 data, reflect post education results**

1st quarter 2013-45% compliance

**\*2nd quarter 2013-72% compliance**

**3rd quarter 2013-38% compliance**

**4th quarter 2013-89% compliance**

**1st quarter 2014-89% compliance**

**2nd quarter 2014-85% compliance**

**3rd quarter 2014-92% compliance**

**4th quarter 2014-62% compliance**

## E 10 - Being Aware of Cultural Differences in the Clinical Setting

### A Tale of Two Countries: Comparing the Heart Failure Patient Journey in the United States and France

---

*Alison Lee Walsh, MSN, RN, OCN, CNE, USA*  
*Judith Hupcey, EdD, CRNP, FAAN, USA*  
*David Munoz, USA*

#### Purpose

The purpose of this presentation is to describe the different healthcare delivery systems in the United States and France from a systems perspective, looking at the differences in insurance coverage, access to healthcare, nursing care, incidence, and outcomes.

#### Target Audience

The target audience of this presentation is nurses in the clinical, academic, and administrative settings in order to improve healthcare delivery and coordination of care to heart failure patients.

#### Abstract

**Purpose:** To compare the healthcare delivery system and care coordination efforts of the United States and France for the care of heart failure patients using a mixed-method research approach.

**Background:** More than 5 million patients in the United States and 15 million patients in Europe are currently living with heart failure, with the rate of new cases projected to rise each year. Heart failure is a devastating and costly disease that accounts for over \$39 billion dollars in health care expenditures in the United States and 2% of the overall national expenditures on healthcare in Europe. In a controversial assessment conducted by the World Health Organization in 2000, France was ranked as the number one healthcare system in the world, with the United States ranking at a distant 38. While the United States is in a transitional stage between private insurance and government health insurance via the Affordable Care Act, French citizens receive government insurance through a system of social security that covers nearly 100% of healthcare costs for chronic disease. Although the U.S. and French healthcare systems differ on many aspects, care coordination has been seen as a major component within high performance healthcare systems. In addition to these facts, it has been argued that better care coordination has the potential of improving health system performance, not only in terms of quality but also cost-efficiency. One of the major failures in care coordination is the poor transmission of information between providers that has led to a suboptimal provision of care. In the U.S., for instance, less than half of patients with heart failure leave the hospital with clear instructions and follow-up care procedure. Hence, understanding what main drivers of success and failure in terms of care coordination in heart failure can potentially result in a more effective and efficient provision of care.

**Methods:** This study utilized a multi-site mixed-methods research approach to compare the U.S. and French healthcare systems in terms of their care coordination capabilities. A multidisciplinary team composed of nursing and engineering scientists and professionals was put in place to design and conduct the multi-site study. The framework used was divided into four main phases: 1) Conducting in-situ observations to the Hershey Medical Center in Pennsylvania and Henri Mondor in Paris; 2) Qualitative semi-structured interviews along with focus groups with key healthcare stakeholders including physicians, nurses, nurse practitioners, case managers, and social workers at the two sites; 3) Quantitative questionnaires including multiple choice and Likert's scales with different healthcare stakeholders, and 4) Initial assessment of the findings using quality improvement tools to categorize and identify main strengths, weaknesses, and barriers of care coordination at both sites. The results provide a baseline for sharing best practices and lessons learned across the U.S. and French healthcare systems.

**Results:** The United States and France have vastly different approaches to tackling heart failure care delivery and coordination. With recent penalties instituted by Medicare for heart failure readmissions within 30 days, much attention has been dedicated to addressing the care coordination of heart failure

patients in the United States. Cardiologists and heart failure clinics manage the majority of heart failure care. Advanced practice nurses have a bigger role than ever in managing outpatient care via clinic visits, transitional care programs, and the use of telehealth. In France, nurses are employed as civil servants and are viewed as more vocational than as college educated professionals. Staffing ratios in France are starkly different, with approximately 35 patients being managed by three nurses and two nurse's aides. A beginning nurse's salary in France ranges from approximately \$1,300 to \$1,400 per month, after taxes, and French physicians make around 60% of what American physicians are paid. Additionally, mild to moderate cases of heart failure are generally managed by the primary care physician in France as opposed to a cardiologist. However, the French healthcare system allows citizens to choose their physician without the constraints of an insurance network, so physicians, specialists, and facilities must be increasingly mindful of their performance in order to stay competitive. Cardiologists are one of the most populous specialties in France, so wait times for appointments are often less than a week. Therefore, French patients have easy access to specialists and hospitals and are less likely to forgo healthcare than an under-insured American.

**Conclusions and Implications:** Both countries have much to learn from each other regarding healthcare delivery and care coordination of heart failure patients. Our approach serves as the baseline or roadmap for process and care coordination improvement. Heart failure is a major public health problem in both countries, with cases continuously on the rise. Although the structure of the French healthcare system allows for easy access and high reimbursements of medical costs, there is increased recognition that the cost of heart failure is too high in relation to hospitalizations and the duration of inpatient stay. This could potentially be addressed by increasing the role of nurses and by adding more educational references for the French public. France does not have internet sites dedicated to heart failure education the way the United States so commonly does. Conversely, the United States would benefit from a government insurance system in which every citizen was provided with healthcare coverage and the ability to choose their providers. This could increase the number of visits for preventative care rather than the majority of healthcare dollars going to emergency and inpatient visits.

## E 10 - Being Aware of Cultural Differences in the Clinical Setting

### Intent of Hispanic/Latino Adolescents toward Tissue and Organ Donation: A Pilot Study of a Culturally Sensitive Educational Intervention

---

Sharon A. Castellanos, DNP, MSN, BSN, RN, WHNP-BC, CNS, AHN-BC, USA

#### Purpose

to examine the impact of a culturally sensitive educational intervention on organ donation intention among Hispanic/Latino students in three urban high schools, both through improving their knowledge of the organ donation process and by encouraging communication within families regarding this subject.

#### Target Audience

High schools, Public health departments, Governmental agencies: DMV, California Transplant Donation Network and Hospitals.

#### Abstract

**Background:** Adolescents of Hispanic descent are an important and under-represented target populations for organ and tissue donation. The intent of this study is to measure the effect of a culturally sensitive educational curriculum on awareness and intent to donate among a predominantly Hispanic cohort of adolescents.

**Methods:** A quasi-experimental pre-post design was conducted among students from 3 high schools with predominantly Hispanic populations. Subjects completed pre-intervention surveys prior to a 40-minute educational intervention. Post-intervention surveys were administered 10-14 days later. Changes to survey responses on knowledge and intent from pre to post intervention were compared using paired t-tests.

**Results:** A total of 301 students participated, 67% of which were Hispanic. Twenty-six percent of subjects expressed intent to donate pre-intervention; this increased by 18 percentage points (95 CI: 12%-25%) to 44% post-intervention ( $p < 0.0001$ ). At baseline, intent to donate was 26% and 22% among Hispanics and non-Hispanics. Post-intervention, 51% of Hispanics expressed intent to donate ( $p = 0.001$ ) and 28% non-Hispanic (0.13). Pre-intervention, females were more likely to discuss organ donation with family compared to males (33% vs 16%,  $p = 0.001$ ); post intervention, the prevalence increased in both groups (to 46% and 41%, in females and males, respectively).

**Conclusion:** This study demonstrates that a culturally appropriate, single classroom intervention can correct misinformation and promote communication about tissue/organ donation among high school students. The intervention appeared particularly effective among Hispanics, a group traditionally underrepresented among tissue and organ donors. These results proved to be effective regarding expressed intent, a large-scale cluster randomized implementation in all 13 high schools located in a large metropolitan bay area school district, is planned in 2015.

**Keywords:** Organ/Tissue donation, adolescents, culturally sensitive, education, knowledge and intent

## E 11 - Enhancing Learning through Online Education

### A Leader's Challenge: Using E-Learning/Flipped Classroom Instructional Techniques to Build Graduate Nursing Student Leadership Skills

---

*Teresa L. Barry Hultquist, PhD, MSN, BSN, APRN-CNS, PHCNS-BC, USA*

*Deanne Ernesti, MSN, RN, USA*

*Suhasini P. Kotcherlakota, PhD, MSc, MEd, BSc, USA*

*Susan Waters, MS, USA*

#### Purpose

The purpose of this presentation is to illustrate an e-learning module (using online simulation and flipped classroom techniques) to develop graduate nursing administration students' political savvy, prioritization and problem solving skills and best practice strategies in navigating a politically delicate scenario involving declining employee satisfaction.

#### Target Audience

The target audience of this presentation is nurses in leadership positions, nurse educators and nursing students.

#### Abstract

**Background:** Healthcare organizations need employees with leadership skills who can successfully navigate politically delicate situations, determine alternatives, prioritize action steps, and develop best practices directed towards issue mitigation and resolution. Faculty are dedicated to ensuring that education is current and relevant for today's nurse leaders, based on authentic situations occurring in the healthcare environment. The e-learning module was developed for nursing administration / leadership students, but could have broader application for any leader. The design of this module included four sections: 1) content (reading/resource) review, 2) interactive online scenario, 3) assessment of the student's choices, and 4) flipped classroom dialogue and practice in skill application. Upon completion, students can assess and apply best leadership practice skills of Political Savvy, Priority Setting, and Problem Solving in politically delicate situations.

**Content Review:** The content review consists of readings and resources for students to develop their understanding of the content and context of politically delicate situations. Learners construct meaning based on their previous experiences and match new information against existing knowledge. For example, students may have seen employees that exemplify an organization's mission statement and values, but also have noticed some employees and teams with vested interests who defend their own needs and sabotage change efforts. In the content review, students learn that employees who are competent in the skill of Political Savvy accept that some employees' behaviors do not match the organization's mission and values. Students can develop skills to deal with these individuals within the organizational constraints (e.g. time, resources). Using Problem Solving, leaders must analyze and determine what the issues really are in a given situation, rather than drawing premature conclusions about the problem and best course of action. In addition, the work environment may have many priorities which might exceed available resources, so using Priority Setting within available finite resources is an important leadership skill.

**Interactive Online Scenario:** The interactive online scenario provides an authentic leadership situation that students might encounter in a healthcare organization today. Students are asked to watch, interact and immerse themselves in the online simulated gaming environment scenario. This immersion allows students to establish meaningful connections between their experiences and the content they've just reviewed. Students play the part of the Quality and Risk Manager and watch leaders (avatars) interact in a 23-bed Critical Access Hospital in a town of 2,500 people. Students are asked by the Chief Executive Officer (CEO) to investigate recent troubling employee survey findings. Leaders they encounter include the Chief Nursing Officer (CNO), the Mayor, the Human Resources Manager, and a Charge

Nurse. Students click on characters or objects (i.e. computer screen, telephone) to move through the scenario. Students view the scenario as many times as they wish.

**Assessment of Student Choices:** After watching the scenario, students are asked to complete an assessment where they need to reflect on the content they've reviewed and synthesize main issues in the scenario to choose priority actions to take (whom to talk to and what questions to ask) based on the content they've learned and the scenario they've seen. The assessment contains three individuals to "talk" to (the CNO, The Human Resources Manager, and the Charge Nurse), and each individual has three scripted questions available to choose. Students may only "talk" with two of three individuals. They are able to ask two questions of the first individual; and one question of the second individual. Once the question is selected, the leader's response is displayed.

As an example, the students can ask the Human Resources Manager, "What turnover rate do we have?" The Human Resources Manager responds by saying "The turnover rate has tripled in the last 2 years". Or students may choose to ask the CNO, "Are 10 of our staff so unhappy that they are considering leaving our organization?" The CNO responds by saying "Just let them go, there are plenty of other staff out there that really want to work."

Rationale for the questions indicate the best evidence (developed by expert nurse leaders based on the assigned learning content) that supports both the priority of both the individual and question chosen (best, second best, or least desirable). Scoring of student choices/priorities is captured in the online learning environment, based on the order and choices made by the students.

**Flipped Classroom:** In this module, the flipped classroom session includes the use of distance technology, students as leaders of the discussion/dialogue, and student developed synthesis of best practices in nursing administration/leadership. Flipped classrooms are designed to provide content prior to a synchronous class so the students come prepared to engage in collaborative learning. The synchronous flipped classroom is done via distance technology (IP video, VIDYO or Adobe Connect) since students live in a variety of states and communities. Students lead the discussion on experiences with the e-learning portion of the module, applying the knowledge and skills they learned in the content review and the online scenario sections. They debate the merits of the actions they each took in the assessment based on the scenario they viewed and the readings about best practices they completed. For example, they dialogue as a group about which person they chose to talk to or questions they chose to ask, and how those choices fit with the readings about best practices/ skilled level of that competency (political savvy, priority setting or problem solving). They compare and contrast the online scenario with experiences they have had as leaders, develop a consensus of best practices, and discuss how they can incorporate the skills they are now honing into their practice. Students then apply these best practices to other written clinical scenarios during the flipped classroom session.

**Assessment Results:**Data from module implementation in Spring 2014 and 2015 are included. Seven students completed the module in 2014, and seventeen completed the module in 2015. Student leadership experience ranged from None (n=12, 50%), Less than 2 years (n=4, 16%), 2-5 years (n=3, 13%), 5-10 years (n=3, 13%) and 10+ years (n=2, 8%). Student's initial (first) assessment results indicated 78% (n=18 of 23) students talked to the "best" individual as their first or second choice. One student experienced a scenario deployment issue and completed the assessment without reviewing the scenario; those results are not reported. Twelve of the twenty-three students (52%) chose to talk to the least desirable individual during the first assessment.

Based on the first individual (best, second best or least desirable person) chosen, thirteen of twenty three (57%) chose the best question to ask that individual, either in their first or second question. In the initial year, students were able to complete the assessment twice, and four of seven students chose to complete the assessment a second time (some indicated they wanted to try to improve their score, and some said they made completely different choices to see more of the questions because they were curious about what other options included). Based on student feedback, in 2015, students could complete the assessment as many times as they wished. The number of times the assessment was done in 2015 ranged between 1 and 15, with an average of 4 times.

Student comments included:

"I found it to be interesting and challenging. As a Director in a rural community hospital, I can relate to receiving a voicemail from the CEO or CNO that says I need information about why these scores are so low by tonight."

"The point of the scenario was being politically savvy, so when you pick the CNO, the scenario basically tells you that, politically, this isn't a good choice because it makes the CNO defensive and unhelpful. I suppose that's a big part of being a good leader, learning who to approach, how and when to approach them, and what questions to ask to get the information/help you need without ruffling feathers."

"Overall, this is a very neat concept and I look forward to doing the next one."

"I really enjoyed the e-learning activity; it reinforced my knowledge of leadership skills and improved my confidence for next time. I also appreciated doing something different other than the same reading and then discussion board postings."

**Conclusions/Recommendations:** This project promotes student' control and active application of content within the interactive scenario, the assessment and the flipped classroom. Application of skills within a simulated setting promotes student confidence in their ability to construct meaning and match new information against existing knowledge. During the flipped classroom discussion, students could make meaningful connections and utilize leadership skills they can transfer to their leadership roles.

## E 11 - Enhancing Learning through Online Education

### Teaching Undergraduate Research in an Online Environment

---

*Nancy C. Falvo, PhD, MSN, BSN, RN, USA*  
*Laurie Bladen, PhD, MBA/HCM, RN, USA*

#### Purpose

describe the transformation of research knowledge into practice by addressing the challenges and opportunities of teaching research to RN BSN students in an online environment. Creative solutions to group work, subject matter, student resources, and distance education will be described. Promoting a culture of inquiry in nurses will be examined.

#### Target Audience

includes educators in both face-to-face and online programs, researchers, and other interested participants.

#### Abstract

The purpose of this presentation is to describe the transformation of research knowledge into practice by addressing the challenges and opportunities of teaching research methods to online RN to BSN students. Historically, the course was taught following the steps for the research process, research critique exercises, and the development of a hypothetical study. As the curriculum moved to an evidence-based practice model, the course was been redesigned to focus on students developing pilot study proposals in small groups, appraising study proposals created by peers, and submitting the final study proposals to the university's institutional review board. Completion of the study is then carried out in the senior capstone course during the following semester.

Guided by faculty with both qualitative and quantitative research experience, students work in small groups to build a research study evolving from the strategic plan priorities of the National Institute of Nursing Research (NINR). Student perceptions of research and online group work prior to the course are at times very negative. Transforming research knowledge also includes changing these initial perceptions. Research design also requires the development of partnerships with other university departments and committees to assist students in understanding the meaning, importance, and process of scientific inquiry. Participants in this presentation will learn about the various teaching methods used in the online environment to assist students in moving from a research question through proposal development. Participants will also recognize creative solutions to common problems associated with online learning, large class size, co-teaching courses, and course content.

## E 11 - Enhancing Learning through Online Education

### Learning Without Boundaries: Strategies for Engaging and Active Online Learning

---

*Deborah A. Raines, PhD, EdS, MSN, BSN, RN, ANEF, USA*

#### Purpose

The purpose of this presentation is to share strategies to promote active learning by having the learner explore beyond the walls of the classroom and to bring a real-world perspective to concepts discussed in course text-books as well as provide a national and global perspective to the material being studied.

#### Target Audience

The target audience of this presentation is nurse educators.

#### Abstract

In *Oh the Places You'll Go*, Dr. Seuss wrote: "You have brains in your head. You have feet in your shoes. You can steer yourself any direction you choose. You're on your own, and you know what you know. And YOU are the one who'll decide where to go..." (Dr. Seuss, 1990) Web-based technologies have removed the barriers of time, cost and location from the learning activities and experiential learning opportunities available to students. Using the tools available on the web and a dose of creativity faculty can design innovative and engaging learning opportunities for their students. Grounded in a constructivist pedagogy this presentation will outline the process of moving beyond discussion board, papers and quizzes to make an online course become an active and engaging learning activity. Examples of virtual field trips, scavenger hunts, conversations with historical figures or leaders, cultural exchanges and other learning activities that facilitate student learning from real world places, people and artifacts will be shared. Having students explore beyond the walls of the classroom, brings a real-world perspective to concepts discussed in course text-books as well as provides a national and global perspective to the material being studied. In addition, learners often find tools and resources that are useful in their academic studies as well as in their current or future professional practice.

## E 12 - Promoting the RN to BSN Transition

### Closing the Leadership Gap: Mentoring the RN to BSN Student for Success

---

*Jill Borgos, PhD, MS, RN, USA*

*Deborah Hodge, MS, USA*

*Anne Sweet, MS, USA*

#### Purpose

The purpose of this presentation is to present findings from a study examining the relationship between how the demand for leadership in the labor market is influencing motivational patterns of associate degree prepared registered nurses returning to complete their BSN. The presentation also examines mentoring for opportunities in leadership growth.

#### Target Audience

The target audience for the presentation includes nursing educational leaders, faculty, or any healthcare professionals who are interested in paving the path for closing the leadership gap in nursing.

#### Abstract

**Purpose/Specific Aim:** The primary purpose of this study was to examine how the “ Campaign for Action” for advancing nursing leadership is unfolding in the labor market for the approximately 60 percent of the Registered Nurses graduating and practicing in the United States who hold 2 year degrees (Benner et al., 2010). Associate degree nursing graduates often received minimal if any leadership education throughout their curriculum despite the demands of the labor market for increasing nursing leadership (Robert Wood Johnson Foundation (RWJF), 2014, Blais & Hayes, 2010, Yoder-Wise, 2015, Grossman & Valiga, 2009). The specific aim of the study was to identify if and in what ways there is an association between students enrolling in a RN to BSN program and the increasing demand for leadership skills in the labor market. Additionally, the study sought to identify the ways in which college faculty and advisors could provide better educational course content and clinical experiences for RN to BSN students seeking growth in the area of leadership.

The nursing literature, prominent nursing organizations, and government agencies have acknowledged the critically important need to infuse leadership education and practice into nursing to improve patient outcomes (RWJF, 2014, Blais & Hayes, 2010, Yoder-Wise, 2015, Grossman & Valiga, 2009, Institute of Medicine, 2003). More specifically, since the release of Keeping Patients Safe: Transforming the Work Environment of Nurses (Institute of Medicine, 2003) and Educating Nurses: A Call for Radical Transformation, (Benner et al., 2010), the discourse on leadership has become increasingly ubiquitous in the nursing literature. Both of these influential publications suggest a strong association between quality and safety and nursing leadership. The Robert Wood Johnson Foundation (RWJF, 2014) reported that in a systematic review of the nursing literature in 2013 on the association between leadership and quality and safety, transformational leadership in particular is associated with “higher patient satisfaction and lower rates of select adverse events such as patient mortality, medication errors, and hospital acquired infections.” A number of nursing organizations such as the American Nurses Association, American Association of Nurse Executives, and Sigma Theta Tau International have issued policy briefs about the importance of advancing nursing leadership. Other organizations vested in advancing nursing leadership to improve quality and safety include the Agency for Health Care Improvement, the American Nurse Credentialing Center, and the National Quality Forum (RWJF, 2014). Recognizing the importance of advancing leadership, Sigma Theta Tau International recently held a national conference in the fall of 2014 titled “Leadership Connection” featuring a plenary session on Models of Leadership along with a vast array of other sessions emphasizing the importance of leadership both nationally and globally. The mounting evidence suggests that there is a leadership gap and that increasing the number of nurses with leadership education and training is a necessary component to improving safety and quality of care. Given that approximately half of the practicing RNs, those holding associate’s degrees, have had little to no exposure to leadership course content or leadership experience during their 2 year degrees,

RN to BSN degree programs can potentially help close the leadership gap by offering both course content and clinical experiences enriched with leadership opportunities.

**Methods:** In this qualitative study, a phenomenological approach using structural coding and analysis techniques in Atlas. Ti., was utilized (Friese, 2012, Marshall & Rossman, 2011, Saldana, 2009). Approval of the State University of New York, Empire State College Institutional Review Board was obtained to examine n=264 essays written by RN to BSN students describing their rationale for seeking a BSN degree. The study was conducted at a single site large public university in the northeast offering an exclusively online RN to BSN degree. Once admitted, all students in the RN to BSN program, as part of their educational planning process, are required to write an essay explaining their rationale for seeking a bachelor's degree as well as outlining their future career goals and courses they would like to take in the program outside of the prescribed degree requirements. De-identifying techniques were used to protect the authors' of the essays. The essays were randomly selected from a larger cohort of n= 942 RN to BSN students admitted during the years of 2008-2013. Additional coding and analysis of the data included demographic information and number of years since completion of their associate's degree. Structural coding of student rationale essays in Atlas. Ti., enabled the examination of the motivational patterns driving associate degree prepared RNs back to higher education to pursue their bachelor's degree (Friese, 2012, Marshall & Rossman, 2011, Saldana, 2009).

**Results:** Findings suggest that due to a shift in the demand for nurses with leadership skills in the labor market, a number of RN to BSN students are returning to complete their degrees for the sole purpose of obtaining skills and knowledge in the area of leadership to further advance their careers. Of the n=254 student essays coded in Atlas. ti., n=90 or 35.4% of the student essays revealed that the purpose of returning to complete the RN to BSN degree was to obtain leadership skills. Students frequently stated that they were unable to advance in the areas of clinical ladders, into acute care settings, nurse educator, or administrative type positions since they did not have the requisite BSN degree. In order to gain the qualifications necessary for leadership or promotional opportunities in these areas, students were seeking education and skills in leadership. Interestingly, the BSN degree was referenced repeatedly as the qualification providing the necessary leadership education and training required for advancement. A general finding among all of the essays is that the nurses did not realize until they were in the job market how limited their opportunity for career grow was having only obtained an associate's degree.

**Conclusion:** A significant proportion of RN to BSN students at a public university research site are pursuing a bachelor's degree in order to gain qualifications necessary to advance in positions requiring education and skills in leadership. Demands in the labor market for nurses with leadership at public and private organizations are increasingly recognizing the value of hiring nurses with leadership skills and in particular those with a bachelor's degree (RWJF, 2014). Consequently, the demand for leadership skills in the labor market is increasing a demand for additional higher education. Moving forward, these findings are significant for both faculty and academic advisors in terms of program evaluation to ensure that leadership growth and opportunities are meeting the needs of the RN to BSN student population. Education and skills training in leadership should be identified for students through course content, appropriate clinical placements, and connections to professional organizations. Ongoing assessment and evaluation of the specific leadership opportunities within RN to BSN programs should be highlighted and career advisement tailored to meet the needs of the adult RN to BSN student seeking leadership opportunities ( Sanberg, 2013, Canton & James, 2011, Johnson & Ridley, 2008) .

## E 12 - Promoting the RN to BSN Transition

### Partnership with a Community Hospital Nurse Residency Program: An Innovative Approach to Increase BSN Prepared RNs in a Rural Area

---

*Michelle H. Cheshire, EdD, MSN, BSN, RN, USA*

*Cassandra D. Ford, PhD, MSN, MBA, BSN, RN, FAHA, USA*

#### Purpose

The purpose of this presentation is to share the development, organization and implementation of an innovative partnership between a community hospital Nurse Residency Program and a RN to BSN academic program. This partnership is designed to increase the baccalaureate workforce in rural community hospitals.

#### Target Audience

The target audience for this presentation is nursing faculty and administration as well as hospital administrators who have a desire to increase the baccalaureate workforce in hospitals.

#### Abstract

Newly graduated nurses have greater responsibility for patient care at an earlier stage in their careers than ever before. The acuity level in both urban and rural hospitals has increased dramatically in the past 10 years. The National Council of State Boards of Nursing (2007) found that organizations perceive newly licensed registered nurses (RNs) are deficient in areas such as identifying abnormalities during physical assessment, responding to emergencies and supervising care provided by other personnel. The UHC/AACN Nurse Residency Program (NRP) was developed, by representatives of the nation's leading academic medical centers and their affiliated schools of nursing, as a one year post-baccalaureate program designed to ease the transition to practice for new graduate nurses. The NRP is built on an evidence based curriculum and uses both learning and work experiences to support graduate nurses as they transition in their first year of professional practice. Strengths of the UHC/AACN NRP include group support for the new graduates, practical application of nursing concepts through expanded discussion, enhancement of critical thinking skills and in-depth development of leadership skills. The program is designed to increase job satisfaction and reinforce residents' commitment to the nursing profession. Arguably all new RN graduates, regardless of their educational preparation, can benefit from the strengths and purpose of this NRP. Fortunately, the developers of the NRP understood that the reality of today's nursing workforce makes it impossible for many rural/community hospitals to hire only BSN graduates. For community hospitals, who offer the UHC/AACN NRP to new hires with ADN preparation, assistance is provided to tailor the curriculum to support their transition into professional roles.

This College of Nursing is one of a limited number of academic partners of the UHC/AACN NRP that is partnered with a community hospital rather than an academic medical center. When the community hospital implemented the NRP in 2012 it was only offered to BSN prepared new hires. Because the community hospital has only 30% BSN prepared new hires it was not impacting the majority of newly employed RNs. There was an outpouring of interest from associate degree new hires to have the opportunity to participate in a residency program. After two cohorts of BSN prepared nurse residents had completed the one year program the hospital administration decided to open the program to all new hires, regardless of their educational preparation. As a result, in the first cohort where associate degree nurses were eligible to apply, 41 of the 49 residents were prepared at the associate degree level. Now, not only was the community hospital providing the residency program for the newly hired BSN prepared graduates of the College, but the door was opened for a partnership with the College's RN to BSN track.

The addition of ADN prepared new hires in the community hospital's NRP provided a wonderful opportunity to embark on an innovative partnership that would address the 2010 Institute of Medicine's The Future of Nursing: Leading Change, Advancing Health report goal to increase the percentage of nurses holding the BSN degree or higher to 80 percent by 2020. Representatives from the academic partner's RN to BSN program and the hospital's NRP met to begin the development of an official

partnership that would offer associate degree nurses, who were enrolled in the residency program, incentives to continue their education to obtain their BSN. The objectives from RN to BSN curriculum and the objectives of the Residency Program were reviewed and aligned in order to offer students who successfully complete the one year Nurse Residency Program credit for course assignments/requirements if they enroll in the RN to BSN track at the College of Nursing.

## E 12 - Promoting the RN to BSN Transition

### The RN to BSN Transition: A Qualitative Systematic Review

---

Allison B. Anbari, RN, USA

#### Purpose

The purpose of this presentation is to discuss the results of a qualitative systematic review conducted to develop a model of registered nurses returning to school for a Bachelor's degree in nursing.

#### Target Audience

The target audience of this presentation is nursing education leaders and faculty who facilitate RN to BSN transition programs.

#### Abstract

**Background and Significance:** Despite ongoing recommendations from leading healthcare and nursing organizations that propose entry to nursing practice should be at the bachelor's degree level, approximately 60 percent of newly licensed registered nurses still enter practice with an associate's degree or diploma in nursing. Due to current recommendations, there has been a rapid growth in the number of associate's degree to bachelor's in nursing programs (RN to BSN programs). There are now more than 600 RN to BSN programs in the United States. Concurrently, much is written about the need for a seamless transition of associate degree and diploma nurses (ADNs) to bachelor's prepared nurses (BSNs).

The purpose of this qualitative systematic review (QSR) was to understand more about what occurs when an ADN returns to school for a BSN and to develop a model of what a seamless transition of ADN to BSN might look like. To date, a model describing the phenomenon of ADNs returning to school for a BSN degree does not exist. The questions that guided the QSR were: What must happen for a nurse to return to school for a BSN degree? What occurs while attending a RN to BSN program? What outcomes of the additional education, if any, to nurses identify? If outcomes are identified, what are contributing factors?

**Method:** This QSR was guided by approaches suggested by Finfgeld-Connett, a leading nurse researcher and pioneer of the QSR method. By definition, QSRs concentrate on generating results that are generalizable and transferable to nursing practice and policy.

Articles and unpublished dissertations using qualitative or mixed methods that were conducted in the United States and met the inclusion criteria were reviewed. The findings of six dissertations and 13 articles were included in this QSR which translates to approximately 445 practicing nurses' perspectives on the ADN to BSN transition. Using content analysis and reflective memoing, the findings of these 19 studies were synthesized into a model of the phenomenon of an ADN returning to school and transitioning to a BSN.

**Results:** Motivation, time, the chosen program, and finances must be coordinated and aligned before an ADN considers enrolling in an RN to BSN program. ADNs are faced with ongoing challenges that follow them as they make the decision to return to school, as well as during progression through the program. Throughout the decision making process and during coursework, ADNs require support. RN to BSN students work to achieve balance as they navigate through school. Institutions of higher learning and the nurses' workplaces provide inconsistent support and often present challenges. Despite adversity, ADNs still make a noticeable transition. RN to BSN students and graduates identify the benefit of online instruction and key courses, which motivate them and make the value of a BSN more relevant. Positive outcomes of obtaining a BSN include benefits to the nurses' personal and professional lives as well as to their nursing practice. A visual representation of the RN to BSN transition was generated.

**Implications:** A seamless transition of the ADN to a bachelor's prepared nurse does not exist at this time. The results of this QSR and corresponding model are useful to nurses, academicians, and healthcare organizations as they move to meet current recommendations.

## E 13 - Global Leadership Perspectives

### Sacred Valley Health: A Global Organization with a Local Impact

---

*Keri Lynn Baker, BSN, MSc, RN, USA*  
*Lynne M Massaro, DNP, RN, ANP-BC, FNP, USA*  
*Maria C. LaFaro, DNP, RN, ANP-BC, USA*

#### Purpose

The purpose of this presentation is to critically reflect upon components that contribute to the sustainability of international health education programs and to recognize the potential benefits of interdisciplinary and interagency partnerships between international health education programs, universities, and professional associations.

#### Target Audience

The target audience of this presentation are faculty and administration in nursing education, global health organizations, and members of professional associations seeking international partnerships.

#### Abstract

Sacred Valley Health (SVH) is a US 501 c3 nonprofit organization working in Ollantaytambo, Peru. The mission of SVH is to promote health in the underserved, rural communities of Peru's Sacred Valley through increased access, education, and community empowerment. The primary focus of the organization is to train promotoras de salud (community health workers). The promotoras serve as healthcare providers and educators in their communities. Evidence demonstrates community health workers increase access to health and improve health outcomes (Lewin et al., 2006). SVH trained promotoras have: (1) facilitated access to care for more than 2,200 community members, (2) provided treatment to 627 individuals, and (3) presented more than 70 health education sessions. With an emphasis on sustainability, SVH launched the Docente program (Train the trainer) in 2014. Promotoras attended a three-week program based in adult learning theory and the Transtheoretical Model, Stages of Change (Prochaska et al., 2002), providing leadership education and teaching techniques. Five female promotoras were selected to become Docentes, who will train the next generation of promotoras. It is anticipated that this will continue to increase access to health services, improve health outcomes, and contribute to the empowerment and economic well being of the families and communities.

The work of SVH is not limited to Peru's Sacred Valley, as the organization has collaborated with nursing, medical, and public health programs in the US in order to provide students with service opportunities. Research has demonstrated global health experiences have a lasting positive impact on students (Smith & Curry, 2011) and are enhanced when partnered with sustainable organizations. (Powell, Gilliss, Hewitt, & Flint, 2010). More than 17 trips have been facilitated in the past three years; students and faculty have strengthened the impact of SVH. In 2014, health campaigns provided education regarding personal and oral hygiene, sexual and reproductive health, and nutrition to 579 children and 312 adults. In addition, these immersion experiences have exposed and shaped the careers of future American health professionals. Student's qualitative evaluation feedback themes that have emerged include: (1) an appreciation of the global perspective of health care, (2) improved understanding of preventative services and education (3) enhanced cultural knowledge and competence, and (4) a desire for continued service opportunities.

In 2014, University of Rochester's Sigma Theta Tau chapter partnered with SVH to provide donations of toothpaste and toothbrushes. These donations were provided to schools in the promotoras' communities in conjunction with health campaigns. This partnership between SVH and this particular Sigma Theta Tau chapter has immense possibility to grow and continue to foster interdisciplinary collaboration, global experience, individual professional development, and minimize attrition of chapter members.

## E 13 - Global Leadership Perspectives

### The Clinical Research Nurse: A Global Perspective on Role, Value and Leadership

---

*Margaret A. McCabe, PhD, RN, PNP, USA*

*Liza Behrens, RN, MSN, USA*

*Shaunagh Marie Browning, BSN, RN, MSN, FNP-BC, USA*

*Mary Jane Williams, DNP, MPH, RN, NE-BC, USA*

*Judith A. Vessey, PhD, MBA, RN, FAAN, USA*

*Stephanie-An Lyle, BS, USA*

#### Purpose

This presentation will provide (1) a definition of the specialty practice of Clinical Research Nurse (CRN), (2) a discussion of role (global perspective), (3) focus group study findings describing CRN's perception of the value of their practice and (4) a discussion of strategic initiatives for advancement of the role globally.

#### Target Audience

The target audience of this presentation is any nurse clinician or academic who is not familiar with the specialty practice of the CRN.

#### Abstract

Clinical research nursing is “the specialized practice of professional nursing focused on maintaining equilibrium between care of the research participant and fidelity to the research protocol.” (International Association of Clinical Research Nurses (IACRN), 2012). Description of nurse involvement in clinical research is present in the literature, however, not until the last two decades has significant progress been made in role description and awareness of the specialty practice of the CRN (Fedor, 2009; Watmough, Flynn, & Wright, 2010; Nagel, Gender, & Bonner, 2010). Clinical research nursing is an emerging specialty within the nursing field that has gained attention internationally for its contributions to the safe and ethical care of patients and the accurate, efficient collection of quality clinical research data (Ledger, Pulfrey, & Luke, 2008; Poston & Buescher, 2010; Spilsbury et al., 2008).

The role of the CRN is gaining increased importance globally in light of clinical and translational science becoming a global priority. The CRN is able to focus beyond the research related tasks to continually balance the needs of the participant with that of the protocol (Hastings et al. 2012) thus assuming a leadership role in advancing novel therapeutics and quality patient outcomes.

The specialty of clinical research nursing incorporates 5 domains of practice, (1) human subject protection; (2) care coordination and continuity; (3) contribution to clinical science; (4) clinical practice; and (5) study management throughout a variety of professional roles, practice settings, and clinical specialties (US Department of health and Human Services, 2009). The value of the contributions that CRNs make to the research enterprise within these domains of specialty practice is not well articulated, therefore in order to move the specialty practice of clinical research nursing forward it is essential that CRNs begin to describe first qualitatively and then quantitatively the value they bring to the domains of the specialty practice and the leadership roles they assume. Mueller 2001, goes one step further and suggests that CRNs need to “empirically demonstrate that the skills and knowledge they bring to clinical research as nurses are qualitatively and quantitatively different, and therefore more beneficial, than those provided by other occupational groups”.

In an effort to begin to clearly articulate the contributions of the CRN to the clinical research enterprise important findings from a recent focus group study of CRNs will be presented and discussed. To add further insight, perspectives from international CRNs will be presented. CRNs are valued members of interprofessional teams practicing globally in culturally diverse settings, all guided by Good Clinical Practice guidelines and sharing the common goals of patient safety and advocacy, quality data collection and protocol fidelity. As CRN specialty practice advances contributions to establishing global standards for CRN practice will be vital. Educational forums are being held globally to educate nurses and other

clinical research professionals in an effort to improve the care of the research subject and improve the integrity of clinical research.

The purpose of this presentation is to provide the learner with (1) a definition of the specialty practice of the Clinical Research Nurse (CRN), (2) a discussion of the role of the CRN, including a global perspective, (3) a presentation of the findings from a recent focus group study describing CRN's perception of the value of their practice on the care of patients enrolled in clinical research and implementation of clinical research and (4) a discussion of strategic initiatives for advancement of the role globally.

## F 10 - How Theory Can Guide Education and Practice

### Effectiveness of Integrating Test-Enhanced Learning into a BSN Foundations of Nursing Class: A Pilot Project

---

*Greta I. Marek, DNP, MSN, BSN, RN, CNE, USA*  
*Laura Dower, MSN, ADN, RN, FNP, CNE, USA*

#### Purpose

The purpose of this presentation is to present the effectiveness of test-enhanced learning as an effective teaching/learning strategy for baccalaureate nursing students.

#### Target Audience

The target audience of this presentation is nurse educators.

#### Abstract

The purpose of this study was to evaluate the effectiveness of a pilot project designed to assist student learning by incorporating weekly post-lecture quizzes intended to increase the spacing time of studying. Numerous studies have reported the positive effect that test-enhanced learning (TEL) has on the long-term retention of information, or what is known as the testing effect, and that it is an effective teaching/learning strategy. We hypothesized that weekly quizzes would increase the frequency and time that a student spent studying lecture material and that the result would be better long-term retention of information and increased grades. Using a pretest-posttest study design, we used three retrospective sets of data from second semester baccalaureate nursing students for fall 2013 (n = 75) and spring 2014 (n = 105). Data gathered included: the Assessment Technologies Institute (ATI) Registered Nurse Content Mastery Exam for Fundamentals; the number of students with a grade of <75 prior to the final exam; and the number of students that failed the course. Standard teaching/learning strategies were used fall 2013 (pretest group), while TEL was implemented in spring 2014 (posttest group). For the pretest group's ATI scores, there were 6 (6%) Level 3, 61 (58%) Level 2, 13 (17%) Level 1, and 1 (<1%) below Level 1. For the posttest group's ATI scores, there were 18 (23%) Level 3, 46 (59%) Level 2, 13 (17%) Level 1, and no students below Level 1. There were 52 (50%) students with a grade <75 before the final exam in the pretest group, and 6 (8%) students in the posttest group. A total of 6 (6%) students failed the course in the pretest group, compared to 5 (6%) in the posttest group. The findings indicate that TEL is an effective teaching/learning strategy that had a positive impact on the retention of course material. Limitations include that the study was not randomized, used a small sample size, was conducted at a single institution, and in a single course. Additional research is needed to determine the effectiveness of TEL in other settings and courses.

## F 10 - How Theory Can Guide Education and Practice

### Applicability of Social Cognitive Career Theory for Future Nursing Faculty Workforce Recruiting

---

*Diana K. Bond, PhD, MS, BSN, RN-BC, CNE, USA*

#### Purpose

to report the applicability of the constructs within Social Cognitive Career Theory as a robust theory to examine career choice intent in future studies of nursing students.

#### Target Audience

nursing program administrators, nursing faculty and other nurses and managers

#### Abstract

This session reports on the usability of the Social Cognitive Career Theory (SCCT) to explore intent for a future nursing faculty position by pre-licensure baccalaureate nursing students. Despite the impending nursing faculty shortage, little theory based research has been conducted about how nursing students may be attracted to or dissuaded from a future nursing faculty role. SCCT was chosen for the study because this middle range theory has been used in more than 50 studies to explore college students' career choices and found to be predictive. Theory derivation was used to apply SCCT to the study. The derived theory propositions were: intent for a future nursing faculty role (career choice goal) is related to self-efficacy, outcome expectations, learning experiences, and interests in the activities of a faculty role; learning experiences include teaching experiences such as peer teaching, peer tutoring or other experiences and receiving role modeling and encouragement from a nursing faculty member will lead to increased interests, self-efficacy, outcome expectations and a career choice goal for a future nursing faculty role; and self-efficacy, outcome expectations and interest in the activities of a faculty role relate to a career choice goal for a future nursing faculty role. The theory propositions led to the creation of a conceptual model of the SCCT constructs for career choice for a future nursing faculty role that included: 1) person inputs (gender, age, race/ethnicity); 2) distal background variables (parent education and occupation); 3) proximal background variables (type of nursing program, educational level, educational background); 4) supports and barriers; 5) self-efficacy for a faculty role; 6) learning experiences (previous teaching experience, observing a faculty role model and receiving encouragement); 7) interests in the activities/tasks of a faculty role; 8) outcome expectations (advantages and disadvantages of a faculty role); and, finally, 9) the outcome variable, career choice or intent for a future faculty role.

The research questions were:

- 1) What is the reliability of the multiple item measures of the SCCT constructs for those intending and those not intending to pursue a future nursing faculty role?
- 2) How well do the SCCT constructs predict intention to pursue a future nursing faculty role?

A prospective correlational research design using a national convenience sample of 1,078 pre-licensure baccalaureate nursing students who responded to an online survey was used to answer the research questions. This survey included the variables of location of nursing program, gender, age, race/ethnicity, parents' education and occupation, type of nursing program, semesters/quarters of clinical nursing education, other degrees or education, supports/barriers to pursue a faculty role, self-efficacy to become a faculty member, types and positivity of previous teaching experiences, nursing faculty role modeling and encouragement to pursue a future faculty role, outcome expectations (advantages and disadvantages) of a future faculty role, and interests in the activities/tasks of a faculty role. For the outcome variable, students were asked to strongly disagree, disagree, unsure, agree or strongly agree with the statement "In the future, I intend to pursue a nursing faculty role." Almost 25% of the sample agreed or strongly agreed with the statement.

The students were divided into two groups to answer the research questions, those who agreed or strongly agreed with the statement became the high intent students and those who disagreed, strongly

disagreed or were unsure became the low/unsure intent students. Cronbach alphas demonstrated good reliability, ranging from .78-.89 with the exception of barriers, which had a Cronbach alpha of .61 for high intent students and .62 for low/unsure intent students.

To compare the differences between the high intent students and the low/unsure intent students, Chi-square statistical tests were used for analyzing the categorical variables and independent-samples-t-tests were used for the continuous variables. All statistical analyses were performed using Statistical Package for the Social Sciences (SPSS) version 18. Preliminary analyses were conducted to ensure there was no multicollinearity among the predictor variables and that all levels of the binary categorical predictor variables had sufficient counts. Eleven predictor variables (age, type of nursing program, supports, barriers, self-efficacy for a faculty role, teaching experience, faculty role modeling, encouragement for pursuit of a faculty role, outcome expectations-advantages, outcome expectations-disadvantages and interests in the activities/tasks of a faculty member) were individually statistically significant and were inputted into the logistic regression model. The full statistical model containing all 11 predictors was statistically significant, [ $\chi^2 (11, N = 1,078) = 300.94, p < .001$ ], indicating that the model was able to distinguish between the high intent students and the low/unsure intent students. The Hosmer and Lemeshow Goodness of Fit Test was non-significant, ( $\chi^2 (8) = 6.76, p = .56$ ), indicating good fit of the model. The model as a whole explained between 24.4% (Cox and Snell R square) and 36.2% (Nagelkerke R square) of the variance in the students' intention status for pursuit of a future nursing faculty role.

While all 11 predictor variables were individually statistically significant, six made a statistically significant contribution to the logistic regression model [interest in the activities/tasks of a faculty role (OR = 2.4), type of nursing program (OR = 2.1), outcome expectations-advantages (OR = 1.9), previous teaching experience (OR = 1.7), encouragement to pursue a faculty role (OR = 1.5), and outcome expectations-disadvantages (OR = 0.8)]. Variables that were not statistically significant in the logistic regression model were age, supports, barriers, self-efficacy for a faculty role, and role modeling.

SCCT provided a comprehensive approach to investigate career intent and is recommended to be a robust theory to examine career choice intent in future studies of nursing students.

## F 10 - How Theory Can Guide Education and Practice

### Case-Based Nursing Peer Review Using Just Culture Principles

---

*Kathleen Jochem, MS, RN, ACNS-BC, USA*

*Connie Ann Scott, MS, RN, NEA-BC, USA*

*Cheryl Lynn Stuckman, BSN, RN, USA*

#### Purpose

The purpose of this presentation is to discuss the process and outcomes of implementing case based nursing peer review in a rural mid-western hospital.

#### Target Audience

The target audience for this presentation is clinical and administrative staff interested in promoting nurses professional development and improving outcomes through case based peer review.

#### Abstract

Although more than twenty five years have passed since the American Nurses Association published the 1988 Peer Review Guidelines and defined nursing peer review as “the process by which practicing registered nurses systematically assess, monitor, and make judgments about the quality of nursing care provided by peers as measured against professional standards of practice” nurses have not fully integrated this into practice. Our Professional Practice Council recognized the need to develop a formal nursing case review process to supplement peer review feedback occurring informally and annually as part of performance review. A core group was formed to search relevant literature, seek hospital risk management and legal counsel input and develop a policy to guide a nursing case review process. Just Culture principles were explored and used as the basis for the development of our non-punitive process. Informational sessions educated staff about the process and expectations of nursing case review committee participants. The Chief Nursing Officer appointed the committee taking into account staff interest and director recommendations. The majority of the committee members are clinical nurses representing the various units of the hospital. Ad hoc members from specific nursing units and other disciplines are invited to the case review as needed. The importance of confidentiality is emphasized, with all staff participating in a case review signing a confidentiality agreement. Case referrals are made by clinical nurses, nursing leadership, medical peer review, performance improvement and risk management. Cases determined to be appropriate are presented to the nursing case review committee by a Clinical Nurse Specialist or the Professional Practice Manager. Nurses involved in a case are invited to voluntarily participate in the process, if possible or may be individually interviewed prior to the case discussion. A case review template is used and action plans are determined at the conclusion of the review. As a result of participating in this process, nurses’ experience increased professional accountability by identifying the need to make practice changes. Since implementation two years ago cases reviewed have supported need for the following process changes: method of implementing of venous thromboembolism prevention measures, medical surgical sepsis screening, screening of surgical patients for opioid tolerance, Magnetic Resonance Imaging prescreen process and direct admission process. Some of the educational needs identified and addressed included the medication reconciliation process, deep tissue injury identification and bowel management regimens.

# F 11 - Building Relationships to Develop Future Leaders

## Developing Future Leaders: The L.O.V.E. Approach

---

*Kathy S. Holloway, DNP, MSN, MA, BSN, RN, CNE, USA*

### Purpose

The purpose of this presentation is to inform nurse leaders, executives, and faculty about the constructs of the L.O.V.E. Approach and provide encouragement and examples of how they can follow this model as they mentor, educate, and develop future leaders in the nursing profession.

### Target Audience

The target audience for this presentation will be registered nurses who are in leadership positions, executive positions, and nurse educators.

### Abstract

Nursing education and leadership must rapidly change as healthcare organizations are reorganizing into detailed 21<sup>st</sup> century multi-faceted systems to provide care for complex conditions. If nurse leaders and nursing faculty incorporate the L.O.V.E. approach into their daily interactions with registered nurses (RNs), and nursing students, both will benefit as will the patients that they care for and the staff that they lead and collaborate with .

Using the L.O.V.E. approach teaches and models professionalism, leadership, civility, ethics, and caring, which should be the framework of professional nursing at its best, especially in these current times when quality of care and services drives healthcare organizations. Nursing organizations and educational programs are emphasizing and exposing nurses and students to many different evidence-based tools to help improve and maintain quality in nursing practice. Nurse leaders and educational faculty need to be role models by providing high quality engagement in the healthcare and educational environment. In a study by Ma, Li, Zhu et al., (2013), three themes were identified that support this approach and relate to facilitation. They involved promoting a sense of professional responsibility and ethics, providing a place in which to practice caring, and learning from positive role models. Further, the Greater Washington Area Chapter (GWAC) of the American Association of Critical-Care Nurses supports chapter succession planning through the development of community and collegiality as a way to identify and mentor future leaders (Hughes, Belkoski, & McNeil-Jones, 2012). The L.O.V.E. Approach supports their succession planning model.

Description of the Approach: The L.O.V.E. acronym stands for the following: legitimize, optimize, validate and empower.

- **Legitimize** their education by creating a social presence that is sincere and authentic, and by setting appropriate benchmarks for the busy working RN and RN student.
- **Optimize** their work environment and, or education by building on their current knowledge and providing opportunities for personal and professional growth that are most advantageous to each nurse or student related to their learning styles, current, and long-term professional goals and leadership succession planning.
- **Validate** their current level of nursing practice expertise and previous education by using it as a framework for practice application and service learning/civic engagement opportunities that stimulate critical thinking and clinical judgment.
- **Empower** them to be leaders in the profession through knowledge attainment, and by being a professional role model of high ethical and moral comportment that is active in professional nursing organizations.

Through the practice of this affective teaching and learning model, personalized support and recognition which may foster cognitive empowerment and allow full engagement in the process of leadership development and learning may be obtained. As nurses are empowered to grow as professional leaders

and students are motivated to perform in academia, likewise, they will be able to motivate and lead others round them in a collaborative manner to provide high quality, evidence-based patient care.

## F 11 - Building Relationships to Develop Future Leaders

### Leadership: Based on Relationships

---

*Michele Rumsey, RN, FACN, Australia*

#### Purpose

The purpose of this presentation is to articulate, through example, the vital role of building relationships between mentors and colleagues when developing leaders in any context, but importantly in lower middle income countries (LMIC). Relationships that span over time and within and beyond country borders.

#### Target Audience

The target audience are practitioners who work in, or with health workers in, LMIC. Also practitioners who are interested in leadership development.

#### Abstract

As secretariat to the **South Pacific Chief Nursing and Midwifery Officers Alliance (SPCNMOA), the World Health Organization Collaborating Centre for Nursing, Midwifery and Health Development at University of Technology Sydney (WHO CC UTS)** works in close partnership to support leaders in nursing and midwifery, directly assisting the governments in 14 South Pacific Island Nations. This partnership has been in place since 2004, when at the first SPCNMOA meeting a request was made to UTS Faculty of Health to take the lead on establishing a WHO Collaborating Centre for the region. As secretariat, the WHO CC UTS is the bridge to provide national, regional and global policy to strengthen health systems for our sometimes isolated colleagues in the Pacific.

To strengthen the partnership and create practical and positive health system strengthening outcomes for the South Pacific Island Nations the WHO CC UTS engages with SPCNMOA not only through constant communication but activities that have a direct impact. A leadership program has been developed and funded by the Australian Department of Foreign Affairs which has, so far, been implemented annually since 2009.

As 105 emerging 'leaders' from the Pacific have now participated in this program we have continually reviewed the program with the SPCNMOA to focus on leadership as a process which includes interpersonal relationships (between leaders and colleagues) and also reinforcing that leadership is not about individuals but about collectives. From this perspective, leadership development does not ask "How do we make better leaders?" but instead "How do we improve leadership in the system?" (Edmonstone, 2011). The success of this program has been documented through many past participants enacting changes in their countries and some becoming chief nurses. Many lessons have been learned that we would like to share with others interested in healthcare leadership models, particularly in developing countries.

In brief, the successful leadership program consists of a **Country team** of potential leaders in nursing and midwifery mentored by the **Chief Nursing /Midwifery Officer** in the Ministry of Health of their country. The teams, in collaboration with key stakeholders recognise a problem and devise an Action Plan to help solve it. A **Reference group** overseas the teams through constant communication, this not only ensures the program is running the way our partners want it to, but enables them to meet in a trusting environment to share problems with Action Plan development and progress.

The skills they have gained has enabled them to strategically plan with key stakeholders, such as Ministries of Finance and Ministries of Health, projects in their countries which are still ongoing and having beneficial impacts today.

The keys to this partnership's success have been clear and are outlined here:

**Trusting relationships** – This is the foundation of how any work done in partnership succeeds. This idea often seems to get lost in the struggle to find funding and the need for measurable outcomes.

**True country ownership** – The **health system strengthening initiatives** that seem obvious aren't actually context driven. So in true country ownership, and by working in their context, some of the **projects need to fail so they can learn and rebuild in their own way to succeed the next time.**

**Being there for the long haul** – we've had a relationship with the SPCNMOA since 2004. Because of our long standing relationship, we understand the issues facing our colleagues and can support ongoing issues connected with project development.

Without the trusting, open and equal partnership built between WHO CC UTS and SPCNMOA this model for enhancing leadership in nursing and midwifery in the South Pacific would not have had the impact on health systems that it has had. We believe a strong relationship is built on trust, allows true country ownership and grows and strengthens over time. The worrying trend in reduction of development dollars means increased pressure for efficiency and a decrease in 'soft' development projects such as these that deal with organisational change. There is a need to apply rigorous research methods to look at the success factors of such a leadership program to provide evidence to funding bodies.

## F 11 - Building Relationships to Develop Future Leaders

### Transforming the Chapter through Servant Leadership

---

*Jennifer Saylor, PhD, RN, APRN-BC, USA*

*Jennifer Graber, EdD, MSN, BSN, APRN, CS, BC, USA*

#### Purpose

The purpose of this presentation is to exemplify avenues to cultivate future and current leaders. This ensures sustainability through mentoring, leadership, enriching knowledge and research, promoting success, and servilization. These initiatives provide an opportunity to expand leadership and research skills, cultivate relationships with mentors, and develop a lasting commitment.

#### Target Audience

The target audience of this presentation is all members of Sigma Theta Tau International from new members to retirees and across all areas of nursing. All members will become engaged in the chapter and new inductees will benefit from current leaders to develop an avenue that effectively addresses leadership challenges.

#### Abstract

Our STTI chapter is dedicated to selfless mentoring and investing in new nurses and new members by engaging in leadership, knowledge and research related activities. Our chapter members cultivate future leaders and ensure an active sustainable chapter through informal and formal mentoring. Mentoring fosters professional and personnel growth and development, which is an essential component to shaping nurse leaders. In the developing evidence based practice healthcare environment there is a growing need for “well prepared and motivated patient care leaders” (Benjamin, Riskus, & Skalla, 2011, p. 156). To develop effective nurse leaders it is important to have mentoring relationships that foster professional goals and growth (Hadidi, Lindquist & Buckwater, 2013). It is essential to develop a good mentor relationship to help nurses be successful in the future. This can be done through a “mutual investment of time, engagement, energy, personal support, and encouragement” (Hadidi, Lindquist, & Buckwater, 201, p. 162).

A review of the literature shows that leadership succession planning is imperative in all areas of nursing. Our chapter is able to reach nursing students in an effort to increase potential nurse leaders within the profession. It is imperative that today’s nurses prepare for the “next generation of nurse leaders” (Crosby & Shields, 2010, p. 363). Leadership extends to all areas of nursing and we must have a plan in place to have our future nurses ready. There is currently a growing need for nurses in the work force. The Health Resources and Services Administration (HRSA) project that the nursing shortage will be over one million nurses by the year 2020 nationwide (HRSA, 2006). HRSA (2006) found that nursing jobs will increase by 26% from 2010 to 2020. Current nurse leaders are responsible for developing new leaders through being mentors and preceptors as well as being role models (Crosby & Shields, 2010). A survey conducted with nurse administrators, managers, staff nurses, and educators (n=85) found several facilitating conditions to developing nurse leaders including positive attitude, advocacy, administrative support, and experienced mentors (Crosby & Sheilds, 2010).

