to examine the effect of a mandatory, interdisciplinary oncology palliative care curriculum on nursing, medical, social work and chaplaincy students' self-perceived comfort with palliative care skills, self-efficacy related to interprofessional learning, and interprofessional palliative care knowledge.

#### Target Audience

educators of nursing and other health professions students.

#### Abstract

Nursing students must be prepared for collaborative interdisciplinary practice if they are to succeed in today's healthcare environment. Preparing baccalaureate nursing students to be effective members of interprofessional teams is a challenge facing undergraduate nursing programs. The need to meet this challenge is evident. Interprofessional communication and collaboration for improving health outcomes is an essential component of baccalaureate education (American Association of Colleges of Nursing, 2008). Team work and collaboration is a core pre-licensure competency according to the Quality and Safety Education for Nurses (QSEN) initiative (Cronenwett, et al, 2007). The key to preparing nursing students for interprofessional communication, collaboration, and team work may lie in interdisciplinary educational experiences in the undergraduate program. Although the need for interprofessional education (IPE) is apparent, there are few published models and fewer still that have been examined for their effectiveness. The purpose of this study was to examine the effect of a mandatory, interdisciplinary oncology palliative care curriculum on nursing, medical, social work and chaplaincy students' self-perceived comfort with palliative care skills, self-efficacy related to interprofessional learning, and interprofessional palliative care knowledge. The Interdisciplinary Curriculum for Oncology Palliative Care Education (ICOPE) consisted of four components: on-line case-based didactics, an interprofessional case management exercise, clinical rotations, and critical reflection writing exercises. Nursing students in the final semester of a BSN program, fourth year medical students, masters-level social work students specializing in healthcare, and chaplain residents completing Clinical Pastoral Education were required to complete all components of the curriculum. A pre-post mixed-methods design was used to examine the impact of the ICOPE curriculum. Pre-post measures included the End-of-Life Professional Caregiver Survey to measure palliative care specific educational needs and the Self-Efficacy for Interprofessional Experiential Learning Scale to measure student self-efficacy perceptions related to learning collaboratively in interprofessional teams. A survey developed by the research team measured interdisciplinary palliative care knowledge. All data were collected via on-line surveys. Although all students were required to complete the ICOPE curriculum as part of their educational experience, participation in the study was optional. Only data from students providing informed consent were analyzed. A total of 527 students completed the curriculum. Pre and post measures were completed by 373 students, the majority of whom were female (75%) nursing (64%) students. Following completion of the curriculum, students across all disciplines demonstrated significant increases in comfort with palliative care skills. All disciplines, except chaplaincy residents, demonstrated significant increases in self-perceived efficacy related to learning collaboratively in interprofessional teams and palliative care knowledge. The lack of significant changes in the chaplain group was possibly due to the small sample size of chaplains as the effect size on all scales were notable (Cohen's  $d = > 0.60$ ). All students rated the ICOPE curriculum highly with 11 of 14 items on the evaluation at 4.0 or greater on a 5 point scale. Themes identified in the open-ended responses on student evaluations included: students most valued the opportunity to observe palliative teams at work and practice team-based skills with other learners; the clinical experience positively affected them professionally and personally; they increased their understanding of and respect for other disciplines; and, they perceived improved ability to function on a team. This mandatory, multimodal, experiential, interdisciplinary oncology palliative care curriculum increased students' comfort with palliative care skills,

self-efficacy in interprofessional learning, and palliative care knowledge. Success will ultimately be determined by long term outcomes, an area for future research. While many obstacles to IPE exist, the value of such experiences to the learners justifies efforts to initiate and continue similar programs. Interprofessional practice plays a key role in the success of health care reform (National Academies of Practice, 2012). No longer can nursing and other health professional students be educated in silos and be expected to function as effective interdisciplinary team members in today's complex health care environment. Nurse educators are ideally suited to develop and lead IPE initiatives.

## E 18 - Emotional Distress for those Afflicted with Cardiovascular Issues

### Associations between Emotional Distress and Coronary Heart Disease: Analysis of National Health Interview Survey 2008-2009

---

*Alethea N. Hill, PhD, MSN, RN, ACNP-BC, ANP-BC, USA*

#### Purpose

The purpose of this study was to elucidate the independent associations between emotional distress and coronary heart disease, beyond known effects of sociodemographic and behavioural risk factors.

#### Target Audience

The target audience of this presentation is staff nurses, advanced practice nurses, student nurses, nurse researchers, and case managers.

#### Abstract

**Background:** Studies investigating psychological factors have shown that negative emotions independently influence coronary heart disease (CHD) outcomes, contribute to decreased quality of life, poor prognosis, and decreased medication adherence. Extant comorbidities, such as diabetes, obesity, hypertension and inadequate sleep are significant correlates of CHD. Yet, the research that has been conducted to distinguish what proportion is independently attributable to these factors lacks consensus.

**Methods:** In a cross-sectional study using a nationally representative sample, we examined the independent associations between emotional distress and CHD among 25,352 adults from the National Health Interview Survey (2008-2009). Relationships were examined using a multivariate hierarchical logistic regression model controlling for sociodemographic variables, self-reported physician diagnosed medical history, sleep duration, emotional distress, and health behaviors.

**Results:** The overall prevalence of participants reporting CHD from the NHIS data was 5.1%, of which 75.2% self-reported hypertension, 30.5% diabetes, 26.6% <6 or >9 hrs of sleep and 16.4% emotional distress. While the least prevalent self-reported condition at baseline, analysis revealed individuals reporting emotional distress had an estimated two-fold increased risk for CHD [OR = 2.00 95% CI: 2.00-2.01; p<0.0001]. The estimated risk of CHD for participants reporting diabetes and inadequate sleep were increased by 84% and 14%, respectively.

**Conclusion:** In this study, emotional distress confers significant risk for CHD beyond traditional risk factors, such as diabetes and obesity. Our findings suggest that clinicians should work with their patients to promote emotional vitality and wellness to blunt the negative impact emotional distress has on cardiovascular health and refer for mental health services when appropriate.