Succession planning has been an important aspect of the business world for years, but has only recently gained attention in the healthcare world. It is an essential strategy to help identify and prepare future nursing leaders (Carriere, Muise, Cummings, & Newburn-Cook, 2009). The researchers found that the key components of a successful succession plan included strategic planning, identifying skills, detecting candidates, mentors, and preceptors, resource allocation and evaluation (Carriere, Muise, Cummings, & Newburn-Cook, 2009). However, no best practices have emerged for healthcare.

Leadership planning can start early in nursing programs through membership in organizations such as STTI and student nursing associations (SNA). “Nurses join professional nursing associations to gain greater control of their professional future and develop greater awareness of nursing issues” (Lapidus-

Graham, 2012, p. 9). Transformational Leadership Theory is a valid framework to use when trying to develop future leaders through teamwork, mentoring, coaching, trust and caring behaviors (Bass & Riggio, 2006). Research has shown that students with positive mentors and role models in nursing school are more likely to become leaders in their career (Hoffman, Harris, & Rosenfeld, 2008). A study conducted with 15 nursing graduates who had been members of their SNA was conducted to determine their leadership development. The participants identified the following themes as helpful to their progression into leadership roles after graduation: communication, collaboration, dealing with conflict, mentoring and mutual support, empowerment, professionalism, teamwork, and accountability (Lapidus-Graham, 2012). "SNAs can become one vehicle for achieving nursing program outcomes" Lapidus-Graham, 2012, p. 10).

Succession planning helps fill key leadership roles as well as develop future nurse leaders (Shifflet & Moyer, 2010; Sherman & Pross, 2010). It is important for current leaders to not see succession planning as a threat, but as a positive way to develop future leaders (Benjamin, Riskus, & Skalla, 2011). Our chapter understands the importance of using a leadership succession program in an effort to increase new member participation and retention. Retaining active members is an ongoing struggle for many chapters across the globe. Our chapter developed a Leadership Intern Program as a formal mentoring process that is mutually beneficial to mentors, mentees, and the chapter. The Leadership Intern Program is monitored by our Leadership Succession Committee. Our chapter uses various mentoring modalities including face-to-face contact, emails, social networking, and telephone.

Every year, the board matches three to four interns with chapter board members. The interns provide much needed support to the chapter and in return, they receive financial support for NCLEX exam. The mentored projects have included social media, chapter history, educational outreach, and social event coordinator and social media, which was crucial in obtaining the "Circle Award". This program also provides members reduced rates for selected STTI/chapter conferences/programs, opportunity to network with nurse leaders, develop leadership skills and a servant leadership mentality, and as resume builder.

Of the many leadership intern positions over the years, three were offered most recently: Diversity in Nursing Initiatives Intern, Social Event Coordinator Intern, and Membership liaison Intern. The Diversity in Nursing Initiatives Intern focused on our outreach program, titled, "Kids into Health Care Career". This intern must possess presentation skills, enjoy working with teens and children, and be creative in working with diverse populations. The Social Event Coordinator intern, focuses on the spring dinner meeting and fundraising events. This intern must possess party planning skills, be highly organized, and creative in fostering fun and meaningful events. The Membership Liaison Intern is an integral person in reactivating new members and archiving all chapter events. This intern must possess strong social media skills, creativity in engaging others, a passion for archives and history of STTI at the chapter and international level.

Our chapter also engages graduate students/ nurse leaders in our Leadership Intern Program. Resumes, interviewing, and other career skills were sought by undergraduate students in the School of Nursing (SON). Therefore, we selected a graduate student Mentorship Intern to organize and conduct a program for seniors at the SON, many of whom are chapter members. This day-long drop-in program included such topics as resume writing, job search tips, preparing for interviews, getting the most from your preceptor, graduate school, working as a school or community nurse, and preparing for your first day on the job. The graduate mentor accessed our chapter nurses from the community to provide the topics and worked hard to create a positive experience for students. The day provided exposure to nurse leaders, other than faculty, and provided an informal way to network with nursing leaders and included snacks and lunch! The graduate intern receives financial compensation for academic expenses.

In recent years our chapter embarked on developing a tutoring program to increase knowledge of nursing students with a philosophy that nursing students should be mentoring, helping, and tutoring their fellow nursing students with supportive chapter members. The initial challenge was to determine student's needs. With the help of our intern, potential tutors were sought via e-mail. Time was spent discussing needs with students. Initially, a "tutoring list" was formulated so students could reference it in order to find the appropriate help. For easy accessible, the tutoring list was placed on the Student Nurses

Organization Website. Challenges identified included the need to have more consistency in the student organizing the tutoring system. Therefore, the Leader in Training position was created to help with this initiative.

Research mentoring within a STTI chapter promotes expansion of knowledge and cultivates future researchers. Members collaborate with the SON to participate in an undergraduate baccalaureate nursing research course, titled, "Research Concepts in Healthcare". This course transforms and ignites research through the application of the research process to health care practice. Students collaborate with research mentors, many from our chapter including faculty and clinicians, to conduct research. The students are able to work with chapter members in small group settings and receive leadership, research, and professional mentoring while completing their course requirements. Our chapter members and other course mentors are provided an opportunity to develop their own research expertise and expand their research programs. The opportunity ranges from bench research to bedside research and spans across all health professions. Depending on the research study and its stage in the process, students may collect data, analyze data, or interpret findings and develop future research questions. Dissemination of the research findings includes a poster presentation at a research symposium on campus and an abstract for submission to a regional research conference.

By developing a successful Leadership Intern Program, collaborating with the SON and the SNA, our chapter continues to cultivate leaders through mentoring while enriching knowledge and research, promoting success, and servilization. More importantly we have ensured sustainability through leadership interns who have fulfilled committee positions including leadership succession and social media, as well as webmaster and newsletter editor. These initiatives provide an opportunity to expand leadership and research skills, cultivate relationships with mentors, and develop a lasting commitment to STTI.

## F 12 - Issues Regarding Maternal-Child Health Around the World

### Effects of an Educational Intervention on Baccalaureate Nursing Students' Knowledge and Attitude in Providing Breastfeeding Support to Mothers

---

*Anjanetta Davis, EdD, MSN, RN, CNL, USA*

#### Purpose

The purpose of this presentation is to discuss the effect an evidence-based educational intervention had on baccalaureate nursing students' knowledge and attitude in regard to breastfeeding support provided for mothers.

#### Target Audience

The target audience of this presentation is nurse educators and nursing students

#### Abstract

Breastfeeding provides many health benefits for both mother and baby, and mothers need support and encouragement in order to have breastfeeding success. The breastfeeding support that mothers receive should come from communities, healthcare providers, and nursing students. However, researchers reported that nursing students are not receiving the educational preparation to provide breastfeeding support that mothers need. The lecture only approach to breastfeeding education is not enough to provide the students with the knowledge and skill needed to provide breastfeeding support. Because of the many benefits that an interaction with a standardized patient (SP) provides, and because the researcher did not find any studies that utilized SPs as a teaching strategy with breastfeeding education, the integration of an SP encounter as a teaching strategy was utilized for the purposes of this study.

The purpose of this presentation is to discuss the effect an evidence-based educational intervention had on baccalaureate nursing students' knowledge and attitude in regard to breastfeeding support provided for mothers.

Nurse educators and nursing students would benefit from the information provided in this presentation.

A randomized pretest-posttest design with a comparison group was used for this study. The educational intervention included an evidence-based breastfeeding lecture followed by a simulation role-play scenario with an SP for the experimental group and an educational breastfeeding video for the control group. The researcher utilized the Australian Breastfeeding Knowledge and Attitude Questionnaire (ABKAQ) to determine pretest and posttest breastfeeding knowledge and attitude scores of the nursing students.

Results revealed a statistically significant difference in pretest and posttest scores in regard to the students' breastfeeding knowledge and attitudes toward breastfeeding.

There was statistically significant evidence at the .05 level to indicate an improvement in the nursing students' breastfeeding knowledge and attitudes toward breastfeeding based on the pretest and posttest knowledge and attitude scores.

The evidence-based breastfeeding educational interventions improved nursing students' breastfeeding knowledge and attitudes toward breastfeeding. The results of this study are consistent with reports from other researchers in that an SP encounter as an educational strategy was beneficial in improving communication and critical thinking skills in students.

The interventions also helped to improve knowledge and skill the students need to provide breastfeeding support to mothers.

## F 12 - Issues Regarding Maternal-Child Health Around the World

### An Evaluation of Midwives for Haiti Programs: Can they Reduce Infant and Maternal Mortality in Haiti?

---

*Jacquelyne L. Brooks, DNP, MSN, BSN, ADN, RN, CNM, WHNP, USA*

#### Purpose

The purpose of this presentation is to describe the evaluation of the Midwives for Haiti programs and demonstrate the ability of the programs to reduce infant and maternal mortality in Haiti by increasing access to skilled maternity care.

#### Target Audience

The target audience of this presentation consists of those who desire a better understanding of maternity healthcare challenges and effective strategies to improve access to skilled maternity care in Haiti. The target audience includes healthcare providers, nursing educators, and those interested in global maternity health issues.

#### Abstract

The United Nations was commissioned to develop a plan to eliminate poverty and hunger and improve health around the globe, which was announced in 2005 as the Millennium Development Goals (United Nations Development Project, 2005). The use of skilled birth attendants (SBAs) in underserved areas was identified by the Millennium Development Goals as a necessary service to reduce maternal and infant mortality (United Nations Development Project, 2005; WHO, 2004). Because of the importance of providing skilled care during pregnancy and childbirth, many international organizations are working to close the competency gap among SBAs (Harvey et al., 2007; Kreyberg & Helsing, 2010).

Haiti has the highest maternal mortality rate in the Western hemisphere and ranks 34<sup>th</sup> amongst all nations for maternal deaths (Central Intelligence Agency, 2014; Ministry of Public Health and Population [MPHP], 2013). In 2010, the neonatal mortality rate was 31 per 1,000 live births in Haiti, compared with 6 per 1,000 live births in the United States (MPHP, 2013; You, Bastian, Wu, & Wardlaw, 2013). In 2012, the infant mortality rate was 59 per 1,000 live births, also the highest in the Western hemisphere (MPHP, 2013).

In response to the alarming maternal and infant mortality rates in Haiti, American certified nurse-midwife, Nadene Brunk, established Midwives for Haiti (MFH, 2014) in 2006. Midwives for Haiti is a non-profit organization with a home base in Richmond, VA and primary teaching site in Hinche, Haiti (MFH, 2014). The mission of MFH (2014) is to reduce maternal and infant mortality rates in Haiti by training Haitian nurses to be SBAs. From 2006-2013, MFH trained 73 SBAs who worked in 11 birth centers or clinics and three hospitals throughout Haiti (N. Brunk, personal communication, March 21, 2014). In 2013, the MFH SBAs attended approximately 10,000 births and provided more than 60,000 prenatal visits (N. Brunk, personal communication, March 21, 2014).

A systems evaluation was conducted using a Logic model to assess the ability of MFH to successfully achieve its mission. The direct investment of human, organizational, Haitian, financial, and teaching resources helps to sustain the activities necessary to train SBAs, support salaries of the Ste. Therese Hospital midwives, and provide free prenatal and postnatal care. The output of the investments and activities is intended to fortify the fragile maternal health infrastructure in Haiti by increasing the number of SBAs and access to perinatal care. In addition, the intent of the Matron Outreach Program is to increase the knowledge and skills of the traditional birth attendants, known as Matrons, and increase referrals to skilled care when needed.

The logic model considers assumptions and external factors that may affect the outcomes of a program (W.K. Kellogg Foundation, 2004). Midwives for Haiti encounters barriers due to various assumptions among global and national agencies, policy makers, and healthcare providers about how the program will

work and the people involved. In addition, external factors that are part of the Haitian society, culture, and healthcare system exist in the environment in which MFH must interact. Working with and within the assumptions and external factors, MFH (2014) has created a network of support and positive relationships to facilitate its programs and increase access to maternity care in several areas of Haiti. The systems evaluation showed that MFH programs have the potential to positively impact the health of infants and childbearing women and reduce infant and mortality rates in Haiti.

## F 12 - Issues Regarding Maternal-Child Health Around the World

### U.S. Health System Reform, Children's Health Care and Nursing: An Integrative Policy Analysis

---

*Eileen K. Fry-Bowers, PhD, JD, RN, CPNP, USA*

#### Purpose

provide nurses with an overview of how to conduct an integrative policy analysis using the example of current U.S. health system reform and its impact on children's health care and the practice of nursing.

#### Target Audience

nurses in leadership roles, or those who aspire to leadership roles, particular in pediatric or family care settings, and those that deal with health policy.

#### Abstract

**Purpose:** Conducting an integrative analysis of a health policy is an important skill for nurse leaders. This presentation will review the process of health policy analysis and describe the analytic process used to examine the Patient Protection and Affordable Care Act of 2010 (ACA) and other health care reform legislation and the subsequent direct and indirect impact on the US child health system. In addition, the speaker will make recommendations for future nursing research to inform nursing leadership, practice and advocacy regarding the delivery of health care services to children.

**Background:** The major provisions of the Patient Protection and Affordable Care Act of 2010 (ACA) emphasized expanding health insurance coverage to previously uninsured populations, promoting new fixes for longstanding delivery system problems and broadening prevention and population health interventions, many of which benefit children. Although the ACA improved insurance coverage for children and their families by covering comprehensive preventive services with no cost sharing, eliminating exclusion for pre-existing conditions, prohibiting lifetime dollar limits, extending dependent health benefits to age 26, and expanding coverage to many previously uninsured parents, the scope of change and its reverberation throughout a complex health system has raised serious questions about the ACA's direct and indirect impacts on children's health care, and its potential to affect the quality of children's health care in ways that were not planned or expected.

The delivery of children's health care is highly dispersed and includes outpatient clinics and physician offices, school-based health centers, early intervention programs for developmentally delayed infants and toddlers, and a host of other specialized programs. While Medicaid is the largest payer for children's healthcare in the U.S., a variety of other state-funded or state administered programs provide essential services for defined populations with special risks and needs. This complex and fragmented set of child health care services is uniquely vulnerable to policy changes, including those embodied in the ACA and other health reform legislation.

**Process:** Using a modified Bardach (2000) approach to policy analysis, specific provisions of the ACA and other legislation were examined for their effects on the delivery of child health services. An integrative review using a comprehensive examination of the literature, as well as interviews with stakeholders (e.g., pediatric providers, clinics, hospitals, advocacy organizations, federal agencies) and exploration of contextual factors (e.g., state laws/regulations) informed analysis.

**Outcomes:** The ACA represents a major transition in health care financing and delivery and, as a result, there are unintended consequences for children's access to care and subsequent health outcomes, especially among low income children, children of color, and children with special health care needs (CSHCN). Child access to health services is influenced by Medicaid expansion to previously uninsured adults. Children's hospitals are impacted by the implementation of Accountable Care Organizations (ACOs) as well as current rules defining network adequacy for "qualified health plans" (QHP), which limit access to pediatric subspecialty care in some regions risking fragmentation of care. And, the "essential

health benefits” package of private plans sold in state marketplaces can fall short of meeting the unique needs of CSHCN, especially with regard to access to habilitative services.

**Conclusions:** The unique health care needs of children highlight the importance of monitoring the effect of the ACA and other health care reform efforts on the U.S. child health system. Although children’s health care is relatively inexpensive, the unique needs and vulnerabilities of children, and the long-term consequence of poor child health outcomes make the stakes for society high. Therefore, researchers must track policy effects in real time to avoid unnecessary harm, take deliberate and strategic action to preserve critical child health services, and leverage opportunities presented by health care reform to improve the child health system. Nurses, as frontline health care providers, are in a prime position to survey the impacts and identify the challenges experienced by children and families in this evolving system.

## F 13 - Developing and Strengthening Mentorship Opportunities

### Developing Faculty-Student Mentor-Mentee Relationships in a DNP Program

---

*Nancy Neff Manister, DNS, MSN, BSN, RN, FNP-BC, USA*  
*Keville C. Frederickson, EdD, RN, FAAN, USA*

#### Purpose

The purpose of this project was to design implement and evaluate a strategy that would address the development of a faculty student mentoring program in one DNP program.

#### Target Audience

DNP Students, Faculty, and Administrators

#### Abstract

The mentoring relationships have been identified as an important influence on professional success. Numerous studies in nursing have described the process and effects, beginning with the relationship between a faculty member and student. As the DNP is a rapidly expanding and evolving educational phenomenon, little is known about this faculty-student relationship. Increasing from eight to two-hundred and forty three programs over the last ten years, there is a need to examine the faculty-student mentoring relationship, and it's effectiveness in assisting DNP students to achieve their end goals. As a clinical doctorate, the literature on the research-focused doctorates is useful in informing the mentorship relationship at the doctoral level but more must be known about the variations in student-faculty mentoring for the DNP.

The purpose of this project was to design, implement and evaluate a strategy that would address the development of a faculty student mentoring program in one DNP program. A workshop was developed to increase knowledge regarding the process and experiences of mentors and mentees in the DNP program setting, and to strengthen this relationship. This workshop was designed to formalize the mentor-mentee relationship in the DNP, based on concepts from *The Five Practices of Exemplary Leadership* (Kouzes & Posner, 2012): Model the way; Inspire a shared vision; Challenge the process; Enable other to act; and Encourage the Heart, as well as other leadership and mentoring concepts.

DNP students who were within one to two years of program completion, selected a faculty mentor and attended a 4 hour workshop with their mentor. Students described the needs that could be fulfilled by faculty mentors, the qualities that they most valued in their faculty mentor, mentor expectations, and mentee contributions to the relationship as part of a pre-workshop assessment. Likewise, mentors noted factors that were important to the mentor-mentee relationship, such as: expected mentor contributions to the relationship, mentee qualities, mentee expectations, and personal mentoring experience as part of their pre-workshop assessment. Students and mentors both valued the opportunity to strengthen the mentor-mentee relationship in this workshop. Evaluations included high marks for relevance and usefulness, and team exercises were viewed positively.

This information is important to nursing as it informs DNP faculty and students on mentoring role expectations, and contributions that each may make to develop a successful mentoring relationship. Additionally, this presentation includes concepts that may be used to strengthen the faculty-student mentoring relationship in DNP programs.

## F 13 - Developing and Strengthening Mentorship Opportunities

### Introducing a Global Leadership Mentoring STTI Online Community

---

*Ellen B. Buckner, PhD, RN, CNE, USA*  
*Claudia K. Y. Lai, PhD, RN, China*

#### Purpose

To discuss the challenges and opportunities using current information technology in the development of future global leaders; to share our lessons learned in establishing a global leadership mentoring process; and to introduce and generate interest to join our Global Leadership Mentoring STTI Online Community

#### Target Audience

Active members of the STTI who are interested in participating in a Global Leadership Mentoring STTI Online Community, in grooming future global leaders of nursing, and in learning from each other using a community leadership platform

#### Abstract

Aim: Nurturing future global leaders in nursing requires engagement with colleagues from other countries and contexts. It requires a deliberate and longitudinal leadership development process mentored by nurses committed to serving as role models. The purpose of this presentation is to describe and introduce prospective participants to a global leadership development opportunity available through technology within the STTI Online Community structure, the Global Leadership Mentoring Community.

Background: Six nurse leaders from across global regions of STTI engaged in a year-long (2012-2013) discussion using technology (Skype, conference calls, email, and shared drives) to explore common and emerging themes of leadership development. The purpose was to strengthen individual and collective capacity as nursing leaders in a global society. Participants shared stories of leadership in their own contexts and developed a model of leadership which included concepts of creativity, change, collaboration, community, context, and courage. Transformative leaders are needed to improve practice and the health of people worldwide. However, role models are often lacking in many settings where nurses practice, teach, study, and influence policy. STTI has a global mission to provide for nurses' professional growth in leadership. The online communities provide an opportunity for engagement, mentoring, and growth. The objective of this presentation is to share with the audience the challenges and opportunities of virtual collaboration in leadership development and introduce the new opportunity within the STTI platform, The Circle. With the advent of technology, we can share the challenges we are facing right now which are the same as many STTI nurse leaders experience around the globe.

Methods: Participants will be introduced to the online community platform with its discussions, libraries, blogs, and forums. Mentors and participants will be invited to join a new cohort for the 2015-2017 biennium. Participants will discuss the need for global leadership, the role of technology in engaging nurse leaders, and the potential for organizations such as STTI in supporting global mentoring. The online Global Leadership Mentoring Community will be initiated following the Biennial Convention and participants in this session will be able to express interest in membership in the new group.

Leadership Goals: Challenges to successful mentoring programs include establishing time and commitment, working across different time zones, and building rapport based on online/virtual not face-to-face contact. A global perspective takes time to develop and therefore we must explore ways encourage our younger generation of nurses to take on a global view of nursing. The mentoring community will foster the development of each young nurse leader into a group with the power of development in its synergy. Nurse leaders develop capacity as they understand their leadership in context and listen to others from diverse countries and settings. Since the younger generation is savvy with the use of IT and social media, the virtual world is limitless and if we are creative enough, the engagement of the younger generation drives us the mentors forward too. Goals for participants in the online community are: a. Discuss leadership in their own context, b. Describe their leadership activities, c. Describe their leadership

values, d. See the role of global leadership in building nursing science, e. Describe the role of STTI in building leadership for nursing, and f. Contribute to leadership initiatives locally and internationally. Following the presentation at the Biennial Convention, a call will go out to prospective mentors and participants. A cohort of about 6-10 dyads would participate over the two years, meeting monthly by virtual technology and contributing to the online community site. The Community would develop its own outcomes which may include an activity, presentation, or manuscript for publication.

## G 10 - Creating Leaders through Faculty Mentoring

### Academic Mentoring and Job Satisfaction of Baccalaureate Nursing Faculty

---

*Kimberly M. Wilson, DNP, RN, USA*

#### Purpose

The purpose of this study was to examine the relationship between the perceptions of academic mentoring and job satisfaction in academic nursing faculty.

#### Target Audience

The target audience consist of any educator entering the academic realm with concerns on their ability to integrate into academia.

#### Abstract

Background/purpose: Nursing faculty are an integral part educating new nurses. The shortage of nursing faculty is estimated to be 7.7% nationally (American Association of Colleges of Nursing [AACN], 2012). According to AACN, (2012), nursing schools in the United States turned away 75,587 qualified nursing applicants from nursing programs in 2011. The nursing faculty shortage may be due in part to inadequate mentoring of nursing faculty that potentially decreases job satisfaction, which in turn contributes to faculty leaving their academic positions (AACN, 2012a). The purpose of this study was to examine the relationship between the perceptions of academic mentoring and job satisfaction in academic nursing faculty.

Method: This study used a descriptive correlational, cross-sectional design to examine the relationship between the perceptions of mentoring and job satisfaction (perceived positive job components) in academic nursing faculty. The Dreher and Ash mentoring scale and Abridged Job Descriptive Index/Job in General Scale (aJDI/aJIG) were used to measure perceived mentoring and job satisfaction. The sample included 92 baccalaureate nursing programs accredited by Commission on Collegiate Nursing Education (CCNE) in the United States. A total of 118 faculty responded to the survey.

Results: There were five out of six correlations significant between the Dreher and Ash Mentoring Scale and Abridged Job Descriptive Index/Job in General Scale. Specifically, those individuals who had more mentoring had more positive views about their jobs in general ( $r = .32, p = .001$ ), opportunities for promotion ( $r = .43, p < .001$ ), and supervision ( $r = .42, p < .001$ ). The correlations between mentoring and pay ( $r = .23, p = .016$ ) and work on present job ( $r = .24, p = .012$ ) while significant, were weak. No significant relationship was found between mentoring and "people on your present job",  $p > .05$  indicating that support from mentors did not translate into more positive views of colleagues. All correlations were in a positive direction.

Conclusions: Academic faculty receiving mentoring within their position appear to have a higher job satisfaction rating. Literature supports the need for further investigation of mentoring in nursing faculty as gaps in the literature mainly exist in the field of nursing academia. Faculty shortages warrant the need to investigate mentoring further in order to see what effect having a mentor has on an individual in the nursing education realm. Information is needed also on the types of mentoring relationships (formal or informal) and how they affect the outcome.

## G 10 - Creating Leaders through Faculty Mentoring

### It Takes a Village and a Plan: Leadership Development of Novice Faculty through a Team Project

---

*Alison H. Edie, DNP, MSN, BSN, FNP-BC, USA*

#### Purpose

The purpose of this presentation is to demonstrate the use of a team project in the leadership development of novice nursing faculty.

#### Target Audience

Nurses new to the faculty role, expert faculty who may consider the role of mentor, and administrators who promote leadership development in their institutions are encouraged to attend.

#### Abstract

The purpose of this presentation is to demonstrate the use of a team project in the leadership development of novice nursing faculty.

The successful transition of expert nurse clinicians into nurse faculty leaders requires an intentional, structured individualized leadership development plan, the support of the academic community and the relationship of an experienced nurse leader that serves as a mentor. The Sigma Theta Tau Nurse Faculty Leadership Academy (NFLA) program uses a team leadership project and mentoring to advance nursing education through the leadership development of novice nurse faculty. (Sigma Theta Tau International, 2015) Through the process of leading a project, the novice faculty member practices leadership skills and reflects on personal leadership attributes. Successes and obstacles in the leading of the project and strategies for responding to difficulties are shared with the leadership mentor and NFLA faculty advisor, a Triad relationship.

The Five Practices of Exemplary Leadership (Kouzes & Posner, 2012) were used as the leadership model in the creation of the team project. The practice of "Model the Way" was selected to clarify the values of the leader and a "Shared Vision" in the recruitment of team members. "Encouraging the Heart" became important in sustaining the project through the obstacles and challenges encountered along the way. The outcomes of positive leadership practices were elicited from a faculty observer, academic leadership, individual self-reflection, pre and post results of the Leadership Practices Inventory (Leadership Challenge, 2015) and most importantly, project team members.

The team assembled for this project included an experienced faculty member, a new faculty member, and a nurse educator. The team developed a standardized web-based scenario to assess the clinical reasoning skills of nurse practitioner students. The leadership development process in creating, leading, and implementing the project will be presented.

## G 10 - Creating Leaders through Faculty Mentoring

### Targeted Strategies to Promote Nursing Faculty Individual and Collective Scholarly Excellence

---

*Jane M. Fall-Dickson, PhD, MSN, BSN, RN, AOCN, USA*

*Edilma L. Yearwood, PhD, MA, BSN, RN, PMHCNS, BC, FAAN, USA*

*Kelley Anderson, PhD, MSN, BSN, RN, FNP, USA*

#### Purpose

The purpose of this presentation is to describe specific targeted strategies to promote nursing faculty individual and collective scholarly excellence.

#### Target Audience

The target audience of this presentation is nursing faculty who are interested in strategies to increase their individual and collective scholarly excellence.

#### Abstract

The Georgetown University (GU) Department of Nursing (DON) is committed to professional development of faculty to promote individual scholarly excellence, as well as, providing opportunities for collective DON scholarship. Recent targeted strategies supported by DON leadership and the DON Council for the Advancement of Nursing Science have demonstrated positive outcomes. For example, the Writing Group, established in 2012 and conducted by the Assistant Chair for Research via conference call, is one promoter for the increased faculty publication rate observed from 2012 (N=24) to 2013 (N=65). Building upon this success, a second Writing Group was formed in 2014 that focuses on clinical manuscripts. Publication efforts of the faculty teaching through Nursing@Georgetown which is the DON distance education platform launched in 2011, represent their 4-year intense effort as distance education innovators and are organized centrally within the DON to promote efficient data retrieval and manuscript submission. DON faculty scholarly interests were assessed to fit naturally into 4 foci of research efforts: translational research, focusing on symptom science; community based participatory research; nursing education science; and global health. These informal centers of scholarly effort not only promote faculty synergy to incubate ideas for grant submissions, but also establish new and use existing inter-professional collaborations. For example, the symptom science group synergizes knowledge and skills of diverse faculty including a family nurse practitioner with cardiovascular expertise, 2 experienced nurse anesthetists, one with experience in acupuncture for pain management, an oncology clinical nurse specialist with expertise in testing novel interventions for pain management in this population, and a nurse scientist with expertise in the field of opioid addiction. Their combined clinical and research expertise allows grant submissions built upon interdisciplinary team science. The nurse education science focus is building upon the tradition of pedagogical excellence established in 1903 through implementation of and evaluation of efficacy of innovative teaching strategies. This effort aligns with the University-wide emphasis on educational innovation as modeled by the GU Center for Innovation and Leadership in Education, and the newly created position of Assistant Dean for Educational Innovation within the School of Nursing & Health Studies (NHS). Global health research and scholarship provides numerous opportunities for faculty engagement with international health systems. Community based participatory research is conducted in collaboration with the numerous health care agencies served by the DON faculty with rich opportunities also available in the NHS-wide Center for Health Equity–Research, Implementation, and Teaching. These 4 foci of faculty scholarship also promote faculty publications, faculty-student publications and research, and presentations at the University, local, regional, national, and international level. Two key NHS values are Cura Personalis, “care for the whole person”, and Excellence. Promoting individual and collective scholarship in our DON faculty operationalizes these values through creation of a supportive academic environment conducive to individual and collective scholarly activity.

## G 11 - Partnering to Educate Future Leaders

### Building a Baccalaureate Workforce Using an Academic/Rural Health System Partnership

---

*Karen R. Cochran, MSN, RN, CNOR, USA*

*Vallire D. Hooper, PhD, MSN, BSN, RN, CPAN, FAAN, USA*

*Judy Neubrander, EdD, RN, FNP-BC, USA*

#### Purpose

This presentation will provide an overview of a unique academic/rural health system partnership formed to advance the IOM Future of Nursing recommendations by increasing the number of Baccalaureate prepared nurses in the rural healthcare setting. Implications for increasing access to primary care and improving population health will also be explored.

#### Target Audience

The target audience for this presentation will include academic and healthcare system leadership interested in unique approaches to advancing the IOM Future of Nursing recommendations for increasing the number of Baccalaureate prepared nurses across multiple healthcare settings.

#### Abstract

Americans living in rural areas face healthcare disparities related to geographic location and educational and economical disadvantages. These disparities lead to limited access to healthcare providers and facilities, as well as an overall inability to achieve good health (Harmon, 2013; Healthy People.gov, 2010). Subsequently, residents of rural areas are at greater risk for morbidity and mortality related to higher rates of obesity, diabetes, cardiovascular, and pulmonary disease.

The hallmark of rural nursing practice is the diversity of practice experiences encountered and the wide range of knowledge necessary to address these challenges (Long & Weinert, 2013). In addition to possessing knowledge and skills related to general medical-surgical care, nurses must function as advanced generalists (Harmon, 2013), with sub-specialty knowledge and proficiency in pediatrics, geriatrics, obstetrics, behavioral health, and emergency care. Because rural nurses are often tasked with the stabilization and transport of high acuity patients to higher level facilities, they must also be skilled in community and resource assessment and allocation, technology use, and care coordination across multiple providers and facilities. The IOM Report on the Future of Nursing (IOM, 2010) supports that higher levels of education are needed to provide nurses with the requisite knowledge and competencies necessary to navigate complex healthcare environments such as the rural healthcare setting. However, only an estimated 30 percent of nurses working in the rural facilities of WNC are Baccalaureate or higher prepared. Many of these nurses have limited financial resources and lack the social support to pursue a Baccalaureate or higher degree.

The purpose of the RN to BSN Rural Education and Support (RN-BRES) program is to increase recruitment, retention and graduation opportunities for disadvantaged populations in schools of nursing, in an effort to increase workforce diversity, reduce health disparities, and achieve population health equity. This grant-funded program is a collaborative partnership between a local university and a large rural health system. The program will address the social determinants of health, focusing on providing support to participants to address those determinants hindering successful educational and professional attainment at the individual, social and structural levels. RN-BRES will increase nursing education opportunities for individuals from disadvantaged backgrounds (focusing on economically and socially underserved, and including racial, ethnic, tribal minorities under-represented among registered nurses) by providing student stipends, scholarships, and opportunities for mentorship. The program will also work to increase the public's access to quality health care by supporting strategies that increase diversity in the nursing workforce. RN-BRES will ensure that, in the participating communities, the right clinicians, with the right skills, are working where they are most needed.

The program has 3 primary goals:

1. Increase the number of students from underrepresented ethnic minorities (UREM) and economically and educationally disadvantaged backgrounds (EEDB) enrolling in and graduating from the RN to BSN program
2. Facilitate the development of an advanced rural generalist competent in the assessment and management of population health across diverse specialties and healthcare delivery environments in the rural environment
3. Increase faculty and healthcare provider's skill set in care coordination and facilitation in the management of a wide variety of population health issues across the continuum of care.

This presentation will present an overview of initial steps in program development and implementation, to include academic/clinical partnership building and collaboration. Early outcome metrics will be presented and plans for program expansion explored.

## G 11 - Partnering to Educate Future Leaders

### Establishing a Global Institution Partnership for Nursing Education

---

Wanda Lawrence, PhD, RN, MSN, USA

#### Purpose

The purpose of this presentation is to discuss the establishment of a global partnership between an American university and a university in China to advance nursing education and research with a global focus. The presentation will focus on the challenges and successes of planning and implementing the nursing partnership.

#### Target Audience

The target audience of this presentation is clinical nurses, educators, clinical administrators, staff nurses, health educators, nursing students, as well as nurse leaders in academia. The presentation will also benefit participants who are interested in global health education.

#### Abstract

Over a decade ago, nurse experts identified factors that impacted nursing practice in the 21st century, which began with the increasing globalization of healthcare and nursing education. Mobilization of nurses has prompted educators to take a close look at variables centered around the education of nurses. A university located in the central part of the People's Republic of China, having over 17,200 students saw a need to strengthen its nursing program by strategically partnering with a university located in South Eastern United States. Both nursing programs met to review and evaluate the curriculum, and revisions were made to assure that the partner nursing program was consistent with the general education and nursing pre-requisite requirements of the American university. Several factors were considered initially: course description; course hours; testing policies; clinical experiences to name a few. A Memorandum of Understanding (MOU) was established between the two universities after a critical review of the nursing curricula. An institution partnership was established with the universities and nursing to implement a partnership that would advance nursing education and research with a global focus. Students from China will complete two years of their curriculum and then enroll in the American university for a two year study and receive a Baccalaureate of Nursing degree. The partnership also provided opportunities for faculty of both universities to work together in a virtual environment as well as face-to-face, and for students to begin to establish relationships with the American faculty prior to their arrival. This presentation will focus on the leadership, planning process for establishing a global partnership and discuss strategies for creating a seamless transfer process. This presentation is a unique example of how two universities from diverse countries and cultures learned to serve locally, transform regionally and lead globally.

## G 11 - Partnering to Educate Future Leaders

### The Power of Partnership: Educator Collaboration with Procedural Area Nurses Improving Professional Development

---

*Ani Jacob, DNP, MSN, BSN, RN-BC, RNC-NIC, AE-C, USA*

#### Purpose

To develop a collaborative partnership with procedural area nurses for professional growth by nurturing a passion and commitment for learning and innovation in nursing care.

#### Target Audience

All RNs, Clinical educators, and NPD specialists

#### Abstract

The nurse educator role as facilitator is to support the staff in pursuing educational opportunities, by providing guidance and collaborative relationships. It also applies to promoting professional growth and leadership opportunities. For the past few years there were inconsistent nurse educator coverage in the procedural areas within the hospital. Many of the house-wide educational initiatives and governing body requirements were not communicated to the staff in real time affecting compliance with educational requirements. This was due to, but not limited to, inconsistent Educator coverage in the procedural areas, inconsistent or delayed dissemination of available information pertaining to education and professional growth opportunities, limited staff participation in hospital –wide educational initiatives (lack of structure and process), and need for revised staff competencies and orientation pathways.

The purpose of the nursing professional development (NPD) initiative was to develop a collaborative partnership between the NPD specialist and procedural areas' nurses to improve RN professional growth and leadership skills. The units included Endoscopy/bronchoscopy, Invasive cardiology- Electro Physiology (EP) and Cardiac catheterization lab, Non-invasive cardiology-Stress and Echo cardiograph labs, and Interventional radiology. The focus areas were: RN specialty certification, Clinical ladder participation, Leadership development opportunities such as preceptor training, and development and participation in educational opportunities such as conferences, journal clubs and continuing education programs.

**Process:** In fall of 2013, an NPD specialist liaison between the nursing education department and the procedural areas was established. Scheduled meetings with managers were conducted to explore, assess and identify priority focus areas for improvement in educational and professional growth opportunities. Other opportunities such as staff meetings and collaborative care council meetings were utilized to meet with the staff and establish rapport. This process led to identifying the key players (innovators) in each of the units for bringing the suggested changes.

The process included reviewing and updating the current staff competency lists in Cath lab, EP lab, stress and Echo lab, interventional radiology and endoscopy areas according to the current Human Resources updates; assessing, evaluating and formulating new ongoing competencies for all areas; selecting staff regarding orientation and precepting ; updating orientation pathways with staff assistance; staff participation and involvement in updating post cardiac catheterization policy; regular educator rounds in the procedural areas to improve visibility, presence, and support; and timely dissemination of information on educational and professional growth opportunities available within the health system.

**Results:** The educator Liaison improved collaboration and communication between the staff, managers and the educational department .The staff engagement in professional development activities exceeded expectations. There was a heightened interest in academic progression among the staff such as RN-BSN opportunities and graduate studies.

Unit	Certification	Clinical ladder	Conference Attendance
Cath Lab	15% → 60%	0% → 35%	
EP Lab	10% → 100%	0% → 92%	
Stress/Echo	25% → 75%	0% → 38%	
IR	8% → 8%	0% → 23%	
Endoscopy	14% → 14%	4% → 20%	

Collaboration with the managers and the staff innovators resulted in revising staff competencies and orientation pathways for new hires in all areas. Staff led **performance improvement projects** were initiated in the Endoscopy unit, Cardiac cath lab, and Interventional radiology. Four RNs in the cardiac cath lab took initiative in developing **journal club** in collaboration with the NPD specialist and nurse practitioners and extended the invitation to EP, stress/Echo lab RNs. The journal club is meeting once every month. **Regular in-services** are done in the labs by partnering with vendors and physicians.

Staff attendance in the specialty specific conferences increased in the Cardiac cath lab and endoscopy unit. Staff took initiative in the process of needs assessment for future educational activities and topics for conferences. Six RNs enrolled themselves in leadership classes including preceptor and mentor development.

**Summary:** Overall, the educator Liaison with the procedural areas was a huge undertaking with exemplary results. One major irony in this collaboration was that the NPD specialist worked as the liaison specialized in pediatric and neonatal nursing and has minimal experience in adult care. The results proved that with appropriate support, collaboration and a nurturing environment can encourage staff in self development, professional growth, and leadership activities.

## G 12 - Transforming Nursing Leadership Practice

### An Innovative Strategy to Lead Clinical Practice Change to Achieve Quality Outcomes

---

*Mickey L. Parsons, RN, PhD, MHA, FAAN, USA*

*Patty Toney, RN, BSN, MSN, USA*

*Andrea E. Berndt, PhD, USA*

#### Purpose

The purpose of this presentation is to delineate the clinical leadership professional development program, innovative clinical microsystem practice change methodology, and outcomes.

#### Target Audience

The target audience for this program is nurse educators, nursing administrators, nurse managers, and clinical staff leaders.

#### Abstract

**PURPOSE:** To delineate the clinical leadership professional development program, innovative clinical microsystem practice change methodology, and outcomes.

**EVIDENCE/LITERATURE REVIEW:** The literature is replete with extensive literature on leadership, quality improvement and evidence based practice. However, there is extant literature on the “how to” of leading practice change to achieve specific outcome(s).

**THEORETICAL FRAMEWORK:** The professional development program content was informed by concepts of interpersonal trust, change theory, best practices for execution, and a practice change tool kit.

**METHODOLOGY:** A ten month program of professional development for twelve Nursing Unit Directors from four facilities was provided. It included ten monthly two hour seminars, and four 1:1 individual coaching sessions. The practice change tool kit incorporated The Four Disciplines of Execution (Covey and McChesney, 2012) adapted, and a comprehensive planning process including the following steps: Clinical opportunity and baseline and expected outcome(s), Stakeholder engagement, Evidence, Specific Nursing Practices - what the staff is "to do," Practice implementation addressing facilitators and barriers to the practice change(s), communication steps, and staff development, Concurrent practice monitoring, Cadence of accountability, and Clinical outcome results.

**RESULTS:** Three instruments were utilized to assess participant outcomes. They were Empowerment - Behavioral, Verbal and Outcome (Irvine, Leatt, Evans & Baker, 1999), Trust in Peers and Management (Cook & Wall, 1980), and Transformational Leadership (Heutson & Wolf, 2011). With a very small participant sample, post program implementation findings represent trends only. Specifically, both self reported behavioral and outcome empowerment scores improved and trust in management and peers post program. The self reported perceptions of the transformational leadership practices improved. Qualitative post survey findings were very positive. The program’s clinical impact was demonstrated through each Director’s patient care project. With their Unit Councils’ they developed, implemented, and evaluated a clinical practice change project to achieve a specific clinical outcome(s). Selected project titles included 1) Improving family satisfaction through face to face handovers from the post anesthesia care unit to the pediatric surgical unit, 2) Eliminating patient falls facility wide through a comprehensive practice review and implementation, 3) Preventing venous thromboembolism (VTE) through consistent achievement of VTE process outcomes

**CONCLUSION:** The early results indicate that the professional development program led to important self reported learning by the Directors and in clinical care impact. Early results indicative of organizational impact are that the health system is spreading the microsystem practice change methodology across the

four hospitals through their shared governance structure and through a new group of Directors participating in the program.

**IMPLICATIONS:** The program and Microsystem Practice Change Method contributes to Nursing executives and clinical leaders armamentarium to achieve and sustain clinical outcomes.

## G 12 - Transforming Nursing Leadership Practice

### Leading Environmental Health Awareness to Transform Nursing Practice

---

*Bernadette M. Longo, MSN, PhD, RN, CNL, APHN, USA*

#### Purpose

The purpose of this presentation is to encourage formation of environmental health initiatives on district/regional levels to enhance nurses' knowledge and their ability to effectively advocate.

#### Target Audience

The target audience of this presentation are nurses who have an interest in the new global Sustainable Development Goals (replacing the Millennium Development Goals) and have an interest in environmental issues.

#### Abstract

In 2013, Nevada joined a handful of state nursing associations committed to enhancing their nurse's level of knowledge about environmental health (EH). As the single largest group of healthcare workers, it is essential that nurses have the knowledge to recognize and address environmental hazards (biological, chemical, radiological, and physical) that may adversely influence their patients and the community at large. Through increased awareness of environmental risks and risk reduction activities, the 31,000 licensed nurses from across this frontier state could best advocate for quality health care and EH initiatives.

The environment is one of the four domains of nursing (Kim, 1998). Not surprising, Nightingale's Environmental Theory (circa 1860) asserted that the focus of nursing was to alter the environment in order to affect change in patient or population health. Environmental factors addressed by Nightingale included purity of air and water, food supplies, drainage, cleanliness of patient and environment, sunlight, temperature and noise. Years later in 1986, the International Council of Nursing called upon nursing's responsibility to participate in efforts to safeguard the environment, conserve the world's resources, study how their use affects mankind, and how adverse effects could be avoided. In 1995, the United State's Institute of Medicine recommended EH competencies for all nurses. The American Nurses Association later published the document titled "ANA's Principles of Environmental Health for Nursing Practice with Implementation Strategies" in 2007. This document presented ten EH principals and associated resources (i.e., precautionary principal), activities and opportunities suitable for the individual nurse, healthcare team, facilities, or communities. Today, schools of nursing are gradually incorporating EH principles into baccalaureate and advanced degree curriculum.

Nursing has an important role regarding global EH issues. The new Sustainable Development Goals offer nursing the opportunity to advance our practice and collaborate with other disciplines to affect change on a global level. The priority areas address EH by including sustainable agriculture, water access, climate and oceans, and sustainable/renewable energy sources. Nursing now has an opportunity to serve locally on environmental initiatives, thereby resulting in regional transformation.

Nursing can lead change by forming coalitions or committees within their region. Specific aims of the EH Committee of the Nevada Nurses Association include: (1) educating all regional nurses about principals of EH, (2) informing nurses in an unbiased manner on EH issues unique to the region, and (3) representing nursing on regional and national events or initiatives that focus on improving the environment for promotion of health. A column in the state-wide, quarterly newsletter educates and informs readers on region-specific EH issues. Non-nursing experts co-author with nurses and present on issues in a state-of-the-evidence manner, yet also recognizing cultural or political biases. Columns are dedicated to environmental matters such as climate change occurring in the Western United States, and radon gas toxicity along with information for testing households. Since 2013, Nevada's nurses have participated in earthquake preparedness and drills across Nevada to minimize casualties and damage due to the high risk of seismic activity in the state. In addition, high intensity and unpredictable wildfires of

the past decade have produced record-level particle air pollution for the region, thus affecting the health of vulnerable populations. The EH Committee responded in a timely manner releasing information on toxicity of fine particle air pollution and evidence-based interventions for use by nurses and their patients. Moreover, EH Committee members represent nursing on multidisciplinary task forces and advocate for the general public during regional or national events.

Regardless of region or country, we as nurses share an urgency to lead and play key roles in transforming health through environmental advocacy. In this next biennium, nurses have the opportunity to form or join EH coalitions that improve health through environmental stewardship. Such risk-taking leadership will require vision and support from all of us in the global nursing community.

## G 12 - Transforming Nursing Leadership Practice

### Creating a Nursing Scholarship Strategic Vision to Transform Nursing Practice

---

*Kenn M. Kirksey, PhD, MSN, BS, RN, ACNS-BC, FAAN, USA*

*JoAnn M. Mick, PhD, MBA, MSN, BSN, BSHA, RN, NEA-BC, USA*

*Jan Keller-Unger, PhD, MS, BS, RN, CENP, USA*

*Phyllis Jean Waters, PhD, MS, BS, RN, USA*

*Gayle McGlory, PhD, MSN, BSN, ADN, RN, CCRN, RN-BC, USA*

#### Purpose

The purpose of this presentation is to delineate the steps used in creating a comprehensive strategic plan to foster nursing scholarship in a clinical setting.

#### Target Audience

The target audience of this presentation is direct-care providers, nurse leaders, and educators.

#### Abstract

**Background:** Nurse leaders at our academic safety net healthcare system have long been resolute in promoting an environment where high quality, patient-centered, fiscally responsible, and evidence-driven nursing care are standard. Nurturing an environment where the delivery of innovative, multi-faceted, and interprofessional care is embraced and supported has been an essential component in facilitating the personal and professional growth of both nurses and healthcare partners. The development of a comprehensive nursing scholarship strategic plan has been a significant part of the continuing commitment to building and fostering this culture of excellence.

A strategic plan serves as an organization's road map in defining goals and outcomes to achieve desired growth, and facilitates decision-making for resources that includes people and capital. A gap analysis was conducted in order to delineate areas of strength and opportunities for improvement. Exploring strategies for further integration of scholarship activities, specifically clinical inquiry related to evidence-based practice (EBP) and research, was deemed a key imperative. The strategy team charged with developing the nursing scholarship strategic vision was intentional in aligning the plan with the organization's overall system strategic plan and national benchmarks for excellence (e.g., American Nurses Credentialing Center Magnet Criteria and Baldrige Performance Excellence Standards).

**Purpose:** A group of system-level nurse leaders (subsequently referred to as "nurse strategists") created a plan to specifically address the vision to advance nursing scholarship. Gaps between the current and desired states were identified and grouped into categories to present a holistic view of the organizational strategic context.

**Method:** The gap analysis assisted the team in determining avenues for further integration of scholarship activities. The nurse strategists worked over several months to analyze the opportunities and to develop high-level action plans. Priority themes, the organization's current state, two- and five-year goal statements, outcome indicators, and persons responsible for leading the work were delineated. While the hospitals and ambulatory care services have employed a doctorally-prepared nurse to teach EBP and research methodology, and support nurses engaged in scholarship for many years, there have been resource limitations in ensuring enculturation for over 2,000 registered nurses across the system. Over the past five years, Nursing Services has supported hiring more doctorally-prepared registered nurses. These nurses are educated either as researchers (Doctor of Philosophy; PhD) or expert clinical leaders (Doctor of Nursing Practice; DNP). Engaging these leaders has diminished the burden for one person to bear sole responsibility for all aspects of scholarship and provided a roadmap for delineating an ideal future.

The previously ascribed priority themes include Foundation, Education, Appraisal, Creation, Innovation, Translation, and Dissemination. "Foundation" is defined as cultivating a spirit of clinical inquiry and building the infrastructure to support the enculturation of scholarly activities. Goals included forming key groups to support nurses engaged in scholarship. The first group termed "Coaches Operationalizing Research Excellence (CORE)" is comprised of the nearly 20 doctorally-prepared nurses employed by the organization. As the group's title implies, the expert nurses are assigned to coach nurses who are novice in scholarship activities. The combination of both PhDs and DNPs is viewed as strength in supporting clinical, administrative, educational, and scientific projects. There has been a concerted effort to pair both types of doctorally-prepared coaches for projects, when warranted. A "Nursing Scholarship Advisory Board," comprised of members of the academic community engaged in nursing research (associate deans of nursing research and other key stakeholders) and select members of the CORE team was also formed in order to define developmental pathways and delineate opportunities for multi-institutional and interprofessional scientific partnerships.

"Education" provides nurses with the foundation for informed participation in research and EBP projects. The gap analysis revealed that approximately 25% of nurse clinicians and 25% of nurse leaders have been formally prepared in these two areas of focus. The education goal for EBP was increased to 90% for leaders and 50% for clinicians during the first two years of implementation. The organization will soon implement an EBP educational series for all nurse leaders. The 15-hour course, consisting of a combination of didactic instruction, online modules, and independent study will enhance nurse leaders' knowledge and application of EBP in daily operational responsibilities.

"Acquisition" refers to obtaining and critically appraising evidence gleaned through data-based publications and expert opinions. Nurses have access to an online reference center, both at work and remotely. All nurses are provided with library cards to allow institutional access to a world-class medical library. The nurse strategists completed a comprehensive review of available journals and identified additional resources that would assist with literature searches.

"Creation" is defined as instituting nurse-led or nurse-participative research projects in order to add to the body of scientific nursing knowledge or to validate existing knowledge through replication. The organization has set two year goals of a minimum of one research study per 100 inpatient beds and a minimum of three studies in the ambulatory care settings.

The definition of "Innovation in service delivery and organization [is] a novel set of behaviors, routines, and ways of working that are directed at improving health outcomes, administrative efficiency, cost effectiveness, or users' experience and that are implemented by planned and coordinated actions" (Greenhalgh, 2004). One initiative is the formation of a mechanism for spreading information across three hospitals and ambulatory care services. A monthly nursing research grand rounds series has been implemented to showcase completed studies by nursing colleagues working in other facilities around the geographic area.

There is a major push in the area of "Translation." It is defined as translating evidence-based knowledge (acquired, created, or replicated) into inquiry-based practice. A two-year goal includes preparing at least 90% of nurse leaders and 50% of clinicians so they are able to articulate the process for integration of published evidence into clinical practice. The EBP course series, designed for leaders, is one way of implementing this goal.

Lastly, "Dissemination" is defined as sharing the results of nurse-led scholarship through refereed presentations and peer-reviewed publications. The efforts in this area have resulted in significant increases in both areas of dissemination.

**Results:** Measurable goals and objectives for two- and five-year timeframes have been developed to advance the organization from its current to the desired state for each of the seven foci. Capital and resources are able to be more effectively directed towards efforts that are best aligned with the defined objectives.

**Implications for Practice:** Having a strategic plan drives the infrastructure and commitment to support scholarship outcomes. Periodic review of the strategic plan and progress made towards targeted outcomes provides an opportunity to realign resources as needed to stay on course to achieve the desired state of advanced scholarship. Partnership with both internal and external partners strengthens the program structure and enhances interprofessional and multi-institutional collaboration.

**Conclusion:** Nurse leaders within the organization have been mindful of creating opportunities for scholarship across nursing and with external partners. Formulating a nursing scholarship strategic vision has provided a framework for the acquisition and appraisal of evidence, creation of new knowledge, and translation of relevant findings that make positive differences for patients and staff. Nurses will be better prepared to use and generate scientific evidence to provide quality care and healing services for our patients and individuals across the globe.

## G 13 - Social Networking: Can it Influence Your Professional Presence?

### Using Social Networking and Social Media Resources for Research Recruitment

---

*Janice M. Jones, PhD, RN, CNS, USA*  
*Dorette Sugg Welk, PhD, MSN, BSN, RN, USA*

#### Purpose

The purpose of this presentation is to acquaint members of the honor society with social networking and social media resources. These resources may serve as recruitment tools for select nursing research studies where a national or global sample is desired.

#### Target Audience

The target audience of this presentation is any honor society members who are or will engage in nursing research and would like more information regarding the use of social networking and social media strategies for sample recruitment.

#### Abstract

The purpose of this presentation is to describe professional social networking opportunities and social media resources for use in research participant recruitment including strategies that refine the researcher's approach based on study need and limitations of media resources. In this presentation, participants will be apprised of the richness of the resources for research as well as search strategies which can maximize the desired subject recruitment. President Hester Klopper's "connectedness" theme is reflected in this presentation as ways in which STTI could provide a means for research recruitment with the outcome of promoting and mentoring excellence in global nursing. The strategies for research recruitment that will be described and discussed are congruent with promoting and sustaining collaboration amongst diverse communities in order to enrich research and scholarship.

As the Digital Divide decreases and the Digital Age expands, the use of social networking and social media has exploded. According to the PEW Research Internet Project (2013), in the United States alone, 42% of online adults use multiple social networking sites with Facebook remaining the platform of choice. As of September 2013, 71% of online adults use Facebook, 17% use Instagram, 21% use Pinterest and 22% use LinkedIn (<http://www.pewinternet.org/fact-sheets/social-networking-fact-sheet/>)

A variety of social networking and social media resources may be used to communicate with others including members of the honor society. To date, STTI encompasses approximately 500 chapters in 675 institutions of higher education with over 135,000 members in 85 countries. This global diversity of nurses and potential participant referrals may serve as a ready population for a variety of nursing research studies.

The Circle is STTI's primary method of chapter communication. Each chapter has its own web page within the Circle. There are a variety of Circle forums, Workgroups and Communities of Interest specific to Staffing Sharing, Role Clarity, Global Member Forum, Good Work in Nursing or nursing specialty topics such as critical care, community/public health, medical-surgical, emergency and cardiovascular nursing. The researcher can personally join any Circle to gain involvement with those members but must have a specific membership in a Workgroup for access to those individuals. For example, Chapter Officers within a Region will find a "Region X Chapter Officers Connect" Workgroup in their list of Circles automatically added by STTI Headquarters staff but this group is not available to other members. Nothing precludes collaboration between Regions for research subject recruitment but the Circle platform itself includes such limitations because of its intent to create the various exclusive common-interest groups for discussion purposes.

Research subject recruitment may also be done via Twitter, Facebook, and LinkedIn. Twitter has been shown in studies to be an effective recruitment tool (Mollett, Moran, & Dunleavy, 2011). A twitter account specific for a research study may be established. Currently, Twitter supports over 35 languages worldwide. It allows for a 140-character message or “tweet” that may include an invitation to participate in a research study. Photos and up-to-four videos may accompany the tweets including a link to a web page detailing the study or use of a hashtag(#). This message may be retweeted or passed on to others to further the recruitment population and ultimately the research sample. This process represents an adaptation of the snowball method of recruitment where identified individuals will then help to distribute the research question or purpose to those who may meet the criteria.

To use Facebook for research, the member would create a Facebook page for the research study. The PEW Report (2013) cites that Facebook users are more trusting than others and have more close relationships. These ideas may help to formalize use of Facebook within a sampling plan where these characteristics would fit the study content.

LinkedIn may also serve as a connection between nursing professionals (<https://www.linkedin.com/groups?gid=129370>). This media resource has the potential of sample recruitment where search terms of interest may locate persons with the desired research criteria.

An example of a research study where the Circle was used for research recruitment will be presented along with its advantages and challenges. One of the original purposes of this qualitative study was to describe cultural differences of perspectives of “Good Work in Nursing” of members of two STTI Circles whose membership represented all six global regions. Although approximately 98% of STTI members reside in the North America (NA) Region, the databases afforded a good array of worldwide members in 30 countries. In the final sample of 20, 19 participants were from the NA Region which then precluded describing cultural differences in the sense of other world regions. Perspectives based on role difference which was another demographic characteristic afforded good qualitative themes and conclusions, however, the researcher learned some lessons which may facilitate the work of other researchers in the future.

Specifically, to reach potential participants in any certain Region, the Circle in use must be mined to identify those persons. To acquire or improve participation in a particular Region, it is possible to identify the geographical location of the Circle member directly in the member’s listing. Those meeting a sample criterion can then be contacted and re-contacted for research purposes. There are also considerations that need to be made for follow-up of research participants. For example, is anonymity expected or does the researcher want to make additional contacts as in theme verification in a qualitative study? Can the researcher avoid additional contacts in re-sending an invitation to join a study when the recipient has already responded? The logistics for managing these recruitment steps will be described in the presentation.

There are several inherent limitations of the sample drawn from the Circle populations. These considerations include self-selection bias, issues of language barriers, and using an internet-based system of research invitations which may be limited by availability of the Internet for the end-user/recipient.

In summary, social networking and social media resources and provisions for links to existing commercial sources can provide a wealth of support for sample recruitment in nursing research. Efforts to include worldwide participants supports the mission and vision of STTI towards transformation and excellence in global nursing.

## G 13 - Social Networking: Can it Influence Your Professional Presence?

### Perceptions of "Good Work in Nursing" of Experienced Administrators, Educators, and Clinicians from Two STTI Circles

---

*Dorette Sugg Welk, PhD, MSN, BSN, RN, USA*

#### Purpose

to describe perceptions of "Good Work in Nursing" of nursing administrators, educators, and clinicians who were members of STTI's Global Member Forum and/or Good Work in Nursing Community in order to consider implications for workforce planning in support of good work.

#### Target Audience

nurses and other professionals who can have an impact on promoting Good Work in Nursing in a variety of practice roles.

#### Abstract

"Good work" (hereafter without quotation marks) is work which is technically proficient and effective as well as morally and socially responsible. Gardner, Csikszentmihalyi, and Damon (2001) initially studied the concept and determined that good work has the three primary characteristics of excellence, ethics, and engagement which serve as the conceptual framework for this study. Miller (2006) specifically applied the Harvard-based research interview protocols in a study involving beginning and experienced nurses regarding their perceptions of supports and obstacles of good work. Welk (2013) reported perceptions of good work in nursing among entry-level registered nurses. The concept of "good work in nursing" embraces 2013-2015 STTI President Dr. Hester Klopper's Call-to-Action that includes servant leadership in nurses' service to others, connectedness with patients, students, families, and co-workers, transformation as nurses participate in workplace changes to enhance good work, and gratitude which benefits collaborations in all types of practice settings.

The research problem relates to the idea that good work takes place in many contexts and practice settings within a nurse's role. The opportunity to express perceptions about good work in nursing in various nursing roles broadens the dialogue about strategies that promote good work in these roles. The research purpose was to describe perceptions of good work in nursing among nursing administrators, educators, and clinicians who were members of STTI's Global Member Forum and/or Good Work in Nursing Community in order to consider implications for workforce planning.

The population was the combined self-selected membership in the two Circles noted above. The population afforded the potential for a representative sample of members in STTI's six worldwide regions. Demographics included region, years of experience as a registered nurse, and current role. The final sample consisted of 20 nurses who designated themselves as administrator of a university program or a health care facility, educator of students or staff, or clinician in a variety of practice areas. Nineteen (19) were from the North America Region and 19 listed RN experience as greater than 15 years. Seven non-US countries were mentioned in the narratives as locations of practice experiences.

The study was approved by the Institutional Review Board of Bloomsburg University, Bloomsburg, Pennsylvania. The participants were recruited through a post in the two Circles which provided a brief description of the study and a link to the Qualtrics site for the letter of informed consent and survey. Return of the survey constituted informed consent. The survey developed in Qualtrics included demographics plus five narrative questions. The participants were asked to define the meaning of good work in nursing in their own words, to note and give an example of when the participant and co-workers would agree that good work was done, to describe and give an example of guidelines or expectations in the practice setting that might be used to decide if good work were done, to describe and give an

example of who decides or sets the rules for good work, and to give a recent example in the practice setting of the participant's perception that good work had been done.

A second invitation to participate was sent to each Circle's members two weeks later with no additional follow-up of the anonymous submissions. The narratives were analyzed using content analysis with open coding, a search for themes, descriptor development, and cross-validation. Dr. Joan Miller who has pioneered the application of Good Work theory and practice to nursing and initiated the STTI Good Work in Nursing Community provided expert review of all aspects of the study, including a review of the data and verification of the researcher's theme analysis, conclusions, and implications.

Results were organized into the three main good work categories of excellence, ethics, and engagement with emerging themes from the study. Within excellence, the themes of responsibility and accountability were evident, with subthemes of safety and goal-setting. Within ethics, values was the predominant theme with subthemes of specified values, patient-family focus, advocacy, and guidelines/evidence-based practice/standards. Within engagement, practice environment emerged as the primary theme with subthemes of time, teamwork, care settings, and decision makers. The conference presentation will review all expanded themes with specific quotations to support theme development and conclusions.

Five conclusions are drawn to describe perspectives of this STTI sample:

1. Values of nurses and about nursing are key to defining good work in nursing regardless of current practice role.
2. Perspectives about good work in nursing tend to be focused on the most immediate recipient of the participant's interactions, e.g., the student for the educator.
3. Patient and family advocacy and safety are central to good work in nursing perceptions of administrators, educators, and clinicians.
4. Good work in nursing results in positive patient outcomes when there is sufficient and proper timing of care supported by multi-disciplinary teams who plan and deliver care based on evidence-based guidelines or standards in a setting appropriate to the patient's needs.
5. Definitions of the perception of good work in nursing in the limited non-North America region examples were very similar to North America region examples, with the former acknowledging other influences, e.g., greater family involvement in care, nature of physician interactions with nurses, patient expectations, and ethnic/cultural beliefs held by patients and families.

Limitations of the study included sample configuration and single age range. Given the potential for a diverse global sample from these particular STTI Circles, the limited return outside of the North America Region for a topic which invited personal descriptions within all cultures was unexpected. Possible reasons for limited respondents from all Regions and age groups will be explored with consideration for future research.

An unexpected finding was the expression of good work through the lens of the practice setting or organization with its unique rules, regulations, and expectations. As examples, an educator cited achieving high passing rates on RN exams as good work and a clinical educator cited clinical education outcomes in hospital settings when staff achieved competency in reading EKGs. Another educator cited making a major and outstanding contribution to nursing in some area as a practice expectation to demonstrate good work. Considerations for future research may include how organizational cultures influence one's definition and practice of good work in a particular role and setting.

Implications for workforce planning suggest that perspectives of individual nurses related to personal values and unique environmental issues should be included when determining steps to be taken to promote good work in nursing. Diversity of practice settings suggests that strategies to promote good work in nursing may differ according to the practice setting. Small group conversations addressing perspectives of what constitutes good work in nursing in a particular role or setting and what obstacles may limit performance of good work may contribute to workforce planning and outcomes. The findings

and conclusions from this study may help to serve as a framework for dialogues to achieve interventions that support good work in nursing.

Additionally, this type of qualitative study provides information that may facilitate future quantitative research regarding workforce planning that promotes environments and circumstances for nurses to do good work in all types of roles and practice settings toward transformation and excellence in global nursing.

## G 13 - Social Networking: Can it Influence Your Professional Presence?

### Social Capital in Nursing: The Potential of Influential Relationships in Enhancing Patient and Organizational Outcomes

---

*Jason H. Gilbert, BSN, MBA, RN, USA*

#### Purpose

The purpose of this presentation is to discuss the results of an integrative review completed on the concept of social capital in nursing. Theoretical basis, conceptual definitions, and empirical referents of social capital in nursing will be discussed. A synthesized conceptual model guiding further research will be presented.

#### Target Audience

The target audience of this presentation is nursing scholars interested in nursing leadership research as well as healthcare organization leaders interested in contemporary transformational leadership models.

#### Abstract

There is a crisis of leadership in the nurse manager role experienced by healthcare organizations across the country. Recent estimates demonstrate that a shortage of 67,000 Nurse Managers may exist by the year 2020. The nurse manager role is known to be a key role in improving patient and organizational outcomes, yet little research has been done on this critical role. Beginning with the restructuring of healthcare organizations in the 1990s and continuing with the implementation of the Affordable Care Act of 2010, the nurse manager role has increased in scope and complexity. Changes in the nurse manager role have accelerated with rapid advances in technology, need for new care models, increased regulation, and shrinking budgets. This increase in complexity and perceived lack of work life balance has decreased the attractiveness of this key role. Plagued by lack of educational requirement standards and scarce evidence on effectiveness of professional development activities, healthcare organizations across the country are struggling with the recruitment, retention, and development of qualified nurse manager candidates.

The essence of requisite leadership skills have changed as the US economy has shifted from the industrial era focused on physical production to the knowledge era in which acquired knowledge must be synthesized in the provision of work. In this environment the manager is not expected to be the all-knowing and all-powerful figure who maintains order through command and control traits. Knowledge workers and their leaders, such as nurses, require different participative and transformational leadership models rich in communication and maintaining productive and influential relationships. Nurse Managers must be skilled communicators, coaches, and mentors in order to be successful in achieving optimal outcomes for their areas of responsibility.

Social capital is a concept which describes the influential relationships necessary for successful leadership practice in modern healthcare organizations. Social capital may be described as the relationships between individuals and organizations that facilitate action and create value. The concept of social capital has been well researched in fields such as psychology, human resources, economics, agriculture, and anthropology, but little evidence exists about the usefulness of this concept in nursing. An integrative review of social capital in nursing was completed in order to compare and contrast the theoretical basis and conceptual definitions of social capital and how social capital has been empirically measured.

A literature search of CINAHL Plus with Full Text, Academic Search Premier, Business Source Premier, Health Business FullTEXT, MEDLINE, and PsychINFO for the years 2004-2014 was completed. Results were filtered for peer review journals written in the English language. The following search terms were used: "social capital AND nursing", "social capital AND nurse manager", and "social capital AND nurse

administrator". The literature search yielded 232 unique results. Titles and abstracts were reviewed for relevancy using the following inclusion criteria: a) contain conceptual or operational definitions of social capital as applied to nursing, b) discuss social capital as an attribute of nursing performance, or c) contain empirical referents to social capital. After title and abstract review, 215 articles were excluded. The remaining 17 full text articles were reviewed based on the following exclusion criteria: a) book chapters or editorials, b) narrative reviews of social capital which did not include literature search methodology, and c) articles focused solely the concept of social capital in terms of gender or professional role disparity in organizations. After the review, 8 articles were included in the final sample.

The results of the integrative review demonstrate that there are three distinct but related theoretical perspectives and conceptual definitions of social capital present in the nursing literature: a) the network perspective which defines social capital as a resource embedded in networks of social relationships, b) the social facilitator perspective which defines social capital as a resource which facilitates individuals to action and enhances collaboration and c) the network facilitator perspective which conceptualizes social capital as a resource both inherent in a network and as a resource which facilitates action among network members.

Commonalities of the attributes of social capital in the reviewed literature are that social capital is a function of influential relationships. Social capital is different from other forms of capital as it is not possessed by a particular individual or group, but is produced in the connections between individuals and groups. Although the relationships are valuable, social capital must be combined with other forms of capital in order to produce patient and organizational outcomes. Social capital acts as a moderator variable on other forms of capital in order to produce value.

Empirical referents of social capital reviewed in the nursing literature are varied and need to be further developed, refined, and researched. Common approaches to empirical measurement of social capital are often through proxy measures such as perceived trust, shared vision or values, social interaction, organizational commitment, and social unity. Across the studies reviewed, measures were inconsistent both in design and how social capital was treated as a variable. Only three empirical studies reviewed provide instrumentation which could be reproduced in another setting. Only one of these three studies developed and psychometrically social capital measures to reflect the complex nursing work environment.

Based on the literature review, a synthesized conceptual model was developed based on social capital theory and nursing intellectual capital theory. This synthesized model guides research of the moderating effects of social capital on other types of capital in producing patient and organizational outcomes. The conceptual model will be presented with recommendations for further research in the practice of mid-level nursing leadership. Implications for nursing leadership practice and healthcare organizations will also be discussed.

## H 10 - Leadership in Nursing Education

### Facilitating Scholarship Success through a Collaborative Faculty Group

---

*Camille Payne, PhD, MSN, BSN, RN, USA*

*Rachel E. Myers, PhD, RN, CDE, USA*

*Judith L. Hold, EdD, BSN, MSN, RN, USA*

#### Purpose

The purpose of this presentation is to describe the development and benefits of a collaborative faculty group for the purpose of facilitating scholarship goals and expectations.

#### Target Audience

The target audience of this presentation is nursing educators and health care administrators engaged in nursing scholarship.

#### Abstract

New faculty entering the world of academia often struggle with meeting university requirements for research and scholarship endeavors. In addition, balancing role expectations for teaching, service and scholarship can seem overwhelming. Furthermore, advancing nursing through the development of new and applied knowledge is not only essential for the individual, but vital for growth of nursing as a profession. This presentation will share strategies for successful faculty collaboration to achieve and balance role expectations for teaching, service and scholarship.

Nursing faculty have reported many barriers to scholarship development and writing for publication, including inexperience, lack of scholar mentors, time constraints, workload issues (e.g., teaching and meeting demands), anxiety and fear of failing, and lack of collegiality (Heinrich & Oberleitner, 2012; Ness, Duffy, McCallum, & Price, 2014). These barriers can interfere with a faculty member's progress in defining and achieving a scholarship program and meeting role expectations.

Setting up a program of research, and learning to write for grants can be a time consuming and arduous process, as not all schools and universities have research departments or personnel to provide support and guidance to individual faculty. Faculty members in some institutions have attempted to address this gap by forming collaborative groups which have been found to help increase scholarly productivity (Ness et al., 2014). A review of the literature, however, reveals this strategy to be underutilized.

In one comprehensive Southeastern university, three tenure track faculty members established a collaborative faculty scholarship group to provide peer support and encouragement in order to cultivate clear individual research programs and goals. Although the initial goals of this group were simply to meet regularly, and to set and achieve realistic short and long term goals, the combined energy and strengths of the members enabled achievement at a higher level than anticipated.

While not a part of the intentionality of the collaboration, as the group evolved, the three members were able to work both individually and collectively to generate presentations, articles and grants. Several factors contributed to this success, such as small group size, frequent and regular meetings, and holding each other accountable. In the initial ten months of collaborative efforts, combined achievements included 5 submitted grants (3 funded), 8 submitted scholarly articles (5 accepted; 3 decisions pending), and 12 submitted and accepted state, national and international podium or poster presentations. These outcomes suggest that this innovative faculty group strategy can be used as a model to promote collaborative nursing and interprofessional scholarship.

## H 10 - Leadership in Nursing Education

### The Use of Standardized Test Score Reports to Inform Instruction Using the Deming Model

---

*Mary Anne Schultz, PhD, MBA, MSN, RN, USA*  
*Geri Chesebrough, MSN, RN, CNE, USA*

#### Purpose

The purpose of this presentation is to identify how nurse educators and program administrators can meaningfully use reports from various standardized tests to inform evaluation of instructional strategy. A discussion of the uses and misuses of this evidence is offered working off reports from Mountain Measurement, NCSBN and ATI.

#### Target Audience

The target audience is nurse educators, program directors, deans and department chairs in nursing who are searching for meaningful ways to effect lasting continuous improvement in instructional strategy. Those who teach didactic or clinical courses are welcome as are those who evaluate classroom and program strategy, especially if remedial.

#### Abstract

When considering evidence-driven approaches to quality improvement in schools or departments of nursing, seldom is a true quality improvement circle observed. Too often, faculty “discuss” results of standardized test scores in ways that could be considered anecdotal, episodic, time-limited and perhaps, idiosyncratic. That is to say that unfortunately, a one-time only end-of-term discussion of the output of one set of standardized test scores are put forth, instead of results in a series of exams, longitudinally. Discussion of results for selected content areas for a student cohort, then, is usually eclipsed by the limitations of time (and know-how) obviating the opportunity for true quality improvement strategizing.

If faculty are given regular formal opportunities to discuss group results of high-stakes, proctored, content-mastery exams (such as those reported by Mountain Measurement, NCSBN and/or ATI), the chance to collaborate both with one course and across a set of courses might emerge if the Deming Plan-Do-Check-Act (PDCA) model is used. Structuring the groups with members representing like content domains (e.g. all medical-surgical nursing instructors) may provide a good beginning for planning a sole course for subsequent offerings but it falls short of true quality improvement if not restructured, in subsequent formal opportunities, to capture creative strategizing from a group of dissimilar content masters. That is, when teachers of courses across a curriculum are assembled, the opportunity to identify weak versus strong content areas traversing a spectrum of learning opportunities might arise. In this fashion, faculty might learn to understand, with depth, what is involved in the measurement of student outcomes, especially as course and program objectives are leveled and considered.

This presentation allows the attendee to witness how a plan for faculty development, in which regular formal opportunities for faculty to view and critically analyze reports of standardized test scores, was designed. With an emphasis on assigning similar, then dissimilar, faculty content masters to groups, the authors will walk the participants through a series of report interpretations identifying the uses, then misuses, of the evidence. Prototypes of data users will be presented, starting with the occasional faculty user of data-those who obtain, then record, a test score for partial course credit in one time-limited course. The presentation progresses, then, to a description of the power-user of data who will compile a set of scores for multiple student cohorts, over time, indicative of alleged teaching prowess alongside possible mitigating trends, again limited to a course over time. Finally, a plan from the program perspective, to align faculty from diverse content areas for more discriminating analysis of report data, will be discussed, in which emphasis is placed on the commonalities of categories of student performance, e.g. patient safety, comfort care, use of the nursing process. It is in this last crucial component, involving similar, then dissimilar faculty areas of expertise, in which true performance improvement might be

realized, especially if faculty can truly engage in the continuous, not static, nature of this process (across, not just within, courses).

Since the introduction of Deming quality improvement principles to health care environments began in the early 1990s, significant resistance has occurred through protestations that principles of Japan's automotive industry improvements (where the model began) could never apply to the human condition. In recent years, however, as hospitals and other health care environments have demonstrated fewer adverse outcomes with use of the PDCA model for provider and administrator decision-making, the use of the model is more frequent. Seldom is it seen used in higher education with few references to PDCA action circles for faculty identified in the literature. It remains to be seen if use of action circles, with changing faculty membership over time, can be associated to improved student learning outcomes such as improved test scores, particularly in nursing where high-stakes content-mastery testing is common and necessary.

## H 10 - Leadership in Nursing Education

### Promoting Excellence in Nursing through North-South Partnerships

---

*Nelouise Geyer, PhD, MCur, BCur, RN, RM, RPsyc, South Africa*

#### Purpose

The purpose of the presentation is to share the successes of a powerful North-South partnership in nursing education and leadership

#### Target Audience

The target audience of the presentation is faculty, health service administrators and clinical practitioners.

#### Abstract

**BACKGROUND:** Publically funded healthcare systems with well-trained primary healthcare professionals offer the best opportunity to deliver care to all. In South Africa the healthcare system is driven by nurses and midwives. The Atlantic Philanthropies believed that strengthening the healthcare system in South Africa has to start with nursing education and training institutions to become world-class teaching facilities able to attract high-caliber faculty and students. Nurses have a potentially powerful role to play in their communities and rebuilding the morale, image and recognition would have broader social implications for communities and the profession.

**OBJECTIVE:** Atlantic Philanthropies set out to restore the image and reputation of nursing as a profession in South Africa by strengthening infrastructure, scholarship and research to ultimately restore the pride in nursing to make a lasting difference to the health and healthcare of South Africans.

Supporting the revitalization and development of the nursing profession in South Africa provided a good fit with Atlantic's overall approach of involvement in areas where other players had traditionally ignored.

**METHODS:** To support this goal Atlantic invested US\$ 32.8 million and was subsequently joined by ELMA Foundation as a co-funder. Technical support was made available to assist organizations to develop funding proposals to access a portion of the funding.

**RESULTS:** Overall outcomes of this partnership provided for increase government funding and commitment to nursing, improved sustainability and collaboration in the profession and a steadily increasing number of trained nurses. Some of the specific outcomes of this partnership will be highlighted which include higher education, professional development, research and scholarship support, development of nurse leadership. As with any other project and partnerships, challenges were experienced in the execution of the participating projects.

**CONCLUSION:** In spite of the challenges experienced, the investment made in the nursing sector has had a major catalytic and sustainable positive impact in nursing that is ongoing. A number of lessons have been learned that other funders should consider when a larger group of potential projects are considered.

## H 11 - Leading Interprofessional Health Education

### Building a Center for Nursing Excellence Using a Role-Based Model for Accountability and Outcomes

---

*Miki Goodwin, PhD, MSN, BSN, RN, PHN, USA*

*Joanne T. Clavelle, DNP, MS, BSN, ASD, RN, NEA-BC, FACHE, USA*

#### Purpose

To describe how the establishment of a Center for Nursing Excellence using a role-based practice model provides the infrastructure for nurses at all levels to have centralized access and support to transform evidence-based practice, education, and research across an entire network, with resources for innovative ideas and opportunities to excel.

#### Target Audience

all nurses from the bedside to boardroom. In addition, an interprofessional audience may include all administrative and managerial professionals who work in a health system, as well as the members of the interdisciplinary team including but not limited to, physicians, pharmacists, respiratory therapists, physical therapists.

#### Abstract

The impetus to create the Center for Nursing Excellence in a southwest region hospital system coincided with new nursing leadership and a newly merged health network comprised of five hospitals. In order to align with the core tenets of Magnet® (ANCC, 2013), a feature of all five hospitals, and to provide access to resources for all nurses at all levels in all areas of nursing, a strategy was needed to bring together the key pillars of professional nursing practice, education, research and innovation. The new Network Chief Clinical Officer established the vision for the Center and pulled together the leadership team to make this vision a reality.

The Center was created on the philosophy of promoting a nursing environment that is as humanistic and compassionate as it is scientifically and technologically sophisticated (adapted from Arnold P. Gold Foundation, 2013). This is achieved through research and education of best practice at all levels, and by collaboration with a broad range of partners who are experts in today's issues, and addressing tomorrow's solutions through research to ensure the best information is available to support diverse populations and their health.

A role-based practice model (O'Rourke & White, 2011) was adopted as a framework the Center's strategic plan and activities of the Center. A key tenet of the model is to promote better outcomes through ownership and accountability for practice at the managerial and clinical level. Within keeping of the Institute of Medicine Report, The Future of Nursing (2011) a long term goal of The Center is to make a global impact on transformative evidence-based practice, professional role development, education, research, and continual Magnet® readiness. The structure of the Center was designed to make the role-based model operational by hiring a diverse team of experts to lead and collaborate using an interdisciplinary and interprofessional approach to healthcare, based on the main investigative elements: patient outcomes, population health, and a well prepared healthcare workforce.

The Center staff includes a network director for each area, including practice, education, research, outcomes and Magnet. Under the direction of an Associate Vice President, this team of directors actively engage with relevant work groups, clinical and managerial, to link accountability and ownership of practice across all levels of the network. Key strategies for the Center include: the Director of Nursing Practice investigating and helping to standardize policy to ensure a model driven approach; the Director of Research providing population data to ensure a patient-centered approach based on precise patient profiles; the Director of Nursing Education ensuring educational activities are consistent across the network, and the Director of Nursing Outcomes working with nurses to make sure they understand their professional role obligation to measure and monitor outcomes and learn how to actively engage in the

process. In this sense, the executive leadership owns accountability for The Center as a vital structure to the network, while each director owns accountability for supporting the themes of their expertise. None of this is possible without close alignment with a well-defined shared governance system that helps make the key professional concept of control of practice a reality. The Center provides vital support for the development of the Councils as they increase their knowledge and skill related to governance and decision-making practice. A shared governance approach requires a flat organizational structure as this increases likelihood that nurses at all levels will be actively engaged in transformational change and the development and implementation of best practices.

Strong academic-practice partnerships have been formed resulting in joint appointments, a distinguished scholar in residence program, and shared teaching and mentoring responsibilities for staff and students at all levels (Baccalaureate to Postdoctoral). In addition, interprofessional and interdisciplinary research, both fundamental and applied are being fostered through The Center as well as a scientific-educational exchange with a Sister City in Kenya. All outcomes are monitored, reported and disseminated from the Center via various means, including through shared governance councils, a website, newsletters, forums and huddles.

# H 11 - Leading Interprofessional Health Education

## Interprofessional Health Education: Preparing for Collaborative Practice

---

*Michele S. Bednarzyk, DNP, FNP, BC, USA*  
*Kathaleen C. Bloom, PhD, CNM, USA*

### Purpose

The purpose of this presentation is to describe the development and implementation of an interprofessional and intercollegiate educational experience.

### Target Audience

The target audience for this presentation is educators and administrators interested in improving interprofessional communication and collaboration for their students.

### Abstract

It is clear to many leading national organizations, such as the Institute of Medicine and other professional groups and accrediting bodies that learning in teams with other health professionals is an important way to improve the health and safety of the population. Interprofessional Education Collaborative Expert Panel (2011), identified four Competency Domains for interprofessional collaborative practice: values and ethics, roles and responsibilities, teams and teamwork, and communication.

Interprofessional health education (IHE) is an innovative teaching-learning approach in which members of more than one health profession learn interactively to improve collaborative practice. The purpose of IHE is to foster strong relationships and partnerships among health care providers to maximize the quality of patient care.

IHE is both interprofessional and intercollegiate in nature. Participants include graduate students in the School of Nursing, Department of Nutrition and Dietetics, and Physical Therapy Program at one southeastern university as well as second year students from the College of Pharmacy at another southeastern university. Three sessions are planned across an academic year. These case studies include all elements of the four interprofessional education competency domains centered around case studies in ethics, safety, and medication errors. Students do preparatory readings prior to each session, upon which they are tested. Students then participate in interprofessional group solutions for problems related to the content areas.

Faculty in the various disciplines facilitate interpersonal and communication skills between the students representing different health-care providers. Students practice shared decision-making, manage conflicts and show flexibility when working with others. Ultimately, joint learning opportunities for students from different health science colleges will result in more collaborative practice skills when these students become health professionals, and this in turn will lead to higher quality, safer clinical care.

## H 11 - Leading Interprofessional Health Education

### Interprofessional Education to Enhance Health-Related Outcomes for LGBT Clients: How One Academic Medical Center is Leading the Way

---

*Tanya R. Friese, DNP, RN, CNL, USA*

*Jamie Cvengros, PhD, USA*

*Cecilia Hardacker, BSN, RN, USA*

*Paul Kent, MD, USA*

*Antonio Logan, BA, USA*

*Edward Ward, MD, MPH, USA*

*Jay Behel, PhD, USA*

#### Purpose

The purpose of this presentation is to educate nursing faculty, medical faculty, and their students on the importance of interprofessional practice aimed at teaching cultural competence, best practices, and adoption of appropriate standards of care focused on the unique healthcare needs of the lesbian, gay, bisexual, and transgender (LGBT) population.

#### Target Audience

The target audience if this presentation is healthcare professions faculty and students, current providers, and allies.

#### Abstract

Healthy People 2020 and the Institute of Medicine are among recent reports that underline the need for culturally competent healthcare for lesbian, gay, bisexual, and transgender (LGBT) individuals. In November of 2014, the Association of American Medical Colleges (AAMC) released guidelines for training physicians to care for people who are LGBT, gender nonconforming, or born with differences of sex development. This is the first set of formal comprehensive standards to help medical schools and health care organizations train providers in the health care needs of these patients. The American Nurses Association (ANA) concurs through their Diversity Awareness in Professional Nursing. In order to provide appropriate care, it is necessary to properly educate health professions students in the academic and clinical setting. Biases held by students must be addressed during their educational careers if these individuals are to become effective providers. Currently, in Canada and the United States medical and nursing students report only 5 hours of LGBT content in school. Gaps in LGBT related content create barriers and inhibit a beneficial patient-provider relationship.

Rush University has been formally educating medical and nursing students to work with individuals who identify as lesbian, gay, bisexual and transgender (LGBT) since 2011. Curriculum focuses on the historical context of identifying and livings as LGBT, healthcare barriers and disparities experienced by the LGBT population, sex and sexuality, legal concerns, association with youth experiencing homelessness and exploitation, risks of suicide and substance abuse, the transgender community, HIV /STIs, and strategies to promote engagement and retention in healthcare. Students also meet self-identified gay faculty members, students, and patients through panel presentations.

In the College of Medicine, LGBT content is introduced in the first week of medical school during clinical skills intensive. It is also included in the social determinants of medicine, "Physicianship" modules during student's M1 and M2 year. Prior to the M2 module, medical students complete the Implicit Association Test for sexuality, race, and a third test of their choosing. In the most recent cohort, over 98% of students attending the classes reported they were able to identify challenges in obtaining appropriate healthcare experienced by sexual minorities. In addition the medical school uses simulated patient extensively. In a random fashion, simulated patients will identify as LGBT to help the student become comfortable and to learn not to assume a patients LGBT status is necessarily connected to their clinical complaint.

In the College of Nursing, LGBT content has been integrated into several courses including Mental Health Nursing, Community and Public Health Nursing and is being added to the Advanced Health Assessment course. Students meet LGBT faculty during the first week of nursing school as part of their introduction to diverse populations. During the third term, in Mental Health nursing, students attend a 6-hour Health Education about LGBT Elders (HEALE) cultural competency curriculum. To date, over 250 individuals, largely Generalist Entry-level Masters' nursing students, have attended these sessions. Remarks are overwhelmingly positive with comments speaking to the great need for this type of education for example "I never knew how to address patients who were transgendered-now I know how to do that". In Community and Public Health, students are asked to formulate questions for an expert panel discussion and report they appreciate the candid responses panel members share. Students are tested about LGBT related content in each course.

Moving forward, Rush University is working with the curricular recommendations of the AAMC and ANA and to fully integrate LGBT content into our course with an emphasis on interprofessional education. Physicians and nurses, working together, with education based on a common set of knowledge, attitudes, and skills are most able to provide the highest standard of care in a safe, non-judgmental environment.

## H 12 - Leadership Development in Nursing Education

### An Evaluation of Emotional Intelligence in Undergraduate Nursing Student Leaders Over 4 Years

---

*Cindy L. Costanzo, PhD, RN, CNL, USA*

#### Purpose

The purpose of this presentation is to disseminate the findings of a leadership development program which assessed the changes in Emotional Intelligence using the EQ-i 2.0™ tool in a cohort of undergraduate nursing students enrolled a four-year extracurricular Leadership Scholars program.

#### Target Audience

The target audience of this presentation includes inter-professional providers, caregivers and educators who are interested in changing the culture of their organization by hiring caregivers who are leaders at the point of care, who are emotionally mature to manage the complex care processes of today's healthcare arena.

#### Abstract

**Purpose:** The purpose of this project was to assess changes in Emotional Intelligence using the EQ-i 2.0™ tool in a cohort of undergraduate nursing students enrolled in a four-year extracurricular Leadership Scholars program.

**Aims:** 1) to explore the student's change of EQ-i 2.0™ scores over a four year period; 2) to explore the student's perception of group involvement, mentoring, relationship development and self-reflection; 3) to compare the change of EQ-i 2.0™ scores with the students perceptions of growth with group involvement, mentoring, relationship development and self reflection.

**Background:** Emotional Intelligence (EI) is emerging as an essential construct in nursing leadership development and is correlated to a person's ability to communicate, collaborate, and manage relationships. EI is foundational to creating a team-based collaborative work environment to maximize clinical, quality, safety and cost outcomes. The four concepts (group involvement, mentoring, relationship development and self reflection) composed the EI conceptual framework for the program intervention.

**Methods:** A descriptive longitudinal comparative design with a convenient sample of students enrolled in the Leadership Scholars program over a 4 year time period. Students completed the EQ-i 2.0™ tool at baseline in their freshman year and annually. The Leadership Scholars program provided students opportunities to engage in the following: reflective journaling; self assessments; and experience a mentor and mentee role. Students participated with alumni leaders in group and service activities and service incorporating Jesuit values as they developed and practiced leadership, communication, and collaboration skills.

**Evaluation of Aims:** 1) Undergraduate nursing students enrolled in the Leadership Scholars program took the standardized EQ-i 2.0™ tool annually and a comparison of the pre/post EQ-i 2.0™ was conducted and analyzed. 2) A qualitative evaluation was conducted to evaluate student's perception of their group involvement, mentoring, relationship development and self reflection; 3) A comparison of the change of EQ-i 2.0™ scores with the qualitative evaluation of student's perception of their group involvement, mentoring, relationship development and self reflection was completed.

## H 12 - Leadership Development in Nursing Education

### Nursing Honors Programs Designed to Meet Global Healthcare Challenges

---

*Judith A. Vessey, PhD, MBA, RN, FAAN, USA*

*Catherine Y. Read, PhD, RN, USA*

*Judith Shindul-Rothschild, PhD, RNPC, USA*

#### Purpose

The purpose of this presentation is to discuss evidence that validates the need for, and strategies to, develop implement quality undergraduate honors programs designed for the 21st century and identify components of an honors program that will prepare emerging nurse leaders to advance nursing, healthcare, and health outcomes globally.

#### Target Audience

The target audience of this presentation is nursing faculty and nursing educational administrators.

#### Abstract

The presence of a nursing honors program is one indicator of baccalaureate program excellence and a pathway to developing nursing leaders for the global community. An evidence-based practice approach was used to determine the state of science regarding nursing honors programs. Initially the existing research and educational literature related was reviewed. Results indicated that the literature uniformly supported the value of nursing honors programs, but little is known about the key content and contextual components needed for a quality nursing honors program. There was also little evaluative information regarding the role honors programs play in the development of future nurse scholars and nurse leaders. Based upon the synthesis of the literature and to further our understanding of nursing honors programs, a directed survey of nursing honors programs was conducted, revealing both strengths and challenges. Finally, a survey of potential honors students was conducted to ascertain their preferences regarding honors program structures and processes. Findings across these three domains—scientific literature findings, expert experience, and user preferences—were compiled. ‘Best practices’ for contemporary nursing honors programs that prepare leaders to serve locally and lead globally are proposed.

Key structural components for successful implementation include: financial support, committed advisors, flexible admission and curriculum design, mentored opportunities for research, opportunities for professional socialization, and a senior capstone project. A research emphasis is requisite but insufficient. Other processes embedded in honors programs must embrace leadership and networking opportunities. To address the needs of the global community, identified activities leading to evidence-based practice capstone projects included global public health coursework, international study experiences (semester or immersion), cultural reflections, volunteer work with individuals of varying cultural backgrounds, and foreign language training and opportunity to use foreign language in clinical settings. Challenges in developing an honors program, such as increased workload of faculty and students as well as insufficient funding, are described. Practical recommendations such as leveraging university and community resources are proposed. The proposed recommendations are designed to facilitate adoption of honors programs at baccalaureate schools of nursing. Outcomes of honors program graduates include being prepared as emerging leaders in the global community and ready to embrace the next steps, including graduate education, to help them realize their full potential. Creation and expansion of nursing honors programs in baccalaureate nursing education to address the healthcare needs of the global community requires the commitment of faculty and financial resources by schools of nursing.

## H 12 - Leadership Development in Nursing Education

### Spirituality in Nursing Education: Are We Teaching Our Students to Provide Spiritual Care?

---

*Kelly Moseley, DHSc, MSN, RN, USA*  
*Sharon Cannon, EdD, RN, ANEF, USA*  
*Carol Boswell, EdD, RN, CNE, ANEF, USA*  
*Joyce Miller, DNP, RN, WHNP-BC, FNP-BC, USA*

#### Purpose

To discuss layers of research regarding spirituality in nursing (among students, practicing nurses, and a more recent study with nursing faculty).

#### Target Audience

Individuals who teach in the academic setting (clinical or didactic setting). Individuals who work in a clinical setting may also find this presentation appealing.

#### Abstract

Nurses are mandated by accreditation organizations such as Joint Commission to address spiritual aspects of the patients. This makes it paramount to insure that holistic care is clearly addressed within the curriculum. The presenters conducted a qualitative study 3 years ago to determine if students felt they were receiving education to equip them with the knowledge to provide spiritual care. The study queried students from the RN-BSN program, the Traditional Undergraduate program, and the graduate program at Texas Tech University Health Sciences Center (TTUHSC) School of Nursing through the review of entries within a journaling network. This study was the first level for future studies to determine where the gap exists regarding spiritual care. The second layer of research was to determine if practicing nurses (including nurse practitioners) provided spiritual care, their comfort level in providing spiritual care, and their belief their nursing education program covered spirituality care. These studies provided the foundational framework for a third study to consider if and where spiritual care was positioned within their curriculum. This study carefully reviewed the types of faculty members as it related to what type of spirituality content was presented within a curriculum. Along with this information, attention was given to identifying key spirituality skills that are used within different schools. This project will lay the foundation for additional work in this region of Texas and beyond.

## A 16 - Clinical Aspects of Pediatric Care

### Pediatric Continuity of Care

---

*Amara Michella Altman, MSN, BA, RN, USA*

#### Purpose

The purpose of this presentation is educate healthcare professionals on how improve the transition of care for pediatric kidney transplant recipients from hospital to home. Specifically, this presentation highlights evidence based transition of care topics for pediatric transplant recipients and their families.

#### Target Audience

The target audience of this presentation is all healthcare professionals who work with pediatric transplant patients.

#### Abstract

Currently, there is no patient centered pediatric discharge Transition of Care (TOC) plan on Tower 8. No educational materials are readily available on this topic either. This is problematic because an initial survey on Tower 8 indicated that many of the nurses at the bedside are uncomfortable educating pediatric transplant patients and their families.

The goal of our project is to implement an evidence based pamphlet highlighting important TOC topics specifically for pediatric transplant recipients. An initial survey was distributed to a multi-disciplinary group of nurses, nurse practitioners, transplant coordinators, and physicians to assess baseline knowledge pertaining to pediatric TOC. We worked closely with the pediatric nephrologists and outpatient RN coordinator to create an evidence based pamphlet addressing essential TOC topics. We reviewed literature from CINAHL, PUBMED, OVID, and COCHRANE databases. Articles from 2009-2013 were used in the literature review. Research indicates that pediatric transplant patients are a unique and vulnerable population with a high risk of life threatening complications. Addressing these potential issues through TOC education immediately after transplantation not only improves patient outcomes, but it also improves the quality of life for these pediatric patients and their families.

The results of our survey indicated limited knowledge regarding pediatric TOC among all practitioners. One hundred percent of practitioners believed additional teaching material are needed for pediatric transplant patients and their families, which is standardized and in low literacy format. The next step is to actually implement the evidence based pamphlet at the bedside. A post survey will then be distributed to the same sample of practitioners 6 months and 1 year post pamphlet implantation on Tower 8. We hypothesize this new educational tool will improve TOC knowledge for pediatric transplant recipients among all practitioners.

## A 16 - Clinical Aspects of Pediatric Care

### Children with Cerebral Palsy Preferences for Adventures and Their Reasons Why

---

*Judith Lang, BSN, RN, CPN, USA*

*Lamara Love, BSN, RN, CPN, USA*

*Sha Clark, MSW, LISW-S, USA*

*Pamela Studer, BSN, RN, USA*

*Victoria von Sadowszky, PhD, RN, FAAN, USA*

#### Purpose

The purpose of this study was to: 1) ascertain what types of adventures were appealing to children with CP, and 2) what were their reasons for choosing these adventures.

#### Target Audience

Staff nurses Nurse researchers interested in children cerebral palsy

#### Abstract

Approximately 1 in 323 children are diagnosed with cerebral palsy (CP). Children with CP are differently abled, 41% of children with CP have limited abilities to crawl, walk, run, or play and up to 31% need special equipment to supplement mobility (Boulet, et al., 2009; CDC, 2015). Hence, children with CP are often less physically active than and have fewer opportunities for socialization with their typically developing peers. In order to engage children with CP in more activities, they need to learn how to adapt different activities to their gross motor ability (CP, 2015). A new intervention is being developed to facilitate learning in this capacity; however, prior to developing the intervention it was important to know what types of “adventures” (activities) the children wished to participate. The purpose of this study was to: 1) ascertain what types of adventures were appealing to children with CP, and 2) what were their reasons for choosing these adventures. After IRB approval, children with CP (N = 100) were approached to be in a 5 minute study addressing the study purposes. After parental/guardian consent and child assent, children were asked to rate their desire to participate in the following adventures: rock climbing, super powers, hockey, or camping. Reasons for participating in this event were also assessed. Data will be analyzed using descriptive statistics. Differences in ratings of adventures and reasons by gender (female, male) and age (5 – 10 yrs., 11 yrs. and older) will be assessed through t-tests and non-parametric statistics. Data collection is in progress. The results from this study will be the first of its kind assessing ratings of different types of activities/adventures and reasons why this population wishes to participate in them. Nurses and health professionals can use these findings to understand what types of activities appeal to this group and target health messages around these activities.

## A 16 - Clinical Aspects of Pediatric Care

### Spirituality and Religiosity as an Approach to Coping for Adolescents Living with Sickle Cell Disease: A Review of the Literature

---

*Dora Clayton-Jones, PhD, MSN, BSN, RN, CPNP-PC, USA*  
*Kristin Haglund, PhD, RN, PNP, FNP, APRN, USA*

#### Purpose

The purpose of this presentation is to provide researchers and clinicians with a review of research on spirituality and religiosity in adolescents with sickle cell disease

#### Target Audience

The target audience of this presentation is any nurse, educator, or researcher interested in adolescents, sickle cell disease, spirituality and health, or psychosocial research.

#### Abstract

**Purpose:** The purpose of this presentation is to provide researchers and clinicians with a review of research on spirituality and religiosity (S/R) in adolescents with sickle cell disease (SCD). The review is based on a systematic review of quantitative and mixed-methods research published in peer reviewed journals. Adolescents with SCD experience symptoms, treatments, and complications of their condition that may hinder them in their physical, psychosocial, emotional, and academic functioning. Spirituality and religiosity has been shown to improve coping and correlates with positive health outcomes in research conducted with children and adolescents.<sup>2-4</sup> Consideration of S/R will enlighten clinicians on the spiritual elements of adolescents and allow for enhanced individualized care when constructing interventions and evaluating health outcomes.

**Methods:** Studies were sought that examined S/R among adolescents with SCD. This search yielded one publication. The search was expanded to studies that included children and adults with SCD. This search strategy represented a developmental view in which the S/R experiences of younger and older persons with SCD were anticipated to provide insights into the experiences of adolescents. Thus studies were included in this review if they met the following criteria: (a) examined S/R in adolescents and/or children with SCD; (b) examined S/R among parents of adolescents and/or children with SCD; (c) examined S/R in adults to include older adolescents aged 18-21; (d) were quantitative or qualitative articles; and (e) were published in peer-reviewed journals. The databases searched were Cumulative Index to Nursing and Allied Health Literature (CINAHL), Health Source Nursing/Academic, ProQuest Health Module, PsycINFO, Medline, PubMed, and the American Theological Library Association (ATLA). The search strategy used in this review included the following string of terms: "sickle cell disease" + "spirit\*" (for spiritual or spirituality) + "adolescen\*" (for adolescent, adolescents, or adolescence) or "x..." The alternate term included the following: "children," "religio\*" (for religion, religious, or religiosity), "health," "pediatric," and "coping." A total of 85 articles were retrieved. Eleven articles met the inclusion criteria and were included in this review.

**Results:** Eleven studies addressed S/R and SCD; one reported on S/R in children with SCD, three included adolescents and children with SCD, one included only adolescents with SCD, and six included adults 18 years and older. In reviewing the studies, four themes emerged including S/R as sources for coping strategies, S/R coping strategies and pain management, S/R coping strategies and health care utilization; and S/R coping strategies and quality of life.<sup>2, 3</sup>

**Conclusions:** Spirituality and religiosity are meaningful concepts for adolescents with sickle cell disease and promote healthy outcomes. Research studies to further investigate the impact of S/R for adolescents are essential to understanding the concept from a developmental perspective. Further exploring the association of S/R coping strategies with pain management, health care utilization, and quality of life will offer direction for future interventions that improve overall health and wellbeing.

## A 17 - Improving Nursing Care in the Clinical Environment

### Optimizing Electronic Health Record Use for Management of Type 2 Diabetes Mellitus in Primary Care

---

*Nancy J. L'Heureux, DNP, MA, APRN, CNP, FNP-C, USA*

#### Purpose

The purpose of this presentation is to disseminate the results of a technology project to expand the use of the electronic health record and implement evidence based workflow processes to increase improved care for patients with type 2 diabetes mellitus.

#### Target Audience

The target audience of this presentation includes nurses and nurse practitioners interested in optimizing care for patients with type 2 diabetes through diabetes guidelines integrated into the EHR and evidence based workflow processes.

#### Abstract

Primary care providers bear much of the responsibility for the ongoing management of the costly, disabling, and deadly chronic disease, type 2 diabetes mellitus (T2DM). A preponderance of evidence demonstrates that implementation of diabetes management guidelines improves patient outcomes. However, primary care providers have inconsistent to poor adherence to guidelines, resulting in significant gaps between evidence based and actual care for people with T2DM. Barriers to optimal care include limited appointment times, lack of ready access to patient information, and limited knowledge of guideline recommendations. Three key objectives for diabetes management defined by the ADA are optimizing provider and team behavior, supporting patient behavior change, and changing the system of care. Optimizing the use of the electronic health record (EHR) by configuring a clinical decision support system (CDSS), changing workflow patterns to include team management, and implementing a structured patient education and behavior change system can improve management of T2DM in primary care. In a Doctorate of Nursing Practice scholarly project at a small primary care clinic, (EHR) use was expanded to incorporate T2DM management guidelines, and clinic workflow was structured for efficient evidence based care.

Core functions of the EHR include effective care delivery, facilitation of chronic disease management, improved efficiency, and enhanced patient safety. Yet, studies of the effect of the EHR on quality of care reveal mixed results including superior care, inferior care, and no association between EHR use and quality of care. Researchers agree that EHR use does not guarantee superior care, but that advanced functions such as CDSS and registry activation make the EHR invaluable. Registries and CDSS tools, which organize, filter, and present useful and timely information contribute to improvement in care. However, small clinics struggle with optimal use of advanced EHR functions because the systems are complex. Optimization of the EHR is a necessary but insufficient means to improve care; modification to workflow is also required.

Although the EHR used at the project clinic came programmed with a Diabetes Registry and a CDSS, the EHR lacked full optimization. Specifically, the system did not capture the data entered during the visit or from laboratory test results and insert the data in the the Registry or the CDSS. The author of this project is not a trained informaticist, but used a systematic process to optimize the system. First, a literature review was conducted regarding diabetes management guidelines and use of the EHR for improving management of patients with diabetes. Then, the website for the EHR vendor was searched. Product development and release webcasts were viewed to obtain an overview of the EHR system and its functionality. Finally, the help documents on the system were examined to determine configuration technique. Following the document instructions, the EHR was configured to allow visit and test result data to populate the Diabetes Registry and activate alerts. When following the directions failed to achieve the intended results, contact with the EHR vendor resulted in interventions by the vendor at the server level to turn on desired capabilities.

A variety of interventions were implemented to augment the EHR. Logical Observation Identifiers Names and Codes (LOINC) were linked with Current Procedural Terminology (CPT) codes to facilitate data capture. Because laboratories use different codes, it is important to choose the laboratory specific code. Structured data was created in Progress Notes section of the EHR, and alerts were configured to provide reminders for guideline based intervention. In addition, a diabetes flowsheet was configured to give providers a graphic view of patient progress. To facilitate barriers to providers' of lack of time and lack of easy access to guidelines, a Diabetes Order Set was developed. Commonly used medications, evidence based tests, procedures, and referrals were integrated into the order set. In addition, PDF documents were uploaded into the system including the American Association of Clinical Endocrinologists' Comprehensive Diabetes Management Algorithm 2013 and the basal insulin algorithm from the American Diabetes Standards of Care 2015. Documents from the National Institutes of Health including foot care, chronic kidney disease, and hypertension management were also uploaded. The PDF documents provide quick access to guidelines from the order set screen of the EHR, reducing time needed to locate references.

During the literature search, reference was found to federally funded Regional Extension Centers, which provide assistance to clinics with EHR implementation. A Google search led to the Regional Extension Center for the state. Although the Regional Resource Centers are being phased out, the Centers for Medicare and Medicaid have collaborated with Quality Improvement Organizations and will continue through 2019. In many states, Qualis Health is the contractor designated to assist in data collection, analysis, and interventions to improve care.

As a result of this DNP project, the clinic has partnered with Qualis Health in an innovation to improve diabetes care. Qualis Health will assist the clinic in ongoing quality improvement strategies and technical assistance in gathering data and improving workflow and documentation. Assistance with Physician Quality Reporting System (PQRS), Value-Based Modifiers (VM), and Quality and Resources Use Reports (QRURs) is provided by Qualis, along with strategies for participating in federal reimbursement programs. The clinic will be responsible to report quarterly data on diabetes intermediate outcomes including HbA1c, lipids, blood pressure, foot exam, and eye exam. The clinic will also refer eligible patients to self-management education identified by Qualis. Assistance for data collection, reporting, and workflow configuration will be provided by Qualis.

An office workflow process was developed to integrate team activity for efficient evidence based care for patients with T2DM. First, a flowchart was developed to describe existing practice. Based on literature evidence, the workflow was revised to integrate staff as part of the team to increase efficiency. Nursing staff identify patients with T2DM by diagnosis or medications, ascertain the managing provider, establish the date of last laboratory work, follow a protocol for influenza and pneumococcal immunizations, lay out a monofilament, and prepare the patient for the provider by asking the patient to remove footwear for foot checks. Front staff ensures that patient education given verbally by the provider and nursing staff is offered to the patient in paper form or is uploaded to the patient portal. Future training with Qualis regarding quality improvement will empower staff to see processes from a quality perspective.

To evaluate the effectiveness of these innovations, an acceptability and satisfaction survey was developed and feedback from providers, staff, and content experts was incorporated into the project. Partnership with Qualis Health ensures the sustainability of this project, and will assist this clinic in providing ongoing quality healthcare. In conclusion, this technology solution can assist all staff, nurses and providers in the clinic in better meeting the needs of patients with diabetes and can promote improved patient outcomes through continuous quality improvement initiatives. Nurses at other clinics can use the results of this project to optimize the EHR and clinic workflow to improve patient management not only for diabetes but also for other diseases.

## A 17 - Improving Nursing Care in the Clinical Environment

### Building an Indigenous Skill-Mixed Nursing Care Model in Taiwan

---

*Yao-Mei Chen, PhD, RN, Taiwan*  
*Hsiu-Hung Wang, PhD, RN, FAAN, Taiwan*  
*Ching-Chiu Kao, MSN, RN, Taiwan*  
*Shu-Chen Chang, PhD, RN, Taiwan*  
*Tse-Yun Chang, MSN, Taiwan*  
*Hui-Chen Tseng, RN, PhD, Taiwan*  
*I-Chin Huang, MSN, RN, Taiwan*

#### Purpose

The purpose of this study is to establish a nursing care model for clinical practice in Taiwan at the national level, with skill mixed personnel, including nurse aides, registered nurses, and advanced practice nurses.

#### Target Audience

The target audience of this presentation is clinical nurses, educators, managers, and administrators.

#### Abstract

**Background:** Nurses in Taiwan have been responsible for many logistic functions for patient's hospitalization. Along with the societal changes, the patients' healthcare needs are evolving and have caused heavy nursing workload and serious nursing shortage in Taiwan.

**Purpose:** The purpose of this study is to establish, at the national level, an innovative model of nursing care for clinical practice in Taiwan.

**Method:** To establish a national nursing care model, the study was conducted in several steps. Step 1, a core team was assembled by 15 national experts from healthcare systems and universities across the country. The core team drafted a basic model for nursing care, including personnel, qualification, education and training, scope of practice, and staffing allocation. Step 2, three regional focus groups were held to interview 4 scholars, 35 nursing administrators, and 22 clinical nurses. The officials were invited to participate in each focus group. The interviews developed several practice-based nursing care issues and have reached preliminary consensus on the model structure. Step 3, a symposium was held with 24 experts participated to establish the reliability and validity of the model structure and the model system. Step 4, three regional conferences were held to communicate with 407 nursing representatives in the areas of clinical practice, associations and unions, and nursing schools and universities. Step 5, the indigenous nursing care model was organized and submitted to the Ministry of Health and Welfare (MHW) for policy development.

**Results:** For the current healthcare systems in Taiwan, skill-mixed collaborative team for nursing care is suggested. Healthcare personnel should include nurse aides, registered nurses, and advanced practice nurses. While national guidelines are not established, this study collects typical consensus from multiple areas. Two nursing care models were illustrated and each has the weakness and strength discussed.

**Conclusion:** MHW has to publicize and legitimize the role functions, qualification, education and training, scope of practice, certification, and staffing allocation. An indigenous model of nursing care is crucial for resolving the dilemma of nursing shortage and heavy workload.

## A 17 - Improving Nursing Care in the Clinical Environment

### Description, Application, and Evaluation of a Model to Teach Community-Based and Population Health across Diverse Clinical Experiences

---

*Elizabeth J. Van Dyk, DNP, APN-BC, USA*

*Sarah Valentine- Maher, MSN, FNP, USA*

*Janet P. Tracy, PhD, RN, CNE, USA*

#### Purpose

The purpose of the presentation is to describe the evaluation and educational implications of the Pillars Constructivist Model in community nursing education. The presentation includes a review of the model as well as results of the mixed-method assessment measuring student growth and the model's ability to provide consistent learning opportunities.

#### Target Audience

The target audience of the presentation is baccalaureate clinical educators and administrators in the community/ public health field as well as community health liaisons and partners of nursing programs.

#### Abstract

Both population health and direct nursing care in the community are important elements in educating baccalaureate nurses. The Pillars Constructivist Model was devised to facilitate clinical teaching at both levels and offers a unifying clinical paradigm with structural and contextual components to support learning at diverse public health sites. The foundation of this model rests upon five conceptual Pillars. These Pillars include:

1. Incorporate determinants of health in nursing care of population aggregates and communities.
2. Provide direct care based on evidence and best practices in community settings.
3. Integrate sensitivity to and appreciation of lived experiences of health and illness into nursing practice.
4. Align the comprehension of public health nursing roles with one's own ethical and professional formation.
5. Demonstrate the ability to collaborate as a member of a multidisciplinary team within the health care system to develop, implement, and evaluate health care provided to clients across the age span.

There has been a call within nursing education to generate evidence that demonstrates the efficacy of models for community/ public health clinical education. The author's approach was a mixed-method study to assess the efficacy of the Pillars Constructivist Model under two overarching questions. The first question was whether the model was able to serve as a unifying structure to facilitate consistent opportunities for student learning in all areas across diverse clinical experiences. The second question was to explore if the model was able to consistently facilitate growth in understanding and disposition to act in all five conceptual Pillars.

A total of 36 students and 6 faculty members participated in in the evaluation to assess the model after its inaugural semester of implementation. The methods included a rating scale measuring the model's ability to provide consistent learning opportunities at both population and direct care clinical sites, a case study that measured student growth within the five conceptual Pillars and a faculty focus group.