## E 18 - Emotional Distress for those Afflicted with Cardiovascular Issues

### Family in the Resuscitation Room: Polish and Finnish Nurses' Experience and Attitudes towards Family-Witnessed Cardiopulmonary Resuscitation in a Hospital Setting

---

*Natalia Sak-Dankosky, MSN, BSN, RN, Finland*

*Pawel Andruszkiewicz, PhD, MD, Poland*

*Paula R. Sherwood, PhD, MSN, BSN, RN, CNRN, FAAN, USA*

*Tarja Kvist, Docent, PhD, MSN, RN, Finland*

#### Purpose

The purpose of this presentation is to inform the audience about family-witnessed cardiopulmonary resuscitation (CPR) practice, continue professional debate on its aspects, inspire listeners to seek for more knowledge, specify and possibly reconsider their views on this phenomenon, and thus enhance clinical outcomes of the family-centered care.

#### Target Audience

The target audience of this presentation are health care professionals and leaders who experience CPR situations in their work environments, as well as educators and policy-makers, willing to increase their knowledge on this ethical phenomenon and get familiar with the way family-witnessed CPR is perceived in different cultural settings.

#### Abstract

Background: Family-witnessed resuscitation offers an option for patients' families to be present during in-hospital cardiopulmonary resuscitation (CPR). It represents principles of the Family-Centered Care Theory which recognizes needs of family members and emphasizes their important role in patients' health and sickness. Due to the research suggesting possible benefits of family-witnessed resuscitation (Clark et al. 2013), many nursing and medical organizations, such as Emergency Nurses Association, European Resuscitation Council and American Heart Association, have officially recommended this practice. There is evidence that while in some countries family-witnessed resuscitation is accepted and implemented, there are many places in which it is not respected and still remains highly controversial (Sak-Dankosky et al. 2014).

Purpose: The purpose of this study is to describe Finnish and Polish emergency (ER) and intensive care (ICU) nurses' experience in family-witnessed resuscitation, and to determine whether there are a differences between their experiences and attitudes towards this practice.

Methods: A total of 270 ICU and ER registered nurses from three university hospitals in Poland and three in Finland took part in the study. A structured questionnaire, developed by Fulbrook P., Albarran J. W. and Latour J. M., was used to collect data. For the purpose of the study the questionnaire was translated into Polish and Finnish, using standard forward-back translation method, and then pilot-tested in order to check the accuracy of the translation. Questionnaire was divided into three parts: first asked about socio-demographic characteristics of the participants, second asked six questions with dichotomous answer alternatives about nurses' experience on family-witnessed resuscitation, and third consisted of thirty 5-point Likert scale questions about nurses' attitudes towards this phenomenon. Attitude questions were divided into three areas of inquiry: (1) decision-making, (2) process, and (3) outcomes. Data, collected between July and December 2013, were analyzed using SPSS 19.0 for Windows. Descriptive statistics such as frequencies, percentage distributions, means and standard deviations were used to characterize the sample. Chi-square test was used to analyze whether there are country differences in previous family-witnessed resuscitation experience. Mann-Whitney U-test was used to order to determine differences in attitudes between countries. The study is a part of a larger project exploring experiences and attitudes of

Finnish and Polish health care professionals and family members towards family-witnessed resuscitation, and was approved by University Committee on Research Ethics.

Results: Most respondents were women (83%). Finland was represented by 153 (57%) registered nurses and Poland by 117 (43%). Mean age was 40 ( $\pm$ SD 10.01) and was approximately the same in both countries. Out of 265 nurses who reported their specialty area, 85 (32%) worked in emergency departments and 180 (68%) in intensive care units. Average working experience was 15 years ( $\pm$ SD 9.88), and was higher in Poland (18 years), than in Finland (13 years). Twelve percent of participants reported obtaining Master's degree in Nursing. The greater number of nurses worked as clinical practitioners (94%). Only 6% worked as educators, managers and researchers. The majority of nurses (72%) have never experienced family-witnessed resuscitation, however among those who have, Polish nurses had significantly more experience than Finnish nurses ( $p=0.003$ ). A total of 76.2% nurses disagreed that family-witnessed resuscitation should be a normal practice. Only 14.5% claimed that it would be a good idea, while 9.3% were not sure. There was no significant difference between Polish and Finnish nurses regarding this statement ( $p=0.375$ ). There was, however, a significant difference between the way Finnish and Polish nurses view the process of family-witnessed resuscitation ( $p=0.031$ ). Polish respondents represented slightly more agreement with the negative process-related consequences of this practice than those from Finland. Level of agreement on aspects regarding attitudes towards decision-making process ( $p=0.133$ ), and the outcomes of family-witnessed resuscitation ( $p=0.111$ ) were not found to be significantly different between these two countries.

Conclusions: Exploring experiences and attitudes towards family-witnessed resuscitation is important in determining why, even though this option is widely recommended, in some countries it is not implemented into practice. Inviting family to be present at the bedside during CPR performed in a hospital setting, is not common in Poland and Finland. It might be explained by rather negative attitude towards this practice in both countries. Despite agreement on the aspects related to decision-making process and outcomes of family-witnessed resuscitation, there are differences regarding process-related attitudes towards this practice. This might be explained by the differences in health care systems and work organization in Poland and Finland. Negative attitudes towards family-witnessed resuscitation have been previously linked to the lack of experience and education regarding this problem (Edwards et al. 2013). It would be beneficial to develop training plans which would improve nurses' understanding of the benefits of family-centered care. Results of this study can help to create a global picture of the extent of the phenomenon and guide further decision-making process. Better understanding of health care professionals' experiences and attitudes will help develop proper strategies, policies and guidelines regarding family-witnessed resuscitation practice, and thus improve the quality of nursing care.