Results were calculated utilizing descriptive, parametric and non-parametric testing. The rating scale of perceived support of the model demonstrated a student average of 6.51 on a 0 to 10 scale, while faculty average mean was 8.18. Faculty ratings were higher than student ratings for each Pillar with these differences significant for Pillar 2 ( $p = .014$ ) and Pillar 5 ( $p = .008$ ). The semester case study results were tabulated based on a rubric and the difference in means between the pre and post semester results were calculated. Results revealed significant growth from beginning to end of semester for Pillar 5 only ( $p =$

0.04). With the exception of Pillar 4, the remaining Pillars indicated some improvement of growth. The summed results of the case study (with the exception of Pillar 4) identify a significant change in total concepts from beginning to end of semester ( $p = .05$ ).

The findings indicate that the model was able to serve the use of multiple small direct care and population focused sites while maintaining consistent concept based learning opportunity for all students. The findings from the case study are nonconclusive regarding demonstration of student growth, however results are suggestive of efficacy of the model as a whole. Although our inaugural evaluation was small in size, the data provides a first step in measuring change in application of knowledge and experience that is relevant to considering the impact of this model on future nursing practice. The authors are led to recommend the continued use and evaluation of the Pillars Constructivist Model and that the model be considered for use in baccalaureate nursing programs.

*Rebecca Ellis, BScN, RN, Canada*  
*Fahreen Rajani, BScN, RN, Canada*  
*Winnifred Savard, BScN, MN, RN, Canada*

#### Purpose

The purpose of this presentation is to share findings of a knowledge synthesis project focused on simulation in pre-licensure nursing education. The presentation will address these questions: 1) what simulation experiences are most effective for which students, in what circumstances, and how? and 2) what further research is required in this area?

#### Target Audience

Researchers in the area of nursing education; nurse educators in pre-licensure nursing programs.

#### Abstract

**Title:** Findings of a Knowledge Synthesis Project of Simulation Use in Pre-licensure Nursing Education

**Background:** Pre-licensure nursing education has a long history of using low- and medium-fidelity simulation. High-fidelity simulation has more recently been incorporated into nursing curricula, for the purposes of improving students' clinical competence and confidence. The growing body of literature in this area reveals variable effectiveness of simulation technologies. There is however an absence of theoretical frameworks and wide variation in the quality and character of the evidence, which raises concerns about its applicability and transferability. A rigorous literature review was needed to answer specific questions about the types, timing, and level of simulation experiences that facilitate optimal learning, skill development, and confidence among nursing students.

**Objectives:** To 1) use a realist literature review to address the question: "what simulation experiences are most effective for which pre-licensure students, in what circumstances, and how?" and 2) identify directions for future research.

**Method:** Electronic searches of CINAHL Plus with full text; MEDLINE; and ERIC were conducted. Searches were limited to published articles and grey literature written in the English language. Grey literature included Proquest Dissertations and Theses database; Conference Papers Index; Knowledge Utilization Database; and GreySource. We also searched websites and reports from educational and nursing organizations and government documents. Titles and abstracts of retrieved articles were reviewed to ensure that they met inclusion criteria. Team members independently reviewed and appraised the remaining articles using Critical Appraisal Skills Programme tools. Relevant information about the author(s), study setting, sample size, research question/purpose, and the main findings/outcomes were summarized.

**Results:** The initial search yielded 1217 articles; 368 of these were discarded in the preliminary review. The remaining articles (n = 849) were reviewed.

**Contributions:** The findings provide decision support for questions concerning the development, effective use, levelling, and evaluation of simulation technologies in pre-licensure nursing education, and guide future research in this area.

Funding was provided by the University of Alberta, Faculty of Nursing, Edmonton, Alberta, CANADA.

## A 18 - Use of Simulation in Undergraduate Nursing Education

### The Effect of Simulation Courseware on Critical Thinking in Undergraduate Nursing Students: Multi-Site Pre-Post Study

---

*Hyunsook Shin, PhD, RN, CPNP, South Korea*

*Kaka Shim, MSN, South Korea*

*Yuna Lee, MSN, South Korea*

*Hyunhee Ma, MSN, South Korea*

*Dahae Lim, BSN, South Korea*

*Hyojin Kim, BSN, South Korea*

*Hyejin Kim, BSN, South Korea*

#### Purpose

The purpose of this presentation is to share the knowledge of the effect of simulation courseware on critical thinking in undergraduate nursing students

#### Target Audience

The target audience of this presentation is nursing faculties who teach nursing students of CT skills or simulation.

#### Abstract

**Background:** The use of simulations has been considered as opportunities for students to enhance their critical thinking (CT), but previous studies were limited because they did not provide in-depth information on the working dynamics of simulation or on the effects of the number of simulation exposures on CT.

**Objectives:** This study examined the effect of an integrated pediatric nursing simulation used in a nursing practicum on students' CT abilities and identified the effects of differing numbers of simulation exposures on CT in a multi-site environment.

**Design:** The study used a multi-site, pre-test, post-test design.

**Participants and settings:** A total of 237 nursing students at three universities enrolled in a pediatric practicum participated in this study from February to December 2013.

**Methods:** All three schools used the same simulation courseware, including the same simulation scenarios, evaluation tools, and simulation equipment. The courseware incorporated high-fidelity simulators and standardized patients. Students at school A completed one simulation session, whereas students at school B and C completed two and three simulation sessions, respectively. Yoon's Critical Thinking Disposition tool (2008) was used to measure students' CT abilities.

**Results:** The gains in students' CT scores varied according to their numbers of exposures to the simulation courseware. With a single exposure, there were no statistically significant gains in CT, whereas three exposures to the courseware produced significant gains in CT. In seven subcategories of critical thinking, three exposures to the simulation courseware produced CT gains in the prudence and intellectual eagerness subcategories, and the overall simulation experience produced CT gains in the prudence, systematicity, healthy skepticism, and intellectual eagerness subcategories.

**Conclusions:** Simulation course ware may produce positive learning outcomes for prudence in nursing education. In addition, the findings from the multi-site comparative study may contribute to greater understanding of how patient simulation experiences impact students' CT abilities.

*Greg Dodd, BScN, RN, Canada*

#### Purpose

The purpose of this presentation is to share our study that investigates simulation utilization and evaluation practices among all undergraduate nursing educational programs in Ontario, Canada. Because comprehensive insight into current approaches is critically important for development of the science of simulation, an overview of early findings will be discussed.

#### Target Audience

The target audience of this presentation includes nurse educators, simulationists, technologists, technicians, administrators, and faculty interested in simulation for nursing education.

#### Abstract

Simulation is becoming one of the most significant teaching-learning strategies available in undergraduate nursing education. Through the development, application, and evaluation of high quality simulation experiences across a full range of modalities, (including high-fidelity, medium-fidelity, and low-fidelity) learners are able to acquire and demonstrate the knowledge and skills necessary for safe, competent, and ethical nursing practice. By approximating clinical practice within nursing education, simulation provides real-time opportunities for students to work through complex patient-care situations, ideally receiving evaluative feedback that promotes increased confidence and competence. Increasingly, simulation is playing an essential role in supporting educators to facilitate nursing students' learning of complex concepts and skills and readying them for clinical practice (CASN, 2007; Cant & Cooper, 2010; Norman, 2012; Ricketts, 2011). Yet, ample, robust evidence that supports the effectiveness of simulation for learning and evaluation in nursing education has yet to be established (Ricketts, 2011). As the use of simulation increases in nursing education, the need to evaluate students appropriately, accurately, and in reliable ways intensifies (Todd, Manz, Hawkins, Parsons, & Hercinger, 2008). Furthermore, as nursing programs increasingly consider simulation as direct clinical replacement in the context of increased student enrolment and dwindling clinical placements, standardized evaluation must play a vital role (CASN, 2007; Norman, 2012; Todd et al., 2008).

In this presentation, we will discuss our study that investigates simulation utilization and simulation evaluation practices used among all undergraduate nursing educational programs in Ontario, Canada. In this province, a total of 36 educational institutions (14 universities along with 22 college partners) are involved in either independently or collaboratively offering baccalaureate degrees in nursing. To date, while literature exists on some of the common practices and approaches to simulation in education, standardization has not resulted (Leighton, 2013). As such, there is little available data broadly, and no available data in Ontario, describing simulation utilization and simulation evaluation in undergraduate nursing education. The goal of our study is to establish a "picture" of current trends, practices, and approaches related to simulation that is employed within this entire province. To this end, a mixed methods approach, in which both quantitative and qualitative data is collected from simulationists, technologists, technicians, faculty, leaders, and administrators through a confidential online questionnaire will be utilized to gather information from all 36 Ontario educational programs. An overview of early results of this study in terms of themes identified and statistical summaries will be shared. The result of this study hold the potential to further research and direct future developments in the ongoing evolution of best

practices in the science of simulation in Ontario nursing education as well as nationally and internationally.

## **A 19 - Undergraduate Nursing Education Research**

### **Health as Expanding Consciousness: Patterns of Clinical Reasoning in Senior Baccalaureate Nursing Students**

---

*Mary W. Stec, PhD, MSN, BSN, RN, CNE, USA*

#### Purpose

share the findings of a study that used Margaret Newman's theory of Health as Expanding Consciousness to explore the meaning and evolving pattern of clinical reasoning in baccalaureate nursing students. The findings broaden the application of the theory beyond the nurse patient interaction to how students think on the clinical area.

#### Target Audience

nurse educators to facilitate their ability to plan and implement clinical learning activities that promote clinical reasoning. Participants will learn the importance of promoting student-patient, faculty-student and interdisciplinary team interaction. Through these interactions students begin to know patient patterns and the patterns of thinking of faculty and interdisciplinary team members.

#### Abstract

Clinical reasoning has been identified as a necessary skill to practice nursing. Multiple studies suggest that a gap exists between the education of nurses and their ability to transition into practice. In addition to possessing necessary knowledge and skills specific to the discipline of nursing, nurses must possess clinical reasoning skills to think through a situation as the patient's condition changes. To make a clinical judgment, nurses use an analytical process that includes pattern recognition, an attribute of clinical reasoning. Newman's theory of Health as Expanding Consciousness and Research as Praxis methodology was used to collect and analyze data. Patterns of individual and across participants revealed the emergence of patterns of relating, knowing, and clinical decision-making as contributing to the evolving pattern of clinical reasoning. The findings of this study were consistent with Newman's theory and support the theoretical framework and methodology. An implication for nursing science was that the nurse-patient interaction broadened the use of this theory to how study participants think in the clinical area. In nursing education and practice the importance of the nurse-patient interaction and pattern recognition facilitated knowing the patient to make effective decisions. Trusting relationships with faculty and members of the interdisciplinary team, confirmed participants' thinking related to a clinical decision. Future research included a longitudinal qualitative study of the emergence of clinical reasoning over time as participants evolve from novice to experience nurses. A quantitative study to measure patterns of relating, knowing and decision-making will further clarify the definition of clinical reasoning.

## A 19 - Undergraduate Nursing Education Research

### Nurturing Caring Values in Pre-Registration Nurse Education: A Qualitative Longitudinal Study

---

*Janet M. E. Scammell, DNSci, MSc (Nsg), BA (SocSci), DipNEd, RGN, SCM, RNT, England*  
*Elizabeth Anne Rosser, DPhil, MN, DipRM, DipNEd, RN, RM, United Kingdom*  
*Vanessa Heaslip, PhD, MA, BSc (Hons), DipHe, RN, DN, United Kingdom*  
*Sara White, EdD, MA, MSc, BSc (Hons), RN, England*  
*Ian Donaldson, EdDocMA, BEd (Hons), DipN (Lond), RN, RNT, England*  
*Karen Cooper, MA (HlthEd), BNS (Hons), DipNS, RGN, United Kingdom*

#### Purpose

The purpose of this presentation is to report on phases 1-3 of a 5 phase qualitative longitudinal study exploring the impact of an undergraduate-nursing curriculum based on humanising philosophy on students' values. Whilst the findings originate in the UK, the audience can judge transferability to nurse education regionally and globally.

#### Target Audience

The target audience of this presentation is primarily nurse educators, including clinical placement educators and student placement supervisors with an interest in how the philosophy underpinning pre-registration education can promote and enhance the development of values for ethical and humanised nursing practice.

#### Abstract

**Background:** There is a global rise in elderly populations with complex long-term conditions; meeting their needs effectively and efficiently but with compassion, represents considerable challenges for financially-constrained health service providers. Internationally, evidence is emerging around concerns about the quality of care, particularly for older people (Katz 2011). It has been argued that in target-driven care environments, there is the potential for care professionals to lose sight of the person receiving the care to focus on task-completion, resulting in a dehumanising culture of care (Galvin and Todres 2013). Within the United Kingdom (UK) a number of high profile examples of poor quality care clearly influenced the publication of a new vision and strategy for nursing and care staff in England (NHS Commissioning Board 2012). This has focused on the organisational culture of the National Health Service (NHS) and in particular the values that underpin care delivery to ensure compassionate competent practice. Predictably attention has also focused on recruitment and education of nursing students as a way to improve the culture in healthcare, resulting in values-based recruitment and different approaches to curricular development. Limited evidence exists however, concerning the impact of such approaches over time.

This paper reports on a study that evidences the impact of an education programme based on a humanising care philosophy in shaping the students' value base as they progress through their education programmes.

**Aim:** This paper reports on phases 1-3 of a 5-phase study exploring the impact of an undergraduate-nursing curriculum based on a humanising care philosophy on the values of individual students.

**Methodology:** The study uses a qualitative longitudinal approach to understand the beliefs and values of student nurses from the day of entry through their education programme to completion. Two cohorts of students, one year apart and commencing February 2013 were recruited, the first on an outgoing curriculum, whereas the second cohort have been exposed to a new curriculum based on a humanising philosophy (Galvin and Todres 2013). This presentation reports a comparison between the two groups at the end of their first placement and end of first year (of a three year programme leading to nurse registration/licensure. Data were collected by individual interviews at commencement of the programme and focus groups thereafter. Ethics approval was gained for the entire project. At each stage of the

process, students were formally invited to participate and on-going individual consent was gained. The audio-recordings were transcribed verbatim and analysed thematically.

**Findings:** Data has been collected from both cohorts at the programme commencement (phase 1), end of first placement (phase 2) and the end of their first year (phase 3). At course commencement, not surprisingly there were few differences between the groups. Following the first placement, again both groups expressed similar perceptions. Students lacked confidence in their ability to put theory into practice, with some negative comments as to their position as students and learning to avoid poor practice. There were many commonalities expressed by both groups about the importance of knowledge, of how much they are learning about themselves and the negative effects of poor staffing on the quality of care. To date, students in the new curriculum more clearly articulated the difference they felt from being a healthcare assistant (HCA), the authority and trust they gained as a student (as opposed to being an HCA) and they focused more readily on the patient at the centre of care rather their own personal development. Phase 3 data collection for the second cohort has just completed at the time of writing; insights from the subsequent analysis will be incorporated in the presentation.

**Conclusion:** By the end of their first placement, both groups were very similar in the expression of their values and to some extent presented a rather negative view of their experiences. Students from both groups were noticeably more articulate in expressing their values particularly in relation to their placement experience, as they moved through their programme. Further comparative insights emerging from the full-set of end of year one data will be a central focus of the presentation. The audience will be invited to judge transferability of findings to their setting; whilst this paper reports on a local study from one university in the UK, the insights will have resonance for other nurse education providers, regionally and globally.

## A 19 - Undergraduate Nursing Education Research Breakthrough Thinking: A Model to Differentiate ADN and BSN Education

---

Sharon K. Kumm, MN, RN, MS, CNE, USA

### Purpose

Introduce a model that can assist faculty teaching in RN to BSN programs to determine appropriate content that builds upon, instead of duplicating, knowledge acquired in associate degree nursing programs.

### Target Audience

faculty teaching in RN-BSN nursing programs

### Abstract

Nursing faculty at an academic medical center revised the traditional BSN curriculum based on five themes: (1) Communication/Professionalism, (2) Leadership, (3) Nursing across the Lifespan, (4) Evidence-based Practice/Quality Improvement and (5) Populations Health. A Q-sort methodology was used to match baccalaureate outcomes to the themes and a model was developed based on the proportion of outcomes per theme. The model informed the pre-licensure nursing program, but was not useful in the post-licensure program due to time constraints.

To revise the model for the post-licensure program, faculty turned to our community college partners. The university has a partnership agreement with the 18 public community colleges with associate degree nursing programs. Originally developed as a means to communicate information about academic progression effectively, the partnership enabled us to explore what is taught in accredited ADN programs. A mixed methods research project design was used to determine which, if any, of the baccalaureate outcomes were met in ADN programs throughout the state. Findings revealed that 42 of the 109 (38%) baccalaureate outcomes were met by 80% of the accredited ADN programs and these outcomes fell into the categories of Nursing Across the Lifespan and Professional Identity/Communication. These outcomes match the nursing role of provider of care.

Matching these research findings and the evidence from earlier five themes yielded a new model for differentiating what is taught in each program. This model can help faculty design and evaluate pre- and post-licensure nursing programs. Differentiating ADN and BSN education will allow for smoother academic progression by eliminating redundancy. The model has been used to develop concurrent ADN and BSN programs.

At the conclusion of the research effort with the associate degree colleagues, a dialogue began about a shared curriculum model in which students could choose an ADN or a BSN track and stay in his/her own home area to complete one or both degrees. The model provided faculty a common language upon which to build. The concurrent curriculum is being piloted with a few community college partners and more are expected to follow in future semesters.

Faculty will learn how the model was developed and how it can be used in curriculum development in a variety of programs.

## A 24 - Changing Perceptions in Nursing Education

### The Relationship of a Dominant Teaching Perspective and Student Perception of the Classroom Learning Environment

---

*Cindy L. Farris, PhD, MSN, MPH, BSN, CNE, USA*

#### Purpose

The purpose of this presentation is to examine results from a quantitative correlational study on the relationship between dominant teaching perspectives and the classroom learning environment. Data was gathered to measure nursing faculty's dominant teaching perspectives and nursing student's perception about the classroom environment along with a demographic questionnaire.

#### Target Audience

The target audience of this presentation is academic nursing educators who primarily teach in the didactic setting; however other educators can benefit from learning about personal teaching perspectives.

#### Abstract

The scholarship of teaching includes the ability to explore the most effective means of meeting the learning needs of students (Boyer, 1990). Boyer's (1990) scholarship of teaching included the ability to explore the most effective means of meeting the learning needs of students. Identifying and reflecting on faculty teaching perspectives provides a foundation for viewing educational practices as well as personal philosophical beliefs and intent (Pratt, Boll, & Collins, 2007). Faculty who are savvy in the diverse needs of today's students must work diligently to develop effective learning environments that will support and nurture the student's professional growth and development (Bain, 2004; Penn, Wilson & Rosseter, 2008; Ursano, Kartheiser, & Ursano, 2007).

An effective classroom environment that is conducive to learning is an important component of a student's success. The classroom learning environment consists of physical surroundings, psychological conditions, and social contexts created by the characteristics, interactions, and relationship of both the student and instructor (Beer & Darkenwald, 1987, Fraser 1994; Hiemstra, 1991; Rowbotham, 2007; Rowbotham 2010). Overall learning environment research has shown over time that across the globe, languages, cultures, disciplines, and education levels, there are consistent and appreciable associations between classroom environment perceptions and student outcomes (Fraser, 2002b; Senocak, 2009). Learning is definitely influenced in basic fundamental ways by the context in which the education occurs (Bransford, Brown, Coking, Donovan, & Pellegrino, 2000). The classroom learning environment must be designed for active learning and especially utilizing a learner-centered approach (Bransford et al., 2000). Faculty must understand the diversity and experiences of the learners being taught. Understanding the make-up of the students in the classroom will provide a more effective classroom environment. While the literature reports that the educator is an important component of the classroom learning environment, little is known about the relationship between a nursing faculty's dominant teaching perspective and the nursing student's perception of the classroom learning atmosphere.

Teaching in higher education is more than just presenting knowledge of content (Menges, 2000). More faculty with no specific educational preparation, experience, development, and training in the components of the role of teaching in the classroom are being hired to teach in undergraduate nursing programs (Beres, 2006). Effective teaching in a higher education setting includes recognition and reflection of dominant teaching perspectives including personal theories of teaching and learning to be utilized in the classroom (Menges, 2000; Pratt & Associates, 1998). Without background in understanding perspective on teaching, the faculty will be unable to assess future goals in effective teaching strategies.

Historically, the role of the higher education faculty has continued to evolve into a multifaceted responsibility. Higher education faculty rarely receive training as an educator, as graduate programs lack specific teaching role development courses (Deggs, Machtmes & Johnson, 2008). What faculty members do as teachers, how time is spent, teaching goals, and instructional methods have all been researched;

however little research has been done on how teachers derive personal theories of teaching and learning (Menges, 2000). Further, personal philosophy, teacher preference, and educational preparation need to be explored especially in combination with the classroom environment.

Using a quantitative correlational study, a research question was proposed considering a relationship between nursing faculty dominant teaching perspectives and nursing student's perception of the classroom environment. A total of 12 nursing faculty responded to a demographic questionnaire as well as the Teaching Perspective Inventory (TPI) to determine personal dominant teaching perspectives. Overall, 422 nursing students from four regional public university campuses in the Midwest completed a demographic questionnaire and the College and University Classroom Environment Inventory (CUCEI) to determine the student's perception of the classroom environment. Through the use of a hierarchical linear model of data analysis, the results of the study noted that there was a statistically significant relationship between the transmission and development teaching perspectives and the nursing students' perception of the classroom environment. Further significance was noted between older nursing faculty, accelerated BSN track, master's degree in nursing education, and obtaining a previous degree prior to nursing in relationship to student's perception of the classroom environment.

## A 24 - Changing Perceptions in Nursing Education

### Nursing Students with Disabilities in the Clinical Setting: Nursing Education Leaders' Perceptions of Accommodations

---

*Julie M. Symes, EdD, RN, IBCLC, USA*

#### Purpose

The purpose of this presentation will describe a study and results found related to U.S. nursing education leaders' perceptions of accommodations made for nursing students with disabilities in the clinical setting.

#### Target Audience

The target audience for this presentation are nurse educators who must be aware of federal legislation requirements, the ADA of 1990 with the ADAAA of 2008, enacted to increase access to higher education for nursing students with disabilities.

#### Abstract

**Background & Purpose:** Nursing programs have reported an increase in the number of nursing students with disabilities. Nurse educators must be aware of federal legislation requirements of the ADA of 1990 with the ADAAA of 2008 enacted to increase access to higher education for students with disabilities. Providing reasonable accommodations for nursing students with disabilities in clinical practice is a dilemma for many nurse educators.

**Research Questions:** What are the reasonable accommodations typically made to support nursing students with disabilities in clinical settings in nursing programs?

How effective are reasonable accommodations made by nursing programs for nursing students with disabilities in clinical settings as perceived by nursing education leaders?

What are barriers to providing reasonable accommodations for nursing students with disabilities in clinical practice settings in nursing programs?

**Study Design:** Descriptive survey

**Sample:** 1251 potential nursing program leader respondents drawn from all pre-licensure baccalaureate and associate programs accredited through the ACEN & CCNE in the U.S.

264 nursing program leaders' responded

- 157 Associate
- 77 Baccalaureate

**Methods:** Disabilities related literature was reviewed including:

- Faculty Perspectives of Students with Disabilities
- Students with Disabilities Experiences & Accommodations
- Nursing Education Studies of Nursing Faculty and Student with Disabilities and clinical accommodations
- General Accommodation Perspectives
- Disability Legislation

A web-based survey instrument was designed by researcher from the literature.

Survey Part B: Demographic information: type of program: student enrollment, numbers of program clinical and simulation hours, & numbers of students with disability types—Physical, Learning, Mental Health, Chronic Illness, Other and more than 1 type

Survey Part A: Clinical Accommodations Types, Effectiveness, and Barriers

Approval obtained from University of South Dakota IRB.

An access link was emailed to 1251 potential nursing program leader respondents.

Descriptive analysis completed with SPSS 20. Frequency, mean and standard deviation were calculated.

Results: The annual numbers of nursing students with disabilities in both types of programs is relatively low, 1-10 students.

The most common disability reported was physical disability (BSN n = 68, (59%); ASN n = 98 (62%)).

The most frequently used clinical accommodation strategies were:

- referrals for counseling, mentorship services, or disabilities services coordinator
- supported students in disclosing issues affecting their clinical learning
- encouragement of clinical instructors/preceptors to schedule regular, honest and constructive feedback sessions.

Findings showed that if an accommodation was frequently used the participants perceived it as effective.

Nursing education leaders' do not perceive any major barriers to providing accommodations. The strongest barrier to providing accommodations was Concerns for patient safety (M = 3.15, SD = 1.28). All listed barriers' means fell between 2.38 (SD = 1.28) and 3.15 (SD = 1.15).

Recommendations: The following recommendations for practice are made based upon the findings of this study:

- Nursing education leaders must continue to find innovative ways to make nursing programs more inclusive for students with disabilities.
- There is no one best clinical accommodation for a type of disability; accommodations must be specific, unique, and tailored for an individual student with a disability.
- Nursing students with disabilities must be assessed and advised as early as possible in the nursing program with a team approach to provide the most effective accommodations.
- Nursing education leaders need to provide guidance to disability services for the most effective accommodations.
- Nursing education leaders must focus on the values and abilities of nursing students with disabilities and what they can bring to the nursing profession.

## A 25 - Using Evidence and Technology with Encouraging Outcomes

### The Use of Electronic Alert System for Early Sepsis Identification

---

*Judy Ong Ho, DNP, RN, APRN, ACNS-BC, CPHQ, USA*  
*Rowena Chona Sano, BSN, RN, ASQ, CQA, CLSSBB, USA*

#### Purpose

1. Describe the steps needed prior to a pilot study on the use of electronic alert system; 2. Identify the barriers encountered at the pilot study; and 3. Determine what next steps are necessary prior to a system wide implementation of an electronic alert system.

#### Target Audience

not limited to nurse clinician who are interested in implementation science. The target audience also includes administrators and organizational leaders.

#### Abstract

**Purpose:** Sepsis is one of the leading causes of mortality worldwide. Sepsis-related hospitalization rates are also on the rise, with impact on hospital length of stay and the utilization of patient care resources. In 2008, the Surviving Sepsis Campaign International Guidelines for Management of Severe Sepsis and Septic Shock (SCC guidelines) were developed to raise sepsis awareness and to increase early and appropriate interventions to decrease mortality rate. Despite strong evidence of the benefits of early recognition and interventions, dissemination of the guidelines into practice has been inconsistent, incomplete and slow. Challenges identified are knowledge deficit, failure to recognize sepsis early and timely bundle management.

The primary purpose of the project was to translate the SCC guidelines into practice and to determine the positive predictive value (PPV) of the alert. The secondary purpose was to determine whether clinicians implemented the three hour bundle interventions as recommended in the SCC guidelines once made aware of possible sepsis.

**Scope:** A fully integrated healthcare system which consists of two full-service hospitals did not have a standardized program to identify and care for the patients with sepsis, severe sepsis, and septic shock. Therefore, a pilot project was approved to develop and implement an automatically triggered alert system in the electronic medical record to identify patients before they become septic. Six different pilot units consisting of emergency centers, rehabilitation and medical surgical units participated in the study.

**Method:** The project team consisted of multidisciplinary members who defined the physiologic parameters for the Sepsis Best Practice Alert (BPA) and the lock out time for the alerts. The team developed clinical algorithms and education modules prior to implementation of the pilot project. All nursing staff received on-line educational modules on sepsis, while physicians were notified through e-mails and at service meetings. Nurse clinicians collected data manually during the four-week pilot program. Data were collected to identify the PPV of the alert and the turn-around-time (TAT) for the 3 hour bundles which include the time of: blood culture draws, antibiotic administration, lactate level collection, and administration of fluid resuscitation boluses.

**Results:** Results suggest a low PPV on non-Emergency Center (EC) units and all interventions for the 3 hour bundles did not meet the three hours completion goal. This study demonstrated that the Sepsis BPA, which used only two physiologic parameters, was too sensitive and thus could lead to alarm fatigue. It also confirmed that the presence of the alert did not necessarily improve the providers' compliance to the SSC guidelines.

**Recommendations:** First, organizational policies should ensure the presence and full support of the Information Technology (IT) department. The absence of an automated report led to the utilization of manual chart abstraction. The inter-rater reliability of the auditors could have affected the results of the

data collected. This contributed to the limitation of evaluating the effectiveness of the project. Secondly, the evaluation of both the PPV and the compliance rate to SSC guidelines will need to be refined for more meaningful data. Future evaluation should include organizational impact as measured by decrease in length of stay and decrease in sepsis mortality rate.

Conclusion: The project provided an opportunity to assess, develop, and implement a pilot study that benefits both patients and organization. Although the early notification through the Sepsis BPA is beneficial, it lacks structural support for providers to implement the SSC guidelines. Further discussions are underway to evaluate the possibility of implementing the recommendations prior to a full system roll-out. The evaluation process lacks rigor, as there was no pre-implementation data available to conduct a pre and post assessment of the interventions. The lack of IT-generated reports limited capture of process outcomes data only. The findings of the Sepsis BPA merits further study that can address the barriers identified.

## A 25 - Using Evidence and Technology with Encouraging Outcomes

### HeartMapp: A Self-Care Mobile Telemedicine Application to Improve Heart Failure Outcomes

---

*Ponrathi Athilingam, PhD, RN, ARNP, FAANP, USA*  
*Miguel A. Labrador, PhD, MSc, USA*

#### Purpose

The purpose of this presentation is to describe the development and beta testing of the novel heart mobile application (HeartMapp) in providing persistent care coordination and prolonged engagement to enhance heart failure knowledge, medication adherence, develop self-care skills and improve quality of life; thus potentially reduce readmission rate.

#### Target Audience

The target audiences for this presentation are clinicians who care for patients with heart failure as well as administrators of the hospital who are concerned with the high readmission rates for heart failure that is not reimbursed under the Affordable Care Act.

#### Abstract

**Background:** Heart failure (HF) is a major public health problem affecting 5.7 million people, costing \$35 billion annually, with over 17 billion spent on hospitalizations in the United States ([Dharmarajan et al., 2013](#); [Go et al., 2014](#)). Treatment and intervention for HF include drug therapy to treat pathophysiology and the use of clinical and educational interventions to improve knowledge, self-care and adherence ([Yancy et al., 2013](#)). Despite increasing compliance with treatment guidelines, hospital readmission rates remain high at 25% within 30-days ([Dharmarajan et al., 2013](#)). Current intervention strategies only reduce hospital readmission rates by a combined 2% representing a critical barrier to progress in this field (Bradley et al., 2013). Patients with HF are expected to learn and remember intricate information on disease management and follow complex self-care practices on their own ([Moser et al., 2012](#)). Telemonitoring intervention and home health care to improve HF outcomes demonstrated inconsistent results in reducing readmissions ([Inglis et al., 2010](#)). Persistent care coordination and prolonged engagement is recommended for effective behavior change to develop knowledge and self-care skills ([Lainscak et al., 2011](#)). Even when knowledge of HF is improved by multiple strategies, accompanying changes in self-care practice and readmission rates are not evident, indicating that significant reductions in HF readmissions may be outside the reach of current management approaches([Davis et al., 2014](#)).

Evidence supports that despite challenges faced by older adults who often resist using mobile technology, once they join the online world, digital technology often becomes an integral part of their daily lives ([Seto et al., 2012](#)). Currently, 91% of adults 65 years or older in the US own a mobile phone, 58% of those are smart phones, and 52% of adults use mobile apps. A recent survey of patients with a variety of chronic diseases (N=2000) reported that 24% of patients are more willing to accept prescriptions for a mHealth app than a pill or invasive devices like FitBits and wireless weighing scales to better manage daily self-care; thus designing a mobile app to improve self-care seemed a viable option ([PmLive, 2014](#)). Therefore our interdisciplinary team designed a patient-centered intervention utilizing a mobile platform to offer persistent engagement to develop self-care skills, improve knowledge, and quality of life, and thus potentially reduce costly HF readmission rates.

#### **The HeartMapp Features and Architecture**

The heart mobile application (HeartMapp) is an easy to use non-pharmacological, non-invasive intervention developed with four main features: the assessment, exercises, vital signs and CHF info. **A) The assessment** feature prompts the user to check daily weight and complete a short questionnaire on HF symptoms. **B) Vital sign** utilizes wearable Bluetooth sensors with built in algorithms to remotely measure physiological parameters in real-time including heart rate, heart rate variability (HRV), and respiratory rate. **C) Exercises** includes animated deep breathing to improve HRV and calculate predicted

distance walked in six minutes based on age, gender, height, and weight to monitor functional improvement. **D) CHF info** includes audio enabled interactive educational modules and reference resources to enhance HF knowledge.

The HeartMapp is designed based on the client-server architecture. The client consists of an Android application, tested on the Nexus 4 and Nexus 5 running the Android 4.4.0 platform. A Zephyr BioHarness™3 strap that connects to the Android phone via Bluetooth sensor and accelerometer data and the built-in algorithms in the HeartMapp calculates vital data on heart rate, HRV, respiration rate. We believe HeartMapp offers a novel multi-dimensional approach specially tailored for self-care management, while the patient is not under direct medical supervision. The multiple dimensions included are:

**A) Patient Engagement:** HeartMapp has been carefully designed to incorporate human-centered interfaces such as self-care and symptom questionnaire, interactive educational modules on HF facts, vital signs monitoring and visualization charts, and step-by-step exercise guides to augment breathing and physical activity.

**B) Automation of Clinical Protocols.** Existing protocols that are part of traditionally prescribed treatments have been implemented into the HeartMapp for ease of execution by the patients. For example, controlled deep breathing at 6 breaths per minute compared reduced blood pressure and significantly increased baro-reflex sensitivity among 81 patients with HF ( $p < 0.0025$ ) compared to 21 healthy controls ([Jerath, Edry, Barnes, & Jerath, 2006](#)). Other clinical protocols that are automated through this architecture include the personalized six-minute walking goal predicted for the individuals' age, gender, height, and weight ([Enright & Sherrill, 1998](#)). HF Self-care questionnaire is weighed based on the New York Heart Association (NYHA) class to determine HF severity ([Lindenfeld et al., 2010](#)) and automated to provide feedback to patients with color coded zones: [Green: Stable with no change in HF symptoms, continue current treatment plan, Yellow: symptoms mildly worse and warrant treatment (an extra dose of water pill) and prompts to call physician, Orange: Symptoms moderately worse and needs to seek help immediately and prompts to call physician, and Red: Symptoms are grave and prompts to call 911 for urgent medical care].

**C) Remote Physiological Monitoring.** HeartMapp utilizes wearable Bluetooth sensors that monitor electrocardiogram (ECG). The built-in algorithm in the HeartMapp calculates heart rate, HRV, and respiratory rate ([Pinna et al., 2005](#)).

**D) Clinical Decision Support.** In the context of HF patients at home under a prescribed treatment, clinical decisions translate into understanding changes to seek early and timely medical help by the patients. One way to accomplish this is to monitor negative changes in the physiological data collected via the wearable sensors as well as the data on weight, blood pressure, and the incorporated patient symptom assessments that resemble the type of questions and/or examinations that a doctor will perform to assess HF severity to determine a treatment plan ([Bosl et al., 2013](#)).

The data entered in HeartMapp including weight, blood pressure, HF symptom questionnaire, distance walked in six minutes, and breathing exercises performed are stored in a secured server and can be viewed by the patient and the clinical team that trigger prompt intervention. The providers will have access to these data for triage and early treatment. The ultimate goal is to encourage persistent utility of HeartMapp by the patients and clinical team to potentially improve daily self-care, knowledge, and symptom assessment and thus potentially reduce the costly readmission rates.

**Method and Design of HeartMapp Development:** The Successive Approximation Model (SAM) was used throughout the design and development phases of the application, for both the instructional content and media ([Allen & Sites, 2012](#)). The HeartMapp was developed utilizing a patient-centered approach with funding from the CS Draper Laboratory and the Florida High Tech Corridor. After obtaining approval from the Institutional Review Board (IRB), patients with HF and currently practicing six clinical cardiologists, nurse practitioners, and nurses were interviewed utilizing a step-by-step questionnaire to

make an accurate assessment of HF symptoms and the specific needs of patients and health care providers.

The alpha testing was performed primarily to test the prototype on three students and three patients with HF to identify any initial design problems for making improvements. Beta testing took place with 10 HF patients from the USF Center for Advanced Health care to understand usability of the HeartMapp.

**Results of Beta Testing:** Mean age of the ten patients was  $63.0 \pm 14.1$  years, ranged from 43 to 81 years of age, 70% were Caucasian, 40% lived alone, 40% had less than high school education, 80% had HF diagnosis for four or more years, mean ejection fraction was  $32.3 \pm 12.05\%$ , 60% were in NYHA class II, all 100% owned a mobile phone, 50% were smart phones, and 60% reported using mobile phones very well. Results on the usability of HeartMapp using yes or no questions are provided in table 1.

Table 1: Beta Testing on Usability of HeartMapp	Percentage
App features and navigations are easy to follow and engaging	100
Use of color, text, pictures, and overall layout are appropriate	100
Language, spelling, and grammar are appropriate	100
The content and features are relevant to the subject of Heart failure	100
Audio in addition to reading information was engaging and appropriate	100
Learned something new from this app that you did not previously know.	67%

Self-confidence in using the HeartMapp was measured using the validated questionnaire using 10 Likert scale (1=not at all confident to 5=extremely confident) with a total score of 50. The mean self-confidence score was  $42.2 \pm 12.08$  indicating very confident in using the HeartMapp.

**Discussion and Conclusion:** The Beta testing of the HeartMapp is promising, particularly with respect to the comfort level of using mobile devices by HF patients who were between the ages 43 to 81 years and all of whom owned a mobile phone. Almost 80% of patients had HF for over 4 years, thus only 67% of participants reported obtaining new information from HeartMapp. However, all of them reported that they would use the app and recommend to it others especially newly diagnosed HF patients. Currently the HeartMapp is undergoing refinement for a proposed clinical trial to test feasibility comparing with home health care and telemonitoring service.

## A 26 - Discussions of Quality of Life in Children with Healthcare Issues

### Validation of an “In the Moment” Pediatric Quality of Life Scale for Hospitalized Children

---

*Nancy A. Ryan-Wenger, RN, PhD, CPNP, USA*  
*Aricka Kesic-Sellers, BS, MSN, RN, NP-C, USA*

#### Purpose

To evaluate the psychometric properties of the Pediatric Quality of Life “In the Moment” scale (PedsQL-IM), a brief measure of the daily impact of illness and outcomes of treatment during hospitalization of children ages 6 to 21 years.

#### Target Audience

those who provide care for hospitalized children, and researchers who evaluate the quality of care and develop new knowledge in this area.

#### Abstract

**BACKGROUND:** Health-related quality of life from the individual’s perspective is widely used to measure of the impact of illness on the individual, outcomes of treatment, and quality of care. Varni and colleagues developed a series of Pediatric Quality of Life (PedsQL™) scales for children ages 5 to 18 years, including a generic Core Scale and scales for chronic disease-specific dimensions of children’s quality of life. These instruments capture quality of life over a specified period of time such as the past week, or the past month. During hospitalization, when perceptions of illness and treatment change daily or hourly, a brief in-the-moment quality of life measure was needed to evaluate quality of care and treatment outcomes.

**PURPOSE:** We evaluated the psychometric properties of the Pediatric Quality of Life “In the Moment” scale (PedsQL-IM), a brief measure of the impact of illness and outcomes of treatment during hospitalization. The instrument was based on Ecological Momentary Assessment Theory in which individuals’ behavior, emotions, and symptoms are assessed in his or her natural environment at that specific moment, thus, minimizing recall bias.

**METHODS:** In a cross-sectional study on the quality of nursing care from the children’s perspective, volunteer participants included 496 children and adolescents, ages 6 to 21 years, hospitalized in a 400-bed freestanding children’s hospital. This study is a secondary analysis of data from 410 (82.7%) patients who completed both the PedsQL-IM and the Revised Children’s Anxiety and Depression Scale (RCADS), which was used for convergent validity. The six PedsQL-IM items included “I feel: afraid or scared, sad or blue, angry, worried about what will happen to me, tired, and pain or hurt,” measured on an ordinal scale, e.g., “I feel angry...” 1=not at all, 2=a little bit angry, 3=somewhat, 4=quite a bit, 5=very much. Total scores ranged from 6 to 30. An Emotional Distress subscale score was the sum of the first four items, ranging from 4 to 20. Psychometric properties were analyzed from three theoretical perspectives: classical measurement theory, domain sampling theory, and generalizability theory.

**RESULTS:** The most frequently experienced PedsQL-IM symptom was tired, followed by pain, worried, sad, afraid, and angry. The mean Total Score was  $4.5 \pm 3.6$  and the mean Emotional Distress subscale score was  $2.2 \pm 2.4$ . Internal consistency reliability of the PedsQL-IM was 0.71. Analyses based on generalizability theory indicated that differences among subjects explained 66.4% of the total variance, items explained 6.7%, and the interaction of subjects by items explained 26.9%. The generalizability coefficient of reliability was 0.71. Unrotated exploratory factor analysis indicated that all 6 items loaded from 0.593 to 0.719 on the first component. The two physical symptoms, tired and pain, also loaded strongly on component 2 (0.557 and 0.487 respectively). Convergent validity was demonstrated by moderately high correlations between RCADS T-scores and PedsQL-IM Total scores ( $r = 0.494$ ,  $p \leq 0.001$ ),

and Emotional Distress subscale scores ( $r = 0.452$ ,  $p \leq 0.001$ ). Each item correlated  $r \geq 0.388$  with at least one RCADS scale. Nearly 20% ( $n=80$ , 19.5%) of the 410 children had at least one RCADS subscale T-score in the borderline and/or clinical range. An ROC analysis indicated that a cut-off PedsQL-IM score of  $\geq 4$  included 65 (81%) of these children with a sensitivity of 81.3%.

**CONCLUSIONS:** Hospitalized children are frequently asked about their levels of pain, but are rarely asked about being worried about what will happen to them, afraid, angry, sad, or tired. The total PedsQL-IM score can be useful to evaluate overall "In the moment" quality of life over time. Children who rate any of these symptoms as somewhat, quite a bit, or very much, are signaling to their nurses and other providers that further questioning, intervention, and follow-up are essential. The PedsQL-IM could be administered with vital signs to evaluate the process and outcomes of pediatric patient care.

## A 26 - Discussions of Quality of Life in Children with Healthcare Issues

### Comparison of Child and Family Health Outcomes in Families with Children with Special Health Care Needs Cared for in Home Care, Long-Term Care, and Medical Day Care Settings

---

*Carmen Caicedo, PhD, RN, USA*

#### Purpose

The purpose of this study was to examine and compare child and parent or guardian physical and mental health outcomes in families with children with special health care needs who have medically complex technology-dependent needs in home care, long-term care, and medical day care settings.

#### Target Audience

The target audience of this presentation is pediatric clinical practice professionals (primary, acute, specialty, home health, and school health).

#### Abstract

There are over 11 million children with special health care needs (CSHCN) in the U.S. resulting from improved survival rates for children with preterm births, congenital anomalies, disease, or injury. Advances in medical technology have enabled children who require medically complex technology-dependent care to survive. Today, care options available for families of these CSHCN remain limited due to lack of available health care, school and community services. Currently many families care for their medically complex technology-dependent children at home, a situation that holds potential consequences for the family. Given the important role of the parents in their child's life, greater efforts are needed to help support them and their well-being. This study provides a comparison of child and parent health outcomes across three different care settings over a five month period.

The **purpose** of this study was to examine and compare child and parent or guardian physical and mental health outcomes in families with children with special health care needs who have medically complex technology-dependent needs in home care, long-term care, and medical day care settings.

**Methods:** Using repeated measures, data were collected over five months from 84 dyads (parent/guardian, medically complex technology-dependent child) recruited from local pediatric primary and specialty physician practices; medical day care centers called prescribed pediatric extended care centers (P-PEC) in Florida; and long-term/residential care facilities (LTC) in South Florida using Pediatric Quality of Life Inventory Generic Core Module 4.0 and Family Impact Module. Data analysis included Chi Square, RM-ANCOVA.

**Results:** There were no significant differences in child physical health, mental health, and functioning outcomes by care setting. Age, race/ethnicity, and level of condition severity were significantly different across settings. Most severely disabled children were in home care; most moderately disabled in medical day care; most children in a vegetative state were in LTC; however parents perceived child's health in each setting as good to excellent. Children in P-PEC had the highest parent reported physical and mental health functioning and children in the LTC settings had the lowest parent reported physical health and mental functioning. Parents/guardians from home care reported the poorest physical health including being tired during the day, too tired to do the things they like to do, feeling physically weak, or feeling sick and had cognitive difficulties, difficulties with worry, communication, and daily activities. Parents/guardians from LTC reported the best physical health with time and energy for a social life and employment.

**Conclusions:** Trends in health care policy indicate a movement away from LTC care to care in the family home where data indicate these parents/guardians are already physically, mentally and functionally

challenged. These challenges need to be targeted with resources to sustain specific community-based support structures to help parent/guardian caregivers of children with medically complex technology-dependent needs.

## A 26 - Discussions of Quality of Life in Children with Healthcare Issues

### Differences in Meaning of Quality of Life and Inner Strength in Families with and without Young Adults with Spina Bifida

---

*Monique Ridosh, PhD, RN, USA*

*Kathleen J. Sawin, PhD, CPNP-PC, FAAN, PhD, CPNP-PC, FAAN, USA*

*Gayle M. Roux, PhD, RN, NP-C, FAAN, USA*

#### Purpose

The purpose of this presentation is to describe the perceptions of Quality of Life (QOL) and evidence of Inner Strength in families.

#### Target Audience

The target audience of this presentation is a health provider and/or policymaker who can develop mechanism for future cost-effective, quality healthcare innovations to include strategies for the health and quality of life of families and adolescents.

#### Abstract

The purpose of this study was to describe the perceptions of Quality of Life (QOL) and evidence of Inner Strength in families. This research is a component of a large mixed method, multi-site study in the United States on improving health outcomes for families with adolescents with spina bifida (SB). The larger study investigated adaptation in families with adolescents and young adults (AYA) with and without spina bifida (SB). Families (N=198), (parent and AYA) completed telephone interviews with QOL questions. Participants included parents with AYA with SB (54%) and without (46%). The parents were primarily female (94%) and Caucasian (86%). The mean age of the adolescent was 15.2 years. Content analysis was conducted. Concepts included perceptions of the meaning of QOL for the family. Parents with AYA with SB more frequently described happiness, being able to do meaningful activities, and enjoying life as components of QOL. Parents of AYA without SB described friendship and need for time more frequently than those with AYA with condition. Differences were not seen in terms of togetherness, enjoyment, support, finances, independence or work in parent perceptions of QOL. AYA with spina bifida reported happiness as making up QOL, yet AYA without SB more frequently reported happiness, friendship and getting along as components of QOL. Differences between groups of AYA were not seen in terms of health or time for togetherness as making up QOL. Differences between individual and family meaning of QOL emerged for the parent, not AYA. Two dimensions of inner strength were found in the meaning of QOL, connectedness and movement (activity). Meaningful activities were important to parents with AYA with SB while connectedness (good relationships) was more frequently described by parents without SB. When activities were discussed, individuals described physical activities such as sports and exercise. Study results can assist providers to focus support on enhancing family strengths important to parents and adolescents. The findings emphasize the need for comprehensive interdisciplinary teams to promote meaningful activities for AYA with SB while enhancing their ability to develop good relationships to build inner strength. Understanding what makes up QOL helps clinicians focus on what is important for families. Future cost-effective, quality healthcare innovations should include strategies for the health and QOL of families and adolescents.

## A 27 - Does Magnet® Status Play a Part?

### From Blank Canvas to Masterwork: Creating a Professional Practice Model at a Magnet Hospital

---

*Lynda J. Dimitroff, PhD, MEd, BSN, RN, MCHES, USA*

*Donna M. Tydings, DNP, RN, CNS-BC, USA*

*Sue Nickoley, MS, RN, GCNS-BC, USA*

*Maureen Krenzer, MS, RN, ACNS-BC, USA*

#### Purpose

The purpose of this presentation is to share the results of a study that engaged registered nurses in the creation of a professional practice model.

#### Target Audience

The target audience of this presentation is clinical nurses, administrators, nurse researchers, and academics.

#### Abstract

Purpose: Professional practice models (PPMs) are significant to the foundation of our nursing practice, roles, positive outcomes, and excellence in care delivery across the continuum of health. The ANCC Magnet Standards of Excellence and expectations provide a framework for professional nursing practice and healthy work environments, and were the driving forces behind this project. Often, PPMs are imposed by standard models or casually generated. The purpose of this study was to engage nurses in the creation of a professional practice model. The research question was: How do registered nurses (RNs) in an acute care hospital conceptualize their professional practice?

Theoretical Framework: The theoretical framework used in this study was The ANCC Magnet Standards of Excellence (2014).

Methods: The research method for this study was qualitative inquiry utilizing descriptive qualitative. Twelve (nine initial and four verification) focus groups were conducted to explore and allow for deep understanding of the RNs values and beliefs about their professional practice.

Data Analysis: Data were analyzed using constant-comparative analysis to code the data, and identify categories, domains, and sub-domains.

Results: The 92 participants represented diverse roles and practice settings. Four domains were identified including: caring, knowing, navigating, and leading. The nurses were able to articulate the results with examples of the domains in their current practice.

Conclusion: Caring, knowing, navigating, and leading clearly described how RNs conceptualized their professional practice.

Caring was defined as the essence of nursing through an affective (emotional) demonstration of commitment to patients and families. Caring included sub-domains of a holistic approach, affirmation, connection, time, and trust.

Knowing was the art and science of nursing, an essential attribute to the success of nurses and the safe delivery of patient care. Knowing was the translation of embodied knowledge into evidence-based clinical decisions, actions, and scholarship. Knowing included sub-domains of “big picture”, competence, critical thinking, intuition, lifelong-learning, and nursing as a profession.

Navigating characterized the nurse’s role on the team, guiding patients and team members through the complexities of the health care experience. It was the nurse having the ultimate responsibility and

accountability for establishing the link between all health care team members to navigate on behalf of patients. Navigating sub-domains included advocacy, communication, hub, “making a difference”, “master of all trades”, support, teamwork, and time.

Leading was organizing people and processes. Organizational and community leadership was charting new directions and having a vast sphere of influence on patients, families, and the nursing profession. Leading included sub-domains of affirmation, global vision, making a difference, nurses as professionals, respect, and support.

In this study, the nurses told us who they were, their identity, what they did, their roles, and how they envisioned nursing should be practiced in their institution. The results of this study were aligned with the internationally recognized ANCC Magnet Model, ANA Standards, Future of Nursing Initiative, and institution’s mission, vision, and values.

Application of rigorous research methods to create a PPM constituted an innovative strategy to advance the science of nursing and give a voice to the nurses at our institution. The future direction of this project includes the evaluation of the integration of the PPM into daily practice and its impact on outcomes.

## A 27 - Does Magnet® Status Play a Part?

### Employment in Magnet-Oriented Hospitals and Socialization of Students in Clinical Nurse Specialist Programs

---

*Terri L. Ares, PhD, MSN, RN, CNS-BC, USA*

#### Purpose

To report findings of an investigation of the influence of employment in Magnet-oriented hospitals prior to graduate program enrollment on the socialization of students in U.S. clinical nurse specialist (CNS) programs. Comparisons between the group that was Magnet exposed and the group that was not will be highlighted.

#### Target Audience

Nurse Educators, administrators, and clinical nurses with an interest in the influence of nurse employment in Magnet-designated hospitals and those on the Magnet journey.

#### Abstract

**Background and Purpose:** Regional transformation of health care is possible with a more educated nursing workforce and the advancement of health care organizations to support professional nursing excellence. The clinical nurse specialist, a graduate-prepared advanced practice registered nurse, has been identified as a role that is important to the success of organizations seeking Magnet recognition, a credential awarded for nursing excellence, quality, and innovation in practice.

In the effort to prepare more nurses for the clinical nurse specialist (CNS) role, graduate nursing programs are responsible for the socialization of students to assume the role. There is also a preparatory phase or anticipatory socialization of the individual that takes place prior to entry into the academic program.

A prior study of the professional socialization of graduating and newly graduated CNS students found that 47.1% had been employed in a Magnet-designated hospital or one on the Magnet journey prior to entering their graduate programs. In 2011, the American Nurses Association reported that only 7% of hospitals in the U.S. had achieved Magnet recognition. It was postulated that working in a Magnet-oriented hospital could have a socializing impact on students as a result of Magnet program values for nursing professionalism and educational advancement. The purpose of this study was to determine if CNS students differed on measures of socialization based on their exposure to Magnet-oriented hospital employment.

**Methods:** A secondary analysis of data from a study of the professional socialization of a national sample of graduating and newly graduated CNS students (N = 225, representing 73 CNS programs) in the United States was conducted. Data for that study were collected from 2012-2013 via an online survey. Researcher designed items and the Nurses Self-Description Form subscales of Professionalism, Work Ethic, and Empathy were analyzed for this study. Comparisons of the students who worked in Magnet-oriented hospitals prior to enrolling in their academic program with students who did not work in such settings was examined. Data were subjected to descriptive, t-test, two-way ANOVA, and chi-squared analyses.

**Results:** Students that were employed in a Magnet-oriented hospital prior to enrolling in their CNS program were significantly more likely to be exposed to the CNS role by working with or observing a CNS in the workplace (chi-square [1] = 14.59, p = .000). The variance in perceived preparedness for CNS practice was not dependent on exposure to the role in a Magnet-oriented hospital. No significant differences in the years of leadership experience, rate of nursing specialty certification, having a mentor-protégé relationship with a CNS, or preconceived impression of the CNS role on the perceived preparedness for practice as a CNS were found when employment status was compared.

There was a significant difference in the interaction effects between Magnet employment and workplace exposure to the CNS role on the professionalism self-concept scores ( $F [1, 221] = 5.035, p = .026$ ). There was a negative effect of exposure to the CNS role for students employed in non-Magnet hospitals, while there was a positive effect of role exposure for those with Magnet-oriented hospital employment on professionalism self-concept.

Exposure to the CNS role in the workplace was helpful to the development of an accurate preconceived impression of the role for students employed in non-Magnet environments at a level approaching significance, but there was no effect for students employed in Magnet-oriented hospitals ( $F [1, 218] = 3.582, p = 0.60$ ).

Conclusion: Few differences in socialization based on student employment in a Magnet-oriented hospital prior to enrollment in CNS graduate program were identified. Students with Magnet-oriented hospital employment had greater workplace exposure to the CNS role which may help explain why they chose the role for their graduate education focus and why such a large percentage of students in the national sample had a history of exposure to Magnet-oriented workplaces. However, since the current ratio of Magnet to non-Magnet hospitals is quite small, it is reassuring that the measures of socialization in CNS students were largely not dependent on employment in a Magnet-oriented hospital. The graduate program is likely the primary socializing agent for CNS students. In consideration of the effort to diffuse the Magnet recognition program internationally, it is not known if the experiences within Magnet-oriented hospitals that were found in this study to foster nurse socialization to an advanced nursing role would apply in the context of other countries' educational and health care contexts.

## A 27 - Does Magnet® Status Play a Part?

### Promoting Evidence-Based Practice: A Study of Perceptions and Practices of Nursing Council Members in a Magnet® Organization

---

*Kelly E. Lancaster, MSN, RN, CAPA, USA*  
*Kristiina Hyrkas, PhD, LicNSc, MNsc, RN, USA*  
*Gertrude Kent, RN, BSN, USA*  
*Debbie Michaud, RN, USA*

#### Purpose

describe perceptions, practices and competencies related to evidence-based practice (EBP) of nursing council members in our Magnet® organization compared with those of other Magnet® and non-Magnet organizations. Opportunities to improve staff competence will be identified by addressing specific barriers to EBP including education, resources such as mentoring and organizational support.

#### Target Audience

Registered nurses who are in roles that require the use of evidence-based practice skills.

#### Abstract

**Background:** Despite the increasing availability of and access to the research literature, and the Institute of Medicine's goal for 2020 that 90% of clinical decisions be supported by accurate, timely and up-to-date clinical information, implementation of evidence-based practice (EBP) remains inconsistent (McClellan et al., 2007). Factors at the individual and organizational level influence the use of EBP. These factors include beliefs that EBP improves patient care and outcomes, extent of EBP knowledge and skills, access to EBP mentors and supportiveness of the organization (Melnyk et al., 2012). Organizations applying for or those that have achieved Magnet® status, a designation awarded by the American Nurses Credentialing Center (ANCC) for excellence in nursing, must demonstrate the use of EBP (ANCC, 2014).

In a recent study by Melnyk and colleagues (2012), a national survey was conducted with a random sample of 1015 RNs who were members of the American Nurses Association (ANA) to assess the state of EBP and the needs of nurses related to EBP, and to determine if these factors differ between master's prepared and non-master's prepared nurses and Magnet® versus non-Magnet organizations. Survey respondents were asked to rate their EBP beliefs, skills and use in practice. A significant majority of respondents believed some form of education and mentoring was needed. More non-master's degree prepared nurses indicated that they needed more knowledge and skills and would participate in EBP education programs. Nurses in Magnet® organizations reported higher levels of knowledge, resources and implementation of evidence-based care. The study results indicated that although the nurses believe in evidence-based care, and the majority reported EBP implementation in their organization, barriers to implementation persisted and included lack of time, non-supportive organizational culture, lack of EBP knowledge and skills, lack of access to information and often lack of support from colleagues, nurse leaders and managers (Melnyk et al.).

**Aim:** The first aim of this study was to assess the evidence-based practices, perceptions and EBP competencies of nursing council members in our Magnet® organization compared to the state of EBP as reported in the national ANA study by Melnyk et al. in 2012. The second aim was to identify opportunities to assist nursing staff to achieve competence in EBP by identification of specific barriers including education, resources, and support.

**Methods:** The setting for this descriptive, exploratory study was a large, urban medical center in Northeastern U.S. The study facility achieved its second Magnet® designation in 2012 and has successfully demonstrated the use of EBP to improve patient care outcomes. EBP education and skills training has been provided for the past ten years through the Clinical Scholar Program. This program is designed to teach EBP skills, provide tools, and reduce some of the common barriers to EBP implementation through the use of mentors (Strout et al. 2009). At the study organization there is also a

shared governance approach to decision making through a council structure that includes Nursing Practice, Research, Quality, Magnet, Clinical Advancement and Informatics councils. Many practice and policy decisions are made by these councils that require the use of EBP skills. Although there is an expectation that nurses will engage in EBP, and an organizational culture that supports EBP, the extent to which nurses have the basic competencies and knowledge of available resources to engage in EBP remained unknown.

Survey invitations were emailed to 235 council members using the Research Electronic Data Capture (RedCAP) secure web-based platform for managing online surveys and databases. The survey instrument was developed with questions taken directly from the ANA survey used by Melnyk and colleagues (2012). Responses to these 18 Likert-scale items ranged from 1 (strongly disagree) to 5 (strongly agree) and were designed to illicit the respondent's perspective, current needs and competencies related to EBP. Melnyk et al. reported good internal consistency (Cronbach's alpha = .88) for the 18-item questionnaire. Permission to use the tool was obtained from the primary author. The final survey was composed of 10 demographic questions, the 18 item ANA questions and 12 additional items. Five items using the same 5-point Likert scale were added that surveyed nurses' perceptions of performing EBP. Seven items using a 5-point Likert response (1= least needed, 5= greatest need) were added to assess the respondent's needs regarding EBP, including education and resources. The data were collected between December 4, 2014 and January 5, 2015 with email invitations and reminders sent every two weeks.

**Results:** Eighty (34.5%) council members responded to the survey invitations. Data were analyzed with descriptive statistics and one-way ANOVA using SPSS version 17.0. The 18-item EBP Survey showed very good internal consistency (Cronbach's alpha = .81). There were no significant differences ( $p=.77$ ) found for total EBP score among education levels or between staff RNs and other positions ( $p=.39$ ). Staff RNs were significantly less clear about EBP steps ( $M=3.59$ ) compared to other positions ( $M=4.10$ ) ( $t=-2.04$ ,  $df=77$ ,  $p=.045$ ) and were significantly more likely to agree that their leaders/managers consistently made evidence-based decisions ( $M=4.03$ ) compared to those in other positions ( $M=3.58$ ) ( $t=2.16$ ,  $df=76$ ,  $p=.036$ ). When data were compared between respondents who were on the Research council versus those on other councils, Research council members were significantly more likely to be clear about EBP steps ( $M=4.38$ ) compared to those respondents on other councils ( $M=3.65$ ) ( $t=1.99$ ,  $df=77$ ,  $p=.05$ ). Research council nurses also agreed more often that barriers were existing in the clinical setting that made implementing EBP challenging ( $M=3.50$ ) compared to other council members ( $M=2.67$ ) ( $t=2.36$ ,  $df=76$ ,  $p=.021$ ). The five additional items that evaluated the nurses' perceptions about their ability to perform evidence-based practice steps showed that staff RNs compared to those in other positions were significantly less likely to agree that they were able to perform a critical appraisal of the literature ( $M=3.19$  vs.  $3.98$ ,  $p=.012$ ) or evaluate outcome data to determine best practice ( $M=3.26$  vs.  $3.85$ ,  $p=.017$ ).

The top three identified needs were on-site education and skills building sessions ( $M=4.09$ ), tools that can help them implement EBP with their patients ( $M=4.00$ ) and consistent access to EBP mentors in the clinical setting ( $M=3.87$ ). The three least needed resources were regular seminars with EBP experts ( $M=3.77$ ), a virtual on-line resource center where best practices are housed and experts are available for consultation ( $M=3.71$ ) and an online education program with expert EBP mentors ( $M=3.62$ ). When staff RNs were compared to other positions, bedside nurses were significantly less likely to perceive a need for the virtual on-line resource center than those in other positions ( $M=3.47$  vs.  $4.05$ ,  $p=.034$ ) respectively.

The data from our study were also compared with Magnet® and non-Magnet results published by Melnyk et al. (2012). There was a significant difference between the three groups based on the 18 EBP survey items ( $F=4.61$ ,  $df=2$ ,  $p=.014$ ). Post hoc Tukey comparisons showed that nurses at the study organization had higher mean scores ( $M=3.87$ ,  $CI=3.67$ ,  $4.06$ ) compared to non-Magnet respondents ( $M=3.46$ ,  $CI=3.27$ ,  $3.67$ ). There were no significant differences with comparisons with the Magnet® published results. Comparisons of the individual EBP survey items among the three groups showed that study nurses were significantly more likely to agree that they believed that EBP results in the best clinical care for patients ( $M=4.61$  vs.  $M=4.46$  Magnet® vs.  $M=5.36$  non-Magnet facilities); and non-Magnet hospitals were significantly more likely to report that there are many barriers to EBP that exist in their clinical environment ( $M=3.06$  vs.  $M=2.79$  Magnet® vs.  $M=2.76$  study facility).

**Limitations:** One limitation of this study is its low response rate (34.5%), which may not have captured the entire view of the council members of the study facility. It also is not possible to know how the characteristics of the responders compared with those of the nonresponders or how the characteristics of the council members compare with the RNs in general who are not members of any of our councils.

**Conclusions and Implications for Practice:** The results of this study confirmed that there is a need to continue educational strategies such as the Clinical Scholar Program and to inform the staff about the EBP tools that are available electronically. The results confirmed as well that there is a continuous and growing need to develop a pool of EBP mentors for consistent access to the staff. As Melnyk et al. (2012) have pointed out, a key factor in sustaining and establishing EBP is the availability of mentors who typically have not only excellent knowledge and skills in EBP, but also skills in individual and organizational behavior change strategies. However, EBP mentors need support and their own mentoring as well. Therefore there is a need to provide feedback and to organize education and retreats for these EBP mentors. The comparison of the results from this study with the national level survey (Melnyk et al. 2012) has been valuable. The results confirmed that our council members' responses regarding EBP were similar to those reported from other Magnet® facilities and higher compared to non-Magnet facilities.

## B 17 - Ways to Use Simulation in Nursing Education

### Using the Delphi Technique to Develop a Peer-Review Debriefing Instrument for Simulation Healthcare Education

---

*Jennifer Saylor, PhD, RN, APRN-BC, USA*

#### Purpose

The purpose of this presentation is to describe the development a peer-debriefing evaluation instrument to assess the effectiveness of a facilitator during simulation education using the Delphi Technique. This presentation will include the Delphi process, inter-rater reliability, and versatility among many health professions and interprofessional simulations.

#### Target Audience

The target audience of this presentation is all members of Sigma Theta Tau International, including students, clinicians, nurses, faculty, and researchers. All members will benefit from understanding faculty development in simulation education and how healthcare professions are being taught and evaluated pre and post licensure.

#### Abstract

**BACKGROUND/SIGNIFICANCE:** Creating an educational curriculum to prepare future healthcare providers with the essential knowledge, psychomotor skills, communication skills and critical thinking skills is vital and challenging for faculty. Simulation has been shown to be an effective method for learning, practicing or demonstrating a variety of skills needed in specific clinical environments (Herge et al, 2013). It provides opportunities for learners to practice cognitive, affective and psychomotor skills in life-like situations without risk to patients. Also, simulation in healthcare is performed in both pre and post licensure in academic and clinical settings. The learners span across the healthcare professions, including nurses, physicians, physical therapists, occupational and speech therapists, or any combination to create interprofessional simulations.

The components of a patient simulation include a pre-briefing, this simulation experience itself, and a post-simulation analysis (debriefing). Debriefing is an essential part of the simulation experience because this is where most of the learning occurs (Arafah, Hansen & Nichols, 2010). Debriefing after a simulation is an intentional process designed to provide awareness and insight, as well as to strengthen and transfer learning via an experiential learning exercise (Arafah, Hansen, & Nichols, 2010; Miller, Riley, Davis, & Hansen, 2008; Morgan, et al., 2009). Through this feedback exchange with a facilitator, the learners have the opportunity to reflect on their decision making, critical thinking, and interprofessional communication, through self-analysis and a peer evaluation.

The literature identifies strategies for developing the simulation experience and evaluating the learners (Dreifuerst, 2009; Fanning & Gaba, 2010). While there exists a body of literature identifying effective strategies to facilitate group discussions in the classroom as well as assessment tools to evaluate faculty effectiveness, these concepts have not been applied to assess faculty effectiveness in facilitating debriefing after a patient clinical simulation. Educators often struggle to transition from instructor-centric education to learner-centric facilitation in the debriefing process.

**PURPOSE:** The purpose of this pilot study was to develop a peer-debriefing evaluation instrument to assess the effectiveness of a facilitator during simulation education using the Delphi Technique.

**METHODS:** The peer-debriefing evaluation instrument was developed using the Delphi technique. This technique is a useful research methodology in achieving consensus on a particular issue where there is a lack of empirical evidence (Asselin & Harper, 2014; Falzarano, 2013). It has been applied in diverse projects including program planning, needs assessment, policy determination and resource utilization and validation of assessment tools ([Stefanovich, Williams, McKee, Hagemann & Carnahan, 2012](#)). This technique is a cost efficient method of generating ideas and facilitating consensus among experts in the

field who do not meet face to face and may be geographically distant (Asselin & Harper, 2014). Three rounds of review and feedback by content experts was necessary to achieve the desired level of consensus.

In preparations of establishing inter-rater reliability among five consented experts, the researchers developed and recorded three debriefing simulations using vignettes to illustrate different performance levels of a facilitator's debriefing proficiency. Each debriefing session was the from same simulation, but competency of the facilitator changed. The five experts received a half-day education session. To demonstrate the phase 2 process, each expert was provided one completed pre-assessment form and three post-evaluation forms, one for each of debriefing vignette. After each debriefing session, experts promptly completed the post evaluation form independently in silence. After all three videos were completed; the researchers reviewed each video and provided the 'real score' and its rationale.

**Sample:** Purposive sampling techniques were used to elicit participation for the expert panel that were identified based on authorship of literature or nomination from established clinical simulation center directors. Of the 15 consented, 11 responded and agreed to complete the study. The expert panel (n=11) and experts (n=5) for phase 2 represented various clinical expertise, including nursing, radiation oncology, medicine, occupational therapy, physical therapy, academia related healthcare fields.

**Instrument development and administration:** A thorough search of contemporary literature and the experiences of the researchers provided the framework for development of items and rating scale for the initial evaluative instrument of faculty effectiveness in conducting a debriefing post clinical simulations activity. The participants completed an Internet-based survey (Qualtrics) over a 5 month period with each of the three rounds lasting approximately 2 hours each, for a total of 6 hours.

The respondents were asked to evaluate 2 parts of the peer-debriefing evaluation instrument. Part one of the respondents' survey, "Pre-assessment of the simulation experience", is a self-assessment of debriefing skills that the debriefer would completed. Part two of the respondents' survey, "Debriefing Evaluation (Self and Peer Assessment)," is an assessment of the various aspects of conducting a simulation, which was categorized in eight areas including structure and organization of the debriefing, verbal and non-verbal communication, recapping the simulation experience, and reflecting on action. Using a 4-point scale, the debriefing experience was evaluated (1-4) based on the percentage completed for each area. This instrument would be completed by both the evaluator and debriefer and then used to guide the peer evaluation process. Respondents were asked to rate statements on the survey for clarity and understandability using a 4-point Likert scale (vague to clear) and were provided ample space to suggest additions, deletions, or changes to survey elements.

**Data analysis:** Quantitative and qualitative analysis methods were used in each phase of the research study and items that do not reach an acceptable level of an 80% consensus among panel experts were omitted. Content analysis of open ended responses was used to refine all components of the instrument. Interclass correlation coefficients (ICC) were calculated to find the inter-rater reliability. ICC were calculated to find the inter-rater reliability.

**Results:** A three-round Delphi process was used to revise the instrument developed by the research team. Feedback from Delphi panelists was evaluated after each round and the instrument was updated to reflect the panel's suggestions. Upon completion of Round 1 (n = 7) changes were made to the assessment tool with respect to structure of the tool and language within the questions and response scales. Specifically the following edits were made to standardize language in the instrument to debriefer rather than facilitator, language and use of terms was clarified and the addition of exemplar behaviors in post-simulation questions was completed, as well as additional explanation on how the post-simulation tool would be used. Two changes were made to the response scales: 1) the definitions of the "Not Familiar" to "Very Familiar" scale were revised; 2) the "Instructor-Centric" through "Learner-Centric" spectrum was decreased from four to three options and the definitions for the new categories were revised.

In round 2, the Delphi panel (n = 11) operationalized the definitions for high-fidelity and low-fidelity simulations. In this final round, consensus at greater than 80% was achieved for both structural and content elements of the assessment tool. Nine participants completed this round; eight of the nine participants had completed Round 2 as well. The inter-rater reliability for the average measures was very strong, ICC = .973, and for the single measure was strong, ICC = .818. As we have achieved 80% agreement that was established a priori, we determined that the assessment tool was ready for pilot testing in the educational setting.

**CONCLUSION:** The key to all successful simulation/debriefing experiences is an effective debriefing facilitator. A skilled facilitator guides and assists the learner in transferring their experience into clinical practice. A peer-review tool may improve the skills of facilitators, thus the debriefing process yielding more proficient healthcare professionals. Faculty can use triangulation of their intended performance/outcomes with this instrument to demonstrate effectiveness and/or excellence.

## B 17 - Ways to Use Simulation in Nursing Education

### The Effect of an Introductory Video on Realism in Clinical Nursing Simulation

---

*Kristy L. Oden, DNP, MSN, BSN, ADN, RN, APRN, FNP-BC, USA*

#### Purpose

The purpose of this presentation is to show how an introductory video to simulation augments realism by setting the stage for the simulation through the provision of visual and auditory narrative context.

#### Target Audience

The target audience of this presentation is nurse educators, students, simulation coordinators, and any other individual who utilizes simulation based learning.

#### Abstract

**Background:** The utilization of high-fidelity simulation in the education of baccalaureate nursing students has become standard practice. It has been proven that students are able to transfer the knowledge gained in the simulated setting to the clinical setting. Simulation faculty at The University of North Alabama College of Nursing wanted to improve the realism factor of simulations, feeling that students did not associate the simulator with an actual patient. Faculty wanted students to feel engaged in the learning experience and knowing that realism is, at least in part, determined by the environment, a video to provide introductory visual and auditory narrative context to a Cardiac Arrest Simulation was developed. The video consisted of three sections followed by a transition to the simulation. The initial section begins with a pictorial journey through the hospital, ending in the patient's room where a conversation is observed between the patient and his daughter. The conversation provides some exposition of the patient's condition while giving the students an introduction to the patient as a real person. Visual clues such as a hat, mustache, and personal belongings were carried over from the video to the simulated patient. As the conversation between the patient and daughter ends, report, using the SBAR method is presented. Graduating nursing students were utilized to report off to their peers, students in the simulated environment. Finally, the video fades as the students hear a crashing sound, the beginning of the simulated experience. The introductory video sets the stage for the students, improving realism and facilitating transfer of knowledge from one setting to another.

**Method:** Fourth level baccalaureate nursing students completed a survey following completion of the cardiac arrest simulation. The survey measured whether or not the video introduction and report improved the realism of the simulation, if the SBAR report was complete, and if the student felt that an introductory video to additional simulations would be effective.

**Results:** The findings indicated that 6 out of 7 students felt that the video introduction and report improved the realism of the simulated experience (avg=3.857143). Also, students indicated that they would like to see more video introductions and reports utilized in the simulated environment (avg=4.28514).

**Conclusion:** The use of an introductory video and report heightens visual and auditory senses leading to increased student engagement and improves realism in the simulated environment, thus continuing the transfer of knowledge from one setting to another.

## B 17 - Ways to Use Simulation in Nursing Education

### The Empathy Enigma: Does It Still Exist? Comparison of Nursing Student Self-Reported Empathy with Standardized Actor and Student Peer Evaluation of Student Empathy

---

*Julia M. Ward, PhD, MSN, BSN, RN, USA*

#### Purpose

The purpose of this presentation is to describe the effect of an educational strategy using standardized actors on nursing students' level of empathy.

#### Target Audience

The target audience of this presentation is nurse educators and clinicians who are interested in strategies that address empathy in nursing.

#### Abstract

**Purpose:** Nursing students learn that empathy should be at the heart of all nurse-patient encounters. Research outcomes have demonstrated that empathy declines among nursing students during the last year of their nursing program. We wanted to learn if an educational strategy would improve empathy among student nurses during undergraduate nursing education.

**Methods:** A quasi-experimental design was used to compare pretest and posttest scores on the Jefferson Scale of Empathy. We used the Jefferson Scale of Empathy Health Provider version (JSE-HPs) to evaluate whether or not an educational intervention using standardized actors positively influenced nursing student empathy. During two simulation experiences the standardized actors and student peers evaluated student empathy using the Jefferson Scale of Patient Perception of Health Professional and the Global Rating Scale of Empathy. Debriefing sessions were conducted and a written recording of each session was analyzed for thematic content.

**Results:** There were no significant overall changes in empathy over time or any significant correlations between students' self-report of empathy and the standardized actors' and peers' evaluations of student empathy. Notably, overall mean empathy scores did not decline over time, and empathy scores increased among some subgroups, including among male participants and second-degree students.

**Conclusion:** Our findings suggested that this educational intervention holds potential for maintaining and possibly improving empathy in nursing students. More research is needed to investigate how this intervention could have a stronger impact on empathy.

## B 18 - Using Genetics Research to Further Practice

### Reductions in Symptom Severity of Posttraumatic Stress Disorder is Associated with Reduced Expression of Inflammatory Genes in Service Members

---

*Hyunhwa Lee, PhD, APRN, PMHNP-BC, USA*

#### Purpose

The purpose of this presentation is to discuss inflammatory gene-activity changes in peripheral blood associated with recovery from posttraumatic stress disorder among service members (SMs) returning from deployment.

#### Target Audience

The target audience of this presentation is health care professionals who work with and/or is interested in patients with posttraumatic stress disorder and underlying genetic mechanisms for the symptoms.

#### Abstract

**Background:** Posttraumatic stress disorder (PTSD) is common and increases morbidity risk in affected service members (SMs) returning from deployment, with even greater risk when depression is comorbid. Inflammation is implicated in PTSD and is linked to morbidity risks; however, the role of gene-activity and relation to inflammation in PTSD recovery is not well understood. Presumably PTSD recovery reverses the morbidity risks related to inflammation and other gene-networks, which would have great implications to the health and well-being of military personnel with PTSD.

**Purpose:** To determine gene-activity changes related to changes in severity of PTSD and depression symptoms in SMs who recently returned from deployment, using peripheral blood transcriptome profiling.

**Methods:** Symptoms of PTSD and depression were determined using the PTSD Checklist Military Version (PCL-M) and the Quick Inventory of Depressive Symptomatology (QIDS), respectively, in a sample of 85 male SMs (mean age 33.7 years; 69.4% White) within 12 months of deployment (baseline) who were also re-evaluated at 3 months follow-up. Symptom severity groups were determined by increase, decrease, or no change in symptoms at 3 months as compared to baseline. RNA samples from peripheral blood drawn at baseline and 3 months were tested on Affymetrix GeneChip HG-U133 Plus 2.0 Array platform. Differential gene expression was determined among the 3 PTSD symptom severity groups (increase, decrease, or no change), and the 3 depression symptom severity groups (increase, decrease, or no change). P-values were corrected for multiple comparisons using false discovery rate (FDR < 0.05). Transcripts were validated by qPCR.

**Results:** SMs in the decreased PTSD symptom severity group at 3 months had significant reductions in the expression levels of a number of genes including inflammatory genes, as compared to the “no change” PTSD symptom group. Network analysis of the gene set specific to PTSD symptoms reductions revealed that cell death and survival is the top gene-network, and that NFκB is the hub gene for the mostly down-regulated genes. The most significant canonical pathways for reduced PTSD symptoms include Cdc42, ERK5, HGF, CNTF, and NGF signaling pathways, with glucocorticoid receptor and B cell receptor signaling pathways being implicated in the majority of these pathways. The depression symptom severity groups were found to have no significant association with levels of gene expression.

**Conclusions:** Our results suggest that reductions in severity of PTSD symptoms are significantly related to genes that are reduced in expression, and that inflammatory genes play a dominant role in these gene-activity changes. Reductions in PTSD symptoms also contribute to signal pathways that regulate cellular responses to stress, neurotrophic growth factors, and other growth factors. Further studies are warranted to discover genes specific to depression symptom severity and its interaction with PTSD, and how these molecular changes may relate to long-term morbidity risks related to PTSD.

## B 18 - Using Genetics Research to Further Practice

### The Chronicle of a Nurses Journey to Translate New Science into Practice: Genetics and Genomics

---

*Beth Harkness, BSN, RN, CPN, USA*

#### Purpose

The purpose of this presentation is analyze clinical examples of how the principles of genetic based care guide nursing practice. Provide examples of methods to educate nurses and disseminate information related to the evolving science of genetic and genomic to nurses in clinical practice.

#### Target Audience

The target audience of this presentation is the entire continuum of nursing; clinical care, leadership, research, education, specialty practice.

#### Abstract

Genomics is “personalized healthcare” in action. Understanding genomics is essential for all clinical nurses and nurse leaders. However, most nurses have limited knowledge of genetics/genomics, how it translates into their practice or the Essentials of Genetic and Genomic Nursing Competencies.<sup>1</sup>

Genomic competencies include family history assessment, understanding targeted therapies, and assessing variability in patients’ responses to medications based upon genomic profiles. Perspectives of the nurse champion will be offered and the various strategies that were implemented for introducing genomics to clinical nurses in a 300-bed mid-Atlantic pediatric Magnet® health care system which employs approximately 2000 nurses. This institution was selected to participate in “Method for Introducing New Competencies (MINC)” study.

A transformative nursing practice approach was established with collaboration amongst targeted leadership champions in administration, nursing, genetics and experts in the community.

A multi-modality communication/education program was developed based on Everett Rogers’s Diffusion of Innovations Theory.<sup>2</sup>Genomic competencies were selected with an emphasis on genomic relevancy

Aligned with the Centers for Disease Control Public Health Genomics<sup>3</sup>themes and specialty specific diseases as a framework.

The approach culminated into a pervasive knowledge-based strategy that incorporated interactive continuing education offerings, advanced practice nurse-led rounds, interprofessional collaboration, and family history tools. Educational advertising juggernaut campaigns with tag-lined genomic messages were used to intensify interest, awareness and relevancy.

Program outcome achievements; increased awareness, knowledge and translation into practice. Outcomes were measured using baseline and post-project statistics from the Genetics and Genomics in Nursing Practice Survey and evaluation of individual hospital educational offerings and action plans. Learner satisfaction scores following each educational offering were consistently greater than 85%.

The achievements of the interventions translated into practice through the collaboration with the genetic molecular biologists and genetic counselors that lead to expanded genetic testing and support capabilities in the health care system, development of guidelines for nurse initiated genetic referrals, and the adoption of a Family History Tool into practice.

The goal of sharing these experiences, barriers, successes, and recommendations of this healthcare systems approach is to aid others introduce “new (genomic) knowledge” because the future is now.

**Overview:** Describe the implementation and evaluation of a National Council of State Boards of Nursing funded genomic literacy and competency program. “Method for Introducing New Competencies (MINC)” study. Present the challenges, successes, and recommendations for introducing genomics to clinical nurses and nursing leadership in pediatrics.

## B 18 - Using Genetics Research to Further Practice

### Lessons Learned: Recruiting and Retaining a Diverse Population in Research

---

*Elisabeth Z. Klein, DNP, MSN, BSN, RN, CNS, RNC-OB, RNC-LRN, USA*  
*Kathi C. Huddleston, PhD, MSN, BSN, RN, CNS, CCRC, USA*

#### Purpose

To describe the successes and challenges in recruiting over 2300 family trios from 100 countries of birth for three whole genome research studies. Diversity of enrollment is critical to the quality of genomic research. Specific efforts are made to recruit subjects of diverse race, ethnicity and socioeconomic status.

#### Target Audience

Nurse researchers recruiting families, recruiting for genetic or genomic research, and/or recruiting subjects of diverse race, ethnicity and socioeconomic status.

#### Abstract

Human genome research is one of the most rapidly growing areas of clinical and public interest. As whole genome sequencing accelerates identification of molecular factors that have statistically significant causal relationships to human growth and development, clinical management will undoubtedly improve. Furthermore, the accuracy and coverage of genomic sequencing, as well as analysis capabilities, will continue to improve. These gains are revealing many novel causes of human disease, including rare Mendelian disorders as well as the molecular underpinnings and genetic susceptibilities involved in complex and multifactorial conditions.

Working in partnership with a hospital, physicians and their staff, and a community safety net clinic, we have recruited over **2300 family trios from 100 countries of birth** for three whole genome research studies. We have established a team of nurse and clinical researchers to be part of a translational research department conducting human genome research at a community hospital. The nurses are uniquely qualified to recruit research subjects. All have experience in working with mothers and/or infants. Several had experience recruiting research subjects. The communication skills required for nursing practice, especially the ability to validate understanding by the participants make nurses excellent research recruiters.

Two of the studies have a longitudinal component. When initiating the studies, we made concerted efforts to capitalize on the diversity of our community to enhance the value of the genomic research. Specific efforts are made to recruit subjects of diverse race, ethnicity and socioeconomic status by utilizing a multicultural staff and multiple modes of recruitment. Recruitment techniques to enhance the diversity of the enrollees include placing native Spanish speakers in a site where this is the primary language, recruitment materials in Spanish, recruiting on social media, and use of a primary phone line and email address to provide consistent access for participants and potential enrollees. Using these methods, we have been able to increase recruitment from 31 participants per month in two sites in Dec. 2012 to 75 per month in 4 sites by December 2014.

We recognize, however, that for longitudinal research, enrollment is an important but small piece of the research process. Retention of participants, as measured by survey return is paramount. Initially, there was a significant discrepancy between the return rate of surveys in English and Spanish. This has been addressed by designating a multicultural staff team devoted to survey compliance and developing culturally relevant surveys for participants. This team initiates the online survey for participants requesting it be emailed, mails it to participants without email and follows up at consistent intervals when a survey has not been received. The survey content incorporates child health status and development questions, demographic information and standardized survey tools exploring maternal confidence, depression, stress and family concerns. The standardized tools have established reliability and validity in English and Spanish. The longitudinal surveys have maintained a **survey response rate of over 75%**.

Successful recruitment and retention of research study participants is dependent on knowing and engaging the patient population being recruited.

## B 19 - Working with Military Backgrounds

### Maximizing Resources - Strengthening Community Ties: A Military Civilian Collaboration

---

*Deborah H. Chatham, DNP, RN, PHCNS-BC, CNE, USA*  
*Joshua W. Baker, MSN, BSN, RN, USA*

#### Purpose

demonstrate the process of implementing a clinical simulation project between a BSN program in a private university and a U.S. air force base located in the same community.

#### Target Audience

nursing instructors in academic programs or hospital education departments, clinical nursing instructors, military instructors or trainers, instructors in simulation based or simulation enhanced programs.

#### Abstract

**Purpose:** Current trends in nursing education include the use of clinical simulations to provide much needed clinical experiences in an environment where schools are competing for limited clinical placement space. In addition, educational institutions are finding it more difficult to locate funding for high cost, high fidelity simulators. New approaches to meeting nursing clinical educational needs must be explored.

**Design:** An MSN educational project was implemented to determine the feasibility of partnering a small, private university BSN program with a nearby air force base with a teaching hospital to use the existing high fidelity simulation lab.

**Setting:** One of the largest air force healthcare training facilities located in the southeast USA served as the setting for the simulation experience. A state-of-the-art high fidelity simulation lab fully staffed and available to provide customized training sessions on a variety of clinical scenarios was utilized for the project.

**Participants:** Sixteen students enrolled in a pediatric course as part of a pre-licensure BSN program in a small, private university (total enrollment < 3,000) took part in an eight hour series of planned clinical simulations.

**Methodology/Process:** The MSN student was an active duty military member who collaborated with airmen and simulation lab personnel to produce clinical scenarios that were 1) fundamental pediatric skills 2) scenarios that were often difficult to encounter in lower level care hospital settings, 3) high fidelity simulations that would not otherwise be available to the nursing students.

**Results:** Nursing students participated in procedures such as IV starts on pediatric size veins, intraosseous needle insertion, pin site care, and urinary catheterization. Included in the simulations were stations that represented 1) Response to respiratory distress and proper airway insertion 2) Identification of heart sounds, cardiac murmurs, and dysrhythmias 3) Pediatric code

**Implications:** Student evaluations as well as interviews with the simulation lab staff and volunteer airmen instructors revealed: Students benefited from exposure to clinical experiences that would otherwise not have been available in traditional settings. Students, staff, and volunteer instructors all expressed a positive experience of collegiality working with a previously unfamiliar community group. Efforts to collaborate with community partners to maximize existing resources can enhance learning experiences and strengthen community ties.

## B 19 - Working with Military Backgrounds

### Relational Certainty: A Theoretical Framework Describing the Relationship between Military Veterans and Companion Canines

---

*Cheryl A. Krause-Parello, PhD, MSN, BSN, RN, USA*  
*Michael John Rice, PhD, RN, APRN-B, FAAN, USA*

#### Purpose

The purpose of this presentation is to describe the impact of relational certainty in human interactions as demonstrated by Companion Canines. Relational certainty is drawn from the adaptive stress responses military veterans' display when reintegrating into society.

#### Target Audience

The target audience of this presentation is nurses, military service members, researchers, healthcare practitioners, animal welfare personnel, and/or educators.

#### Abstract

**Purpose:** The purpose of this presentation is to describe the impact of relational certainty in human interactions as demonstrated by Companion Canines. Relational certainty is drawn from the adaptive stress responses military veterans' display when reintegrating into society. The theory explains how veterans internally construct meaning of relationships, with the level of relational certainty indicating a balance of biological and social links. A model of relational certainty demonstrating the concepts and associations form the foundation of explaining the role of companion canines which match the theoretical and empirical postulates. Discussion of the theory is systematized based on two main strands: nature and social nurture.

**Theory Development:** The process used to develop this theory included derivation, synthesis, and analysis. The development began with an in-depth review of existing literature on stress in the military veteran population. This information was blended with the reports of military veterans on the value of companion canines. The information gathered was separated and blended to form two main theoretical strands: nature and social nurture.

**Linking to practice:** The theoretical strands of the model are linked by pairs of predetermined genetically expressed responses and externally nurtured responses, or relagens. The relagens are comprised of varying amounts of partial genetic links and partial nurture links. If the genetic and nurture links are not balanced, or unduly affected by stress, then the opposing link compensates and becomes the dominant link altering the expression of relational activity. This then, without intervention, becomes the basis for replication and creates cycles of similar relationships expressions. Reports from the veterans on the value of canine companions indicate that they actions adhere to Weiss' Social Provision Theory (1974) defined some of the key relational strategies: reliable alliance (assurance that one could be counted on in times of stress), reassurance of worth (recognition of the individual's value), attachment (emotional closeness), social integration (a sense of belonging together), and opportunity for nurturance (providing comfort and assistance to). The basic nature of any human being is based on three antecedents of external relational certainty: 1) The level of stress associated with any recurring experience that affects the veteran's emotional response and cognitive responses colored by prior experiences and perception; 2) Relagens expression capacity of the appraisal of external relational certainty- the process of placing a value on the certainty of the relationship within any given situation; 3) Relagens expression of the relational certainty- for or in coping with uncertain events.

**Conclusion:** This theory as demonstrated by canine companions is comprised of knowledge resulting from the experiences of military veterans, addresses a need for research, and suggests a balance of epigenetic and external social links for explaining the process of determining the certainty of any relationships to members within the military veteran population.

## B 19 - Working with Military Backgrounds

### The Lived Experience of Iraqi Nurses in Communities Impacted by War or Terrorist Threat

---

*Elizabeth J. Diener, PhD, MSN, BSN, RN, CNE, USA*

#### Purpose

The purpose of this presentation is to describe the experiences of Iraqi nurses who have experienced the realities of war or terrorist threat as both citizens and practitioners in Iraq.

#### Target Audience

The target audience of this presentation is all nurses concerned with the global impact of conflict impacting delivery of nursing care.

#### Abstract

**Background:** Over the last two decades Iraq has endured three international wars, 13 years of economic sanctions, dictatorship, foreign occupation, and acts of terrorism. For professional nurses practicing in Iraq, expectations have been that professional life continues “as usual;” caregivers are to function as if the stress of political unrest and personal insecurity does not have personal impact. Results of an extensive review of the literature review emphasize the lack of published research exploring the lived experiences of nurses living and practicing in communities that experience war and terrorist threat. These gaps make development of supportive structures, policy, and educational interventions impossible.

**Methodology:** Guided by Jean Watson’s Human Caring Science, the purpose of this phenomenological investigation is to describe the lived experiences of Iraqi nurses who have experienced the realities of war as both citizens and practitioners in Iraq. Hour-long phenomenologic interviews were conducted with 10 male Iraqi nurses who met the inclusion criteria of: Possessing a degree in nursing, lived and practiced nursing in Iraq during a time of war or terrorist threat, and are able to communicate in English or Arabic. Data analysis was ongoing utilizing Giorgi’s approach.

**Findings:** Two main themes and seven subthemes emerged from data analysis. Main Themes-Living under the Shadow of War and Violence: A Daily Routine and, second, the Shield of Adaptation and Resilience. The first theme, Living under the Shadow of War and Violence, had five subthemes, Impact on Personal Life, Effects on Physical Well-Being, Influence on Mental Health and Emotional Well-being, Impact on the Delivery of Nursing Care, and Lost Sense of Personal Safety. The second theme, The Shield of Adaptation and Resilience, yielded two subthemes, Faith- Based Hope and Commitment to a Profession of Care

This research highlights a number of outcomes from traumatic experiences faced by Iraqi nurses on a daily basis and their multidimensional effects. The first theme confirms the heavy responsibility of caring and advocating for citizens of a distressed community while also experiencing this same trauma. Continuous trauma not only affected their physical well-being, but also social integration, nursing practice quality, and psycho-mental health. Major symptoms of PTSD such as flashbacks, unexplained anxiety, nightmares, and insomnia were evident.

As portrayed by the second theme, even without a secure practice setting Iraqi nurses adapted to their environment using faith-based resilience and professional commitment. Nonetheless, nurses also needed professional and formal support to continue performance of their professional role while holding the responsibility of caring and advocating for traumatized members of a community to which they were members.

**Recommendations:** Results from this phenomenological study are expected to inform and guide “caregivers of caregivers” in healing the trauma of war and terror. This study confirms that nurses living

and practicing in communities continually impacted by violence lose their sense of security and suffer the consequences of prolonged and constant stress. Establishing work environments that assure physical safety and provide treatment for stress related disorders are imperative to assure quality, care-centered nursing practice.

## B 24 - Utilizing Technology in Nursing Education: Pitfalls and Successes

### Back to the Blackboard? Personal Technology Use and Knowledge Acquisition

---

*Patricia Frohock Hanes, PhD, MSN, MAEd, MS-DPEM, RN, CNE, USA*  
*Marilyn D. Klakovich, DNSc, RN, NEA-BC, USA*

#### Purpose

The purpose of this presentation is describe the effects of students' use of technology in the classroom on learning and to articulate ways faculty can mitigate the effects of technology use on student learning.

#### Target Audience

The target audience of this presentation is nursing students and nurse educators who seek to promote maximum learning in the academic setting.

#### Abstract

**Background/Problem:** Students in face-to-face classrooms (F2F) are using multiple technologies, communicating on social media, and surfing the web while listening to the professor. Faculty allow their adult learners to engage in use of information and communication technologies (ICTs). Faculty themselves use technology and social media in the classroom in the hope that it will engage students and enhance their learning. The problem we are examining is: Are we tacitly encouraging students' intellectual "absence" by allowing them to use multiple technologies in the classroom? Is there an effect on peers' learning?

**Conceptual Frameworks:** The theory of situated action, gratifications theory, theories of cognition, media theories, and Bloom's taxonomy were used in this study.

**Methods:** A review of the literature was conducted using the following search terms: social media, multitasking, technology, nursing, students, presence, attention, and distraction. Articles were limited to those from 2010 and later involving higher education in a F2F format. Disciplines represented in the articles included nursing, computer science, cognitive psychology, education, communication, marketing, media studies, neuroscience, and academic development. A preliminary survey was conducted, asking nursing students about technology use in the classroom.

**Results:** Review of the literature revealed that although several large-scale studies have been conducted with non-nursing populations, little was found related to nursing students' use of technology in the classroom. Key findings were that multitasking degrades learning and increases learning time, decreases student engagement, and lowers GPA. Use of technology not only has a negative effect on those students using the technology, but also negatively affects the learning of those around them. Furthermore, biological influences may affect students' ability to refrain from using technology. Students revealed that they engage in multiple technology use, unrelated to course content, during class time, and that this use disengages them from the class and inhibits learning.

**Conclusions and Implications:** There are multiple entities competing for students' attention in today's F2F classroom. The role of the professor is to limit outside distractions and encourage delayed gratification (learning) versus immediate gratification (technology use). Teaching strategies need to be interactive versus passive. Further studies are needed with larger samples of nursing students and incorporating both qualitative and quantitative data with NCLEX pass rates as an outcome variable. Further research is also needed on effective teaching strategies related to technology, social media use, and learning outcomes.

## B 24 - Utilizing Technology in Nursing Education: Pitfalls and Successes

### Attitudes toward Plagiarism in Online RN to BSN Students

---

*Katherine E. Quartuccio, DNP, MSN/ED, BSN, RN, USA*  
*Cheryle G. Levitt, PhD, MSN, BSN, RN, USA*

#### Purpose

The purpose of this presentation is to disseminate research findings that measured the attitudes toward plagiarism of online RN to BSN students (n=173). The Attitudes Toward Plagiarism questionnaire revealed students' approval, rejection/condemnation, and perspectives of societal norms regarding plagiarism.

#### Target Audience

The target audience of this presentation is nursing faculty who are seeking to understand student attitudes toward plagiarism prevalent in nursing students. This information can be used to plan policies and procedures that seek to influence attitudes that precede the behavior of plagiarism.

#### Abstract

**Purpose:** Plagiarism, an increasingly common occurrence in diverse academic settings, violates codes of honor, obstructs intellectual honesty, impedes students' academic success, causes a lack of confidence in student integrity, and threatens university reputations for academic integrity. In studies focusing on nursing students, researchers noted no statistical difference in the number of nursing students who plagiarized compared to other academic disciplines (McCabe, as cited in Smedley, Crawford, & Cloete, 2015). Explanations for the high rate of academic integrity violations include reasons such as saving time, improving grades, completing the academic program, or gaining professional positions. According to the Theory of Planned Behavior, attitudes toward behaviors precede actions (Mavrinac, Brumini, Bilic-Zulle, & Petroveck, 2010). The act of plagiarism, one form of academic integrity violation, is an intentional behavior that is preceded and influenced by personal attitudes, sociodemographic conditions, and situational conditions (Krueger, 2014). Understanding personal attitudes influencing the choice to commit plagiarism can provide educators with greater awareness and understanding to guide the development of preemptive interventions to decrease the incidence of plagiarism, as well as the design of codes of conduct that encourage student ownership of academic integrity decisions and behaviors. This study examined online RN to BSN students' attitudes towards the act of plagiarism in an effort to reveal information that could assist in addressing the rising incidence of academic integrity violations.

**Methods:** This descriptive correlational study, approved by two university IRB committees, examined the demographic and descriptive characteristics of a convenience sample (n= 173) of students in an online RN to BSN program and their attitudes towards plagiarism. Using the Attitudes Toward Plagiarism Questionnaire, three sub-scales of attitudes were measured. The attitudes sub-scales described the students' justification or approval (positive attitudes) of plagiarism, acceptance of other student's acts of plagiarism (negative attitudes), and the social norms (subjective norms) surrounding the act of plagiarism. In addition to a compilation of descriptive and demographic data, data were also sorted into groups for age, ethnicity, years of nursing practice, level of education, nursing position, tuition assistance, and courses completed in the program. Examination of the data then included bivariate analysis of the three sub-scales of attitudes toward plagiarism, as identified in the ATP questionnaire between groups.

**Results:** The sample (n=173) included 87.3% females with a mean age of 36.8 + 9.9. Ethnicity noted 78% white/Caucasian and 21.4% non white, and the majority noted English as their first language. Current nursing positions included point of care nurses, charge nurses, nurse managers, and those currently not actively practicing nursing. Mean course completion was 6.6 courses, and years of nursing practice varied from none to greater than 15 years of practice, with the highest category at 3-5 years of practice.

Scores for the entire sample, related to attitudes toward plagiarism, demonstrated a low approval of the act of plagiarism, with neither condemnation nor disapproval toward others who practice plagiarism, and a recognition of societal condemnation of plagiarism. Bivariate analysis demonstrated statistically significant findings between groups within the demographic and descriptive variables noting group differences in scores between ages, race/ethnicity, English as the primary language, practice positions, number of courses completed in the program, and years of nursing experience. There were no significant results found in the attitudes toward plagiarism by gender, those receiving tuition assistance, or those who have additional college education.

**Conclusion:** This study revealed both traditional college student characteristics (gender, age, race) and nontraditional demographic characteristics (nursing practice position, years of practice) in the sample representing a diverse group of online RN to BSN students with a range of beliefs and attitudes towards plagiarism. The responses identified attitudes identifying plagiarism as an undesirable behavior and which recognized societal rejection of plagiarism, yet concurrently lacked condemnation of plagiarism behaviors in others. These findings acknowledge that while some students recognize that plagiarism is wrong, they will “turn a blind eye” towards the practice, and not condemn their peers. Additionally, the results demonstrated different perspectives of the act of plagiarism within groups. In an attempt to reverse the trend of rising plagiarism, evaluating the attitudes toward plagiarism provides constructive information to support direction and guidance for preemptive interventions and policies to address academic integrity in academic settings. Striving to improve the academic integrity practices of nursing students serves to develop and strengthen the ethical behaviors required for personal behavior and professional practice. Improving academic integrity may influence future nursing practice, and ultimately affect the decisions for safe, effective, and ethical nursing practice (Brown, as cited in Theart & Smit, 2012).

## B 24 - Utilizing Technology in Nursing Education: Pitfalls and Successes

### Assessing Outcomes of Learning in Virtual Learning Environments: Scoping Review

---

*Rebecca Sisk, PhD, RN, CNE, USA*

*Dee McGonigle, PhD, MSN, BSN, RN, CNE, FAAN, ANEF, USA*

#### Purpose

The purpose of this presentation is to describe a scoping review of literature on (1) VLE learning activities that have been described in the literature, (2) the reported learning outcomes of these activities, and (3) the categories of VLE learning activities the scoping review reveal.

#### Target Audience

The target audience of this presentation is the nurse educator seeking ideas on authentic learning activities as well as evidence that virtual learning environments, such as Second Life, are efficacious in helping students meet selected learning outcomes.

#### Abstract

Virtual learning environments (VLEs) such as Second Life provide a unique opportunity for nursing students to work through case studies and practice new roles in a safe milieu (Anderson, Page, & Wendorf, 2013). Taking students into a VLE for instruction involves immersing them into an authentic environment to work together and apply critical thinking and problem-solving skills (Bai, Lavin, & Duncan, 2012). As with any learning environment, a program of instruction in VLEs begins with specific learning outcomes and an assessment of learner needs, proceeds to selection of appropriate learning activities, and ends with an evaluation of whether students are meeting learning outcomes.

The literature in nursing describes multiple learning activities used in VLEs, many of them examples of active learning. However, no organized method of categorizing these activities or studying whether they improve learning outcomes exists. Scoping reviews are used when the types and amount of relevant literature on a topic are unclear. Therefore, the purpose of this presentation is to describe a scoping review of VLE learning activities that have been reported in the literature, to categorize those activities according to the types of learning outcomes they address, and to describe any research related to those learning outcomes. The questions posed were (1) What are the VLE learning activities that have been described in the literature, (2) What are the reported learning outcomes of these activities, and (3) What categories of VLE learning activities does the scoping review reveal?

The review is based on a thorough search in the EBSCOHost, Proquest, and OVID databases. Specific EBSCOHost databases used are CINAHL, Education Research Complete, ERIC, and MEDLINE. Search terms used are "learning outcomes," "nursing," and "virtual learning environment or Second Life". Learning activities are demonstrated with a table that describes the author and year of publication, the name of the activity, learning outcomes addressed, and a brief summary of the results of any research reported on assessment of learning. A model is provided in the presentation that demonstrates the categories of learning activities and possible learning outcomes found in the scoping review.

## B 25 - Women Affected with Cancer: Research and Practice

### The Related Factors of Receiving Pap Tests among Immigrant Women of Vietnamese Origin in Taiwan

---

*Hsiu-Hung Wang, PhD, RN, FAAN, Taiwan*

*Fang-Hsin Lee, RN, Taiwan*

*Hsiu-Min Tsai, PhD, RN, Taiwan*

*Lin Miaoling, RN, MSA, Taiwan*

#### Purpose

to explore the factors associated with Pap testing among married immigrant women of Vietnamese origin, including demographics, knowledge of cervical cancer, knowledge of Pap tests, fatalism, attitudes toward cervical cancer, and barriers to receiving Pap tests.

#### Target Audience

researchers, public health care providers, healthcare policy makers.

#### Abstract

**Background:** In recent years, a common social phenomenon has been for foreign women to immigrate to Taiwan for marriage. Women who immigrate for marriage are a disadvantaged minority in the public health system in Taiwan and are typically infrequent users of medical resources and preventive healthcare. Pap test participation rates for newly immigrated women in Taiwan are significantly lower than the rates for non-immigrant Taiwanese women as well as women in America and European countries. Research in Taiwan regarding precautionary measures for cervical cancer for women who immigrated for marriage are still lacking.

**Objectives:** The purpose of this study was to explore the factors associated with Pap testing among married immigrant women of Vietnamese origin, including demographics, knowledge of cervical cancer, knowledge of Pap tests, fatalism, attitudes toward cervical cancer, and barriers to receiving Pap tests.

**Methods:** A cross-sectional correlational design was used. Data were collected from July 2012 to January 2013. Participants were recruited through snowball sampling in two communities in Southern Taiwan. A total of 451 married immigrant women of Vietnamese origin aged 30 years and over were invited to participate in the study, and 427 participated. Data analysis included descriptive statistics and multivariate logistic regression.

**Results:** Participants with no children were 72.2% less likely to have received a Pap test; each additional point of knowledge of Pap tests increased the likelihood of having a Pap test by 19 percent, and each additional point in barriers to receiving Pap tests decreased the chances of having received a Pap test (Odds Ratio=0.714).

**Conclusion:** The results can provide governments with a reference for developing policies in terms of cervical cancer prevention among married immigrant women of Vietnamese origin.

## B 25 - Women Affected with Cancer: Research and Practice

### Engaging the Community to Deliver Educational Programming for Young Breast Cancer Survivors

---

*Timiya S. Nolan, MSN, CRNP, ANP-BC, USA*  
*Silvia Gisiger Camata, MPH, RN, USA*  
*Karen Meneses, PhD, FAAN, RN, USA*

#### Purpose

The purpose of the presentation is to report community-based participatory practices and outreach component outcomes of the Young Breast Cancer Survivorship Network, a nurse-led community-based survivorship program.

#### Target Audience

Delivery of this presentation is targeted toward healthcare professionals and researchers who have an interest in community-based participatory research and/or breast cancer survivorship education initiatives among young women.

#### Abstract

**Background:** In the United States, about 5% of breast cancer survivors are premenopausal (young) at diagnosis. Young breast cancer survivors (YBCS) have greater health disparities than older survivors: higher incidence of advanced disease, mortality, and poorer quality of life. YBCS report age-specific survivorship needs (e.g. managing children and family relationships, sexuality, cognitive demands, and work) in addition to general survivorship needs. The Young Breast Cancer Survivorship Network (led by trained oncology nurses) is adapted from an evidence-based survivorship tool that addresses age-specific needs by educating, supporting, and networking among YBCS and community stakeholders. Using the community-based participatory research (CBPR) model in the context of young breast cancer survivorship in central Alabama, the Network engaged equitable partners to design and disseminate age-specific education within four outreach components: (1) survivorship service referral; (2) monthly education and support seminars; (3) annual workshop; and (4) electronic education via website and Facebook.

**Methods:** Partners (YBCS and other community stakeholders) completed surveys after each seminar and workshop. Data were analyzed for age-specific needs. A YBCS advisory board met to validate identified themes that were subsequently adapted for dissemination in the Network's components. Component data were tracked.

**Results:** In 2 years, the Network referred 83 YBCS for services and provided 16 seminars to 149 attendees. On a 1-10 scale, attendees highly rated helpfulness (9.7) and meeting survivorship needs (9.8). Participants stated that their objectives were met (99%) and information was useful (100%). The Network's 2 annual workshops educated 173 YBCS, families, and healthcare providers with high helpfulness and satisfaction ratings. The Network website, housing 46 electronic tip-sheets and community partners links, and Facebook page respectively had 290 daily visits and 165 likes.

**Discussion:** Age-specific survivorship education was disseminated through partner engagement. Further study of YBCS using CBPR can improve education delivery and decrease health disparities among YBCS. Future directions of the Network include expansion of dissemination through internet and social media presence.

## B 25 - Women Affected with Cancer: Research and Practice

### Descriptive Study of Cognitive Disturbances in Older Breast Cancer Survivors

---

*Melissa A. Craft, PhD, MS (Nsg), BSN, APRN, RN, AOCN, USA*

#### Purpose

to discuss the factors, both biological and functional, that relate to and impact cognitive function in older breast cancer survivors who report persistent cognitive impairment after chemotherapy in order to enable the provider to facilitate the development of interventions to help women cope, adapt and even improve their cognitive functioning.

#### Target Audience

anyone who is interested in and/or working with people experiencing cognitive impairment following cancer treatment. Clinicians, researchers and educators may find this session informative regarding the trajectory of cancer treatment and survival.

#### Abstract

Breast cancer continues to be the number one cause of cancer in women over age 50, with a median age at diagnosis of 61 years. (ACS, 2013). Treatment advances have led to a significant increase in the number of breast cancer survivors; survival rates now range from 88% at 5 years to 78% after 15 years post diagnosis (ACS, 2013). A significant number of these women, 35% of early stage breast cancer (Stages I/II) and 61% of later stage breast cancer patients (Stages III/IV), receive chemotherapy (The National Cancer Database, 2008).

Cognitive disturbances, often referred to as “chemobrain” are common among breast cancer survivors. Where most experience cognitive disturbances during treatment, many improve upon treatment termination, up to a fourth may experience persistent cognitive decline 1-year post treatment. Many describe these issues as related to declines in memory.

In older patients, the likelihood of cognitive disturbances are even greater (Ahles, 2010) because they often have lower cerebral blood flow, and have additional comorbidities, including undetected neurodegenerative diseases.

The purposes of this descriptive exploratory study are twofold: (1) examine how factors, both biological and functional, relate to cognitive function, in older breast cancer survivors who report persistent cognitive impairment, 12-36 months after completing their chemotherapy regimen and (2) characterize and compare the genetic and phenotypical profiles of breast cancer survivors to the profiles found in a neurologist verified sample of older adults diagnosed with mild cognitive impairment (MCI), pre MCI, and no MCI.

Twenty older breast cancer survivors (10 with and 10 without measurable impairment, age 50 years and older) will complete a 4 day journal and complete questionnaires describing the impact of their treatment regimen on their ability to think and the strategies they use to adapt to their perceived deficits. Afterwards, they will come to the Neurocognitive Assessment Laboratory and undergo a comprehensive neurocognitive battery, including behavioral and electroencephalographic measures of memory functions, sleep, and cerebral oxygenation. Blood draws for inflammation, oxidative stress and neuroprotective factors (neuroglobin, antioxidant activity and brain derived neurotrophic factors) and genetic polymorphism (APOE, neuroglobin) will also be measured in order to compare these variables to equivalent data collected from adults without cancer.

Data will be analyzed using thematic content analysis for the journals, schematic plots and t-tests for the measures of proinflammatory risk, neuroprotective factors and memory consolidation. Cross tabulation and chi-square will be used to compare genetic risk between samples. Each marker will be analyzed in a

two-way ANOVA, sample by cognitive status, where the interaction will be used to test the differential relationship of the marker and cognitive status by cancer status

Results will be used to develop a larger, prospective study aimed at refining the recognition of women at greater risk for persistent cognitive decline and factors to ameliorate that risk. In addition to this, information gained from this study will facilitate the development of interventions to help women cope, adapt and even improve their cognitive functioning while on treatment.

### **Lessons Learned: Nursing School Faculty Revamp Program Curriculum to Promote Student Engagement, and Systematic, Effective Validation of Student Competence throughout the Curriculum**

---

*Cindy Ford, PhD, MSN, BSN, RN, CNE, USA*  
*Victoria Thornley, MSN, RN, CNE, USA*  
*Alicia Anger, MSN, RN, USA*

#### Purpose

The purpose of this presentation is to share with nurse educators/administrators the lived experience of the implementation of a theoretical framework to the nursing program curriculum with the goal of improved student engagement and learning outcomes.

#### Target Audience

The target audience will be nurse educators and nursing school/program administrators with an interest in the implementation of a theoretical framework with the goal of improved student engagement and learning outcomes.

#### Abstract

Covenant School of Nursing (CSON) has a rich nursing education history encompassing more than 95 years of preparing novice registered nurses to enter the workforce confidently. A hospital based program known for excellence in nursing education, CSON recently entered a formal a partnership with a local university department of nursing to allow a seamless articulation to the BSN degree.

In 2012, the faculty of the fourth (final) semester worked with Carrie B. Lenburg, EdD, RN to apply the Lenburg COPA model (Lenburg, 1999) and evidence based assessment methods into a clinical grading rubric to evaluate the impact on student learning engagement in the clinical setting and the subsequent outcome of increased perceived competence of the 4<sup>th</sup>semester nursing students. The research results yielding evidence of themes reflecting student increased motivation to excel, greater proficiency, and clearer expectations was presented previously at STTI Nursing Research Congress in Brisbane, Australia.