## E 18 - Emotional Distress for those Afflicted with Cardiovascular Issues

### The Role of Stress and Inflammation in Depression in Hispanics with Chronic Heart Failure

---

Samira Moughrabi, PhD, RN, CNS, USA

#### Purpose

Understand the relationship between depression, stress, SES, and inflammation in patients with heart failure Identify the implications of depression to health outcomes and nursing practice and research

#### Target Audience

Nurses who are in practice, research, and academia

#### Abstract

**Introduction:** Depression is a common comorbidity in heart failure (HF) and is commonly associated with increased inflammation leading to poor outcomes. Low socioeconomic status (SES) and stress are common in Hispanics but have not adequately been described in those with HF. The purpose of this exploratory study was to examine depression and its relationship with socioeconomic status, stress, and inflammation in Hispanics with HF.

**Methods:** 55 patients (71.62±11.33; 74.5% male; 31% Hispanic) with HF were assessed for their perceived stress (PS) using PSS, CRP serum levels, and education level and yearly income as indices of SES. Descriptive data and t-test and chi-square were used to compare Hispanics and non-Hispanic Whites (NHW) on sociodemographic and clinical characteristics and linear multiple regression to assess the relationship between depression, ethnicity, PS, CRP, and SES.

**Results:** Hispanics were younger and had lower education and income levels than NHW. No significant difference was found between both groups in depression and stress scores, and CRP levels. Independent of age, gender, NYHA class, BMI, education levels, and perceived stress (B=0.39, p=0.009) and marital status (B=0.37, p=0.049) predicted depression scores. When yearly income replaced education level in the multiple regression model, only PS (B=0.43, p=0.003) predicted depression. Hispanic ethnicity and CRP did not contribute to the variation of depression in both models.

**Conclusion:** This study shows the importance of stress in depression. Sources of stress in HF should be further explored to develop interventions that effectively reduce stress regardless of patient's et

## E 19 - Putting Community Health Research into Practice

### Promoting Health Promotion Practices in the Low Income Population

---

*Maria Alice Masciarelli, DNP, RN, FACHE, CPHQ, USA*

#### Purpose

demonstrate the impact of applying findings from research on health promotion into every day practice. Research findings in a variety of populations, including the low income population, have indicated that strong interpersonal relationships play a vital role in the adoption of health promoting behaviors.

#### Target Audience

all researchers and clinicians interested in health promotion and population health for the 21st century. As health care delivery focuses more on quality of outcomes, every health care practitioner needs to focus on building stronger interpersonal relationships with their patients and the families.

#### Abstract

The increasing proportion of the low income, uninsured population has become the focus of the United States health care reform. The importance of health promotion is emphasized in the literature and the Affordable Care Act. The literature has focused on perceived health status, perceived health competence and health-promoting behaviors of some populations but revealed that little is known about the health promotion behaviors of the low income population. In 2013, an exploratory, descriptive study using a structured interview method was used to explore the perceived health status, perceived health competence and health-promoting behaviors of this population with a sample of 44 uninsured adults, whose income was at 200% of federal poverty or lower, and who spoke and understood English. Using Pender's Health Promotion Model as a framework, the pilot project also explored the relationships among the variables. A questionnaire consisting of four questions exploring health status, the Perceived Health Competence Scale (PHCS), the Health-Promoting Lifestyle Profile II (HPLP II) and a demographic survey was used during a face-to-face structured interview with each informant once a written consent had been obtained. Data from 41 questionnaires were analyzed using descriptive statistics, two-tailed t-tests, ANOVA and Pearson correlation statistics. The results indicated that the informants rated their health as good to fair, reported a moderate degree of health competence, and engaged primarily in interpersonal relations and spiritual growth behaviors. The project contributed to the understanding the low income population's perceptions of their health, their health competence and health promotion behaviors, and provided a direction for future research and clinical care. The results from this study have guided the beginning of the transformation of clinical practice at a non-profit health clinic in Denton, Texas. The change strategies included team meetings and refocusing on the mission of the clinic. The challenges were varies and will be described in the presentation. The outcomes of the adoption of a new care delivery model that focused on fostering health promotion behaviors include increased adherence to treatment plans, decreased rate of not showing up for appointments, and patient satisfaction.

## E 19 - Putting Community Health Research into Practice

### How Self-Efficacy and Self-Regulation Influence Nutrition and Exercise Behaviors of a Community Sample of Adults

---

*Carol Shieh, DNSc, MPH, RNC-OB, USA*

*Michael Weaver, PhD, FAAN, RN, USA*

*Kathleen Newsome, BSN, RN, USA*

*Kathleen Hanna, PhD, RN, USA*

*Mulubrhan Mogos, PhD, BSN, MSN, USA*

#### Purpose

The purpose of this presentation is to report findings of a study that exams two health behavior change determinants (self-efficacy and self-regulation) and their relationships to nutrition and exercise behaviors.

#### Target Audience

The target audience of this presentation is nurses who provide health education or health promotion services to adults.