Prior to 2012, the curriculum was based on components of the COPA model. The positive outcome results from the 4<sup>th</sup>semester research project coupled with a faculty desire to adjust the curriculum to promote increased student engagement and student evaluation measurement across the program, prompted the faculty to enhance the utilization of the COPA model program wide. A full curriculum redesign was conducted with extensive faculty involvement, workshops with Dr. Lenburg and Veronica Abdur-Rahman, PhD, RN, CNE, a nurse educator experienced with implementation of the COPA model with nursing programs. The overall goal was for the students and graduates to demonstrate the key conceptual pillars of the COPA model.

The lessons learned through the curriculum revision process have yielded a continuum of reactions and emotions ranging from challenging and frustrating, to rewarding and energizing. The purpose of today's presentation is to speak to the rewards to be gleaned through a united faculty effort with the goal of student engagement and improved outcomes throughout the program. The presentation will highlight challenges of implementation of this theoretical model to guide nursing education, the first-hand step by step experience of implementation of curriculum change and encouraging the faculty engagement of a theoretical model to guide the evaluation process.

The COPA model (Lenburg, et al., 2009) is designed and structured as a theoretical curriculum framework to promote competence for practice. It is based on the philosophy of competency-based,

practice-oriented methods and outcomes, and is organized around four essential conceptual pillars. One implication of the IOM report (1999; Greiner & Knebel, 2003) was that safe nursing care is equated with competence, and competency based instruction must receive more emphasis. Additionally, implementation of the COPA model requires significant changes in traditional educational attitudes and methods in nursing programs to promote competent, effective, professional practice and patient safety (Lenburg et al., 2009).

Lenburg (2011) reports that the model or major components of it have been adopted effectively by many nursing programs. With guidance and persistence, faculty work through the challenges of change and ultimately observe remarkable differences in student performance. Alvin Toffler (1990) is often quoted as saying that the unprepared of the 21st century will not be those who cannot read and write, but those who cannot learn, unlearn, and re-learn. Lenburg (2011) states that nurse leaders, educators, and students are caught in the struggle of shifting from past practices to contemporary requirements with the need to unlearn and relearn. This presentation of the curriculum redesign of the Covenant School of Nursing is one such story to be shared and learned from.

### **A Toilet or a Mobile Phone?: Exploring Interactions and Choices That Influence the Health of Mothers in Kenya Using Structural Equation Modeling**

---

*Sarah E. Oerther, MSN, MEd, BSN, RN, USA*

#### Purpose

The purpose of this presentation is to presents results of a retrospective study comparing the relative contribution of toilets or mobile phones for protecting the health of mothers using structural equation modeling.

#### Target Audience

Nurse researchers looking for statistical tools to support the construction of nursing theories with a particular emphasis on data gender gaps in low income countries.

#### Abstract

In 2013 the UN opined, "Of the world's seven billion people, six billion have mobile phones. However, only 4.5 billion have access to toilets or latrines..." (Eliasson, 2013). This statement clearly reflects a bias that implies toilets are better than mobile phones for meeting basic needs. While it is well document that access to toilets results in improved health through improved hygiene, it remains to be determined if investments in toilets provide a greater return for protecting health as compared to investments in alternative technologies such as mobile phones. The research gap that this study aims to address is to compare the relative contributions of toilets or mobile phones for protecting the health of mothers. The approach taken in this study is to construct and evaluate a structural equation model (SEM) that explicitly tests the hypothesis, toilets are more important than mobile phones for protecting the health of mothers. A secondary data set collected in 2008 from household surveys in Kenya was retrieved from the demographic healthy survey program funded by the United States Agency for International Development (USAID). The SEM was constructed to evaluate maternal health as the primary objective with socioeconomic status, household education, the presence of a toilet, and the presence of a mobile phone as critical inputs. Output measures included maternal body mass index (BMI) and child BMI. This project highlights that interventions such as toilets or mobile phones are best evaluated when considering the complex interactions that are part of a dynamic health system with rapid advances occurring in technology.

## B 26 - Expanding Your Thinking: Revamping Curriculum and Cultural Interactions

### Responding to the Research: Culture Care for a Migrant Dominican Community in the Northeastern United States

---

Constance Sobon Sensor, PhD, MSN, BSN, RN, CTN-A, USA

#### Purpose

Share qualitative research findings that describe migrant Dominican cultural beliefs and practices related to health, ways that migrant Dominicans take care of their health, and their experience with professional health care in the United States.

#### Target Audience

Nurses who work with Dominicans; nurses, educators, & students interested in specific strategies for culturally responsive care; & researchers interested in qualitative methods to learn about targeted populations using specially trained culturally appropriate interpreters as gatekeepers and cultural brokers, and as assistants for recruitment, obtaining consent, data collection and interpretation.

#### Abstract

**Background:** The researcher observed the values, beliefs, and traditional health practices of people in rural areas of the Dominican Republic while participating in a service project there in 2007, and saw that their beliefs and practices differed from those of the professional nurse in the United States. This sparked an interest in Dominicans who migrate to the Northeastern United States. Current trends indicate the migrant Dominican population in the United States is increasing rapidly, and there is a higher prevalence of diabetes, hypertension, and obesity in first generation Dominicans, compared to other Latino populations living in New York City. Professional health care may be an unfamiliar concept to these migrant Dominicans. In addition, Dominicans make adaptive changes in their traditional health practices when they migrate, but their generic (folk) care practices remain largely unknown to people outside of their community. Health care providers lack knowledge and understanding of traditional Dominican beliefs and practices that can create barriers for migrants seeking professional health care. In order to provide culturally appropriate care and risk-reduction interventions, nurses must understand Dominican health practices in their new environment.

**Purpose:** This study aimed to discover and describe migrant Dominican cultural beliefs and practices related to health, the ways that migrant Dominicans take care of their health in their new environment, and their experience with professional health care in the northeastern United States.

**Design:** This descriptive qualitative study was guided by Leininger's Theory of Culture Care Diversity and Universality and four-phase analysis method. The health-related beliefs, practices and experiences of a convenience sample of 15 self-identified adult Dominicans living in the United States for six months or more were explored in three focus groups, assisted by trained culturally appropriate interpreters.

**Findings:** Data analysis of focus group transcripts and observations revealed four themes: (a) stress affects health and well-being, (b) family support and faith in God are essential for healing, and promoting health and well-being, (c) migrant Dominicans use both folk care and professional care to treat illness and promote healing, health, and well-being, and (d) perceptions about the quality of professional care are affected by access to care, cost, communication and expressions of caring practices.

**Discussion and Conclusion:** Findings from this study may lead to more culturally responsive professional health care for Dominicans, and help reduce health disparities in this group. Better understanding may improve the quality of care provided, and may also improve patient-provider trust and communication, as well as help patients adhere to prevention and treatment plans. Implications and recommendations for nursing practice, education and research will be discussed. Design and

implementation challenges from this study, and strategies used to bridge cultural and linguistic barriers, may guide others in planning research with similar populations.

## B 27 - Promoting Satisfaction and Civility Within Nursing Faculty

### Incivility in the Workplace: Implications for Nursing Education

---

*Kimberly Ann Balko, PhD, MSN, BSN, RN, USA*

#### Purpose

is to give insight into existence of incivility, ageism and intent to quit among RN to BS nursing students. The discussion of how can we further prevent RN's from leaving the workforce and their education.

#### Target Audience

Deans, Nurse educators, and RN's and nursing students.

#### Abstract

Students in RN-BS nursing degree programs face barriers to successful completion of their programs of study such as memories of incivility within their pre-licensure nursing program and their current educational and workplace experiences of incivility and ageism. This incivility, along with generational differences, adds to the growing concerns of nurses' intent to quit their employers or the profession, which adds to the current and future nursing shortage. The incorporation of multigenerational education for nurses can enhance generational awareness including ageism, communication skills, conflict resolution, coaching, and mentoring to guide employed RNs and nursing students to produce positive, cohesive working relationships in the workplace.

This research study used a quantitative correlational survey design to survey registered nurses enrolled in an online RN to BS nursing program. Three instruments were used to gather data for analysis: Cortina, Kabat-Farr, Leskinen, Huerta, and Magley's, Workplace Incivility Scale; Palmore's Ageism Survey; and Kelloway, Gottlieb, and Barham's, Turnover Intention Scale. A demographic questionnaire was also incorporated into the survey to obtain relevant demographics including gender, approximate age, employment status, shift work, years of nursing experience, leadership role, work setting, race, ethnicity, and state of residence. The findings indicated that in the workplace RN to BS nursing students experienced incivility, ageism, and turnover. Results also indicated that both incivility and ageism are experienced regardless of gender, age, or generational cohort. Therefore, it is important that educators seek ways to support RN to BS nursing students within their work environments and classroom settings, so they continue their education, go on to graduate, and competently perform their role within the workplace to ultimately remain in the profession.

## **B 27 - Promoting Satisfaction and Civility Within Nursing Faculty**

### **Workplace Stress/Role Strain, Empowerment and Faculty-to-Faculty Incivility among Nursing Educators: A Mediation Analysis**

---

*Deborah Dayus, RN, BA, BScN, MSc, Canada*

#### Purpose

The purpose of this presentation is to share the results of a mediation analysis that looked to discover whether structural and/or psychological empowerment mediated the relationship between workplace stress/role strain and faculty-to-faculty incivility among educators in nursing.

#### Target Audience

The target audience of this presentation is nursing educators and leaders in nursing education. The results have implications that may be applied throughout the profession of nursing.

#### Abstract

Researchers are aware of the association of workplace stress and academic incivility (Clark, 2008). An identified limitation of previous research is if there are organizational mediators of workplace stress and how these have an impact on incivility among nursing faculty. One of these potential mediators is empowerment. The question is whether or not structural and psychological empowerment mediates stress, an essential aspect of Clark's incivility model, and in doing so has an effect to potentially decrease faculty-to-faculty incivility in the academic nursing environment. It is this broader impact of culture of the faculty, the perceptions of workplace stress and the mediating potential of both structural and psychological empowerment (Laschinger, 2009), that is unknown.

This paper therefore addresses the following key question: To what extent does structural and psychological empowerment mediate the relationship between workplace stress/role strain and faculty-to-faculty incivility? 93 educators in Southwestern Ontario, Canada completed an online survey. Participants completed four study tools including the Faculty to Faculty Incivility Survey (F-FI survey) (Clark & Springer, 2010), the Role Strain Scale (Mobily, 1991), The Conditions for Work Effectiveness Questionnaire-II (CWEQ-II) (Laschinger et al., 2001) in relation to structural empowerment, and The Psychological Empowerment Questionnaire (Spreitzer, 1995). The results provided evidence sought to further advance the conceptual relationships as presented by the supporting theories, the 'Conceptual Model for Fostering Civility in Nursing Education' (Clark, 2008) and the 'Expanded Model of Empowerment' (Laschinger et al., 2001). As a result of the lack of significance between the predictor variables of workplace stress/role strain and structural and psychological empowerment and the outcome measure of faculty-to-faculty incivility, the steps of mediation analysis were violated and therefore no further testing for mediation was warranted. Whether or not empowerment may be a moderator or confounder requires additional research. Further findings and the sharing of experience related to the perceptions of workplace stress/role strain, structural and psychological empowerment and faculty-to-faculty incivility in nursing education provided a wealth of information supporting previous research done in this field. The implications for leadership and the need for strong policy development to address the issue of faculty-to-faculty incivility in nursing education were strongly voiced by the participants. This study and presentation invites a discussion about what the future holds for nursing educators and nursing education leaders relative to workplace stress/role strain and its effects on faculty-to-faculty civility.

## B 27 - Promoting Satisfaction and Civility Within Nursing Faculty

### The Effect of a Formal Mentoring Program on Career Satisfaction and Intent to Stay in the Faculty Role for Novice Nurse Faculty

---

*Bette A. Mariani, PhD, RN, USA*

*Stephanie M. Jeffers, PhD, MSN, BSN, RN, USA*

#### Purpose

The purpose of this presentation is to present the findings of a study that explored the influence of a formal mentoring program on career satisfaction and intent to continue in a faculty role of novice full-time nurse faculty in undergraduate baccalaureate and graduate nursing programs.

#### Target Audience

The target audience of this presentation is nurses who are in a faculty role, or nurses who are considering a faculty role.

#### Abstract

**Background:** The transition from the role of a clinician to that of faculty in an academic setting can be challenging and stressful for novice nurse faculty. A lack of support and mentoring for these novice nurse faculty can impact how they view their role as faculty. In 2006, the National League for Nursing (NLN) released a position statement describing their vision of mentoring for nurse faculty. This statement declared that mentorship among nurse faculty is essential in order to recruit and retain nursing faculty, to fill the numerous vacancies in colleges and universities and ultimately have available resources to educate the next generation of nurses. The NLN also described the positive aspects of mentoring nurse faculty, such as providing a supportive work environment, decreasing feelings of seclusion, and increasing nurse faculty's confidence, knowledge, and skill in nursing education. With the impending nurse faculty shortage, it is imperative that nursing education programs develop an approach such as formal mentorship programs to recruit and retain novice nurse faculty.

**Purpose:** The primary purpose of this study was to explore the influence of a formal mentoring program on career satisfaction of novice full-time nurse faculty in undergraduate baccalaureate and graduate nursing programs. The second purpose of the study was to explore the influence of participation in a formal mentoring program on novice nurse faculty intent to continue in the role of nursing faculty. The third purpose of this study was to explore the experience of novice faculty.

**Design:** This mixed-method study used a combination of a quantitative, descriptive comparative and qualitative designs. The purpose of the descriptive comparative study was to: 1) describe and examine the differences in career satisfaction between two groups, those novice nurse faculty that have participated in a formal mentoring program and those novice nurse faculty that have not participated in a formal mentoring program; and 2) explore the intent of novice nurse faculty to stay in the faculty role. The phenomenon of interest was mentoring and the dependent variables were career satisfaction and intent to continue in a nurse faculty role. This study also included a qualitative piece, with open-ended questions in the survey. The purpose of this was to gain further understanding of the experiences and emotions experienced by the participants during their transition from clinical practice to academia, as well as their possible experiences with being mentored in the faculty role.

**Sample and Setting:** The sample included a random selection of nursing faculty of undergraduate baccalaureate and graduate nursing programs across the country. The study was conducted through the use of an electronic survey that was emailed to the participants with a letter of explanation.

**Method:** Following IRB approval an email with a letter of explanation and a link to the electronic survey were sent. The survey instruments included a demographic questionnaire and the Mariani Nursing Career Satisfaction Scale (MNCSS), a 16-item semantic differential scale intended to measure career satisfaction. This instrument has a CVI of .84 and a Cronbach's alpha of > .90. Additionally, participants

were asked open-ended questions about their experience as novice nurse faculty and the mentoring process.

**Results:** The survey was emailed to 905 participants, with a response rate of 17% (N = 150). The mean score for the MNCSS was obtained and independent t-tests were computed to compare scores of the faculty who had participated in a mentoring program with those who had not. Additional quantitative analysis was conducted for demographic data. Content analysis of the open-ended answers on the survey was conducted by reading and re-reading the answers; common themes were identified and will be reported.

**Conclusions/Implications for Nursing:** It is clear that there will be a nursing faculty shortage as experienced and older faculty begin to retire. With the plethora of novice nurse faculty that are and will be entering the academic setting to fill these vacant faculty roles, it is imperative that more experienced nurse faculty and faculty leadership identify strategies to support these novice nurse faculty. Studies that demonstrate positive outcomes of mentoring programs are needed to provide support for these programs and novice faculty.

## C 16 - The Psychological Impact of Nursing and Nursing Care

### Amputees' Perceptions of What Nurses Should Know about Mirror Interventions

---

*Wyona M. Freysteinson, PhD, MN, BSN, RN, USA*

*Lisa W. Thomas, MS, BSN, RN, CRRN, APRN, CNS, USA*

*Amy L. Sebastian-Deutsch, DNP, MSN, BSN, APRN, CNS, AOCNS, USA*

#### Purpose

The purpose of this presentation is to share the perceptions of amputees as to what they believe nurses should know about the experience of viewing oneself in a mirror after an amputation. Additionally, the perceptions of amputees related to mirror interventions nurses should take are shared.

#### Target Audience

The target audience of this presentation is nurses who work with individuals who have recently had an amputation of an upper and/or lower limb. The presentation is also suitable for nurses in academia who prepare students for the nursing role.

#### Abstract

**Purpose:** Approximately two million people in the United States are living with the loss of a limb. Researchers have demonstrated that a visible disfigurement such as an amputation may have a profound psychological impact on individuals, including his/her perception of one's own body image. An aspect of body image that appeared to be neglected in the literature for amputees was the mirror-viewing experience. Evidence that addressed viewing one's self in a mirror after the amputation of a limb(s) appeared to be non-existent. The aim of this multi-disciplinary, qualitative research study was two-fold: to generate a description of the trajectory of the mirror experience over time following a limb amputation, and to gain an understanding of appropriate clinical and/or educational mirror interventions for individuals who have had limb amputations. In this presentation, the perceptions of the participants as to what nurses should know and do concerning the mirror experience are examined.

**Methods:** Audio-taped focus groups were held with nine women and eight men, ages 19 to 68 ( $M=42.82$ ,  $SD=14.34$ ), who had lost an upper or lower limb anywhere from 1 to 48 years prior to the study. One of the questions asked in the focus groups was: What should every health care provider know about the mirror experience? This question generated a considerable amount of data that pertained to a variety of health care professionals including nurses.

**Results:** Key life stories the amputees shared are used to highlight the need for nurses to take an active role in the mirror experience following amputation. The lack of mirrors in hospital rooms was acknowledged by almost all study participants. Only one participant had ever discussed mirrors with a health care provider. As such, amputees in these focus groups learned from each other how mirrors may be used: to care for their residual limbs, in gait and prosthesis training, and in coming to know one's new body. Viewing self in a mirror after an amputation may be a traumatic event as evidenced by words such as shock, horrible, disgust, devastated, and ashamed. A story is shared of the visceral reaction of one participant who accidentally encountered her reflection in a full length mirror for the first time after her amputation in a physical therapy room surrounded by numerous other patients. Step by step instructions as to how these participants believed large mirrors should be introduced after an amputation and who should be present, for support, are provided. Information as to when a patient should be referred to a psychologist regarding the mirror experience is explored. In addition, education on the importance of using a small mirror in self-assessment of the residual limb is examined.

**Conclusion:** The information provided in this presentation may be used in preparing interventions for future mirror studies aimed at the ways in which nurses may be more involved in the care of an individual who has suffered an amputation of a limb. It has also provided information that will allow for the development of caring, compassionate, clinical nursing mirror interventions and professional education aimed at enhancing acceptance of body image and avoidance of skin breakdown and infection.

## C 16 - The Psychological Impact of Nursing and Nursing Care

### Career Choice and Longevity in U.S. Psychiatric-Mental Health Nurses

---

*Cynthia A. Diefenbeck, PsyD, MSN, RN, PMHCNS-BC, USA*  
*Robbi K. Alexander, MSN, RN, PMHCNS-BC, USA*

#### Purpose

To present original research findings from a descriptive phenomenologic study conducted to explore career choice and career longevity in US psychiatric-mental health nurses. Findings will inform nurse educators, administrators, and clinicians how to best recruit nursing students and retain nurses in the psychiatric specialty area.

#### Target Audience

Nurse educators, administrators, and clinicians.

#### Abstract

In the United States (US), demand for mental health services continues to increase as federal initiatives such as the Affordable Care Act and mental health parity improve access to and coverage for mental health services. Psychiatric-mental health nurses are uniquely qualified to bolster mental health treatment across the continuum of care, but relative few nurses enter and remain in the specialty. Prior research has focused on the unpopularity of psychiatric nursing as a career choice for nursing students. The purpose of the study was to explore the experiences of those nurses who did choose psychiatric nursing careers and have remained in the specialty area. Descriptive phenomenology was employed to examine how nurses entered and remained in the specialty. In a face-to-face interview, eight registered nurses described their experiences with psychiatric nursing as a student, their entry into psychiatric nursing, and factors related to their longevity in the specialty. Giorgi's Existential Phenomenological Research Method was employed to analyze the interview data. Three themes emerged related to career choice: Interest developed prior to or while in nursing school, Personal relevance, and Validation of potential. Three themes emerged related to retention: Overcoming stereotypes to develop career pride, Positive team dynamics, and Remaining hopeful. Nurse educators play an important role in identifying talent, validating capability, enhancing interest, and increasing confidence to pursue a psychiatric nursing career, while nursing administrators and clinicians play a key role in retention. Findings also stimulate pertinent questions surrounding the long-term viability of the psychiatric-mental health nursing specialty in the US as well as the nation's model of generalist entry-to-practice model of nursing education.

## C 16 - The Psychological Impact of Nursing and Nursing Care

### The Concept of Self-Stigma: A Clinical Investigation

---

*Linda Carman Copel, PhD, MSN, MSMFT, BSN, RN, PMHCNS, BC, CNE, ANEF, NCC, FAPA, USA*  
*Khamis Al-Mamari, MSN, RN, USA*

#### Purpose

The purpose of this presentation is to describe the nature of the phenomenon of self-stigma as it is experienced by women with disabilities who had experienced intimate partner violence.

#### Target Audience

The target audience for this presentation is nurse clinicians, educators and researchers who work with vulnerable populations, such as women with disabilities who have experienced intimate partner violence.

#### Abstract

The concept of stigma is recognized as a widespread, universal experience which is a major cause of personal suffering and a deterrent to obtaining health care. Vulnerable populations, such as women with disabilities (WWD) who have experienced intimate partner violence (IPV), are at risk for several of the various forms of stigma, especially self-stigma. Health care providers and social scientists believe that stigma has a negative influence on people's lives by contributing to high levels of stress and social disadvantages.

The primary purpose of this research study was to describe the nature of the phenomenon of self-stigma by WWD who had experienced IPV and extricated themselves from their violent situations. A secondary purpose was to identify if additional types of stigma were experienced by these disabled women and to compare the findings to a stigma model constructed through the process of concept analysis. The study was conducted through the use of a secondary data analysis on qualitative data obtained from a phenomenological research study which explored the lived experience of WWD who experienced IPV. The population was adult women who were currently participating in either individual counseling or a women's support group at a community mental health center located in the Mid-Atlantic region of the United States. A convenience sample of 24 disabled women over the age of 21 was recruited from the center. After obtaining Institutional Review Board approval and each individual participant's consent, the interviews and the collection of the demographic data were held at the counseling center. Each interview was audio-recorded in a private office. The data used for the secondary analysis were the original transcripts analyzed again using Colaizzi's phenomenological methodology.

A description of the participants' background, health status, and abuse history was obtained from the demographic data collection. The findings revealed 53 examples of self-stigma validated from the interviews. Several examples of public stigma, double stigma, and health care provider stigma also were identified. The four empirical referents from the concept analysis, experience of discrimination, feelings of being devalued, negative attitude towards self, and struggles with self-care and functioning were confirmed. For the women in this study, the experience of self-stigma was present, along with conditions identified in the literature as precursors or antecedents to the experience of stigma. Of the nine consequences determined from the concept analysis of stigma, the participants identified seven of these outcomes as a part of their personal experiences. The model, constructed as a part of the concept analysis of stigma, to illustrate the pervasiveness of stigma and how it influences aspects of life and functioning was modified based on the study findings. Additional research is needed to validate the concept analysis, support or further modify the model and to determine its psycho-educational use.

## C 17 - The Aftermath of Operative Procedures: Research Pertaining to Operative Outcomes

### Realities of Post-Operative Pain Management in Ghana: Evidence from Method and Participant Triangulation

---

*Lydia Aziato, PhD, MPhil, BA, RN, FWACN, ONDEC, Ghana*

#### Purpose

The purpose of the presentation is highlight the specific factors that contribute to inadequate post-operative pain management in Ghana

#### Target Audience

The target audience of this presentation is nurse researchers and clinicians within the domain of qualitative research and surgery

#### Abstract

**Introduction:** Post-operative pain has been a problem over the years for many countries including Ghana. Thus patients continue to experience moderate to severe post-operative pain.

**Aim:** The study aimed to understand the factors that contribute to ineffective post-operative pain management at two hospitals in Accra, Ghana.

**Method:** A focused ethnography was employed using multiple data collection methods such as individual interviews, observation, and documentary review. The participants included patients (13), nurses (11), surgeons (3), pharmacists (1), and anaesthetists (1). Sixteen participant observations with partial immersion were conducted and 44 nurses' documentation of care was reviewed. Purposive sampling was used to recruit participants and the sample size was determined by data saturation. Content analysis was used to analyse the data generated and the NVivo 9 software was used to manage the data.

**Findings:** It was realized that multiple factors contributed to ineffective post-operative pain management. These factors were related to the individual, the health system and national policies. The individual factors included socio-cultural, psychological, and inadequate knowledge. Health system factors were negative attitude, poor supervision and team work. National factors included lack of policies and unavailability of opioids.

**Conclusion:** The study concluded that a multidisciplinary and multi-sectorial approach is required to enhance post-operative pain management in a resource-limited clinical context such as Ghana. The need for a context appropriate clinical guideline was highlighted.

## C 17 - The Aftermath of Operative Procedures: Research Pertaining to Operative Outcomes

### An Exploration of the Incidence of and Risk Factors for Unplanned Perioperative Hypothermia (UPH) in the Ambulatory Surgical Patient

---

*Vallire D. Hooper, PhD, MSN, BSN, RN, CPAN, FAAN, USA*

#### Purpose

The purpose of this presentation is to discuss the design, implementation, analysis, and results of an exploratory study examining the incidence of and risk for UPH in the ambulatory surgery population. Results will be discussed within the context of previous inpatient findings. Implications for practice will also be described.

#### Target Audience

The target audience for this presentation will include practicing staff nurses and research scientists interested in the design, conduct, and impact of large dataset research on clinical practice.

#### Abstract

**Introduction:** Unplanned perioperative hypothermia (UPH) is a common occurrence in surgical patients in both inpatient and outpatient settings, and has been associated with a 68% increase in the incidence of surgical site infection (SSI). The ASPAN Guideline for the Promotion of Perioperative Normothermia (Hooper, et al, 2010) recommends numerous perioperative interventions as a means of maintaining normothermia throughout the surgical continuum.

**Identification of the Problem:** Outpatient surgeries comprise 75% of all surgeries; however, the incidence of UPH in the ambulatory surgical population, as well as the relationship of warming interventions to the development of UPH in this population is not well elucidated.

**Purpose of the Study:** The purpose of this study was to describe the incidence of UPH in an outpatient surgical population of a large regional-referral healthcare setting. The effect of evidence-based interventions associated with the prevention of UPH was also explored.

**Methodology:** A retrospective exploratory design was used. Data were abstracted electronically from a purposive convenience sample of medical records. Independent variables included all risk factors and confounding variables associated with the development of UPH. Dependent variables included postoperative patient temperature and incidence of UPH. Descriptive statistics included measures of central tendency and frequency measures. Regression was used to explore the relationships of the independent variables to development of UPH.

**Results:** 7102 charts were electronically abstracted. Mean age of the sample was 54.26 years. 39.2% were male; 60.8% were female. 51% of the sample was ASA II. 59.7% of patients received general anesthesia. Mean first postoperative and last temperature was 97.9°F. Mean incidence of postoperative hypothermia was 1.0%. Regression analysis indicated no significant predictors for first postoperative temp; however age, gender, ASA status, intraoperative forced-air use, preoperative temperature, BMI, and OR and surgical time were significant predictors ( $p=0.00-0.008$ ) of last postoperative temperature.

**Discussion/Conclusion:** Incidence of unplanned perioperative hypothermia (UPH) in this population was well below the incidence reported in the literature for the inpatient population. Predictors of last postoperative temperature; however, were consistent with current national evidence-based guidelines.

**Clinical and Research Implications:** While incidence of UPH in this population was minimal, perioperative vigilance regarding temperature management in the ambulatory surgery setting should be

encouraged. Future research into perioperative temperature trending in the ambulatory surgery population is also indicated.

## C 17 - The Aftermath of Operative Procedures: Research Pertaining to Operative Outcomes

### Examining the Use of the Transdermal Scopolamine Patch in the Prevention of Postdischarge Nausea and/or Vomiting: A Secondary Analysis

---

*James I. Masiongale, DNP, CRNA, USA*

*Jane Garvin, PhD, RN, USA*

*Marguerite J. Murphy, DNP, RN, USA*

*Stephen W. Looney, PhD, USA*

#### Purpose

Postdischarge nausea and/or vomiting (PDNV) is estimated to effect up to 50% of patients undergoing general anesthesia. The purpose of this study was to examine the use of the long acting antiemetic, transdermal scopolamine patch (TDS), and the subsequent incidence of nausea and vomiting among ambulatory surgical patients.

#### Target Audience

All nurses that provide care for surgical patients to include preoperative, intraoperative and postoperative care. Academic nurses that teach perianesthesia courses and administrative nurses involved in policy development for surgical services.

#### Abstract

Postdischarge nausea and/or vomiting (PDNV) is estimated to affect up to 50% of patients undergoing general anesthesia. New guidelines recommend long acting antiemetics for those considered to be at risk for PDNV. Therefore, the purpose of this study was to examine the use of the long acting antiemetic, transdermal scopolamine patch (TDS), and the subsequent incidence of nausea and vomiting among ambulatory surgical patients. From the multicenter observational cohort study of 2170 adult ambulatory surgical patients collected from 2007-2008, data were analyzed from 2098 participants with sufficient information to calculate risk scores. The parent study contained variables of interest that were recoded for this study. Descriptive statistics were used to characterize participants in terms of demographics, risk for nausea and/or vomiting, surgical procedure, TDS use (none, during anesthesia, or following the operation in the postanesthesia care unit), and incidence of nausea and/or vomiting. On average, participants were overweight (body mass index = 28.3, SD = 6.9), approximately 50 years of age (M = 49.7, SD = 15.4) and primarily female (65%). Common surgical procedures were general surgery (N = 426, 20%), gynecologic (N = 230, 11%), knee arthroscopy (N = 222, 11%), and breast (N = 219, 10%). TDS was used in less than 4% of the participants; no TDS (N = 2020, 96%), TDS during anesthesia (N = 71, 3.4%), and TDS in PACU (N = 7, <1%). For those qualified to receive a long acting antiemetic based on risk scores, less than 1% received TDS. Over 90% (N = 64) of those receiving TDS during anesthesia had a PDNV Risk Score of  $\geq 3$ ; 86% (N = 6) of those receiving TDS in PACU had a PDNV Risk Score of  $\geq 3$ . Given the expected PDNV incidence of 20,30,50,60, and 80% for a risk score of 1,2,3,4,5, respectively, those not receiving TDS experienced PDNV at the expected incidence based on PDNV risk score (18,31,49,61,and 82% respectively). Those receiving TDS during anesthesia generally had an incidence of PDNV less than expected (0, 40, 37, 53,and 71% respectively). Six of the seven receiving TDS in PACU had a postoperative nausea and/or vomiting risk score  $\geq 3$ . Five of the seven receiving TDS in PACU had nausea and/or vomiting while in the PACU. Those with a PDNV risk score of 3, 4, or 5 receiving TDS in PACU had higher incidence of PDNV than expected (67, 100, and 100%); this was likely due to providers reserving TDS for those with the highest risk scores and those already experiencing nausea or vomiting in the PACU. Findings from this study highlight the limited use of TDS as a long acting antiemetic in ambulatory surgical settings and the potential value when given during anesthesia. While this cohort study has limitations, further study is needed to examine the effect of TDS on the individual components of PDNV (nausea, vomiting, nausea or vomiting, and nausea and vomiting), as well as severity of PDNV, using a randomized controlled trial to examine TDS across all levels of PDNV risk score.

## C 18 - Effects of Toxic People

### The Lived Experience of Incivility in Nursing Classrooms

---

*Elizabeth J. Diener, PhD, MSN, BSN, RN, CNE, USA*

#### Purpose

To continue the dialogue of incivility in nursing education and present findings from the current phenomenological study, including how uncivil encounters could have been defused.

#### Target Audience

Nurses working in any faculty role in nursing education.

#### Abstract

**Background:** In recent years the prevalence of incivility in educational settings has received heightened attention in academic and popular press. In light of nursing's position as a profession of humanistic, caring interaction, measures to reduce incivility are of dire need in the academic setting. The presence of uncivil behaviors not only diminishes the modeling of professional nursing and fails to set a standard of acceptable behavior, but restricts learning and destroys the educational environment. Missing from current research is the study of whether faculty, using a conscious, caring approach are able to defuse escalating uncivil encounters. The purpose of this phenomenological investigation was to describe the lived experiences of nursing faculty who have experienced or witnessed incivility in the classroom and to elicit reflection on how these situations might have been defused.

**Method:** A phenomenological approach was used to guide data collection and analysis. Purposive sampling will be used to recruit 10 nurse educators who self-identify as having experienced incivility in the classroom as a nurse educator. Participants meeting the inclusion criteria participated in single session, 60 minute interviews with one of the co-researchers. Inclusion criteria consisted of possessing a Master's degree in nursing and have been employed in a school-based, classroom setting as nurse educator for longer than 12 months.

**Findings:** Two themes were identified: The first theme, Tolerance, illustrated how perpetuation of incivility occurred. A second theme, Opportunities to Diffuse, addressed actions that could, and were, taken to deescalate incivility through conscious action. Conscious action became the "Living Rule" of embodiment of Caritas practices. Caring begins in nursing classrooms and moves outward into the clinical environment. Fostering a community of care begins with respectful regard prior to clinical engagement.

## C 18 - Effects of Toxic People

### Helping Men Rebuild Their Sense of Self Following Workplace Bullying

---

*Judith A. MacIntosh, BN, MScN, PhD, RN, Canada*

#### Purpose

The purpose of this session is to help health professionals understand the impacts of workplace bullying on men's sense of self and how to assist them to rebuild following workplace bullying.

#### Target Audience

The target audience of this presentation is researchers, human resource and health care practitioners, and educators.

#### Abstract

Workplace bullying is prevalent abuse consisting of offensive behaviours that humiliate or intimidate others at work (Carbo and Hughes, 2010). The reported incidence varies with type of abuse and measurement methods but world-wide rates are reported to be increasing. Workplace violence has been identified as an international problem (World Health Organization, n.d.). We know that workplace bullying has effects on physiological, psychological, social, and economic health. Our past research showed how workplace bullying influenced women's health promotion and workforce engagement (MacIntosh, O'Donnell, Wuest, & Merritt-Gray, 2011). We recognized a need to study men's experiences because of potential differences in biology, gender norms, and help seeking behaviours.

We used grounded theory to study and develop a substantive theory of how men took care of their health and engaged in the workforce following workplace bullying. We recruited a community sample and interviewed 36 adult men, ranging in age from 30 to 81 years (average age 52 years). Most men had some high school education and many had gone to university. Men in this study worked in healthcare, office work, trades, labour, and business in cities, towns, and villages and in both large and small workplaces. About 2/3 of men were bullied by bosses and about 2/3 of those bosses were men. The rest of the people bullying were co-workers or groups of them. Most men reported psychological bullying. About 1/3 of men were fired, laid off, or forced to retire early because they were blamed for being bullied. Only about 1/4 of men stayed in their workplaces.

The main problem for men experiencing workplace bullying was that it eroded their sense of self. How they thought of themselves was shaken. It was hard to understand and how they were treated did not fit with how they saw themselves. Men addressed this problem using a four stage process we named Sustaining Self. We called the stages noting discrepancies, gauging damage, preserving, and coming to terms. Men's efforts to take care of their health and to keep working were affected by the amount of support they got from friends, family, health care workers, and at work. How men thought they were expected to behave as men affected what they did about being bullied.

I will talk about how men managed workplace bullying and what they believed would help them to manage and to rebuild their sense of self. Their recommendations include policy and workplace culture change strategies. Many men in this study sought help from available resources and I will talk about which sources of help they tried and accessed, and the outcomes of that help-seeking. That men did seek help leads us to further research concerning which men are more likely to seek help for health problems and what prompts them to do so.

## C 18 - Effects of Toxic People

### "Know What Battle to Fight and How to Fight It": Navigating the Cultural Terrain of Healthcare

---

Josephine B. Etowa, RN, PhD, Canada

#### Purpose

To discuss the role of organization culture work life of visible minority nurses To examine the inter-personal relationship of Minority nurses with colleagues and patients To explicate the various manifestations of racial discrimination in nursing To present the strategies for dealing with differential treatment

#### Target Audience

Front-line nurses Nurse Managers Senior Healthcare Administrators Researchers Educators and nursing students.

#### Abstract

**Background:** Globalisation and the changing demographics of contemporary society call for a diverse health professionals' workforce to provide effective health care for all consumers. There has been growing interest in issues of diversity, social inclusion, and racism within the nursing profession and programs are being developed to promote diversity in the profession. This growing interest in understanding the importance of diversity and social inclusion, as well as the specific experiences of minority health professionals, holds promise for health care. Therefore, sustained efforts to create a healthy population should include examining the work life experiences of minority nurses already working in the system and creating a healthy work environment for all nurses irrespective their ethno-cultural backgrounds.

**Purpose:** This paper will present the findings of a grounded theory study that investigated the work life of visible minority nurses in Atlantic Canada.

**Methodology:** Qualitative study using grounded theory. In-depth individual interviews of twelve Registered Nurses (RN) were primary source of data collection. Snowball technique and theoretical sampling directed recruitment to enhance maximum variation. Interviews were transcribed verbatim and coded. Constant comparative method was used for data analysis and Atlas ti computer software facilitated data storage and management

**Results:** The paper will focus on the theme of relationship with professional colleagues and patients as well as the organizational culture that formed the backdrop to these relationships. It will explicate the conditions that influence the work life of visible minority nurses including racism, organizational culture and discrimination. It will discuss the impact that experiencing and witnessing racism have on the mental health of these nurses and their responses to differential treatment.

**Conclusion:** It will conclude with recommendations for fostering a healthy work environment for visible minority nurses including mentoring programs and opportunities for career advancements.

## C 19 - Implications and Innovations in Childhood Obesity

### NAHN Miami Chapter Presents Muevete on Cinco de Mayo Day to Reduce Obesity in Children of Migrant Workers

---

*Patricia R. Messmer, PhD, MSN, MA, BSN, RN-BC, FAAN, USA*

*Yolanda Nitti, MSN, RN, USA*

*Giannina Santos, DNP, MSN, ARNP, USA*

*Yamina Alvarez, DNP, RN, USA*

#### Purpose

To promote healthy eating habits and decrease obesity in Mexican migrant children and Hispanic children

#### Target Audience

To provide an awareness that other countries for example Mexico restricts junk food ads along with the Muevete project to reduce obesity in Hispanic children

#### Abstract

**Introduction:** In July, 2014, Mexico restricted food marketing to children since Mexico is the biggest +per-capitala consumer of Coca-Cola and 3rd largest market by revenue for Pepsi (Wall Street Journal, 8/22/2014). Television ads were banned on cereals like Fruit Loops and Frosted Flakes between 2:30pm and 7:30pm on weekdays and 7:30am and 7:30pm on weekends ([www.foodnavigator-usa.com/Regulation/mexico-restricts-junk-food-ads-time-for-rethink-on-advertising](http://www.foodnavigator-usa.com/Regulation/mexico-restricts-junk-food-ads-time-for-rethink-on-advertising)). Mexico is fast becoming a leader in the fight against obesity with other countries like the United Kingdom, Norway and Quebec, CandaChildhood obesity is widely recognized as a major public health problem of global significance (Onis, 2014). Treating obesity-related illness (25% of Florida population) is \$6,675,940 with Latino children at a greater risk of obesity with prevalence increasing over time (Wikley, eta al, 2014). Obese Miami-Dade County children (20%) are more likely to develop Diabetes Type 2 and cardiovascular disease (RWJ & NCLS, 2012). National Association of Hispanic Nurses (NAHN) Miami Chapter participated (2013-2014) in Muevete USA™ Project to reduce Hispanic children obesity (Milan, 2011). Coca-Cola Foundation funded the program in partnership with Let's Move ([www.letsmove.gov](http://www.letsmove.gov)) and weight management programs (Brown et al, 2014). However children in Migrant workers in South Florida are more obese due to eating habits and finances and are exposed to the ban of TV ads.

**Purpose:** To determine if presenting Mexican TV ads and an educational program on nutrition, labels, physical activity and exercise can increase Mexican migrant workers children's knowledge and attitude of obesity.

**Methodology:** A descriptive exploratory research design conducted in a clinic for children of Migrant workers in south Florida. Mexican children listened to Mexican TV ads, completed five pre/post tests= 15 questions - "My Plate"; "Food Label"; "Physical Activity and Exercise" "Healthy Snacks" and "Goal Setting". Content validity was established. Community Health ASN & RN-BSN students participated in Muevete USA™ during Cinco de Mayo Day. Students, received 10 community hours for designing posters and promoting healthy habits for 25 children (4-15); taking food cutouts, making plates with appropriate portions, nutritional requirements and reading labels. Healthy snacks were served. Each child received a jumping rope along with exercises and games. A FDA representative taught hand washing techniques.

**Results:** Over 357 Hispanic children participated over two years in two different sites; There were 100 children at the 1<sup>st</sup> site 1st year and 132 2nd year and 125 children at 2<sup>nd</sup> site in the 2nd year. Hispanic children ranged in age 4-16, mean age 9.4 at 1<sup>st</sup> site while it was mean age of 8.1 at 2<sup>nd</sup> site ranging from kindergarten to 9<sup>th</sup> grade. There were equal number Blacks and Hispanics with lower number of Caucasians at the 1st site while at the 2<sup>nd</sup> site, there were predominately Hispanics with more Caucasians than Blacks. There were more males at both sites. Mean number of questions correct out of 15 (pretest) was 9.4 and increased to 10.58 at posttest. children ranged in age 4-12; M for pretest was

9.4 increasing to 10.58 posttest with 13.62% change at 1st site and Mean for pretest at 2nd site M pretest was 8.33 increasing to 9.45 with 13% change. Higher scores correlated with older children pre to posttest. Children of Mexican migrant worker's (25) participated on Cinco de Mayo Day ranging in age 4-12; M for pretest was 8.0, increasing to 9.0 posttest with 10% change.

**Discussion:** Mexican children listened to the Mexican TV ads and understood nutrition facts labels, identified food handling, daily portions of fruits, vegetables, grains, dairy, protein and drew a plate with food portions ([www.choosemyplate.gov](http://www.choosemyplate.gov)). They exercised with a jumping rope, did hand washing techniques. Parents received nutrition classes. Most missed question was-"How much Sodium is in this entire food product?" per food label. Sodium-440 mg; 4 servings = 1760mg.

**Conclusion:** Mexican children loved watching Mexican TV ads, jumping rope, eating healthy snacks and exercising. They understood the need to wash their hands and learned to overcome and confront childhood obesity. This program helps to reduce obesity for Mexican children, decreasing the obesity level and reducing the associated healthcare costs.

## C 19 - Implications and Innovations in Childhood Obesity

### Parenting Practices and Children's Physical Activity

---

*Amy M. Hutchens, MS, RN, CNE, USA*

#### Purpose

The purpose of this presentation is to explore the state of the science concerning the influence of parenting practices on children's physical activity levels. Parents have influence over children's physical activity levels. The level of influence and the nature of the relationship is not well studied.

#### Target Audience

The target audience for this presentation includes a variety of disciplines interested in health promotion and disease prevention. This includes but is not limited to physicians, nurses, nurse practitioners, nurse educators, dietitians, and physical therapists.

#### Abstract

Lack of physical activity (PA) has been identified as the 4<sup>th</sup> leading cause of death globally (WHO, 2014). People who are physically active typically live longer than those who are not (Paffenbarger, Hyde, Wing, & Hsieh, 1986). They also have lower rates of heart disease, stroke, type 2 diabetes, depression, and some cancers (AHA, 2013). Parents have influence over children's physical activity levels. The level of influence and the nature of the relationship is not well studied. The purpose of this integrative review is to critically analyze the state of science concerning the influence of parenting practices on children's physical activity levels.

In the United States 42% of children ages 6-11 obtain the recommended daily levels of 60 or more minutes of moderate to vigorous physical activity per day, and only 8% of youth aged 12-15 year old obtain that amount (National Physical Activity Plan, 2014). It is well known that physical activity helps maintain a healthy body weight (Obarzanek, Schreiber, Crawford, 1994). It has recently been predicted that by 2030, 13 states could have obesity rates above 60% (Levi, Segal, St. Laurent, Lang, & Rayburn, 2012). It is essential that improvement in physical activity levels be improved to prevent obesity.

Components of two conceptual frameworks guided this review. Bandura's Social Cognitive Theory (Bandura, 1986) and the Family Ecological Model (FEM) (Davison, Jurkowski, & Lawson, 2012) framed the study based on appropriateness of conceptual fit (Figure 1). Bandura's (1986) Social Cognitive Theory was chosen as a component of the conceptual framework for this review because of its emphasis on social influence. Criteria set forth by Whittemore and Knafel (2005) guided this review. Criteria includes problem identification, literature search, data reduction, data display, and data comparison. Key concepts were identified, evidence and methodological evidence was evaluated (Whittemore & Knafel). The design of the review also includes principles of cross case analysis described by Miles, Huberman, and Saldana (2014).

This review covered an 11 year period (2003-2014). The CINAHL, JSTOR, PsycINFO, and PubMed databases were searched in October of 2014 for eligible studies. The search terms consisted of combinations of "parenting practices", "children", "physical activity", "physical" and "activity". Inclusion criteria for this study were qualitative and quantitative studies published in English language professional journals investigating parenting practices that influence physical activity in children and adolescents. Unpublished studies were not included in the review. Sixty- four studies were identified from the database searches. A total of 10 studies met the inclusion criteria. The majority of the studies (n=7, 70%) were cross sectional, non-experimental, prospective studies. The body of research is limited in experimental designs. There is an inadequate amount of evidence aimed at the prediction and control level.

The Activity related Parenting Practices Scale provided a consistent measurement for parenting practices across the studies. Reliability was consistently reported in the quantitative studies with eight out of nine (88.9%) reporting a Cronbach's alpha for the tools used to measure physical activity related parenting

practices. The research could be strengthened by using accelerometers as a measurement of PA. Seven (70%) of the ten studies contained at least one aim to examine the links between parenting practices and children's physical activity. Two (20%) of the studies, the qualitative ones, aimed to describe parent's perceptions of practices impacting children's physical activity levels. Six of the studies (60%) measured parental role modeling of PA as a parenting practice influencing children's PA. Four (40%) of the studies found significant associations between parental role modeling of PA and children's physical levels. Both of the qualitative studies evaluated identified parental role modeling of PA as important in promoting children's physical activity (DeLepeleere et al., 2013; O'Connor et al., 2013). The results of the current review support parental role modeling of physical activity as influencing children's physical activity levels. The science widely involves the use of logistic support and sedentary behaviors as a concepts involved in parenting practices influencing children's PA. Monitoring children's PA is not widely utilized in the literature as a definition of parenting practices influencing children's PA.

Missing elements in this body of literature are original studies as opposed to cross sectional studies aimed at investigating the influence of parenting practices on children's physical activity. The majority of the studies in this review were cross sectional, non-experimental prospective studies. This means that the original design was not primarily intended to examine parenting practices influencing children's PA. The science would be expanded if an original study was conducted to examine the influences between parenting practices and children's PA.

## C 19 - Implications and Innovations in Childhood Obesity

### Obesity-Related Behaviors of Korean Female Adolescents in Their Classroom-Based Peer Networks

---

*Sophia Chung, PhD, MSN, RN, South Korea*

#### Purpose

The purpose of this pilot study is to examine obesity-related behaviors of female Korean adolescents in their classroom-based peer networks.

#### Target Audience

The target audience of this presentation is people who are interested in adolescent health, especially adolescents' behaviors contributing to obesity. This presentation provides a new point of view and possibility to intervene with adolescent obesity to people who develop the interventions for adolescent obesity.

#### Abstract

**Purpose:** The purpose of this pilot study is to examine obesity-related behaviors of female Korean adolescents within a classroom-based peer network

**Design:** A complete social network analysis approach was used. Demographic and behavioral data, including physical activity and eating habits, were obtained from 104 female Korean adolescents aged 16 to 18 from three classrooms in a girls-only high school in Korea. After excluding incomplete answers, network data from 98 adolescents were used for network analysis.

**Method:** Physical activity of adolescents was measured using the International Physical Activity Questionnaires; and the Adolescent Food Habits Checklist for eating habits. Adolescents' peer-network data were collected by friendship nomination. Using descriptive statistics, the characteristics of the adolescents, the level of physical activities and the eating habits were provided. A sociogram, a graphic display consisting of nodes and lines, was created to represent peer networks in the classroom.

**Finding:** Female adolescents mentioned fewer friends among their nominated peer networks in the classrooms when they were asked about physical activity during or after school, compared to the number of friends who had lunch or snack together. Sociogram, created based on the network data relating to eating, indicated that an adolescent was connected to at least one of the peers in the classroom. Several students functioning as bridges between networks were found in each classroom.

**Conclusion:** For the events relating to eating, all female adolescents were connected within their classroom-based peer networks; while fewer networks were found for physical activity.

**Clinical relevance:** Involvement of peers or cliques for intervention would be effective to promote healthier eating habits of female adolescents in Korea. For improvement of the level of physical activity, a classroom-based network approach among female adolescents might be less helpful.

## C 24 - Noting Cultural Differences in the Arena of Mental Health

### Mental Health Treatment and Media Preferences for Persons of Mexican Heritage

---

*Tanya Renee' Sorrell, PhD, MSN, MS, BS, RN, PMHNP-BC, USA*

#### Purpose

To review the results of a qualitative research study describing the treatment preferences, media preferences and influences for mental health treatment for persons of Mexican heritage living along the US-Mexico border in Yuma County, Arizona.

#### Target Audience

Advanced practice and mental health nurses working with, or interested in, Mexican/Latino, and border health populations.

#### Abstract

Determining culturally based methods of care aligning with patient values and preferences is a focal point in mental health services provision. Unfortunately, few studies have focus on mental health treatment preferences of persons of Mexican heritage. A wide range of factors may influence treatment preferences including personal characteristics, acculturation perspectives about mental health issues, illness and treatment experience, and media influences presented in English and Spanish. Achieving patient-centered care in mental health services begins with understanding patient values and preferences and adapting services to meet needs, values and preferences.

**Problem:** This qualitative study describes the treatment preferences, media preferences and influences, and ascribed meanings of mental health treatment for persons of Mexican heritage.

**Methods:** In this IRB approved study, twenty-one participants living along the US-Mexico border in Yuma County, Arizona were interviewed and responses analyzed using Atlas-ti qualitative analysis software. The participants reported twenty-five treatment preferences associated with their demographics.

**Results:** Media influences on mental health information and ascribed meaning of mental health and illness also affected treatment preferences. Themes identified included- prescribed mental health treatments, self-management interventions, and holistic- integrative medicine treatments. Implications for provision of culturally-sensitive mental health services will be discussed. Mental health services for persons of Mexican heritage should include varying holistic mental health treatment practices, need for varied media modes and an understanding of potential meanings for mental health issues and illness.

## C 24 - Noting Cultural Differences in the Arena of Mental Health

### The Experiences of Low Income Non-Resident African-American Fathers with Parenting and Depressive Symptoms

---

*Omolara Fyle-Thorpe, BSN, MSN, RN, FNP-BC, USA*

#### Purpose

The purpose of this presentation is to expand the understanding of low income non-resident African American fathers' experiences with regards to parenting and depressive symptoms. These fathers are a vulnerable group of parents due to the many factors that affect their parenting and put them at risk for depressive symptoms.

#### Target Audience

Nurses who work with, teach about, and do research about vulnerable populations. The disparities undeserved populations face can be universal. This study will expand knowledge of how to address those disparities and improve practice.

#### Abstract

**Background/Significance and Purpose:** Low income, non-resident African American fathers are a vulnerable group of parents due to the many factors that affect their parenting and put them at risk for depressive symptoms. This population experiences many stressors related to poverty, limited resources, child support, discrimination, and poor social support. An expanded understanding of this population's challenges and coping will allow health care providers to better care for these fathers and their families. The purpose of this study is to explore the experiences of low income non-resident African American fathers with regards to parenting and depressive symptoms.

**Theoretical rationale:** Interpretive phenomenology or hermeneutics is the theoretical framework that will be used for this study. Interpretive phenomenology will provide an in depth understanding on how participants are situated in the world, their background meanings and practical understanding of the world which informs how they cope with stressors and barriers.

**Method:** Data was collected from fourteen low income non-resident African American fathers over a three month period. Fathers completed 3 interviews and 3 scales: The Center for Epidemiologic Studies Depression scale, the Gotland Scale for male depression and the Adverse Childhood Experiences questionnaire. Responses from the scales were used to expand and enrich the data by providing examples of symptoms of depression experienced by fathers. These responses added to the data by prompting discussions about childhood experiences and depressive symptoms. Interpretive analysis: Transcribed interviews and responses from scales were analyzed. Transcribed data was coded and emerging themes were grouped into categories to identify patterns, ascertain exemplars and paradigm cases.

**Results and Conclusions:** Findings from this study expand our understanding of the supports and challenges faced by low income African American fathers who are non-resident. Variations in fathers' coping with depressive symptoms and parenting practices are needed to provide clinical care. Findings also support the development of interventions and intervention studies to promote paternal and child wellbeing.

## C 25 - Nursing Outcomes Based on Data

### Reducing Device-Related Pressure Ulcers: Leveraging Data and Innovation to Improve Adult/Pediatrics Outcomes

---

*Peggy Kalowes, PhD, RN, CNS, FAHA, USA*  
*Raquel Paige, MSN, RN, CPN, CRRN, USA*  
*Valerie Messina, BSN, RN, CWCN, USA*

#### Purpose

Purpose of this session is to share an effective interprofessional performance improvement project, which examined etiology of medical device related pressure ulcers (MDRPU) in adult/pediatric patients. A PU Prevention Model and evidence based algorithm was designed to identify risk, cost effective strategies in reducing our MDRPU rate to 'zero' 2-years.

#### Target Audience

The target audience of this presentation is clinical leaders, staff nurses, advanced practice registered nurses (APRNs) and the quality and performance improvement teams.

#### Abstract

**Significance and Background:** Pressure ulcers are acquired among high-risk patients in pediatric and adult hospitals, and are key indicators of the effectiveness of care. The NPUAP<sup>1</sup> recognizes that PUs can occur on any tissue under pressure, including beneath medical devices (MDs) used for diagnostic/therapeutic purposes. In the past two years we have reduced our quarterly prevalence of PUs (sacral, coccyx, and heel) to zero to 0.3% using an EB Skin Bundle<sup>5</sup> plus a 5-Layered Silicone Border Dressing\* thus the direct impact of MDR PUs has become more transparent. Stage III, IV, and Unstageable PUs are reportable as sentinel events, and are linked with litigation and lack of Medicare/Medicaid reimbursement. In 2012, using our CALNOC (Collaborative Alliance for Nursing Outcomes) nurse indicator PU data, we found a surge of MDR PUs >benchmark in Pediatrics and Adult units, (5-Tracheostomy; 2-Noninvasive Ventilation Masks (NIVM); 1-IV Hub). Thus as we strive to be a high-reliability organization, we have intensified efforts to improve safety through better process re-design, changing practice to EB therapies<sup>1-4</sup> and building a culture of safety.

**Purpose:** The aim of this Interprofessional performance improvement (PI) project, was to examine our on-going rate of medical device related (MDR) pressure ulcers (PUs) among pediatric and adult patients; and to institute a novel PI program for MDR PU prevention, based on evidence and innovation.

**Methods:** The adult/pediatric advance practice nurses and the director of nursing research, convened an interprofessional team (staff nurses; MDs; PT; PI nurses; wound care specialist) who reviewed the literature, and a subsequent development of an intervention model using a rapid-cycle, Plan-Do-Study-Act (PDSA) framework. A root cause analysis of all 8 MDR PUs in 2012 was conducted reviewing stage, location, device involved, and compliance with our standard SKIN Bundle.<sup>4</sup> Because of the urgency to reduce NIVM and tracheostomy-related MDR PUs, we immediately (2<sup>nd</sup> Q, 2012), deployed the use of Mepilex® Transfer or Lite, beneath all tracheostomy neck plates and NIVM. We finalized our comprehensive MDR Prevention Model (2013), to include a new MDR PU Prevention Bundle<sup>1,3,4</sup> with EB interventions, including frequent skin/device assessments, moisture -reducing device interface and pressure-free device interface.

**Evaluation and Discussion:** Our MDR Prevention Model was fully launched in 3<sup>rd</sup> quarter, 2013. We've closely tracked point-prevalence/and incidence data, along team compliance with the MDR prevention bundle for the past 3 Quarters. There was an absolute reduction of MDR PUs from 0.06% incidence of stage 3+ MDR HAPU's per 1000 patient days to zero in pediatrics (benchmark 0.0 – 0.04%); and among adults from 0.28% incidence to zero with (benchmark 0.05-0.09 %). Thus, thru interprofessional team implementation of the MDR prevention program, and deployment of EB therapies to relieve pressure at the device–skin interface effectively,<sup>1,3,4,5</sup> rigorous education and continuous monitoring, we have

sustained a 'zero' incidence among adults and pediatric patients. These interventions can be integrated into daily workflow and result in sustained effect on nursing practice, teamwork and patient outcomes.

## C 25 - Nursing Outcomes Based on Data

### Empirical Outcomes: An Autograph for Our Nursing Care

---

*Pamela Petto, MEdHRD, BSN, RN, USA*

*Tangee Pruitt, MHSA, USA*

*Renee Roberts-Turner, MSN, DHA, RN, NE-BC, CPHQ, USA*

#### Purpose

To discuss the specific steps necessary to identify, build, describe, and demonstrate success in empirical outcome measurement(s). To develop an outline describing the background, problem, goal, methods, participants, and outcome and to select the best metric and proper graphic display to demonstrate empirical outcome achievement(s).

#### Target Audience

Clinical nurses, educators, nurse leaders, nurses in quality and performance improvement.

#### Abstract

**Background:** Changes in the current healthcare environment necessitate an awareness to and transparency of safe and quality patient outcomes. In nursing, empirical outcomes are becoming increasingly important and are an expectation by several accrediting bodies. Some say the bar is lifted for nursing care; others say there is a stronger emphasis on patient outcomes as a measurement of our care. Both of these statements are true; and with this change, measurement of empirical outcomes provides greater evidence of nursing care within the healthcare system and across all providers. Empirical outcomes and the improvements nurses are able to make through best practices in nursing care, the nurse practice environment, and the patient experience are the autograph of our nursing care.

**Purpose:** This session discusses a step-by-step approach to achieving success using empirical outcome measures by describing the background, problem, goal, methods, participants, and outcome. Selecting the best metric and proper graphic display is key to demonstrating successful outcomes.

**Methods:** Empirical outcomes require a deliberate approach to describing and demonstrating improvements in nursing care through an outlined nursing process: background (assessment); problem (diagnosis); desired goal; intervention(s); and evaluation (outcomes). The goal statement is essential and indicates where the project started and its initial direction. The goal statement should reflect a measurable and desired goal attainment and match the quantitative data measurement used. Empirical outcomes require pre- and post-data to demonstrate excellence. Data is evidence of enculturated structures and processes and subsequent sustainment of interventions as the achieved outcome. Pre-data is required to validate that a problem existed prior to the implementation of an intervention or practice change. Each intervention described must have a minimum of three post-data points to demonstrate the effectiveness of the interventions and sustainability of improvement(s). Development of clear and readable graphs depicting all required information is key to demonstrating successful achievement(s).

**Results:** This session will provide examples of initiatives in nursing practice, the nurse practice environment, and the patient experience to describe the development and use of empirical outcomes to demonstrate nursing excellence. A guided outline for each example will be presented along with a detailed, graphic display demonstrating successful achievement of each goal.

**Conclusion:** This session will discuss the specific steps necessary to identify, build, describe, and demonstrate success in empirical outcome measurement(s). The use of empirical outcomes and improvements made through best practices in nursing care, the nurse practice environment, and the patient experience demonstrate the autograph of our nursing care.

## C 25 - Nursing Outcomes Based on Data

### Nurse-Patient Assignments: Moving Beyond Nurse-Patient Ratios for Better Patient, Staff and Organizational Outcomes

---

*Stephanie B. Allen, PhD, MSN, MS, BSN, ASN, RN, NE-BC, USA*

#### Purpose

to explore the current “science” behind nurse-patient assignments. Financial constraints require movement beyond staffing as a solution to our nurse scheduling issues. This study explored the purpose, factors considered and steps of the nurse-patient assignment process. By understanding how we make assignments we can maximize organizational, staff and patient outcomes.

#### Target Audience

nurse leaders, nurse managers, charge nurses and all nurses who make or are recipients of nurse-patient assignments.

#### Abstract

Adverse patient safety outcomes have been linked to higher nurse-patient staffing ratios (1). But given the current shortage of nurses and financial constraints, reliance on lower nurse-patient staffing ratios is not a tenable solution for the delivery of high quality, safe patient care. More educated nurses and better work practice environments have been suggested as solutions to improving patient safety (2).

A seminal study concluded that increasing the percentage of baccalaureate prepared nurses by 10% decreased the risk of mortality and failure to rescue by 5% after they controlled for patient and hospital characteristics (3). Another study found that a one-year increase in the average tenure of the RN was associated with a 1.3 percent decrease in length of stay (4). Other researchers suggested that factors such as patient acuity and nurse competence affect patient safety outcomes (5, 6). These authors suggested that instead of increasing nurse-patient ratios, clinicians’ efforts to improve patient safety should rely on more efficient and effective nurse-patient assignments.

This session will describe the results of a descriptive study about the nurse-patient assignment process. Specifically, what were the purposes, factors and steps of the process. Fourteen charge nurses from 11 different units were interviewed for this study and gave semi-structured interviews detailing how they approach the nurse-patient assignment process.

The results of the study indicated the purposes of the nurse-patient assignment process were interrelated among the patient, nurse and nursing environment. “Best care” was the overarching purpose of the nurse-patient assignment. Participants across units strove to make nurse-patient assignments where best care was a priority while ensuring that nurses were treated equitably and the work of the unit was completed. The most common decision factors were related to patient and nurse demographics, acuity, proximity, competence, workload, nurse-patient ratio, collegiality and staffing. Participants on each type of unit considered factors that were specific to their unit environments. Participants described three pathways to making nurse-patient assignments which corresponded to the type of nursing unit on which they worked.

Unit type and characteristics played a role in the differences seen amongst the three types of units related to purposes, decision factors and steps of the nurse-patient assignment. Based on these findings nurse leaders can implement evidence-based, unit-specific solutions to improve outcomes for nursing staff, patients and the organization. Process and quality improvement activities can track important outcomes for patients (ie, falls, infections, length of stay), nursing staff (ie, retention, sick time, morale) and organization (ie, costs, work environment). Implementing policy & procedures and conducting policy & procedure reviews can standardize processes and improve assignment making transparency.

## C 26 - Innovations in Healthcare Practices

### Safe Zone Implementation in Contact Isolation Rooms: Can the Simplicity of Duct Tape Improve the Patient Experience?

---

*Danell M. Stengem, MSN, RN-BC, CNL, USA*

*Patricia Newcomb, PhD, RN, CPNP, USA*

*Joe Hafley, MSN, RN, CCRN, CNL, USA*

#### Purpose

The purpose of this presentation is to describe how Clinical Nurse Leader's at a large urban medical facility implemented a "Safe Zone" in contact isolation patient rooms.

#### Target Audience

The target audience of this presentation is Registered Nurses, Hospital Administrators, Hospital Nursing Leadership, Infection Preventionists.

#### Abstract

Background: A small but growing body of literature has indicated that contact precautions may be used unnecessarily at times and may contribute unnecessarily to patient loneliness, stigmatization, boredom, anxiety, depression, and decreased patient satisfaction. The time consuming and costly action of donning personal protective equipment (PPE) before having a conversation with the patient creates a barrier to communication and can negatively affect the patient experience.

Description of Methods: This IRB-approved nursing research project was a time series, multiple pre-test; multiple control quasi-experimental study in which the units of analysis are groups of patients cared for in geographically distinct medical-surgical nursing units. A single treatment unit carried out the research intervention and outcomes were compared to outcomes on four control units.

This study created a Safe Zone in contact isolation rooms on the treatment unit. A Safe Zone is a 3-foot square floor space outlined with duct tape extending from the threshold of the door into the patient room. Inside this space, any healthcare worker could stand and carry on a conversation with the patient without donning PPE.

The Caring Assessment Tool (CAT-V) and the Patient Evaluation of Emotional Care During Hospitalization (PEECH) were administered to all patients in the study. Random observations of patient-personnel interaction on all units were recorded on an observation checklist. Infection rates were monitored for all units involved in the study.

Summary of Outcomes/Data: Observations of 897 encounters among 146 random patients on contact isolation precautions revealed that control units used a de facto Safe Zone procedure when staff members stood in patient room doorways to communicate with patients without donning PPE. Over the entire sample of observations, only 10% of patient encounters took place in the doorway (in the Safe Zone). There was an expected significant relationship ( $X^2 = 128.7$ ;  $p = .0001$ ) between donning PPE and entering the patient's room.

On both PEECH and CAT-V tools, higher scores corresponded to perception of greater nurse or staff emotional caring. The mean PEECH score on the treatment unit was 53, while the mean PEECH score on control units was 36. The mean CAT-V score for treatment unit patients was 118, while the mean CAT-V for patients on the control units was 93. The differences in scores between units for both tools were statistically significant. Scores on the CAT-V were highly correlated with scores on the PEECH. Rates of targeted infections remained low and were not significantly different between units, indicating the Safe Zone procedure is safe.

Recommendations: This research project found that infection rates remained low when the Safe Zone procedure was observed to be used informally across all units. However, scores on emotional caring was significantly higher on the treatment unit. There was a stronger Clinical Nurse Leaders (CNL) presence on the treatment unit compared to the control units during the study period, thus CNL presence may have confounded the effects of the Safe Zone procedure. Further research on the effect of Clinical Nurse Leaders presence on patient perception of emotional caring is recommended.

## C 26 - Innovations in Healthcare Practices

### Elements Needed for Innovation Sustainability: An Investigation of Rapid Response Teams

---

*Deonni P. Stolldorf, PhD, RN, USA*

#### Purpose

to describe sustainability and the elements that are needed for the sustainability of innovations in acute care hospitals.

#### Target Audience

is staff nurses, staff development experts, and nurse leaders and administrators.

#### Abstract

Research objectives: The purpose of the study was to (a) determine the level of rapid response team sustainability in a group of hospitals that participated in a collaborative to implement and sustain rapid response teams; and (b) determine the association between sustainability elements and reported rapid response team sustainability scores.

Methods: A cross-sectional design using survey methodology was used. The Program Sustainability Index (PSI) was used to measure for the presence of RRT sustainability elements. The PSI consists of 35 items and five subscales, namely leadership competence, effective collaboration, demonstrating program results, strategic funding, staff involvement and integration, and program responsiveness.

Population studied: All the hospitals in a southeastern state in the U.S. that participated in a 9-month statewide collaborative conducted in 2006 and 2007 with the goal to successfully establish, implement, measure, evaluate, and sustain RRTs in acute care hospitals in the state.

Principle findings: Twenty-five hospitals participated in the study (response rate of 45%). Academic medical centers and community hospitals participated. Preliminary findings indicate variability in sustainability scores between hospitals and the presence of sustainability elements, and potential relationships between sustainability elements of leadership competence, effective collaboration, demonstrating program results, strategic funding, staff involvement and integration, and program responsiveness. A full report of the study findings, including the association between sustainability elements and sustainability scores, will be reported at the presentation. It is anticipated that, based on previous studies, variation will exist in the strength of associations between elements and sustainability scores.

Conclusions: The sustainability of RRTs has not yet been fully realized in hospitals that participated in the collaborative. Additional conclusions will be drawn following a more in-depth analysis of the study results.

Implications for policy: The preliminary findings of the study suggest that mandating RRT implementation and participation in a statewide collaborative may not be enough to achieve RRT sustainability. Without sustainability the outcomes hoped from RRT implementation may continue to elude organizations.

## C 27 - Effects of HIV/AIDS Around the World

### HIV-Related Stigma and Self-Care among Young People Living with HIV in Thailand

---

*Benjamas Suksatit, PhD, RN, APN, Thailand*  
*Warunee Fongkaew, PhD, RN, Thailand*

#### Purpose

The purpose of this presentation is to describe and determine the HIV stigma and its impact on self-care among 92 young people living with HIV/AIDS in Chiang Mai, Thailand.

#### Target Audience

The target audience of this presentation is nurses, nursing students, nurse educators, and all stakeholders.

#### Abstract

This study sought to describe and determine the HIV-related stigma and its impact on self-care among 92 young people living with HIV/AIDS (YPLWH) who were recruited from the network of people living with HIV/AIDS, which operates out of 4 community hospitals in Chiang Mai, Thailand. The theoretical framework for this study was derived from Orem's Self-Care Theory. Data was collected from July 2011 – June 2012, by self-report questionnaires using a demographic data form, the HIV Stigma Scale, and the Self-Care Questionnaire.

This study showed that the mean score of HIV stigma was at a moderate level. Regarding the subscale of HIV stigma, respondents were most concerned with disclosure to others, followed by personalized stigma (attitudes or experiences of the respondents toward being HIV/AIDS), negative self-image, and public attitude toward people with HIV/AIDS, respectively. When examining the relationship between HIV stigma and self-care, negative relationship was found between HIV stigma and self-care including, 1) total HIV-related stigma and self-care behaviors ( $r = -.230, p < .05$ ), 2) total HIV-related stigma and universal self-care ( $r = -.270, p < .01$ ), 3) personalized stigma subscale and universal self-care ( $r = -.236, p < .05$ ), 4) negative self-image subscale and total self-care behaviors ( $r = -.244, p < .05$ ), 5) negative self-image subscale and universal self-care ( $r = -.282, p < .01$ ), 6) concern with public attitudes about people with HIV subscale and total self-care behaviors ( $r = -.285, p < .01$ ), and 7) concern with public attitudes about people with HIV subscale and universal self-care ( $r = -.323, p < .01$ ). However, disclosure concerns subscale found no significant relationship with any self-care behaviors. Additionally, HIV-related stigma had no significant correlation with developmental self-care and health-deviated self-care.

The study revealed that HIV stigma might act as a barrier for YPLWH in performing self-care. All stakeholders should participate in enhancing knowledge, understanding, and accepting people living with HIV/AIDS, which will reduce stigmatization toward them. Without fear of being stigmatized, they may perceive the opportunities to perform self-care to maintain life, health, well-being, and be able to live with other people in the community.

## C 27 - Effects of HIV/AIDS Around the World

### Nurses' Involvement in HIV Policy Formulation in Nigerian Health Care System

---

*Ekaete Francis Asuquo, MNSc, BNSc, RN, RM, RPN, Nigeria*  
*Josphine Basse Etowa, BNSc, PhD, RN, RM, Canada*

#### Purpose

The purpose of this presentation is to highlight nurses' involvement in HIV policy formulation in the context of mother-to-child transmission of HIV in Nigerian Health Care System

#### Target Audience

"The target audience of this presentation is nurses/ nurse leaders, health care system stakeholders, international organizational leaders etc

#### Abstract

**Background of study:** Nigerian national policy on HIV stresses the need for the adoption of multi-sectoral and multi-disciplinary approach in policy formulation, with the health sector taking the lead. This calls for collaboration among the various stakeholders including nurses in policy development initiatives to ensure the attainment of HIV health related goals.

**Purpose:** This paper will present the findings of a recent study which examined nurse's involvement in research productivity and policy development in the context of mother to child transmission (MTCT) of HIV in Nigeria.

**Methodology:** A qualitative case study design under the guiding tenets of critical social theory and participatory action research (PAR). The research is a single case study of one state with embedded units. Thirty nurse-leaders from the various embedded units were recruited through purposive and snowball sampling technique. Semi-structured interview and document reviews were used for data collection. Data was analysed using thematic analysis.

**Result:** This paper will focus on the major theme of nurse's involvement in policy development. This includes the following sub-themes: 1) Knowledge of policy initiatives 2) Barriers to involvement in policy development and 3) Facilitators to involvement in policy development. The paper will also highlight the interplay of power dynamics in the health care system as it hinders nurse's involvement in policy formulation

**Conclusion:** The paper will conclude with some of the lessons learnt in the study and suggestions for effective integration of nurses in policy arena. This includes the need for a broad-based educational curriculum which will incorporate strategies to build nurses capacity for leadership and policy development in training schools.

Key Words: Nurses, HIV Policy, power dynamics, Nigeria

## C 27 - Effects of HIV/AIDS Around the World

### A Persistent Problem in America's Paradise: Examination of the HIV/AIDS Epidemic in the United States Virgin Islands

---

*Safiya George Dalmida, PhD, APRN-BC, USA*

#### Purpose

Describe the nature and history of the HIV/AIDS epidemic in the United States Virgin Islands and identify factors related to that epidemic.

#### Target Audience

Nurses, nurse educators, nurse researchers and nursing students interested in global health, HIV/AIDS or risk behavior.

#### Abstract

**Background:** For over a decade, the U.S. Virgin Islands (USVI) has consistently had one of the highest prevalence rates of HIV infection in the nation. The USVI had the highest rate of adults and adolescents (per capita) living with a diagnosis of HIV in 2005, the second highest rate from 2006 through 2009, and currently has the third highest rate (685.1), since 2010 (667.1). According to the President's National HIV/AIDS Strategy (NHAS), the USVI is a geographic hot spot for increased HIV risk. Majority of people living with HIV (PLWH) in the USVI are: AA/Black (56.9%), age 25-54 years (75.6%) and exposed through heterosexual contact (34.6%) or unknown (40.2%). Half are male. The USVI also has the 3<sup>rd</sup> highest rate (365.5/100,000) of adults/adolescents living with an AIDS diagnosis in the U.S. Recent local USVI news reports highlight the territory's alarming rates of some sexually transmitted infections (STIs), including HIV, Chlamydia, and gonorrhea, which are also among the highest in the nation (among females ages 15 to 24 years). Moreover, local experts believe the rates of HIV and STIs in the USVI are significantly higher, but current data are not available to support this due to insufficient testing, data collection and reporting.

**Purpose:** The purpose of this analysis is to present findings that highlight a persistent HIV/AIDS epidemic in a small U.S. territory by evaluating and analyzing USVI HIV-related data from 2005 – 2010 from two reputable sources: the CDC (2005 and 2009 data) and the USVI Department of Health (2008 and 2010 data).

**Methods:** U.S. Virgin Islands 2008 and 2010 HIV Surveillance data was evaluated for historical and sociodemographic trends. Additionally, U.S. Virgin Islands Data from CDC Behavioral Risk Surveillance System (BRFSS) 2009 and 2005 Annual Surveys were analyzed using PASW 18.0 software. Descriptive statistics were used to determine the sociodemographics of the population and frequency of HIV testing and HIV risk behavior for 2005 and 2009. Chi-square tests examined associations between age, gender, race/ethnicity and high-risk HIV behavior and logistic regression examined predictors of high risk HIV behavior, using 2005 data. Only data for the U.S. Virgin Islands were included in the analyses. Significance was set at 5% alpha.

**Results/Findings:** Local USVI data/findings: By the end of 2010, cumulatively, among PLWH, 57.3% identified as Black/AA, 32.9% as Hispanic, and 7.7% as White. Similarly, by the end of 2010, among adults/adolescents living, approximately 59% were AA/Black, 32% Hispanic and 8% White. Approximately sixty percent of cases of HIV infections in the USVI in 2010 were among males and they accounted for approximately 50% of cumulative HIV cases by end of 2010. Of risk categories reported, heterosexual transmission is the most common HIV risk category in the USVI (34.6%); for males (34.5%) and females (82.7%). Male-to-male sexual contact accounted for approximately 13.2% (in 2010) to 22.6% (in 2008). Injection drug use accounted for 8.1% (in 2010). Majority of HIV infections in 2010 (74.2%) and cumulative cases by the end of 2010 (75.6%) were in people 25 to 54 years old.

CDC BRFSS data/findings: 2,509 people surveyed in 2009 and 2,422 in 2005. Majority of the sample were high school graduates (34.1%, n=855) or attended (18%, n=452) or graduated from college (28.3%, n=710). Majority were married (40.9%, n=1026), employed/self-employed (63.0%, n=1581) or retired (18.6%, n=467) and made less than \$25,000 annually (30.1%, n=248). However, 29.3% (n=735) made over \$50,000/year and 27.6% made \$25-50K/year. Majority were Black and non-Hispanic (86.4%, n=2168). More than half (60.6%, n=1154) reported ever having had an HIV test (compared to 53.6%, n=1074 in 2005) and only 5.5% (n=105) reported engaging in high HIV risk behavior (compared to 6.5%; n=130 in 2005). Gender was not significantly associated with high HIV risk behavior (Chi-square=0.28, p=.597), but age was (Chi-square=8.57, p=.0002). Among 18-24 year olds, 19.7% reported high HIV risk (vs 13.5% not at risk) and among 25-44 year olds, 59.1% reported high HIV risk (vs 45.8% not at risk). In a logistic regression model, including race/ethnicity and gender, being 18-24 years (t=2.83, p=.0047) or 25-44 years (t=3.49, p=.0005) old significantly predicted high risk for HIV (Wald Chi-square=631.48, df=4, p=.0001) such that they were 2.5 times (CI 1.3-4.9) and 2.4 times (CI 1.5-3.8) more likely to be at high risk for HIV, respectively. A more comprehensive logistic regression model (education, gender, income, race/ethnicity and age) significantly predicted risk for HIV (Wald Chi-square =779.58, df=20, p=.0001). Age 25-44 years was the only significant predictor (t=2.9, p=.0038) and they were 2.2 times more likely to have high risk for HIV (CI 1.3-3.6).

**Discussion/Conclusions:** Results indicate an increase in reported history of HIV testing and a decrease in reported high HIV-associated risk behavior between 2005 and 2009. Being a young adult significantly (twice higher) increased the odds of being at high risk for HIV. Local USVI 2008 and 2010 data show that the HIV epidemic in the USVI is primarily among African American, heterosexual men and women between the ages of 25 to 54 years old. More studies are needed to examine the HIV-associated sexual risk behaviors of young adults in the USVI and to facilitate the development of appropriate HIV prevention interventions for this population.

## D 16 - Nursing as a Career: Student Perspectives

### Creating a Legacy through Nursing Leadership, Innovation, and Global Connectivity

---

Shannon, K. Lizer, PhD, FNP-BC, USA  
Asako Katsumata, PhD, ME, BA, RN, CNL, USA  
Gordana Dermody, MSN, RN, CNL, USA  
Elizabeth M. Carson, EdD, MSN, RN, CNE, USA

#### Purpose

to make contributions to the advancement of nursing leadership, clinical practice, and nursing education in Japan, to establish and foster an international collaboration between Saint Anthony College of Nursing (SACN) and Japanese nursing leaders, both educators and clinicians, and to support nursing professional development in an international context.

#### Target Audience

nursing leaders, clinical experts, and educators who may wish to establish similar international nursing partnerships.

#### Abstract

**Background:** "Nurse leaders face a crucial need to understand and take initiative in responding to this radically changing world" (McElmurry, Kim, & Al Gasseer, 2000). It is often a challenge for nurse leaders to develop a diverse world view without interacting with nurse leaders in a global context (Nichols, Shaffer, & Porter, 2011). **Objectives:** The Global Nursing Initiative aims: a) to make contributions to the advancement of nursing leadership, clinical practice, and nursing education in Japan; b) to establish an international collaboration between Saint Anthony College of Nursing (SACN) and Japanese higher education and healthcare institutions to facilitate scholarship development; c) to demonstrate roles of an Advanced Practice Nurse in the US healthcare system; d) to learn about the Japanese healthcare system; and e) to introduce the mission and values of SACN and the OSF HealthCare System in an international context. **Method:** During three tours (May - June 2012, 2013, and 2014), 62 presentations by faculty and students of SACN and expert nursing staff of Saint Anthony Medical Center were delivered at six health science and nursing colleges, and six hospitals in Japan. **Outcomes:** Partnership development has occurred in the area of: 1) a week-long training seminar and an international conference delivered at SACN and SAMC in July of 2013; 2) collaborative international research and grant applications; 3) advancement of nursing leadership, which focused on advanced practice, clinical nurse leader role, Magnet programs and organizational culture; 4) a visit of Japanese nurse leaders and educators occurred for Sigma Theta Tau International Phi Omicron sponsored international conferences in Summer 2014 and 2015; and 5) continuation of international educational program delivery. **Conclusion:** The collaboration of SACN faculty and Japanese nursing leaders led to quality program delivery and building of mutual trusting relationships among the nurse leaders from both nations, which has stimulated further facilitation of global nursing leadership development opportunities.

### African-American Non-Nursing Science Majors' Perceptions of Nursing in the Context of Career Ideals

---

*Robbi K. Alexander, MSN, RN, PMHCNS-BC, USA*  
*Cynthia A. Diefenbeck, PsyD, MSN, RN, PMHCNS-BC, USA*

#### Purpose

To present original research findings from a descriptive qualitative study conducted to 1. gain insight into the career behaviors of African American undergraduate non-nursing science/STEM majors, 2. elicit their perceptions of nursing and 3. inform strategies to recruit this group of academically talented students to nursing.

#### Target Audience

Nurse educators and administrators

#### Abstract

The racial/ethnic distribution of the Registered Nurse (RN) workforce (African Americans 5.4%) differs substantially from the United States population (African Americans 13.1%). It has been suggested that a career in nursing is not the path to upward social and professional mobility that it once was for African American women. Researchers suggest that views students hold about nursing as a career option contribute to the lack of RN workforce diversity. Much of the nursing education literature that addresses nursing students from underrepresented minority groups focuses on the recruitment, support and retention of disadvantaged and academically underprepared students. This qualitative descriptive study was designed to explore the career behaviors of African American undergraduate non-nursing science majors and describe their perceptions about the nursing profession and the desirability of a nursing career for themselves. The results of this study indicate that for this group of STEM (science, technology, engineering, and math) oriented African American non-nursing science majors, the most desirable careers are those that afford one the power to, (a) live and work with a high degree of choice and autonomy, (b) help others and personally affect change, (c) be a positive role model of African American culture and (d) disprove negative stereotypes about African Americans. Strategies to recruit students from this underrepresented racial/ethnic group to nursing should include those which improve the visibility of the profession, highlight APN and leadership roles, and demonstrate the profession's power to affect change.

*Dale Rajacich, PhD, RN, Canada*

*Sheila Cameron, RN, EdD, DSc (Hon), Canada*

#### Purpose

The purpose of this research was to explore what influenced male nursing students to enter their baccalaureate nursing program and to remain in the program.

#### Target Audience

The target audience of this presentation is nurse educators, nurse managers, preceptors, and students.

#### Abstract

**Background:** The national workforce of RNs in Canada is only 6.8% male, with provincial percentages of male RNs ranging from their lowest in Prince Edward Island (2%) to their highest in Quebec (10%) (Canadian Nurses Association, 2012). This small number of males attracted to nursing as a profession is particularly important because of the projected shortages of RNs (Murphy et al., 2012). If current trends in Canada's health profile continue Canada will face a 23% (N=60,000) RN shortage by the year 2022 (Tomblin Murphy et al., 2012). In order to increase the number of men in the nursing profession, it is essential to understand what factors brought current nursing students into their nursing program, as well as what factors affect their decisions to stay in their nursing program.

**Method:** Purposive and snowball sampling was used in this descriptive, qualitative study. Sixteen male nursing students participated in two focus groups conducted in southwestern Ontario. Through open-ended questions, students were asked to share what attracted them to nursing; if they have been treated differently from their female colleagues; what challenges they face as male nursing students; and what has kept them in the program and/or led them to consider withdrawing from their program. Focus group transcripts were subjected to manifest and latent inductive content analysis to identify both common and unique features of the experience of male nursing students.

**Results:** Several common themes emerged as factors that affect the recruitment of men into nursing, including the stereotyped perceptions of nursing, public perception of men in nursing, the influence of significant others, and job opportunities and job security. While male nursing students identified experiences with discrimination and stereotyping as negatively influencing their career choice, the rewarding experiences they encountered while providing patient care, positively influenced their retention within their nursing program. Greater understanding of the attractive and deterrant factors for men to enter a nursing program may provide areas of focus for recruitment strategies for post-secondary institutions. As well, understanding the causative factors affecting retention of men once they have entered a nursing program may provide an increased understanding of methods by which male attrition can be decreased.

## D 17 - Nursing Student Involvement in Nursing Education

### Challenging Global Health Perspectives with Nursing Internship Experiences

---

*Amy Nagorski Johnson, PhD, MSN, RNC-NIC-E, USA*

#### Purpose

The purpose of this presentation is to describe how to foster collaboration globally to develop nursing internship experiences that challenge the global healthcare perspectives of nursing students.

#### Target Audience

The target audience of this presentation is nurses in academia and clinical practice who are looking for experiences for student nurses beyond service learning to challenge global views.

#### Abstract

**Background:** The trend of University students traveling on semester abroad programs is common, yet nursing students experience problems trying to fit these experiences in to their sometimes overwhelming curriculum plan. Although global healthcare issues are infused in nursing discussions on campus, hands on clinical experiences and interactions with healthcare workers in developed and developing countries give new nurses a unique perspective on the issues within the global system. The problem, however, is how do we make the contacts to develop experiences that are meaningful to nursing while maintaining our curricular plan?

**Goal:** To establish global clinical nursing internship experiences that are tied to the eight Millennium Development Goals of the United Nations, the blueprint of a global action plan that crosses healthcare in developed and developing countries.

**Method:** A thinktank of health sciences professors at our University discussed the implications of internship programs and determined that course credit should be associated with the experience to guide the student in understanding the global issues while acknowledging this experience on their transcripts for professional development. A one credit course was written to meet the objectives including synthesize experiential and academic knowledge to gain an understanding of global healthcare issues, demonstrate an understanding of cultural considerations in healthcare delivery, discuss cultural considerations locally and globally in providing care to diverse populations, and compare professional role behaviors relevant to practice locally and globally.

Potential clinical sites were identified through University exchange agreements and international research activity and contacts were made to determine interest in this collaboration. With a goal of sending one hundred students on global internship experiences in the coming year, programs were established, advertised through the media and interest meetings, and applications began coming in to our online registration site. Because all programs filled in less than a month and we exceeded our projected goal, it is clear that these experiences filled a student need.

**Evaluation:** An online evaluation tool was developed to determine student satisfaction with the experiences as well as measure outcomes. This will be completed in the coming months once all students have returned from their internship placements.

**Conclusion:** Global placement for nursing experiences offer a unique perspective to the novice nurse in caring for culturally diverse populations with differing resources. With challenges in obtaining clinical placements locally, perhaps this is a potential solution to getting the clinical experiences students need before graduation.

## D 17 - Nursing Student Involvement in Nursing Education

### Boosting Students' Engagement in Political Learning

---

*Pamela M. Gehrke, EdD, MS, BS, AS, RN, USA*

#### Purpose

The purpose of this presentation is to share how undergraduate students in one required, online hybrid course learned political and policy concepts. A grounded theory study revealed engaged learning through reading, writing, discussion, and experiential learning despite participants not being interested in politics or policy at course beginning.

#### Target Audience

The target audience for this presentation is educators, researchers, and administrators. The knowledge, skills, and inclination to participate in policy work is required for nurses to influence health. Intentional strategies to boost students' learning engagement may help normalize political work as a fundamental part of nursing practice.

#### Abstract

Health care and nursing are political, and nurses' contributions are needed in policy decision-making processes. Political and policy participation can happen wherever nurses practice: in hospitals, agencies, communities, and government from local to global levels. However, the knowledge, skills, and inclination to participate in policy processes are not automatic and are required of nurses in order to influence healthy lives for all. Graduate nursing education prepares nurses for policy roles, but research is limited about what political and policy education is taught to undergraduate nursing students or how they learn the concepts, skills, and disposition for this work.

Nurses need education for civic engagement and political advocacy in their initial professional education. A study was done to learn how undergraduate nursing students made sense of concepts like political advocacy and policy making in an innovative, online blended, required "Policy, Power & Voice" course in one nursing program. The study was approved by the university human subjects' review committee.

Constructivist grounded theory method guided study design and conduct. Interviews of fourteen students post-course and course documents provided rich data resulting in a theory of political learning, "Engaging in Learning Together". Four primary processes of learning were identified: Push Starting Learning, Doing the Work, Learning Online Together, and Making it Real. These four processes resulted in Learning Deeply for most participants, which contrasted with previous experiences of "learning by checklist." Engaged learning was defined as a "...promotive, synergistic learning process involving self, peers, teachers, and/or others, requiring investment of one's physical and mental capabilities along with a positive commitment of spirit and energy. Put simply, it is learning in relationship with others that involves head, hands, and heart".

Study conclusions were: 1) "Engaging in Learning Together" was revealed as a theory for undergraduate nursing participants' political and policy learning; 2) Deep, meaningful learning occurred with peers, the instructor, and others through reading, writing, discussion, and experiential activities; and 3) The disciplinary focus created a positive context for learning about civic engagement and furthered professional formation of participants' knowledge, skills, and disposition for political and policy advocacy work as future nurses.

This presentation will highlight teaching and learning practices within the four learning processes which fostered participants' engagement in learning despite the fact many participants were not interested in politics or policy at course beginning. Specific ways these practices deepened students' learning through reading, writing, discussion, and experiential learning will be emphasized.

In similar contexts, the theory may have potential for guiding nurse educators' course design and instructional strategies for teaching political and policy advocacy to undergraduate students. Creating intentional activities for students to develop these skills in their beginning education may help normalize these as a fundamental part of practice with importance equivalent to knowing how to perform vital signs.

Intentional, deliberate inclusion of political and policy education for nursing students in their beginning education has the goal of promoting nurses' future civic engagement in their profession, organizations, communities, and governmental realms. Participants in this study revealed new understanding of nursing's roles in policy and political advocacy. Development of civically engaged professional nurses should position them to participate in these processes, create a stronger foundation for graduate education, and expand the profession's development of political and policy leadership.

### An Academic-Based Nurse Practitioner Fellowship Program: A Pilot Project Designed to Ease Nurse Practitioner Transition to Practice

---

*Hilary S. Morgan, PhD, MSN, BSN, ARNP, CNM, USA*  
*Michelle L. Edmonds, PhD, MSN, BSN, FNP-BC, CNE, USA*

#### Purpose

The purpose of this program is to present the results of an academic based nurse practitioner fellowship program that was implemented to ease the transition to practice for newly graduated novice nurse practitioners

#### Target Audience

The target audience of this presentation is nursing educators, current and future advanced practice. Additionally practice administrators may be interested in the findings.

#### Abstract

Graduate nurse practitioners (NPs) face numerous challenges transitioning from registered nurse to advanced practice nurse. They may struggle with role identification, communication and teamwork as well as other professional issues. Nurse practitioner residency programs have been developed at a few locations across the country. These programs are rare and generally found only at larger organizations. Because many NPs are hired individually in small practice settings, NP faculty at a small private university in northeast Florida developed an academic based Nurse Practitioner Fellowship designed to ease the transition to practice for graduating NPs.

A theoretical framework titled From Limbo to Legitimacy was used to develop the program. This model consists of four major categories: Laying the Foundation, Launching, Meeting the Challenge and Broadening the Perspective. Subcategories include negotiating the bureaucracy feeling like an imposter, gaining confidence. Nurse practitioner faculty used the model to identify three themes that informed the curriculum for the fellowship: evidence based practice, communication and teamwork, and professional development.

The Nurse Practitioner Fellowship will begin within one month of graduation from an NP program and consist of meeting one evening per month as well as non-synchronous online discussions. The expected duration of the program is four months. Subject matter will include negotiations, scope of practice, billing, credentialing, measuring outcomes, and specific patient scenarios. Participants will be free to bring forth any issues or topics that present while practicing. It is expected that participants will be at various stages of transition as some may be still seeking NP employment whereas others will have already begun practicing as an NP.

Success of the program is measured through use of three instruments administered at the program's start and end. The first instrument is a demographic questionnaire that evaluates the participant's age, gender, race, highest educational level, years working as an RN and specialty setting as an RN. The second instrument is the Casey Fink Graduate Nurse Experience Survey (Casey et al., 2004). This survey evaluates role transition and consists of five sections: demographic information, skills, procedure performance including assessment of comfort/confidence, organizing-prioritizing ability, perceived support, patient safety, personal stress, communication leadership, professional satisfaction, and job satisfaction. The last instrument measures job satisfaction and uses the McCloskey Mueller Satisfaction Scale (1990). This instrument is a multidimensional questionnaire measures satisfaction in 8 domains: satisfaction with extrinsic rewards, scheduling, family/work balance, co-workers, interaction, professional opportunities, praise/recognition, and control/responsibility.

## D 18 - The Use of Tools and Instruments to Advance the Profession

### Selecting an Early Child Development Assessment Tool in Rural Limpopo, South Africa

---

*Gwyneth Rhiannon Milbrath, MSN, MPH, RN, CEN, USA*  
*Claire M. Constance, USA*  
*Vidya V. Gopinath, BS, USA*  
*Audrey Ogendi, BA, USA*  
*Madison B. Compton, USA*

#### Purpose

The purpose of this study is to compare the acceptability and feasibility of two pediatric assessment tools to track child development in a rural health district in Limpopo, South Africa.

#### Target Audience

The target audience of this presentation is nursing researchers, public health nurses, pediatric nurses, and nurses interested in global health or cultural sensitivity.

#### Abstract

More than 200 million children under five fail to reach their cognitive potential due to poverty, poor health, poor nutrition and lack of care. Providing increased cognitive stimulation or learning opportunities to young children significantly increases cognitive and social-emotional competence later in life. An interdisciplinary team of students from the United States worked with the University of Venda and the Vhembe Health District in Limpopo to determine the acceptability and feasibility of a pediatric assessment tool and program to track child development in a rural health district in Limpopo, South Africa. A total of 11 primary health nurses from the region in two focus groups were selected to learn and compare two child development assessment tools: the Cognitive Adaptive Test/Clinical Linguistic and Auditory Milestone Scale (CAT/CLAMS) and Ages and Stages Questionnaire (ASQ). Data were analyzed using versus coding to compare between the two focus groups and between ASQ and CAT/CLAMS. There were no major differences in the opinions between the two focus groups. The major categories that emerged from the discussion were current practice, usability, resource management, cultural adaptation, patient and parent factors, and new knowledge. The two tools were compared within these categories and the Ages and Stages program was most feasible for this population. This study is the first to investigate any type of child developmental assessment in rural, sub-Saharan Africa, and is a small step to improving overall child health in this region through developmental tracking and parental education.

## D 18 - The Use of Tools and Instruments to Advance the Profession

### Validation of Yoon's Critical Thinking Disposition Instrument

---

*Hyunsook Shin, PhD, RN, CPNP, South Korea*

*Kaka Shim, MSN, South Korea*

*Yuna Lee, MSN, South Korea*

*Hyunhee Ma, MSN, South Korea*

*Dahae Lim, BSN, South Korea*

*Hyojin Kim, BSN, South Korea*

*Hyejin Kim, BSN, South Korea*

#### Purpose

The purpose of this presentation is to share knowledge of validation of Yoon's Critical Thinking Disposition Instrument

#### Target Audience

The target audience of this presentation is for nursing faculties who are interested in teaching CT skills of Nursing students or people who are interested in validation of CT skills

#### Abstract

**Background:** The lack of reliable and valid evaluation tools targeting Korean nursing students' critical thinking(CT) abilities has been reported as one of the barriers to instructing and evaluating students in undergraduate programs. Yoon's Critical Thinking Disposition(YCTD) instrument was developed for Korean nursing students, but few studies have assessed its validity and reliability.

**Objectives:** This study aimed to validate the YCTD. Specifically, the YCTD was assessed to identify its cross-sectional and longitudinal measurement invariance.

**Methods:** This was a validation study in which a cross-sectional and longitudinal(pre- and post-nursing practicum) survey was used to validate the YCTD using 345 nursing students at three universities in Seoul, Korea. The participants' CT abilities were assessed using the YCTD before and after completing and established pediatric nursing practicum. The validity of the YCTD was estimated and then group invariance test using multi-group CFA was performed to confirm the measurement compatibility of multi-groups.

**Results:** A test of the seven-factor model showed that the YCTD demonstrated good construct validity. Multi-group CFA findings for the measurement invariance suggested that this model structure demonstrated strong invariance between groups(i.e., configural, factor loading, and intercept combined) but weak invariance within a group(i.e., configural and factor loading combined).

**Conclusions:** In general, traditional methods for assessing instrument validity have been less than thorough. In the study, multi-group CFA using cross-sectional and longitudinal measurement data allowed validation of the YCTD. The study concluded that the YCTD can be used to evaluate Korean nursing students' CT abilities.

## D 18 - The Use of Tools and Instruments to Advance the Profession

### Kangaroo Care: Creating a Video Teaching Tool for Parents and Neonatal Nurses

---

*Melissa K. Robinson, RN, BSN, USA*

#### Purpose

The purpose of this presentation is to educate healthcare professionals and parents of newborns on the benefits of Kangaroo Care (KC). After surveying a Newborn Intensive Unit, a need was identified for KC education. A teaching video was created to provide consistent information about KC benefits and proper implementation.

#### Target Audience

The target audience of this presentation is nurses and physicians caring for premature and full term newborns including NICU providers, labor and delivery providers, pediatric providers, lactation specialists, etc. Mothers and fathers of newborns will also benefit from the information in this presentation.

#### Abstract

Kangaroo Care (KC) is the process of holding an infant skin-to-skin, a timeless technique with scientific benefits revealed in the 1970's (Johnson, 2013). With a thorough literature review, many benefits of KC were discovered for infants, parents, and nurses. Many professional health care organizations support the implementation of KC early in the infant's life, as neonates are better regulated by their mothers as compared to hospital incubators (Mori, Khanna, Pledge & Nakayama, 2010). A survey of nurses (n=70) was conducted at a Neonatal Intensive Care Unit to identify a possible need for increased KC education, evaluate the nurses' perceptions of KC, and establish a preference for a teaching tool. The majority of those surveyed (64%) agreed a video would be the most effective medium to educate both parents and nurses on KC. In addition, research has shown that videos serve as an effective tool to educate patients in a cost-effective manner (Shah, Swanson, Nobay, Peterson, Caprio & Karuza, 2012). A DVD explaining the benefits of KC was created, and the proper transfer technique for KC was demonstrated. This teaching tool is intended to be used in the NCCC to educate parents and nurses on the benefits of KC for infants, and to increase implementation of KC.

## D 19 - Innovations in Cancer Care and Practice

### Caregiver Activation: Cancer Communication in Home Hospice

---

*Catherine E. Dingley, PhD, MSN, BSN, RN, USA*

*Djin L. Lai, BSN, RN, USA*

*Katherine Doyon, BSN, BS (Bio), MS, USA*

*Maija Reblin, PhD, USA*

*Lee Ellington, PhD, USA*

*Margaret Clayton, PhD, MS, BSN, RN, APRN-BC, USA*

#### Purpose

The purpose of this presentation is to describe study findings focused on communication in home hospice. We examined caregiver and nurse communication behaviors associated with caregiver activation during cancer patients' home hospice visits. (As part of a larger study P01CA138317)

#### Target Audience

The target audience of this presentation is clinical, academic, and research focused nurses and healthcare providers.

#### Abstract

**Background:** Current research demonstrates that activated patients have the skills, knowledge, and confidence to manage their care, resulting in positive outcomes such as lower hospital readmission and fewer adverse consequences due to poor communication with providers (Greene & Hibbard, 2011). In addition, studies indicate activation plays an important role throughout the course of disease management as the demands of illness change over time. Despite extensive evidence on patient activation, little is known about activation in the home hospice setting, when family caregivers assume more responsibility in care management.

**Aims:** We examined caregiver and nurse communication behaviors associated with caregiver activation during cancer patients' home hospice visits. (As part of a larger study P01CA138317)

The specific aims were:

- Identify and describe caregiver communication behaviors associated with caregiver activation
- Identify and describe nurse communication behaviors that precede and follow activated caregiver communications

**Methods:** We conducted an observational, longitudinal multi-site study of hospice nurse home visits. Hospice nurses wore digital recorders to capture naturally occurring conversations in the home. We initially analyzed 20 audio-recorded visits using an adapted Street's Activation Verbal Coding tool to hospice caregiver communication and used qualitative thematic analysis to develop codes for nurse communications that preceded and followed each activation statement. Three researchers reviewed the audio-recordings at least three times, conducted the primary coding, and met regularly to discuss the recordings. Differences in coding were typically related to semantics and not substantive issues. These differences were discussed and resolved with consensus. In addition, the inter-disciplinary research team from the larger parent study provided consultation and a broader context to the coding process and findings. Once the initial codes were developed, we extended our analysis to include a total of 60 audio-recordings.

**Results:** Analysis of audio-recordings of 60 distinct nurse-caregiver-patient triads yielded a total of 3893 coded communication events. Caregivers tended to be spouses (65%), mostly female (70%) with a mean age of 59.5 (SD=14.4) and reported an average of 2.5 health problems (SD=1.3). The average age of patients was 70.2 (SD=11.12) and the most common cancer diagnoses were lung, prostate, brain, and breast. Nurses were primarily female (91%) with a mean age of 41.4 (SD=10.36), and had been hospice case managers for an average of 4 years (SD=4.5) Commonly used activated caregiver communication

behaviors (n=1805) included: demonstrating knowledge regarding patient/care (present in 93% of tapes), describing care strategies (92%), expressing opinions regarding care (87%), requesting explanations of care (78%), and directing the conversation toward the patient (60%). Nurses' responded by (n=1959): providing education (present in 90% of tapes), reassessing the patient/care environment (85%), validating communications (83%), clarifying care issues (83%), updating/revising care (73%), and making recommendations for future care (63%). Most common communications that preceded nurses updating/revising care were caregivers' expressing a concern/opinion (40%) and describing care strategies (36%). Nurses prompted caregiver activation through focused care-specific questions, open-ended questions / statements, and personal questions.

**Discussion:** Hospice nurses are uniquely situated in the home setting, providing coordination for patient and family care as well as facilitating access to the interdisciplinary hospice care team. A recent analysis of U.S. thought leaders in hospice nursing revealed key areas of focus should include the role of communication and the importance of assessing the caregiver's ability to provide safe and responsible care (Ellington, Cloyes, Berry, Thomas, Reblin, & Clayton, 2013). However, few studies have investigated caregiver communication in home hospice and to our knowledge no other studies focused on caregiver activation. Activated caregivers may facilitate patient-centered care through communication with nurses in home hospice thus resulting in enhanced patient outcomes. Home-based end of life care significantly increases the responsibilities of family caregivers requiring them to face new and potentially overwhelming tasks. Often, they are required to manage complex care, perform procedures, operate medical equipment, and recognize and alleviate patient symptoms (Given, Given, & Sherwood, 2012). The current study can provide a foundation to develop a framework of caregiver activation through enhanced communication with nurses in home hospice. Future directions for research should include a longitudinal analysis to determine if caregiver activation changes over time, studies focused on the outcomes of caregiver activation and communication for patients and caregivers, exploration of hospice caregiver activation and communication in diverse populations, and the development of complimentary evidence-based education / coaching for home hospice caregivers and nurses. Transformative nursing practice focused on communication processes that facilitate caregiver activation in home hospice can potentially affect patient and caregiver outcomes in end of life care.

## D 19 - Innovations in Cancer Care and Practice

### Colorectal Cancer Screening Practices among Texas Nurse Practitioners and Physician Assistants

---

*Sandra Anne Laird, MSN, BSN, RN, ACNP-BC, AOCNP, USA*

*Barbara M. Raudonis, PhD, MS, BSN, MS, BA, FNGNA, FPCN, USA*

#### Purpose

The purpose of this presentation is to disseminate the findings of a statewide survey of non-physician health care providers regarding their beliefs, attitudes and practices regarding colorectal cancer screening.

#### Target Audience

The target audience of this presentation is advanced practice nurses, nurse scientists and professional nurses.

#### Abstract

**Background:** Cancer now rivals cardiovascular disease as a leading cause of death. New cases of cancer are projected to increase 42% by 2025. Colorectal cancer (CRC) is the second leading cause of cancer death when mortality for men and women are combined. CRC is preventable and survivable if appropriate risk stratified screening and surveillance is undertaken. Nurse practitioners (NP) and physician assistants (PA) currently provide essential primary and specialty care. These providers will play an important role in risk stratified cancer screening, co-management with oncologists, and other members of the cancer care team. Knowledge and use of national CRC screening guidelines should be part of NP and PA practice. A review of the literature suggests there is a gap in NP and PA knowledge of risk stratified CRC screening and surveillance guidelines. CRC screening in primary care is under-utilized compared to breast and cervical cancer screening. The **purposes** of this descriptive correlational study were to: 1) describe the beliefs, attitudes, and practices of Texas NPs and PAs with regard to risk stratified CRC screening and surveillance, 2) determine the associations between the NP and PA knowledge of CRC screening and surveillance guidelines and their screening practices, and 3) describe the perceived barriers to CRC screening.

**Theoretical Framework:** This study was guided by Azjen's Theory of Planned Behavior. The theory of planned behavior is an extension of Fishbein & Ajzen's 1975 Theory of Reasoned Action. According to Ajzen the intention to perform various kinds of action can be predicted by the individual's attitudes and beliefs about the action, the subjective norms in the individual's environment, and the perceived behavioral control the individual has over the action. The combination of an individual's intention and their perceived behavioral control contributes to the variance in actually carrying out the action (Ajzen, 1991). Ajzen recognized that there are behaviors over which an individual lacks actual control.

**Research Questions:** 1) What are the beliefs, attitudes, and practices of Texas NPs and PAs with regard to risk stratified CRC screening in adults? 2) Is there a relationship between NP and PA knowledge of national screening guidelines for adults at varying risk of CRC and their CRC screening behavior? 3) Is there a relationship between provider demographics and CRC screening? 4) What are the barriers to CRC screening identified by NPs and PAs?

**Sample:** An email invitation to participate in the study was sent to the 3520 eligible members of the Texas Nurse Practitioner (TNP) organization and the Texas Academy of Physician Assistants (TAPA). The response rate to the survey was 7%. The convenience sample consisted of 258 non-physician providers: 167 NPs (64%) with a Texas nursing license and who were authorized to practice as an advanced practice registered nurse and 91 PAs (35%) with an active Texas license and who order cancer screening or diagnostic testing in adults. The NPs ranged from 24 to 70 years old (M=50.74, SD10.56). The PAs ranged from 25-75 years old (M= 43.64, SD13.55). The length of time in the

professional role ranged from 1 to 40 years for the NPs (M= 8.9 SD 8.59) and 1 to 40 years for the PAs (M= 12.73 SD 11.10).

**Methods:** This study used a descriptive correlational design. Data were collected with a self-administered web-based questionnaire using Qualtrics® (version 12018) software. The survey instrument for this study was adapted from versions used in previously published studies. The questionnaire consisted of 44 items categorized in three domains: personal and practice demographics, knowledge of national guidelines for risk stratified CRC screening, and providers' personal practices and perceived barriers to screening.

**Results:** Background factors impacting provider beliefs and attitudes regarding CRC screening included: administrative support, adequate time to screen patients during visits and inclusion of screening even with a mandate to see more patients. Eighty-three percent of NPs and 85.8 % of PAs stated they had adequate administrative support for risk stratified CRC screening. The majority reported having adequate time to screen (NPs 87.5%, n= 146; PAs 84.6%, n=77). Only 39.5%, (n = 60) NPs and 36.3 %, (n= 33) PAs stated the demand to see more patients limited their ability to perform risk stratified CRC screening. Both groups engaged in cancer screening for breast cancer (NPs 88.6%, n=158; PAs 82.4%) and cervical cancer (NPs 80.2 %, n= PAs 74.7% n=) and colorectal cancer screening in particular. Fecal Occult Blood (FOBT) was the most frequent non-invasive CRC screening test used. Slightly more NPs (75%, n= 161) ordered FOBT than PAs (68% n=62). Fecal Immuno-histochemical testing (FIT) was ordered less often by both groups: NPs 15.6% (n =26) PAs 15.4% (n=14). Both groups ordered a colonoscopy in average risk patients: NPs 85% (n=142) and PAs 86.8% (n=79). One hundred thirty (50.2%) of the respondents identified patients' statements of inability to pay the out of pocket cost or lack of insurance coverage for colonoscopy, as reasons they would not order a colonoscopy. Providers refrained from ordering a colonoscopy due to patients' preference, co-morbidities, and age above the limit for routine screening. Fear and dislike of the bowel preparation required for a complete evaluation of the colon were major reasons patients refused the screening. Patients also were fearful of complications from the procedure and receiving an abnormal result. Other barriers were lack of transportation, a belief that the procedure had no personal benefit to them, or they were just too busy and could not take time away from work.

**Limitations:** Findings from the study should be carefully interpreted due to several limitations. The small sample size was underpowered and limited the statistical analyses. The sample was also restricted to non-physician members of two professional organizations in the state of Texas. Respondents who met the inclusion criteria and initially agreed to participate in the study read some of the items but did not complete the online survey and had to be eliminated from the analyses. Although the items of the questionnaire were used by researchers in previously published articles no psychometric analysis of the questionnaire has been done to date. Due to these limitations the findings are not generalizable to the wider non-physician provider group in Texas or beyond.

**Conclusions:** The majority of non-physician providers (NPs and PAs) who are members of two professional organizations in the state of Texas use their knowledge of national CRC screening guidelines and administrative support to actively screen their patients at varying risk for colon cancer. Although the providers are willing to order screening colonoscopies their patients continue to voice numerous barriers to completing the procedure.

## D 19 - Innovations in Cancer Care and Practice

### Innovations in the Care of Cancer Survivors and their Families

---

*Ann Solari Twadell, PhD, FAAN, USA*  
*Gayle M. Roux, PhD, RN, NP-C, FAAN, USA*

#### Purpose

The purpose of the study was to explore economical community-based interventions tailored for cancer survivors and their families to make recommendations for future research and practice.

#### Target Audience

The target audience of this presentation is oncology and community health nurses, APRNs, psychologists, counselors, and other interprofessional health professionals.

#### Abstract

**Background:** Today cancer is considered a “Chronic Health Condition” with over 12 million survivors. While most survivors will be treated within their local communities, there is limited literature on the costs, specific types, and efficacy of community-based interventions with cancer survivors and their families.

**Purpose:** The purpose of the study was to explore economical community-based interventions tailored for cancer survivors and their families to make recommendations for future research and practice. Initially, an extensive literature synthesis was completed. Based on the results of the literature synthesis, a corresponding survey was developed which focused on care of cancer survivors and their families.

**Method:** A systematic inquiry format was employed to review the literature. A comprehensive literature search was completed using a range of databases resulting in over 200 articles. The literature search was limited to dates between 2004 and 2014. Articles with community-based interventions for survivors and their families were selected, resulting in fifteen articles. Based on the findings of the literature synthesis, items were developed for a survey. The survey was conducted with a convenience sample of Faith Community Nurses (FCN) as these members of the profession represent nurses living within the same communities as the survivors. The FCN's represented a wide geographical distribution over the U.S. and diverse types of faith communities. The survey examined if they were engaged with cancer survivors and if so, what were the most frequently used interventions.

**Results:** The literature synthesis noted five themes: 1.) Support services for clients and families are available in the community; 2.) Variance exists in types of services available, settings, cost, and levels of support for these services; 3.) There is a disparity in the integration of minorities; 4.) Exercise is a primary focus for cancer rehabilitation; and, 5.) There is a lack of spiritual and family interventions with limited integration of the role of the Faith Community Nurse in survivorship care. Listening, support, prayer, guidance on resources, support groups along with home visits and presence were the most important interventions in caring for cancer survivors noted by these FCN's.