#### Abstract

Fruit/vegetable consumption and physical activity are beneficial for disease prevention and health promotion; however, one-third of the U.S. adults do not eat fruits and vegetables even one time a day and nearly a quarter of adults do not participate in any physical activities. Self-efficacy and self-regulation are two theory-based determinants of health promotion. Self-efficacy is perceived confidence to perform a health behavior. Self-regulation includes a spectrum of effortful activities such as goal setting, affect regulation, coping strategy development, problem solving, self-monitoring, self-reinforcement, self-evaluation, cognitive restructuring, and stimulus control. Understanding how self-efficacy and self-regulation influence nutrition and exercise behaviors will help nurses develop determinant-behavior specific intervention. This study examined (1) the association of self-efficacy and self-regulation with three nutrition behaviors and exercise and (2) how men and women differ on these determinants and health behaviors. Methods: A cross-sectional design was used and 108 adults (54 men, 54 women) were recruited from a community event in a Midwestern county. This county, as compared to the U.S. top performing counties in the 90<sup>th</sup> percentile, has more premature deaths (6,992 vs. 5,317), adult obesity (31% vs. 25%) and physical inactivity (26% vs. 21%), and lower rates of access to exercise opportunities (48% vs. 85%) and diabetic screening (85% vs. 90%). Nutrition behaviors (fruit/vegetable consumption, dinner cooking, and restaurant eating) and exercise were measured using total days in last week a behavior was reported. Instruments measuring self-efficacy and self-regulation demonstrated excellent Cronbach's alphas (.93 - .95). Path analysis and t-test were used for data analysis. Findings: Most of the 108 participants were Caucasian (80%) and aged 20 to 49 years old (68%). About 31% had not engaged in any physical activity and 4% had not eaten any fruits and vegetables during the week before data collection. Self-efficacy and self-regulation were associated with exercise and fruit/vegetable consumption but not with dinner cooking or restaurant eating. Path model analysis indicated that self-efficacy had an indirect effect on fruit/vegetable consumption (IE = 0.088; SE = 0.025; 95% CI = 0.042 - 0.141), and both direct ( $\gamma_{21}$  = 0.114; 95% CI = 0.056 - 0.171) and indirect (IE = 0.082; SE = 0.022; 95% CI = 0.043 - 0.128) effects on exercise. Self-regulation directly influenced fruit/vegetable consumption ( $\beta_{21}$  = 0.619; 95% CI = 0.306 - 0.930) and exercise ( $\beta_{21}$  = 0.564; 95% CI = 0.303 - 0.825). Compared to men, women had higher fruit/vegetable consumption and more dinner cooking but no difference in self-efficacy or self-regulation. Conclusions: self-efficacy and self-regulation are associated with exercise and fruit/vegetable consumption. For fruit/vegetable consumption, self-efficacy plays an indirect role, but self-regulation exerts direct influence. Intervention that enhancing self-regulation than self-efficacy may have a better likelihood of increasing fruit/vegetable consumption in an individual or a population. For exercise, both self-efficacy and self-regulation play a direct role in influencing exercise frequency. Due to their unique contributions to health promotion behaviors, self-efficacy and self-regulation should be strategically incorporated in interventions to improve specific health behavior.

## E 19 - Putting Community Health Research into Practice

### Determinants of Access to Specialty Care for Community Health Clinic Patients

---

*Mabel Ezeonwu, PhD, RN, USA*

#### Purpose

To explore the factors that determine access to off-site specialty care services for community health clinic/center (CHC) patients.

#### Target Audience

Policy makers, hospital administrators, specialty care providers at hospitals, nurse executives at hospitals and community health clinics, and nurse educators.

#### Abstract

**Purpose:** To explore the factors that determine access to off-site specialty care services for community health clinic/center (CHC) patients.

**Background:** Community health centers and clinics (CHC) constitute a critical part of the United States health care system. In Washington State for example, 10.1% of its population were served by CHCs in 2008 (Adashi, Geiger & Fine, 2010). CHCs provide primary care to anyone that walks through their doors. Individuals served by the clinics on average have poor health status (Schauffler & Wolin, 1996) and higher prevalence of chronic disease conditions than the general population (Ferrer, 2007). The patients often need follow-up care with specialists for continued and consistent recovery or health maintenance. CHCs however are limited in their abilities to provide diagnostic and specialty services, and other important aspects of care that go beyond primary care (Gusmano, Fairbrother & Park, 2002; Weissman et al, 2003). Studies suggest that CHC patients have difficulty accessing specialty and diagnostic services that are not provided directly by the CHCs (Cook, et al, 2007; Cook, Ayanian, Orav & Hicks, 2009; & Adashi, Geiger & Fine, 2010). This study aims to explore the factors that restrict or facilitate access to specialty care for CHC patients.

Majority of CHC patients are from vulnerable populations. Seven out of ten community health center patients live in poverty, and well over half are minorities (Adashi et al., 2010). Specialty care referral and follow-up for these patients are not well studied and documented. Cook et al. (2007) evaluated access to specialty care by CHC patients from the point of view of medical directors. No study has examined the perspectives of frontline personnel that take on the day-to-day responsibilities of coordinating specialty care referrals and therefore understands the nuts and bolts of the process. This study fills this gap by examining the views of community health clinic Nurse Managers, Directors, and Referral Coordinators on factors that determine access to specialty care for CHC patients.

**Method:** For this qualitative descriptive study, face-to-face and phone interviews were conducted with personnel who oversee and conduct specialty care coordination and referrals at community health clinics/centers in Washington State. Thirty five community health clinics were represented in the study. Qualitative content analysis was used to analyze the data.

#### **Findings:**

- The key patient factors that determine access to specialty care include: Type of insurance coverage, language, access to transportation services, socio-economic status and education/literacy level. Among these factors, insurance is by far the most impactful. The study shows that there is significant gap or disparity in access between private insurance carriers and those on Medicaid/Medicare, and those with no insurance. CHC personnel spend the greatest part of their work time searching for specialists that could accept the patients' insurance and those willing to provide charity care for the uninsured.
- Several clinic or systems factors that delay the process include: Shortage of CHC personnel who actively participate in care coordination and referral, high patient volumes, location, and shortage

of specialists. The shortage of personnel, particularly specialists, has a direct negative effect on health outcomes due to unnecessary delays in specialty care access.

- Centralized electronic health records, clinic-hospital affiliations, centralized pool of available specialists, and availability of interpreters are major clinic/systems' level factors that enhance specialty care coordination, referral and access.
- There is a high demand for all specialty services in Washington State. The most frequently requested specialty is orthopedics followed by cardiology, neurology, rheumatology, ophthalmology, and gastroenterology and pain management.

**Conclusion/Policy Implications:** Continuity of care is essential for improved patient outcomes. Both primary care and specialist care providers have important roles to play in ensuring the best possible outcomes for underserved populations globally. As more people obtain health insurance coverage through the Affordable Care Act (ACA) in the United States, CHCs will see increased number of patients. It is however still uncertain whether increased access to primary care translates into easier, faster and increased access to specialty care. Although the ACA addresses issues related to insurance coverage, other policy approaches should support clinic-hospital affiliations, improving workforce shortages, and promoting an expanded use of the electronic health records in all CHCs. An integrative model of care is essential in all policy agenda to ensure timely and unrestricted access to specialty care.