**Conclusions:** The role of Faith Community and FCN's in caring for cancer survivors needs to be researched further as an innovative contribution to the whole person care and well-being of cancer survivors and their families. Inclusion of the FCN as a trusted member of the interprofessional oncology team holds promise to improve outcomes for survivors and decrease health care expenditures. Further research is needed on the efficacy of interventions for survivors within their community-based settings.

## D 24 - The Psychological Impact of Disease and Illness of Families

### A Structured Communication Intervention to Reduce the Anxiety of Family Members Waiting for Relatives Undergoing a Surgical Procedure

---

*Kate Kynoch, MN (ICU), BN, RN, CertIVTAE, Australia*

*Judy Munday, DipEd (Nurs), BA (Hons), RN, Australia*

*Sonia J. Hines, MAppSci (Rsch), GradDipEd, BN, RN, Australia*

*Cara Joyce Cabilan, BN, RN, Australia*

#### Purpose

The purpose of this presentation is to present the results of a pilot research implementation project. This study utilized a multi-dimensional intervention of an information card and an in-person nursing update to reduce the anxiety of families awaiting relatives undergoing elective surgical procedures.

#### Target Audience

The target audience of this presentation is nurses working in acute care settings. Predominately the target group is operating room staff, however the principles of family-centred care can be applied to any healthcare setting.

#### Abstract

**Objective:** The aim of this study was to establish the effect of a structured communication program on family members' anxiety awaiting relatives undergoing elective surgical procedures.

**Background:** It is evident through the literature that perioperative nurses recognise that family members experience increased levels of anxiety during the wait for a relative undergoing a surgical procedure. However it is during this time that little or no meaningful communication occurs between family members and health professionals. Families are increasingly expected to take an active part in care provision, particularly in the post-operative and discharge phase, but in the same way that patient anxiety can affect surgical outcome and recovery, family anxiety and being under-informed may impair the family's ability to effectively carry out these activities. In some areas of the world, family involvement in hospital care is not only desirable but vital due to nursing staff shortages. The importance of family involvement and the concept of family centred-care have been established as key themes in many areas of healthcare practice and form the humanistic and holistic approaches to nursing care that remain the foundation of clinical practice. Thereby, it is necessary to recognise the barriers to patient support arising from family anxiety states in the perioperative environment and take steps to meet family needs during this time. The need for this project was highlighted from a Joanna Briggs Institute systematic review which recommended that in-person interventions providing an update on the patient's status during surgery be utilized to reduce family anxiety. Additionally the review emphasized the need for more research investigating ways of providing information to families and assessing outcomes utilising validated tools.

**Methods:** This project utilised a quasi-experimental research design. The setting was the perioperative department in a large multi-disciplinary healthcare organisation in Brisbane Australia. The sample was 128 family members of patients undergoing elective surgical procedures. Consecutive sampling was used to recruit family members firstly for the control group, and then secondly for the intervention group. Eligible participants were recruited during the admission process. The intervention group received a structured communication intervention which included an information card with hospital information and phone numbers as well as the approximate surgery completion time. In addition, families also received an in-person nursing report when the patient arrived in the recovery room. The control group received usual care. A demographic data collection form and the validated State Trait Anxiety Inventory were used to collect data.

**Results:** Results from the project confirm that structured communication interventions for families awaiting relatives undergoing surgical procedures do reduce family anxiety however results were not statistically significant. There was a strong negative correlation between the age of the patient and state

anxiety of family. Additionally this paper will report on several barriers to the successful implementation of recommendations from this systematic review. Overall, families in the intervention group found the information card useful and received increased communication from the healthcare team.

**Conclusion:** In the consumer-oriented and family-focused climate of current health care, more nursing interventions designed to reduce family members' anxiety during the operative waiting period are needed. This project has contributed to the knowledge base surrounding family anxiety during surgical procedures as well as provided information on barriers to implementing communication based interventions. In order for these types of interventions to be successful a dedicated role needs to be established. This requires the acknowledgement of organisations and management of the important role families play in the care and recovery of patients in the acute health care system.

## D 24 - The Psychological Impact of Disease and Illness of Families

### Family Caregivers' Perceptions of the Resistiveness to Care They Experience Caring for People with Dementia

---

*Pamela C. Spigelmyer, PhD, RN, CNS, USA*

#### Purpose

The purpose of this investigation was to identify commonalities in family caregivers' experiences of resistiveness to care and build a general meaning structure, which represents essential integrated parts of the experience for the participants.

#### Target Audience

The intended audience includes nurses practicing in all areas of healthcare and will focus on family caregivers of people with dementia and ways in which nursing and future research can help to support family caregivers as co-providers of care for people with dementia especially when they experience resistiveness to care.

#### Abstract

Family caregivers today are co-providers of care, assuming care once provided by professional nurses. Although rewarding at times, providing care for people with dementia is challenging, stressful, and places the overall well being of the family caregiver at risk. Resistiveness to care is one notably stressful experience for family caregivers. Currently nursing research related to resistiveness to care focuses on observed behaviors but does not address family caregivers' perceptions of the episodes of resistiveness. Family caregivers' perceptions are their reality of the experience therefore, needs to be fully understood. Since perceptions of experiences drive the meaning assigned to the experience a descriptive scientific phenomenological method by Giorgi (2009) was utilized for this study. Descriptive scientific phenomenology incorporates a human science approach, a disciplinary perspective, and is ideal for studying behavioral phenomenon that may not be readily studied by the natural sciences. The nursing disciplinary perspective used for this study permitted this nurse researcher to grasp objectively the subjective structural meaning assigned to this phenomenon by family caregivers. The outcome of the descriptive scientific phenomenology method is to identify and define perceptions of an experience. The purpose of this investigation was to identify commonalities in family caregivers' experiences of resistiveness to care and build a general meaning structure, which represents essential integrated parts of the experience for the participants. Institutional Review Board approval was obtained to conduct this study. Eight dementia family caregivers were recruited from Alzheimer's support group meetings, provided informed consent and were interviewed individually at a mutually agreed upon location. Each participant provided in depth descriptions of chosen resistive events that they perceived to have experienced. Analysis using the scientific phenomenology method included a nursing disciplinary perspective and revealed a structure of resistiveness to care that nurses can use to gain insights into resistiveness to care as perceived by family caregivers. The identified structure also provides focal points for future research and interventions to help family caregivers to mediate the stress of resistiveness to care.

## D 24 - The Psychological Impact of Disease and Illness of Families

### Beyond Survival: An Interpretive Phenomenological Investigation Into Being the Father of a Very Low Birth Weight Infant

---

*Donald Johnston, PhD, MHS, RN, RRT, USA*

#### Purpose

The purpose of this presentation is to educate the audience about recent research regarding fathers of neonates, including how findings can be incorporated into family-centered nursing practice. The aim is to both illuminate the needs of fathers and improve fathers' engagement in the care of their infants.

#### Target Audience

The target audience of this presentation is any health care provider who comes into contact with fathers of premature infants.

#### Abstract

This phenomenological study, based on the writings of Martin Heidegger, describes what it was like for eleven fathers of very low birth weight infants during their infants' stay in a neonatal intensive care unit. Each participant was interviewed up to three times. Interviews were semi-structured, digitally recorded and transcribed verbatim. Data were analyzed using Max van Manen's methodology, along with a metaphorical illustration to illuminate meanings of experiences. Analysis was structured using Heidegger's philosophical concepts of Being-in-the-world and Being-with-others, as well as the added concept of Being a changed man. The themes that emerged were: shock; exploring hostile terrain; fearing the unnatural; feeling powerless; unpredictability; surviving; baggage; feeling left out; feeling misunderstood; needing/accepting support; holding back from Mom; and doubting/accepting paternity. The findings revealed that fathers struggle with powerlessness as they attempt to acclimate to the foreign environment of NICU and respond best when given tasks to perform. They tend to choose their battles based on the wisest expenditure of energy, and may leave an environment where they perceive they are not needed. Fathers benefit from developing close relationships with NICU nurses, but often feel misunderstood and require that trust be earned.

## D 25 - Focusing on the Family

### Staff Response to Flexible Visitation in the Post-Anesthesia Care Unit (PACU)

---

*Patricia Newcomb, PhD, RN, CPNP, USA*  
*Gail Voncina, BSN, RN, USA*

#### Purpose

The purpose of this presentation is to report results and implications of a study conducted to evaluate the impact of an enhanced PACU family visitation program on surgical services staff.

#### Target Audience

The target audience of this presentation is clinical or academic nurses who are concerned with the care of surgical patients and their families.

#### Abstract

**Background.** Family visitation in post-anesthesia care is recommended by The American Society of PeriAnesthesia Nurses and meets JCAHO's requirement for Family-centered care. Based on evidence supporting expanded family visitation in post-anesthesia units, the PACU in a 750 bed Texas hospital implemented a visitation policy for family members of patients in 2009, including a survey of staff attitudes towards the practice change. Components of the program included: 1) creation of a Nurse Liaison Position, 2) implementation of an Electronic Tracking System with documentation from direct caregivers throughout all stages of care, 3) guided family visitation, 4) increased signage, 5) written materials for families and 6) staff education. In 2013, five years since implementation, the original survey of staff attitudes toward expanded visitation was replicated.

**Methods:** This project is a cross-sectional study employing mixed methods to analyze the beliefs of surgical staff regarding expanded family visitation before and after implementation of an enhanced PACU visitation policy. A survey, including scaled and qualitative items, was administered to a sample of multidisciplinary personnel involved in the care of the post-anesthesia patient. Differences between the 2009 and 2013 groups on scaled responses were assessed using the Mann-Whitney –U statistic due to unequal group size and non-normal distributions of variables. Content analysis including conceptual and relational coding was performed on the qualitative items in the survey.

**Results.** Twenty-five individuals responded to the survey in 2009 and 56 responded in 2013. Categories of personnel included physicians (anesthesia only), registered nurses, and Other (volunteers, technicians, clerks). The response rate in 2009 was about 40% and the response rate in 2013 was about 90% based on estimates of personnel available (60-65) to complete surveys in the study periods. In 2009 71% of the respondents were registered nurses, while that proportion dropped to 48% in 2013. The proportion of physicians who responded to the survey remained about the same from the first survey to the second, but "other" respondents, which included unlicensed personnel such as patient care technicians, increased. In both years respondents tended to agree to the same extent that emotional care of families was a part of their job and that appropriate emotional care was being provided to family members in PACU.

After four years of expanded visitation, the 2013 cohort reported feeling significantly more comfortable providing emotional support to families in the PACU. There was also a significant difference in the belief that family members should have the option to visit in the PACU. Internal consistency reliability of the set of three identical scaled items was good in both the 2009 and 2013 study periods (alpha = 0.94 and 0.81 respectively).

In 2009, 72% of respondents reported that their jobs were hampered by family presence. Four years later only 37% believed their jobs were hampered by family presence. This represents a significant difference between cohorts ( $X^2 = 8.5$ ;  $p = 0.004$ ). Furthermore, the 2009 cohort showed no relationship between perception that the job of caring for the patient was hampered by family presence and the desire to be able to visit one's own family members in PACU. In contrast, 2013 respondents who reported their work

was not hampered by family presence were significantly more likely than the 2009 cohort to want to be able to visit their own family members in PACU ( $X^2 = 9.03$ ;  $p = 0.003$ ). There was no significant difference between RNs and other workers in regard to perception of jobs being hampered by family in the PACU.

Qualitative data supported the change trends noted in the scaled survey items and also highlighted issues that had not changed. In 2009 96% of respondents provided comments about what they perceived as barriers to family visits in PACU; in 2013 64% of respondents provided text about perceived barriers. From 2009 to 2013 concerns about lack of space dominated the list of perceived barriers to family visits in the PACU and concerns about lack of patient privacy followed closely. Other factors respondents identified as barriers to family visits in the PACU included interference by family members with patient care, staff failure to enforce visitation rules, staff resistance to visitation, lack of pre-operative education for family members regarding visitation policies, noise, and risk for infection.

**Discussion.** The fact that response rates increased dramatically from the first survey to the second may indicate greater staff engagement and/or interest in the PACU visitation process over time. Increased willingness to participate in research surveys may also be related to the changing culture in the institution, which was Magnet designated for the third time recently. As a result of increased sensitivity to Magnet values, classes and events emphasizing the importance of research and the role of evidence in professional practice have occurred on a regular basis at the hospital.

Persistent exposure to family members visiting patients in the PACU is associated with increasing staff commitment to family-centered care and greater comfort of staff in the provision of emotional care to families; however it is simultaneously a substantial stressor for staff. Even in environments in which staff are highly committed to providing emotional care to family members, barriers, such as lack of space, noise, privacy concerns, and failure of staff to consistently apply visiting rules affects the experience of staff, and may well affect the patient and family experience, as well. In post-anesthesia units where family visiting is permitted, staff stress may be prevented and family visitation sustained by excellent pre-operative education of family members regarding visitation, frequent reminders to staff about the importance of compliance with visitation guidelines, affordable environmental interventions, and training to empower nurses and other staff members to be compassionately assertive to enforce requirements of the family visit situation.

## D 25 - Focusing on the Family

### Nurse Family Presence Beliefs and Decisions in Adult Intensive Care Unit

---

*Beverly Jones, PhD, MPH, BSN, FAAN, USA*

#### Purpose

The purpose of this presentation is to trigger positive thoughts and strategy development for use by attendees to advance understanding/execution of open family presence in adult ICUs.

#### Target Audience

The target audience of this presentation are staff nurses, nurse leaders and educators.

#### Abstract

**Background:** Hospitals continue to have restrictive hospital and ICU visiting policies (Lui, Read, Scruth & Cheng, 2013). Intensive care units are places of complex quaternary and tertiary care for which most families give thanks and also fear. Medical and nursing innovations along with patient response to treatment are remarkably improved however; in the midst of progress the ICU experience continues to be anxiety-producing and overwhelming for families. In addition to the emotional upheaval for patients, families experience fear because of required separation from loved ones at a time of potential or actual physiological and hemodynamic instability and possibly death. The combination of psychological and physiological effects related to the unexpected admission, separation, and uncertain outcomes, have been known to evoke feelings of chaos and helplessness for families. The patient-centered care philosophy and mounting interest in associated outcomes heightens the importance of open family presence (FP) in adult ICUs. Yet, families of adult intensive care patients continue to be relegated to restrictive bedside visitation practices.

To positively impact this unpleasant issue for families requires better understanding of the involved factors and behaviors. Because nurses are pivotal to quality care, are at the center of family care in ICUs and, are the actual “gatekeepers” who regulate family presence at the bedside, it is imperative to understand how their beliefs and attitudes influence FP decisions (Agard & Lomborg, 2010, pp 1107). Exploring influences experienced by ICU nurses related to decision-making regarding open FP is important to uncovering knowledge pertinent to behavioral determinants and opportunities for change. Additionally, it is important to examine factors that are perceived as the basis for nurse beliefs, expectations related to FP that come from those who are identified by the nurse as important and to understand perceptions about obstacles that may prevent the performance of a given behavioral outcome. Beliefs and attitudes of nurses regarding family presence in intensive care units (ICU) are fundamental to ICU visiting practices. Examination of nurse beliefs, as well as social and personal variables can uncover information regarding the impact of influences on decisions and held knowledge that can ultimately be used to target changes in FP nurse practices.

**Purpose:** The purpose of this study was to examine the influence of nurse beliefs on the relations between social, personal and situational variables and nurse decisions regarding FP in adult ICUs.

**Methods:** A cross-sectional research design guided by The Theory of Planned Behavior (Ajzen, 2011) was utilized to examine relations and the extent to which nurse beliefs mediated relations between nurse’s social, personal, situational predictor and outcome variables (FP decisions in adult ICUs). The Adult Intensive Care Nurses’ Family Presence Questionnaire (AICFPQ) was used to measure nurse beliefs, attitudes, and other influential variables and behaviors related to ICU nurse FP decisions.

**Results:** Ten factors emerged from the factor analysis of the AICFPQ. The four factors with the highest internal consistency reliability were used for analysis ( $\alpha = 0.67- 0.94$ ). Of the 680 nurse respondents 91% were female, 40% were 50 years or older and 15% were non-Caucasian. Statistical significant relations were identified between nurse variables, beliefs and decisions. Over half of the nurses agreed that open

FP increased patient and family satisfaction however, a majority (60%) of nurses did not routinely permit open FP.

**Conclusions:** Select variables were influential in ICU nurse FP decisions. Positive and negative nurse beliefs effected the magnitude of relations. Findings provide new knowledge for practice change interventions.

## D 25 - Focusing on the Family

### Perceptions of Interprofessional Collaborative Practice and the Correlation with Patient and Family Satisfaction Scores

---

*MaryDee Fisher, DNP, MSN, BSN, ADN, RN, CPN, USA*

*Donna Weyant, MSN, RN, CPN, USA*

*Susan E. Sterrett, EdD, MSN, MBA, RN, USA*

*Heather Lynne Ambrose, DNP, RN, CPON, USA*

#### Purpose

The purpose of this presentation is to describe clinicians' perceptions of interprofessional collaboration on individual patient care units. The correlation with patient and family perceptions of collaborative practices will also be summarized.

#### Target Audience

The target audience includes clinical, administrative and academic personnel invested in the practice perceptions and benefits of interprofessional collaboration.

#### Abstract

Effective interprofessional collaboration is viewed as an essential component for the delivery of quality patient care in increasingly complex clinical environments. Various groups of professionals may have worked as a team on a project, however are perceptions of interprofessional clinicians viewed as collaborative? Moving forward in establishing a model for interprofessional collaboration requires identifying elements of achievement on high functioning patient care units. Correlation of patient satisfaction and perceptions of collaboration provides insight into aspects of successful interprofessional practices.

**Purpose:** The purpose of this study is to gain an understanding of clinicians' perceptions of the level of collaboration between disciplines on individual units and to measure correlations between levels of collaboration and patient satisfaction scores on identified units. The study goals are to:

1. Describe clinicians' perceptions of interprofessional collaborative practice within specific patient care units of a large urban hospital.
2. Identify the relationships between perceptions of interprofessional collaborative practice and reported patient/family satisfaction scores.

**Background and Significance:** In the current healthcare environment, leaders and care providers strive to deliver care that is high quality, safe and patient-centered. The Institute of Medicine (Greiner & Knebel, 2003), and more recently the World Health Organization (Hopkins, 2010) have called for interprofessional collaboration as an essential component for attainment of this type of care delivery. The growing complexity of care delivery challenges professionals in attainment of these delivery goals.

Over two decades ago, Baggs et al (1992) identified an association between interprofessional collaboration and patient outcomes in an intensive care unit. More recently, Schroder et al (2011) have developed a tool to accurately measure practitioners' perceptions of interprofessional practice, so as to identify professional development needs and related future educational interventions to be addressed.

No study has explored the relationship between perceptions of collaborative practices related to outcome measures, such as patient and family satisfaction scores. Exploring the association between interprofessional collaboration and patient outcomes is essential to promoting effective models of collaboration in interprofessional practice. To address the gap in the literature, this study focuses on clinicians' perceptions of collaboration on individual units and its correlation with patient and family perceptions of collaboration.

**Study Design:** An academic pediatric hospital in the northeastern United States begins the process of assessing the status of collaboration on selected patient care units and determining what is desirable to increase the quality of overall collaborative care practices. Interprofessional clinicians are defined as those individuals who have a direct impact on patient care operations. Interprofessional clinicians on randomly chosen units within selected areas of service were chosen to participate in this study. The Collaborative Practice Assessment Test (CPAT ©) [Schroder et al. 2011] scores are correlated with selected items from the Press Ganey® survey, a measure of patient/family satisfaction, within the timeframe corresponding to the completion of surveys. Descriptive statistics describe interprofessional participant and basic patient/family basic demographics, as well as results of CPAT © survey responses. A correlational analysis provides data examining relationships among the CPAT© unit aggregate scores and selected items from each unit's aggregate Press Ganey® patient satisfaction survey scores. Results of this study will be used to develop practices that further enhance interprofessional practices and improve patient/family outcomes.

## D 26 - Augmenting Academic Risk for Nursing Students

### Identifying Academic Risk Factors of BSN Students Using the College Persistence Questionnaire to Better Understand Student Attrition

---

*Kelly J. Betts, EdD, MNsc, RN, USA*

#### Purpose

The purpose of this study was to determine academic and social risk factors related to nursing student attrition in order to develop academic and social interventions that will increase student retention and decrease student attrition during the first year of the BSN program.

#### Target Audience

The target audience of this presentation is administrators, faculty, and clinicians who teach in nursing education programs. Students can also gain an understanding of what factors constitute academic and social risk in undergraduate nursing programs.

#### Abstract

Due to the academic difficulty of baccalaureate nursing programs, attrition and individual success of students passing the NCLEX-RN Licensure exam is of great concern. The UAMS College of Nursing has implemented standardized exams and an individualized remediation program to aid those students who are at risk during the nursing program. However, there is a gap of knowledge as to what exactly are the academic and social risk factors that affect a student's academic performance during the nursing program. The purpose of this study was to determine academic and social risk factors related to nursing student attrition in order to develop academic and social interventions that will increase student retention and decrease student attrition during the first year of the BSN program. Once academic and social risk factors are identified, faculty can identify and implement strategies to promote academic success and student retention; and improve probabilities for the student to pass the NCLEX-RN Exam on the first attempt. This quantitative, descriptive pretest/posttests pilot study used the College Persistence Questionnaire (CPQ) to help identify factors that influence academic and social risk for students in the UAMS College of Nursing baccalaureate program. The students received a pre and post questionnaire at two time points during their first year of the BSN program. The questionnaire data provided information that can be used to 1) compare the results of this study with the results of other schools who have utilized the CPQ and 2) compare students who receive interventions and those who did not to the results of the CPQ, and 3) look for trends in improvement of outcomes. Student retention was measured by data obtained from the CPQ and the associated risk factors that are identified, as well as pre-program testing scores, course exams scores, and standardized testing scores during the first year of the program and individual remediation that takes place with students who are at risk for academic and social issues. Results indicate that the use of the CPQ questionnaire is helpful to determine academic and social risk factors that impact student outcomes and attrition in the BSN program.

## D 26 - Augmenting Academic Risk for Nursing Students

### Predicting Nursing Students Passing of the ATI Comprehensive Predictor Examination

---

*Kathleen L. Gilchrist, PhD, MSN, BSN, ASN, RN, FNP, PHN, USA*

*Shalise Pollock, MSN, BSN, RN, FNP-C, PHN, USA*

*Charles Collom, JD, BA, SN, USA*

#### Purpose

The purpose of this research was to determine if there were any correlations between the 2014 graduating nursing class and their Test of Essential Academic Skills (TEAS) scores, taking remedial math or English; and failing the ATI Comprehensive Predictor Examination. The results may predict future success in the nursing program.

#### Target Audience

The target audience of this presentation are nurse educators who utilize assessments to predict performance on the ATI Comprehensive Predictor Examination and/or NCLEX Examination.

#### Abstract

**Purpose:** The purpose of this research was to determine if there were any correlations between the 2014 graduating class and their Test of Essential Academic Skills (TEAS) test scores, taking remedial math or remedial English, and failing the ATI Comprehensive Predictor Examination. In addition, the subject areas that nursing students were weak were identified.

**Background:** ATI Nursing Education has published two research briefs regarding some of the indicators that help to predict the passing of ATIs Comprehensive Predictor examination. Each of these studies were based on large sample sizes and one study was able to demonstrate that achieving a level two or above on the Medical-Surgical, Nutrition, and Maternal-Newborn Content Mastery Series tests predicted passing of the ATI Comprehensive Predictor exam. Recently, in one graduating class, faculty noted the students had more difficulty passing the ATI Comprehensive Predictor than previously noted in other cohorts. Faculty wanted to determine if they could see any correlations in the predictors in the 2014 graduating class.

**Methodology:** An exploratory, quantitative research project was conducted. Previously gathered data were accessed, once approval was granted by the IRB. There were 51 subjects in this data set. Research questions asked were: For the class of 2014 is there a correlation between a student's TEAS score and the Comprehensive Predictor, January 2014 score? For the class of 2014, is there a statistically significant correlation in the Comprehensive Predictor January 2014 scores between those students who took remedial math and those who did not? For the class of 2014, is there a statistically significant correlation in the Comprehensive Predictor January 2014 scores between those students who took remedial English and those who did not? The p value for statistical significance selected was 0.05. Data were entered into SPSS and descriptive statistics; Pearson's r and Student's t-test were utilized to analyze data.

**Results:** There were data from 51 student subjects entered into a SPSS file. There were forty-three females and eight males, ranging in age from 23 to 49. The ethnicity of the subjects included: 37% White, 20% Asian, 13% Hispanic, 7% African American, 5% Filipino, 4% Asian Indian, 3% Other, two declined and one Native American. The average admitting GPA for these students was 3.59. The admitting TEAS test score was 81.5%, however currently students are allowed to retake the TEAS test as many times as they desire.

For the first research question, the TEAS test scores and passing the Comprehensive Predictor passing were correlated,  $r=0.538$  with  $p<.000$ . Approximately 30 percent of the variation in the January 2014 Comprehensive Predictor scores were accounted for by the students' TEAS test scores. Interestingly, for

those who remediated in math, the mean score for both groups was identical to three decimal places: 0.724. Similarly, for those who remediated in English, the mean score was 0.712 while the mean score for those who did not remediate in English was 0.741; even so, this was not statistically significant. However, one subject area, Pharmacology was proven to be difficult for not only this 2014 group of students, but previous groups.

**Implications:** The TEAS test scores for this group of students did correlate with passing the ATI Comprehensive Predictor Examination. This is similar to the research conducted by ATI. However, there was no statistically significant difference in the ATI Comprehensive Predictor Examination scores for those students who took remedial math or those who took remedial English. Nurse educators need to be aware the TEAS test scores do help to predict the success of nursing students in the nursing program. Since the TEAS test scores are used as part of the entrance requirements into the traditional BSN program, nursing faculty need to be made aware of these scores and assist students who score low on the TEAS test to provide extra assistance throughout their BSN program. Moreover, it is important for nurse educators to decrease attrition rates in order to reduce faculty and students' time and costs. Increased attrition may leave spots in a program open causing other potential students to miss out on the opportunity to be admitted into a nursing program. In addition, the curriculum is being revised to include more pharmacology for future students since this was noted as a trend.

**Global Implications:** Nursing students that take remedial English or Math are not necessarily at a disadvantage to those who do not. International students who read and write English at a high-remedial level or need assistance with math should be encouraged to remediate in English or Math and pursue a nursing career. It is important both locally, nationally, and globally to develop and maintain metrics of student success which can track student performance. This allows nursing schools to utilize their scarce resources better; a topic of great concern in less affluent nations. Further research is required on what some of the other predictors are not only for this group of nursing students, but also so nurse educators can enhance the success of nursing students throughout their nursing programs.

## D 26 - Augmenting Academic Risk for Nursing Students

### Motivated Strategies for Learning in Accelerated Second Degree Bachelor of Science in Nursing Students

---

*Majeda M. El-Banna, PhD, MSN, BSN, RN, USA*

*Billinda Tebbenhoff, DNP, APRN-BC, RN, USA*

*Malinda Lee Whitlow, DNP, FNP-BC, RN, USA*

*Karen Fraser Wyche, PhD, MSW, USA*

#### Purpose

The purpose of this presentation is to show the differences in Accelerated Second Degree Bachelor of Science in Nursing (ABS/N) students' academic motivation orientations to achieve academic success and the use of different learning strategy and self-esteem based on their demographic data.

#### Target Audience

The target audiences of this presentation are nurse educators, faculty, nurses and nursing students

#### Abstract

**Background/Purpose:** Accelerated Second Degree Bachelor of Science in Nursing (ABS/N) students enter nursing programs motivated to learn. These students, from diverse educational and employment backgrounds, must adapt quickly to an unfamiliar curriculum. ABS/N students may rate themselves high in self-directedness and motivation to learn and study. Also, they report unique needs and expectations (Walker, et al., 2007). Their perceptions are influenced by their life experiences (D'Antonio et. al., 2010) and academic stressors based partly on family responsibilities (Weitzel & McCahon, 2008). Given this information and our experiences with ABS/N students enrolled in The George Washington University's 15 month program, we explored the differences in students' motivational orientations to achieve academic success and the use of different learning strategies and self-esteem by demographic characteristics.

**Methods:** ABS/N students (n =82) from four different semesters completed online: a demographic survey, the Motivated Strategies for Learning Questionnaire (MSLQ) to assess motivation and learning strategies (Pintrich & Smith 1993), and the Rosenberg Self-Esteem Scale (RSES) which is a global measure of self-worth (Iacobucci, Daly, Lindell, & Griffin, 2012). The MSLQ consists of motivation and learning strategies sections. The motivation section consists of six scales (intrinsic and extrinsic goal orientation, task value, control of learning beliefs, and test anxiety). The learning section consists of nine scales (rehearsal, elaboration, organization, critical thinking, self-regulation, time and study environment, effort regulation, peer learning and help seeking). MSLQ items are scored on a scale of 1 to 7 with the values of 1 "not all true of me" to 7 "very true of me". The RSES assesses a person's overall evaluation self-worthiness as a human being. Responses are coded on a 4-point scale ranging from 1 (strongly disagree) to 4 (strongly agree). Data analysis included descriptive statistics, t-test and one-way ANOVA.

**Results:** This student sample was predominantly white (71%), in their twenties (67%), single (54%), worked part time (49%), and had a family income of \$50,000 or more (74%). Students scored within normal ranges on self-esteem with no differences between students in different semesters or by demographic data. There were no semester differences on any of the measures of motivation or learning scales. The mean score of motivation to engage with courses material and learning strategies was (M=5.4). Students who identified themselves as white and have pre-requisites GPA higher than or equal 3.7 were highly motivated and more likely to use a variety of learning strategies. On the motivation scales, low income students, younger than 30 years old, with children and a GPA higher than or equal 3.7 were more likely to participate in tasks in order to obtain good grades, rewards or approval (extrinsic goal orientation). Students who identified themselves as single and a race other than white had the belief that the courses were less interesting and less valuable (task value). On learning scales, males and students who identified themselves as white expressed that they were repeatedly using summarizing information (elaboration) as a learning strategy to succeed. Students who self-identified as "not single" scored higher on organizing information using outlines and tables (organization) than single students. Males reported

frequently evaluating new ideas and applying them to novel situations (critical thinking) during their learning more than females. Students identified themselves as white reported high study skills and appropriate use of study time (time and study environment). On the scale of effort regulation (continuing to study when content is perceived to be boring) the mean scores of individuals who were identified as not single, white, having children, a pre-requisite GPA less than 3.7 and older than 30 were significantly higher than those students identified as single, not white, childless, having a pre-requisite GPA greater than or equal to 3.7 and younger than 30.

**Conclusion & Implication:** Programs with ABSN students need to know about the motivational orientations and the learning strategies used by their students as they progress through a fast-paced curriculum. Awareness, support and integration of social and academic characteristics of ABSN students can help faculty and programs boost students' motivation and improve their achievement. Course content and faculty input can help student's navigate a nursing curriculum which will help improve outcomes for students and provide information for program, curricular and pedagogical improvements.

## D 27 - Community Health Needs for Our Veterans

### Experiences of Homeless Vietnam Veterans in Deciding to Access or Not Access Healthcare

---

*Susan K. Lee, PhD, MSN, BSN, RN, USA*

#### Purpose

The purpose of this presentation is to explore the healthcare decision-making process of homeless Vietnam Veterans (HVV) who access or do not access healthcare services using the HVV Healthcare Utilization Model. Specific factors that contributed to and influenced HVV decision-making processes will also be presented.

#### Target Audience

The target audience of this presentation is healthcare professionals who provide physical and mental health services to vulnerable homeless populations, including Registered Nurses, members of Veterans Administration and community healthcare organizations, social work, medicine, and psychiatry.

#### Abstract

Homeless Vietnam Veterans (HVV) report their health status as poor, indicating a multitude of health concerns, including physical and psychological problems, post-traumatic stress disorder (PTSD), and alcohol or drug dependencies. Prompt attention to health care may improve the prognosis; however, HVV tend to delay seeking medical attention. The purpose of this study was to explore the process utilized by HVV to make the decision to access or to not access health care services. According to inclusion criteria of the study, all participants served in the US military during the Vietnam War.

Eleven HVV were interviewed to understand the decision-making process about accessing health care services. Using Grounded Theory Methodology with Symbolic Interactionism as the philosophical framework, semi-structured interviews were conducted. Data analysis was performed according to Straussian methodology and included open, axial, and selective coding.

Three predominant categories surfaced: military experiences, substance use, and access issues. A lesser category of homelessness with informal communication via the grapevine was also identified. The core category is healthcare decision-making. A description of processes used by HVV in accessing health care was used to create a preliminary theory.

Based on the data, healthcare decision-making seems to occur within the context of military experiences; substance use; homelessness, where communication occurs via the grapevine, and access issues with difficulty with mobility, convenience, quality, and system inefficiencies. While none of these concepts alone appear to be the primary trigger for healthcare decision-making in HVV, healthcare decision-making certainly occurs within the context of the collective of these concepts.

Therefore, the preliminary HVV Health Care Utilization Theory is that HVV have an alternate view of wellness and health. Rather than health being the absence of disease, it is surviving in the presence of disease. The environment of homelessness enhances diminished or compromised wellness. Camaraderie is important in the homeless environment, where information sharing occurs via informal networks- as through the grapevine. When HVV enter the healthcare environment, especially when using VA facilities, HVV experience more burden than benefit because of access issues.

## D 27 - Community Health Needs for Our Veterans

### The Socio-Cultural Contexts of Male Iraq and Afghanistan War Veterans Help-Seeking Behavior and Healthcare Utilization: An Interpretive Phenomenological Study

---

*Uchenna Nworah, PhD, MS, BS, BA, APRN, FNP-BC, USA*

*Lene Symes, PhD, RN, USA*

*Anne Young, EdD, MS, RN, USA*

*Rae Langford, EdD, MS, RN, USA*

#### Purpose

The purpose of this presentation is to present the study findings that explored the help-seeking behaviors of twenty Iraq and Afghanistan war veterans to illuminate the socio-cultural contexts of what help-seeking means to the veterans and to provide a better understanding of the veterans' help-seeking behavior and healthcare use.

#### Target Audience

The target audiences of this presentation are healthcare providers who provide care to veterans in all settings including the Veterans Administration (VA), civilian healthcare facilities, health clinics in the communities, and healthcare administrators who make healthcare policies that may impact Iraq and Afghanistan war veterans' care.

#### Abstract

**Background:** Operation Iraqi Freedom (OIF) and Operation Enduring Freedom (OEF) veterans have combat-related healthcare needs that include post-traumatic stress disorder (PTSD), major depression, generalized anxiety disorders, and traumatic brain injury (TBI) (Stecker, et al., 2010; Morissette et al., 2011; Kim, et al., 2010; Reiber et al., 2010). A low number of OIF/OEF veterans seek help for their healthcare needs or use available healthcare resources (Kim, et al., 2010; Seal et al., 2010; Vogt, 2011; Brown et al., 2011; Randall, 2012). The disparity between increased healthcare needs and underuse of healthcare services indicates the need to understand what seeking help means to the veterans and what informs their decision to seek help or not. The study explored the research question: What is the meaning of seeking healthcare for the United States male veterans who served in the Iraq and Afghanistan wars? The aim is to provide an enhanced understanding of what seeking help for healthcare needs means to the veterans and the context of their help-seeking behaviors and health resource use.

**Method:** Heidegger's interpretive phenomenology served as the philosophical underpinning for this study. Purposive sampling with snowball strategy was used to recruit participants from a large veteran organization and around the Houston metropolis after institutional review board approval was granted. The inclusion criteria were that participants be United States male veterans who served in either, or both the Afghanistan and Iraq wars, and who were community dwelling veterans. All participants were properly consented. Data was collected in a face-to-face interview that lasted between 30-45 minutes using a semi-structured interview guide that elicited information on three core areas: health maintenance, seeking healthcare, and reflections on healthcare decisions. All interviews were digitally audio-recorded and transcribed verbatim for analysis.

**Analysis:** Data collection and analysis were conducted concurrently. The final sample size (N=20) was determined by saturation of analytic data. Data was analyzed using Ricoeur's interpretation method adapted by Lindseth and Norberg's (2004) with hermeneutic circle technique. This is an iterative process of in-depth reading of each transcript several times to identify words, phrases, and concepts, which were coded. The codes were then categorized and further merged into five themes. The researcher used the technique of hermeneutic circle that involves moving forth and back between explanation and understanding in the analysis process, employing the researcher's pre-knowledge, and experiences of help-seeking phenomenon among men and the OEF/OIF veterans to achieve interpretation and thus a

richer understanding of the phenomenon of seeking help. Qualitative rigor is established by methodic consistency, resulting in the potential for replication and for establishing the readers' trust in the research findings (Thomas and Magilvy, 2011). Rigor was maintained through congruency between the study design, research question, the philosophical underpinning, and methodology, such as the interview technique for data collection and analysis through textual interpretation. Data collection continued until data saturation. Divergent views were identified and reported for balance and credibility. Descriptive data and rich texts are provided to support themes and conclusions that depicted the participants' demographics and help-seeking experiences.

**Result:** Most informants (N=20) were single white males between 25-40 years of age, 90% were of enlisted military rank, and 75% served in the Army. All the participants were deployed veterans; 90% had experienced combat; and most were deployed more than once. Five themes emerged from analysis that highlighted the psychosocial and cultural basis of the meaning of participants' help-seeking behaviors and healthcare decisions- Health perception: "I just felt like I was a soldier...I didn't need to go to the doctor"; Conforming to traditional masculinity values: "you're not a man if you can't fix your own problems"; Military culture values: "suck it up and keep going"; Stigma of seeking help: "you just feel weak. Like I'm being a pansy or a wuss, a cry baby"; and Paradox of multiple masculinities: "I've done everything beyond my means to fix myself...they're the people that can fix me."

**Discussion, practice implications, and future research:** Help-seeking behavior is situated in contexts and was mostly constructed through the lens of traditional masculinity values of self-reliance, resilience, strength, and stoicism that interplayed with military culture and multiple masculinity values. It is a dynamic and complex behavior that is impacted by interrelated personal, social, and cultural factors. What it means to seek help is illuminated and understood within the contexts of time, participants' socio-cultural milieu, and healthcare needs. Having a better understanding of OEF/OIF veterans' perception of health, health beliefs, attitudes, values, and what influence them to seek or use healthcare resources or not, will help in formulating policies, interventions, and programs that not only focus on access issues but on psychosocial and cultural issues that may lead to increase in seeking healthcare and better use of healthcare services. Strategies and interventions that may enhance OEF/OIF veterans' healthcare experiences to facilitate help-seeking, implications for nursing practice, and suggestions for future studies are discussed.

## D 27 - Community Health Needs for Our Veterans

### Rural Women Veterans' Use and Perception of Mental Health Services

---

*Kathy M. Ingelse, DNP, MS, BSN, RN, PMHNP-BC, FNP-BC, USA*

#### Purpose

The purpose of this presentation is to describe rural women veterans' use and perception of mental health services and to discuss how communities can identify and then develop interventions to decrease barriers to care.

#### Target Audience

The target audience of this presentation is the advanced practice nurse who works with women veterans and/or with rural residing women who face barriers to accessing mental health care.

#### Abstract

While the total number of veterans in the U.S. is decreasing overall, the number of women veterans is significantly increasing. There are numerous barriers which keep women veterans from accessing mental health care. One barrier which can impact receiving care is living in a rural area. Veterans in rural areas have access to fewer mental health services than do urban residing veterans, and women veterans in general have less access to mental health care than do their male colleagues. Little is known about rural women veterans and their mental health service needs. Women, who have served in the military, have unique problems related to their service compared to their male colleagues including higher rates of Post-Traumatic Stress Disorder (PTSD) and Military Sexual Trauma (MST). This qualitative study investigated use of and barriers to receiving mental health care for rural women veterans. In-depth interviews were conducted with ten women veterans who have reported experiencing problems with either MST, PTSD, or combat trauma. All ten women had utilized mental health services during active-duty military service, and post service, in VA community based-outpatient clinics. Several recurring themes in the women's experience were identified. For all of the women interviewed, a sentinel precipitating event led to seeking mental health services. These precipitating events included episodes of chronic sexual harassment and ridicule, traumatic sexual assaults, and difficult combat experiences. Efforts to report mistreatment were unsuccessful or met with punishment. All the women interviewed reported that they would not have sought services without the help of a supportive peer who encouraged seeking care. Barriers to seeking care included feeling like they weren't really a combat veteran (in spite of serving in a combat unit in Iraq); feeling stigmatized by providers and other military personnel, being treated as crazy; and a lack of interest from those providing care in hearing their stories. This study may generate positive social change by helping providers approach women veterans in a way that is sympathetic to their experiences.

## E 16 - Teaching and Learning Strategies for Educating Nurses

### Transforming Assessment in Nursing Education: Virtual Simulations

---

*Nancyruth Leibold, EdD, MSN, RN, PHN, LSN, CNE, USA*  
*Laura Marie Schwarz, DNP, RN, CNE, USA*

#### Purpose

The purpose of this presentation is to disseminate research findings from a study of learner perceptions of the use of a conflict management virtual simulation as an assessment method in a nursing leadership and management course.

#### Target Audience

The target audience of this presentation is anyone in nursing who has an interest in the use of virtual simulations as an assessment method in nursing education.

#### Abstract

**Introduction and Purpose of Study:** Virtual simulations in nursing are online scenarios that include one or more learners who participate in a teaching/learning activity in a safe, convenient, online environment. Virtual simulations provide opportunities for learner engagement to build knowledge base. Virtual simulations are also an assessment strategy. The purpose of this research study is to determine the nursing students' perceptions of the conflict management in nursing virtual simulation, and their specific perceptions of the effectiveness of virtual simulation as a teaching/learning/assessment strategy in nursing education. This study includes an examination of technical/ease of use related to virtual simulation, as the authors value a smooth assessment experience.

#### Research Questions

1. What are the strengths of using a virtual simulation about conflict management in nursing for a teaching/learning/assessment activity from the learner's point of view?
2. What are facilitation successes and areas for improvement with using the virtual simulation about conflict management in nursing for a teaching/learning/assessment activity from the learner's point of view?
3. What are factors that relate to technological ease with using the virtual simulation about conflict management in nursing for a teaching/learning/assessment from the learner's point of view?

**Methods:** The study used a mixed-methods design to describe and document aspects of the conflict management for nurses' virtual simulation as a teaching/learning/assessment technique in undergraduate Nursing Leadership and Management courses. The mixed methods approach gives participants an opportunity to provide comments so researchers can better understand their perception of the virtual simulation experience. A 43-item qualitative and quantitative online survey developed by the researchers, called the Learner Perceptions of the Conflict Management in Nursing Virtual Simulation Survey was used for the study measures. The survey includes demographics questions as well as items about the use of the virtual simulation over other assessments, such as papers or examinations. Quantitative data analysis was done with the Statistical Package for Social Sciences (SPSS) (version 22.0, SPSS Inc., Chicago, IL). Descriptive statistics were used to analyze demographic and Likert-type quantitative items. Content analysis was utilized to examine qualitative data.

**Results:** Results presented in this session include the 1) use of ease; 2) effectiveness and connection to learning outcomes; 3) the virtual simulation as an assessment strategy; 4) learning and active participation within the virtual simulation; and 5) facilitation of the virtual simulation. A majority of participants reported the virtual simulation was user friendly and convenient. Participants reported a strong connection between the learning outcomes and the virtual simulation. All participants reported the virtual simulation was a more effective assessment of learning than a paper or quiz on the topic of Conflict Management for Nurses. A majority of participants reported they were actively engaged in the virtual simulation activity. Additionally, participants reported the instructions were clear and the pre-simulation

briefing was helpful. Qualitative themes that emerged were the virtual simulation 1) provided a safe environment; 2) broke conflict management into easy to apply steps; 3) provided a user-friendly assessment; and 4) was convenient and could be completed at an individual pace.

Conclusion: The results of this study indicate nursing learners received the Conflict Management for Nurses virtual simulation favorably. The nature of the topic of Conflict Management is a blend of skill, evidence, and knowledge that fits well with the virtual simulation activity. The authors recommend further study of the virtual simulation use in nursing to examine the effectiveness.

## E 16 - Teaching and Learning Strategies for Educating Nurses

### Are Your Multiple-Choice Tests "FIT"? Using the Fairness of Items Tool (FIT) as a Component of the Test Development Process

---

*Nikole Anderson Hicks, PhD, MSN, BSN, RNC, CNE, USA*

#### Purpose

The purpose of this presentation is to discuss the development, validation, and implementation of the Fairness of Items Tool (FIT) for its use by nurse educators as a component of the test development process to improve the quality of multiple-choice examinations.

#### Target Audience

The target audience of this presentation is nurses in academic education, staff development, faculty development, and academic administration.

#### Abstract

**Purpose:** This presentation will discuss the development, validation, and implementation of the Fairness of Items Tool (FIT) for its use by nurse educators as a component of the test development process to improve the quality of multiple-choice examinations. The FIT provides clear and concise guidelines for nursing faculty to use in developing unbiased test items.

**Background:** Multiple-choice examinations are a common assessment method used in nursing programs, and conclusions based on these assessments have high stakes consequences. Faculty members therefore have an obligation to ensure that tests are valid and reliable assessments of student learning. For a test to be fair, valid, and reliable, it must contain well-written items. Constructing and revising test items is difficult and time consuming, and nursing faculty members lack adequate preparation and sufficient time for examination construction and analysis. Published guidelines are available to assist faculty in creating examination items; however, assessments and textbook item banks contain violations of these guidelines, resulting in the administration of assessments containing flawed test items. Developing clear and concise guidelines for nursing faculty to use in developing unbiased test items is one strategy that may improve the quality of nursing assessments, thereby improving the quality of the decisions made based on these assessments.

**Methodology:** Development and validation of the FIT was a three-phase process grounded in two theoretical frameworks adapted for this research study: the Revised Framework for Quality Assessment and the Conceptual Model for Test Development. In the first phase, the tool was developed by the primary investigator through an extensive review of published higher education and nursing literature related to item-writing rules, examination bias, and cultural bias. Phases two and three used systematic methods to establish the validity and reliability of the FIT. In phase two, content validity and face validity were established through review by a panel of item-writing experts. In phase three, multiple measures were used to establish reliability and construct validity through testing of the FIT by nursing faculty (N = 488) to evaluate sample MCQs.

The sample for this research study was drawn from a list of 5,786 names and email addresses systematically sampled from AACN member school websites. Inclusion criteria included active teaching in a nursing program and utilization of faculty-generated MC examinations for student assessment. Faculty-generated MC examinations include those that are developed by faculty through writing new test items, using test bank items, revising test items from any source, or any combination of these activities. Overall, the demographic characteristics of the sample population were fairly representative of the general nursing faculty population, consisting primarily of educated white females over age 45. The sample population was more likely to have doctoral preparation, full-time and tenured or tenure track status, certification in academic nursing education, and hold higher academic rank than the general nursing faculty population. Males were slightly overrepresented in the sample, while African Americans were underrepresented. The

sample represented all regions in the United States, over 162 programs of nursing, and diverse clinical specialties.

**Results:** The results of this research study support the hypothesis that the FIT is a valid and reliable tool for identifying bias in MCQs as a component of a systematic process for test development. The known groups comparison supported the validity of the FIT as a measure of item bias. Tests for independence demonstrated that FIT scores are not affected by demographic variables. Analysis of agreements provided strong support for equivalence, and the KR20 supported the stability of the FIT. Cronbach alpha correlation coefficients demonstrated adequate reliability for a newly developed tool. This research study also demonstrated that participants made similar decisions when using the FIT to evaluate MCQs.

**Conclusion/Recommendations:** Nurse educators can use the FIT as a component of the test development process to improve the quality of multiple-choice examinations. The FIT provides clear and concise guidelines for writing MCQs and revising textbook test bank items. The FIT provides a means to facilitate systematic research to validate guidelines and testing procedures and to improve the quality of MC test items. Improving the quality of examinations has the potential to improve student success and better prepare graduates for licensure and certification examinations, indirectly increasing the quality, quantity, and diversity of nurses joining the workforce.

**Note:** This research study used Research Electronic Database Capture (REDCap), a secure, web-based survey tool and database, supported by Center for Clinical and Translational Science and Training grant UL1-RR026314.

## E 17 - Interprofessional Issues in Nursing Education

### Promoting Student Resiliency through Interprofessional Education Collaboration

---

*Nassrine Nouredine, EdD, MSN, BSN, RN, USA*

*Darla K. Hagge, PhD, MA, BA, CCC-SLP, USA*

*Debra Brady, DNP, MSN, RN, CNS, USA*

*Will Ofstad, PharmD, BCPS, CDE, USA*

#### Purpose

The purpose of this presentation is to discuss two universities' experiences with Interprofessional Education involving: Nursing, Speech-Language Pathology and Pharmacy. Health professional students must learn to be resilient. Today's global society is increasingly diverse and complex requiring resiliency to successfully navigate challenges in the workplace.

#### Target Audience

The target audience for this presentation are clinical and academic educators from across health care disciplines.

#### Abstract

Health professional students must learn how to be resilient. Today's global society is increasingly diverse and complex requiring resiliency to successfully navigate challenges in the workplace. Healthcare students learn core knowledge, skills, attitudes and values and are asked to quickly apply learning to a clinical or functional setting. Their ability to move from receiving direct instruction to clinical practice is facilitated through supervised interprofessional training in simulation, experiential opportunities, and co-curricular settings that develop practitioner resilience which predicts long term success better than GPA or IQ. This presentation will present two universities' experiences and outcomes with Interprofessional Education (IPE) that involved three healthcare disciplines: Nursing, Speech-Language Pathology and Pharmacy.

**BACKGROUND AND SIGNIFICANCE:** Traditionally, students in health professions are educated and trained in silos, isolated from other disciplines. After graduation, however, students are expected to collaborate successfully on a team that represents many disciplines and perspectives. Given this education model, it is not surprising that communication problems among health care personnel have been implicated as a cause of most patient errors (IOM, 2001, 2003; American Association of Critical Care Nurses [AACN], 2005; Joint Commission, 2005, 2007, 2008; Wachter, 2004). In addition, the Joint Commission reported that breakdowns in communication were the leading root cause of sentinel events between 1995 and 2006 (World Health Organization, 2007).

In an effort to improve healthcare delivery and patient outcomes, the Institute of Medicine (IOM) strongly advocates that "health professionals should be educated to deliver patient-centered care as members of an interdisciplinary team" (IOM, 2003, p. 20). The IOM (2003) reports that "health professionals are asked to work in interdisciplinary teams, often to support those with chronic conditions, yet they are not educated together or trained in team-based skills" (p. 19).

After fifty years of gathering data, there is sufficient evidence indicating the efficacy of interprofessional education as a means to support interprofessional practice (WHO, 2010). Interprofessional education (IPE) exists when students from two or more healthcare disciplines have the opportunity to "learn about, from and with each other to enable effective collaboration and improve health outcomes" (WHO, 2010, pg. 7). Therefore, the purpose of IPE is to prepare healthcare professionals who are ready to collaborate in multidisciplinary teams and provide improved services to patients that result in stronger health outcomes and improved patient safety (WHO, 2010).

The concept has only recently emerged in studies focusing on students' learning contexts and experiences in higher education. Walker et al. (2006) defines resiliency as the "...ability to recover rapidly

from difficult situations” and the “...capacity to endure ongoing hardship in every conceivable way” (p. 251). Resiliency (also known as grit) is a learned trait that educators in the United States’ educational system are beginning to advocate for its incorporation into the curriculum.

Grit can be defined as the “perseverance and passion for long-term goals,” and is an emerging noncognitive characteristic strongly linked to success across education, professional, and personal achievement domains (Duckworth, et al., 2007; Eskreis-Winkler, et al., 2014). Duckworth and Quinn (2009) have proposed and validated a short survey to assess grit, the Short Grit Scale (GRIT–S). Grit outperforms intelligence and GPA in predicting success, and educators see grit as a game changer in education and healthcare (Raehl et al., 2012-2013). Finding meaningful ways to cultivate resiliency is central to student development and a predictor for achieving mastery. The US Department of Education looked at 50 programs targeting the development of perseverance and grit and have drafted a number of recommendations for educators to promote grit by educators. Two key research-based recommendations include [Recommendation 2a]:

“students need to have the opportunity to take on long-term or high-order goals that, to the student, are “worthy” of pursuit”

“provide a rigorous and supportive environment for accomplishing their goals”

Interprofessional education set in co-curricular, simulation, and active learning experiences create opportunities for students see their didactic knowledge, skills, attitudes, and values put into practice with teams and scenarios reflecting real practice settings. Students report these experiences to be highly engaging across the interprofessional literature. These experiences are rigorous but supportive and include reflection and feedback that is inquiry driven rather than evaluative. Interprofessional education for healthcare students may be an ideal pedagogy to develop grit and is a key focus of this research group.

**PURPOSE:** The purpose of the IPE curriculum developed by the authors is to prepare collaborative practice-ready resilient health care professionals that have applied the essential skills of working in teams across a variety of clinical and educational settings and environments.

**METHOD:** By design, a variety of required and voluntary IPE opportunities were integrated into each discipline’s curriculum. To enhance student learning, multiple pedagogies and teaching strategies were used to train the nursing, pharmacy, and speech-language pathology students. These approaches included experiential, transformation and resiliency:

- Cross-discipline didactic education and training
  - Team-based learning – Pharmacy & Nursing; SLP & Nursing
  - Case-based learning – Pharmacy & Nursing; SLP & Nursing
  - Integrated Simulation Experience
    - Simulation Lab – Pharmacy & Nursing; SLP & Nursing
    - Community Engagement – Pharmacy, Nursing & SLP volunteers
    - Saha Health Center
    - CSUS Shot Clinic
    - CSUS Communication Recovery Groups and Communicating Through Art, Life Participation Approach Programs for Persons with Aphasia
    - Interprofessional Cross University Research Team
    - Interprofessional Education Research Academy (IERA) – Pharmacy, Nursing & SLP student and faculty collaborators

**RESULTS:** The outcome data (qualitative and quantitative) from two integrated simulation experiences involving pharmacy, nursing, and speech-language pathology students will be presented demonstrating positive learning outcomes related to IPE goals. Development of grit will be measured using the Short Grit Scale (GRIT–S). In addition, learning outcomes from community engagement activities will be presented.

## E 17 - Interprofessional Issues in Nursing Education

### Interprofessional Education in Nursing Education: A New Way of Knowing

---

*Marian J. George, EdD, MCE, BScN, RN, GNC(C), CCHN(C), Canada*

#### Purpose

The purpose of this presentation is to disseminate research about how nurse educators teach interprofessional education in undergraduate nursing program and identify a new way of knowing in nursing education.

#### Target Audience

The target audience of this presentation is nurse educators in education and practice that are interested in developing knowledge about interprofessional education and practice.

#### Abstract

Background: Teaching and learning in nursing is changing in response to increased complexity and societal issues in client care. A call for innovation in nursing education is imminent and IPE may be the innovative teaching process needed to address this change. However, change may be difficult in a bound profession such as nursing. The intent of completing this research was to identify the perspectives and meanings of IPE as seen through the eyes of nurse educators.

Purpose: To explore how nurse educators understand interprofessional education (IPE) in the context of nursing education, and explore how nurse educators use interprofessional education when teaching in an undergraduate nursing program in a western Canada.

Methods: Grounded in constructivism, qualitative methodology was used. A single exploratory case study provided opportunity to explore a real-life complex phenomenon in the natural setting of nursing education (n=15). Data analysis was framed in social constructivism and transformative learning theory, underpinned by adult learning theory.

Results: A knowledge gap about IPE in nurses' ways of knowing exists; it may be time to add to the established culture of nursing and explore a way of knowing about IPE in nursing, adding to the characteristics and ways of knowing of the profession. As the nurse educators suggested, this new way of knowing may require risk taking and motivation but it may be time for nurse educators to move beyond the insular knowledge of the traditional profession in order to teach in the 21<sup>st</sup> century

Implications: Faculty development in ways of knowing about interprofessional education is needed. Future research to illuminate how language guides nursing education, policy development, and a new way of knowing about IPE.