## E 24 - Engaging Students in Research and Practice

### Ebola 101 Module: An Opportunity for Students to Think Globally, Act Locally

---

*Elizabeth A. Tinnon, PhD, MSN, BSN, RN, CNE, USA*

#### Purpose

The purpose of this presentation was to increase student knowledge in the nursing care required for patients with Ebola Virus Disease (EVD) using inquiry-based learning.

#### Target Audience

The primary target audience for this presentation is nursing faculty. However, this teaching learning strategy could be used within any healthcare discipline curriculum.

#### Abstract

Purpose: The purpose of this project was to increase student knowledge in the nursing care required for patients with Ebola Virus Disease (EVD) using inquiry-based learning.

Background: On September 30, 2014, United States (US) health care providers experienced firsthand, Ebola, a disease that had always "been over there". It was evident that health care facilities and health care providers were not prepared to provide care to patients with EVD or patients who may have been exposed. Prior to the United States EVD outbreak nursing education had relegated EVD to a brief mention in the community health course. Nurses as frontline healthcare providers must be knowledgeable in all aspects of caring for the patient with EVD. With the access and ability for worldwide travel, our global borders are shrinking and it is probable that the United States will see additional incidences of EVD. Normally EVD is not taught in the Chronic Conditions course (students completed their population health course the previous semester) but the faculty wanted to take advantage of this unique moment in time to prepare our students to properly care for patients with EVD.

Teaching/Learning Methodology: Utilizing the framework of inquiry based learning (Levy, Aiyegbayot, & Little 2009) the faculty developed a learning activity to increase the nursing students' knowledge of EVD and the care of patients with EVD. The opportunity for students to create a learning module would stimulate their interest, increase their curiosity and enable them to think creatively and independently. Students were placed into 5 groups. Each group was assigned a different aspect to investigate regarding the EVD outbreak. The assignments were:

- Group 1: What is EVD? Pathophysiology, epidemiology, signs and symptoms
- Group 2: How is EVD transmitted? Transmission routes, risk factors
- Group 3: What infection control measures are needed to protect health care provider and patients?
- Group 4: How do we treat Ebola? Current treatments and vaccines
- Group 5: Tracking EVD: Outbreak map to track EVD from its beginning, discuss how it has "traveled and why"

Each group was instructed to produce both written work and an oral presentation on their assigned content. Students were informed that the collected information would be compiled into a notebook entitled, "Ebola 101: What every nursing student needs to know". Students were allowed to determine their own methods of obtaining, synthesizing and presenting information.

Results : For faculty this project exceeded all our expectations, we were amazed at the depth and breadth of information the students brought forward. On the day of the presentation the community faculty was also invited to hear the presentations and participate in the dialogue, they too voiced an appreciation for the broad scope of knowledge the students had gained.

The students' response to the EVD project was overwhelmingly positive. Students were enthusiastic about the opportunity to structure their own learning experience. As the project progressed students were constantly sharing websites, new and changing information with faculty and peers.

Students saw the importance of infection control policies and procedures for the safety of health care providers and their patients. Though faculty reiterates this ad nauseum, the EVD outbreak in the United States really brought that home for our students. Students also expressed amazement at how rapidly these policies and procedures changed over the course of the outbreak.

The positive and negative aspects of media coverage were examined. In particular, students were outraged a nurse was the first blamed during the EVD outbreak. Discussion ensued about whether some journalist or scientist were fanning the flames of hysteria or presenting another valid side to the issue.

For the first time our students associated EVD with real individuals with faces and names rather than as a statistical table with no relevance to the human condition. As student shared about the earlier outbreaks and the number of people affected the students began to realize the cost in terms of lost lives.

They discovered the other side of the world in their own backyard. One group of students purchased a map and used pins to keep their colleagues up to date regarding the spread of EVD from the first identified case until the current cases in the fall of 2014.

The student created learning module was a success for both faculty and students. This teaching learning strategy could be used effectively within any nursing course, and with any content.

## E 24 - Engaging Students in Research and Practice

### Engaging Nursing Students in Health Promotion Research and Practice

---

*Donna M. Callaghan, PhD, RN-C, GCNS-BC, CNE, USA*

#### Purpose

to highlight nursing student engagement in a nursing faculty member's program of research. This program of research investigated the effects of three faith community nurse-led educational programs in promoting healthy behaviors in adults. Pre-licensure and graduate nursing students participated in the development, implementation, and evaluation of the research studies.

#### Target Audience

nurses from practice (specifically faith community, community health, public health), education (academic and clinical), and research environments.

#### Abstract

**Purpose:** The purpose of this presentation is to highlight nursing student engagement in a nursing faculty member's program of research. This program of research investigated the effects of three faith community nurse-led educational programs in promoting healthy behaviors in adults. Three pre-licensure nursing honors students participated in the implementation and evaluation of two of the health promotion programs. The development of the health promotion programs was based on the relationships identified by Callaghan (2003, 2005, 2006) among the variables of health-promoting self-care behaviors (Pender, Murdaugh, & Parsons, 2002), self-care self-efficacy (Bandura, 1997), and self-care agency (Orem, 2001). Two graduate nursing students assisted in the development of the program based on these identified relationships. The purpose of the program of research was to identify if attending the educational programs, which focused on spiritual growth as the foundation of health, would lead to an increase in the practice of healthy behaviors in adults.

**Theory:** The educational program reflects the use of a supportive-educative nursing system, as defined in Orem's Self-Care Model (2001), to promote the healthy behaviors of spiritual growth, nutrition, physical activity, stress management, interpersonal relations, and health responsibility, as defined in Pender's Health Promotion Model (2002). Bandura's Theory of Self-Efficacy (1997) directed the development of program activities that increase self-efficacy of these healthy behaviors.

**Methodology:** A family-focused program, held within a faith community, consisted of six two-hour presentations on the healthy behavior topics. Each two-hour presentation included one hour of Power Point information and one hour of selected activities to increase self-efficacy. A student-focused program, held within a university community, and an older adult-focused program, held within an urban community senior center, consisted of six one-hour presentations, 30 minutes each for the presentations and activities. A pre-test post-test quasi-experimental design was used to investigate the effect of the program on healthy behaviors. IRB approval was obtained through the researcher's university and letters of support were obtained from each of the three intervention settings. The program participants completed a consent form and the study instruments, which included the Health-Promoting Lifestyle Profile II Scale and a demographic questionnaire, one week before and one week after completion of the program. A paired t-test using SPSS 20 was performed to measure the effect of the program on the participants' healthy behaviors.

**Findings:** Four participants (two couples) completed the family-focused program with mean scores on the HPLPII increasing an average of 10 points but with a significance level of  $p = .075$  due to the small sample size. Twenty-three participants completed the student nurse-focused program with mean scores increasing an average of 18 points with a significance level of  $p < .001$ . Five participants completed the older adult-focused program with mean scores increasing an average of 16 points with a significance level of  $p = .002$ .

**Implications for Nursing Practice and Nursing Education:** The research results in this study indicated that the health promotion programs did have an effect on the practice of healthy behaviors in the participants. This program also introduced the faith, university, and senior communities to the practice of Faith Community Nursing as well as introduced nursing students to the importance of spirituality and self-care in their practices. The students directly involved in the research were engaged in the research process, program development, implementation, and evaluation, as well as service to the community. Opportunities for all nursing students to be engaged in scholarly activities such as these are essential for their personal professional growth as well as the growth of the profession of nursing.

## E 24 - Engaging Students in Research and Practice

### Enhancing the Patient Safety Culture of ABSN Students through Instruction on Medical Error Recovery

---

*Darlene Mary Burke, PhD, MS, MA, RN, USA*

#### Purpose

To inform the audience about research study implications.

#### Target Audience

A nurse/nurse educator passionate about patient safety.

#### Abstract

Attitudes toward patient safety are the foundation of patient safety culture. Nursing students begin to formulate their patient safety attitudes while in educational programs. Nursing faculty have been challenged in their efforts to enhance the patient safety culture of students because there is a lack of empirical evidence as to which teaching strategies positively affect student attitudes toward patient safety. The purpose of this study was to examine the relationship between a 50-minute teaching module based upon the concept of medical error recovery and 9 dimensions of patient safety culture as measured by the Attitudes to Patient Safety Questionnaire (APSQ III). The guiding framework for the study was the reciprocal interactive theory of patient safety culture in nursing. The conceptual model used to illuminate the role of nurses in recovering medical errors in the educational intervention was the modified Eindhoven model of near-miss events. The sample comprised 4 student cohorts (N = 142) enrolled in an accelerated bachelor of science in nursing (ABSN) program at one university, with 4 participants lost to follow-up (n = 138). A quasi-experimental, nonequivalent control group, pretest/posttest design was used to compare mean attitude scores between the control (n = 75) group and the intervention group (n = 63) after statistically controlling for the pretest. ANCOVA revealed statistically higher mean attitude scores for the intervention group in 5 of 9 dimensions of patient safety culture with a small-medium effect size associated with the intervention: patient safety training, error inevitability, professional incompetence as error cause, patient's role in error, and importance of patient safety culture in curriculum. The results supported the use of a short-duration educational session on medical error recovery to enhance a subset of patient safety culture dimensions among ABSN students.

## E 25 - The Psychological Welfare of Nursing Students

### Factors Influencing Australian Nursing Students' Psychological Well-Being and Suicidal Ideation

---

*Pi-Ming Yeh, PhD, RN, USA*

*Lorna Moxham, PhD, RN, MHN, MEd, BHSc, DAS, (Nsg), GradCertOH&S, GradCertQualMgt, FCON, FACMH, Australia*

*Christopher Patterson, BN (Hons), MN (MH), RN, Australia*

*Carolyn Antoniou, MSN, RN, Austria*

#### Purpose

The purpose of this study was to examine the state of psychological well-being and suicidal ideation of Australian nursing students. The study also examined levels of anxiety and depression, and features of personality and family interaction as well as the relationship of these to students' psychological well-being and suicidal ideation.

#### Target Audience

The target audience of this presentation is nursing educators, nursing students, nurses, and nursing staffs.

#### Abstract

**Purpose:** The purpose of this study was to examine the state of psychological well-being and suicidal ideation of Australian nursing students. The study also examined levels of anxiety and depression, and features of personality and family interaction as well as the relationship of these to students' psychological well-being and suicidal ideation.

**Methods:** Participants were Bachelor of nursing students from a University in the Australia. This study utilized a cross sectional descriptive research design, with data collected by structured questionnaires. Data was analyzed using SPSS version 20 with descriptive data analysis, Pearson Correlation, and Stepwise Multiple Regression.

**Results:** A total of 201 nursing students (20 male, 181 female) participated in this study; 157 (78.1%) participants were Australian. The mean age of nursing students was 25.80 (SD = 8.43) and 96 (47.8%) identified as Christian. The statistical significant factors related to psychological well-being include anxiety ( $r = -.540, p \leq 0.001$ ), depression ( $r = -.647, p \leq 0.001$ ), personality ( $r = .642, p \leq 0.001$ ), positive family interaction ( $r = .362, p \leq 0.001$ ), and negative family interaction ( $r = -.239, p \leq 0.001$ ).

The statistical significant factors related to suicidal ideation include psychological well-being ( $r = -.480, p \leq 0.001$ ), anxiety ( $r = .590, p \leq 0.001$ ), depression ( $r = .684, p \leq 0.001$ ), personality ( $r = -.372, p \leq 0.001$ ), and positive family interaction ( $r = -.182, p \leq 0.01$ ).

Results indicate a relationship between anxiety and depression and states of psychological well-being and suicidal ideation. Students' with lower ratings of anxiety and depression have increased ratings of psychological well-being and decreased ratings of suicidal ideation. Additionally, increased ratings of positive personality and positive family were related to increased ratings of psychological well-being and decreased ratings of suicidal ideation. Negative family interaction decreases the nursing students' psychological well-being.

**Conclusion:** Depression, personality, and family interaction impact Australian nursing students' psychological well-being. Anxiety, depression, and negative family interaction are influencing factors of the suicidal ideation of Australian nursing students.

## E 25 - The Psychological Welfare of Nursing Students

### Influence of Rape Myth Acceptance on Responsibility to Rape Action, and Degree of Rape Trauma: Student Nurses' Perception

---

*Adesola A. Ogunfowokan, BNSc, MScN, PhD, RN, RM, RPHN, FWACN, Nigeria*  
*AanuOluwapo Olajubu, BNSc, MSCN, RN, RM, RPHN,, Nigeria*  
*Francisca Eghonghon Gbenu, BNSc, RN, RM, Nigeria*

#### Purpose

The purpose of this presentation is to discuss the how rape myth acceptance of student nurses influences their perception of responsibilities of rape victim and perpetrators, and the degree of trauma experienced by rape victim

#### Target Audience

The target audiences of this presentation are clinical nurses, student nurses, researchers, nurse educators and members of organizations that work with rape victims and perpetrators

#### Abstract

The study employed a descriptive-explorative design and was conducted among part-time student nurses of Obafemi Awolowo University, Ile-Ife, Nigeria. One hundred and sixteen students participated in the study. The study was aimed at exploring the Rape Myth Acceptance (RMA) of the students. It also determined the influence of the students' RMA and gender on their perception of victims' and perpetrators' responsibilities in cases of acquaintance, stranger, marital and date rape; and degree of trauma experienced by rape victim. An adapted structured questionnaire containing Rape Myth Acceptance Scale with four rape vignettes was used to collect data. Data generated was analyzed using Statistical Package for Social Sciences (SPSS) version 16. Results showed that 46% of the students had Low Rape Myth Acceptance (LRMA) while 54% had High Rape Myth Acceptance (HRMA). Less than 50% of the students with HRMA and LRMA assigned 'lots of responsibility' to the perpetrator in marital rape while fewer numbers of males (32%) and females (33%) assigned 'lots of responsibility' to perpetrators in acquaintance rape. No statistically significant difference existed between those that had LRMA and HRMA in their rating of perpetrator's responsibility ( $p = 0.7$ ) but, a statistically significant difference existed in their rating of victim's responsibility ( $p = 0.02$ ). However, RMA of the students influenced their perception of degree of trauma when the victim is a prostitute ( $p = 0.12$ ); a married woman ( $p = 0.21$ ); and a divorced woman ( $p = 0.05$ ). Also, a smaller percentage of males and females assigned 'definitely traumatic' to a prostitute (7.1%, 4.5%), and a divorced woman (17.9%, 26.1%) in perceiving the degree of rape trauma. It is concluded that acceptance of rape myth is still high among student nurses who have the opportunity to manage rape victims and perpetrators in their clinical practice.

## E 25 - The Psychological Welfare of Nursing Students

### Mindfulness Interventions for Nursing Students

---

*Mary Elaine Koren, RN, PhD, RN, PhD, USA*

*Manju N. Daniel, PhD, FNP, MSN, RN, USA*

#### Purpose

The purpose of this presentation is to increase the awareness of mindfulness interventions that can be implemented for nursing students.

#### Target Audience

The target audience for this presentation is nursing administrators, nursing faculty and nursing students.

#### Abstract

Overview: Nursing students report higher levels of stress, anxiety and depression than university students in general or working adults in the same age category (Chernomas & Shapiro, 2013). Mindfulness exercises are one method for coping with stress. Mindfulness increases awareness of the present moment by blocking past and future thoughts (Moscaritolo, 2009). An integrative literature review found the most effective evidence-based intervention to increase productivity and well-being of health care providers was mindfulness training (Koren & Purohit, 2014). Studies suggest mindfulness training maybe an effective intervention for nursing students as well (Beddoe & Murphy, 2004; Kang, Choi, & Ryu, 2009). Most mindfulness classes are conducted during one hour practice sessions during a four to eight week period of time. Lack of sufficient time for training and practice however, commonly leads to attrition in mindfulness (Koren & Purohit, 2014). Shorter mindfulness training and practice sessions may reduce attrition.

Purpose: The purpose of this quasi-experimental pilot study was to evaluate differences in reported perceived mindfulness, stress levels, and self-compassion scores between nursing students who participated in 10-minute instructional sessions of mindfulness exercises compared with those with no intervention.

Methods: After IRB approval from the affiliated university, a convenience sample of nursing students from section one of a nursing research class (n=8) were assigned to the experimental group and students from section two of the research class (n=5) served as the control group. Both groups completed the Mindfulness Attention Awareness Scale (MAAS), a measure a measure of day-to-day attentiveness; the Perceived Stress Scale (PSS) a measure of thoughts and feelings; and the Self-Compassion Scale (SCS), a measure of how one acts towards self during stressful times, at the beginning and end of a six week period of time. The MAAS instrument is scored using the mean of the 15 items, and mean scores could range between 1.00 and 6.00 with higher scores indicating higher levels of mindfulness. The PSS instrument is scored using the mean of four items, and mean scores could range between 0 and 4.00 with higher scores indicating higher levels of stress. The MAAS instrument is scored using the mean of 12 items, and mean scores could range between 1.00 and 5.00 with higher scores indicating higher levels of self-compassion. The experimental group also participated in a 10-minute mindfulness training once a week. Participants in the experimental group learned four mindfulness exercises: deep breathing, progressive muscle relaxation, meditation, and mantra. Once a week for six weeks, the researcher met with students from the experimental group to practice one of the mindfulness interventions. Experimental participants were encouraged to use the learned mindfulness exercises throughout the week and were asked to record the frequency of their use and any comments regarding their mindfulness practice.

Results: All study participants were female with a mean age of 27 years and age range 20-52 years. All but one participant, who was in the control group, reported some type of previous mindfulness practice.

The experimental group mean MASS scores increased from pretest (u= 3.31) to posttest (u=3.81) to a greater extent than the control group pretest (u= 3.36) to posttest (u= 3.73), but the differences were not

significant. Likewise, the experimental group mean PSS scores decreased from pretest ( $u= 2.75$ ) to posttest ( $u= 2.31$ ) to a greater extent than the control group pretest ( $u= 2.58$ ) to posttest ( $u= 2.31$ ), but the differences were not significant. There was little change in SCS scores for either the experimental group pretest ( $u= 2.95$ ) to posttest ( $u= 3.01$ ) or control group pretest ( $u= 3.0$ ) to posttest ( $u= 2.96$ ), and none were significant.

Only four subjects in the experimental group recorded the frequency of their mindfulness practice. One of the four participants practiced mindfulness exercises four times during the six week period of time. Two participants practiced mindfulness for five minutes almost daily, and the fourth participant used mindfulness strategies during the hour long commute to school.

Discussion: It was no surprise that all that subjects were female since the majority of students enrolled in this nursing program are female; however, the students who participated in this study were older than the national average of pre-licensure students (NLN, 2012). It might be that older students are more interested in a mindfulness practice, and therefore more likely to volunteer to participate.

Study participants in the experimental group did increase their MAAS scores and decrease their PSS scores after only six weeks of 10 minutes of instruction to a great extent than the control group, although the changes did not reach significance. This is noteworthy on two accounts. One, the participants practiced these interventions on an average of five minutes per day, yet there was definite progress in mindfulness techniques as evidence by the higher MAAS scores and lower PSS scores. This is promising since most studies recommend longer periods of practice. Time is a precious commodity and in short supply. Nevertheless, the participants practiced the interventions an average of five minutes per day.

Study limitations include small sample size and the small number of practice sessions with the nursing students and non-random assignment. For future studies, larger group sizes and a larger number of practice sessions are recommended. Random assignment of participants to treatment and control groups would enhance generalizability of the findings. Results from this pilot suggest that as few as 10 minutes of a mindfulness instruction and short daily practice may have an impact on mindfulness practice sessions as a transformative nursing practice that may ultimately enhance clinical, patient and educational outcomes.

## E 26 - Research and Evidence-Based Medication Administration

### Medication Reconciliation: It's in the Bag

---

*Dawn Becker, DNP, RN, CEN, ACNS-BC, USA*

#### Purpose

The purpose of this presentation is to show evidence supporting the implementation of a bag medication intervention at hospital discharge can decrease medication discrepancies at the first follow-up visit

#### Target Audience

The target audience for this presentation is any clinical nurse who discharges patients to home. The initiative can be instituted in long-term care, skilled nursing facilities, and rehabilitation centers.

#### Abstract

Background: Medication discrepancies, defined as unexplained differences in documented medications between various sites of care, occur in 70% of patients at hospital admission or discharge. These discrepancies may result in serious harm to patients, prolonged hospitalizations, post-discharge emergency department visits, readmissions and use of other healthcare resources. Unplanned readmissions due to medication discrepancies alone cost \$17.4 million annually and represented 17% of total hospital payments. Approximately 15% of patients experience a medication error or discrepancy after hospital discharge. These medication errors cost organizations \$5.6 million annually. Literature identifies multiple reasons for the discrepancies including: miscommunication, financial disparities, personal preference, lack of understanding, physical abilities and health literacy. This prompted the practice question: In adult, in-patient, medical-surgical patients discharged to home with prescriptions, does the implementation of a bag medication reconciliation initiative compared to usual care, result in decreased medication discrepancies?

Evidence Synthesis: The Johns Hopkins Nursing Evidence-based Practice Model (Dearholt & Dang, 2012) was used to evaluate the literature. Databases searched included CINAHL, PubMed, AHRQ with key words: "brown bag," "discharge," "adverse drug events" and "medication discrepancies". A total of 41 articles were used for the synthesis. There were 34 quantitative articles, 3 qualitative articles, 1 expert opinion and 3 quality improvement articles deemed good or high quality that were used for the basis of the project.

Translation Model: The Ottawa model of Research Utilization by Logan and Graham was chosen for translation because of its non-linear approach to translating evidence as well as focusing on patient and family involvement in projects. This model has a holistic approach to research translation, it is meant to be a guide not a recipe for translation.

Methods: The setting was a 572-bed, teaching facility located in south central Pennsylvania. The project unit was general medical telemetry, consisting of 22 beds with a 1:5 nurse-to-patient ratio. Upon discharge, the nurses on the unit gave the medication bag to any patients from either the medical or family practice residency services. Most of the patients received follow-up care at one of two local clinics. The staff at the clinics were required to file a Safety Reporting System (SRS) report when medication discrepancies were noted. As part of usual care follow-up phone calls were made within 2 days of discharge as well as post-hospitalization follow-up appointments within 7 days of discharge. Providers continued to complete medication reconciliation at follow-up. Safety Reporting System events (SRS) were used to document and monitor medication discrepancies. A list was kept of all patients receiving a bag at d/c. The clinics were asked to keep a record of the patients who returned for their follow-up visit with the bag. The only change to the discharge/post-hospitalization care was the initiation of the bag with instructions to bring ALL medications back to the first post-hospitalization follow-up visit. The primary source for data collection was the SRS reports. Demographic data were obtained by chart review and utilized to identify correlations. Pre and post-intervention data were evaluated.

The medication bag had specific instructions for the patients and family which included: all prescription medications, all over-the-counter medications, all herbal alternative medications, any organizational medication boxes, a list of all doctors with phone numbers, a list of all allergies especially to foods or medications, a list of any questions or concerns related to medications, and a spouse or caregiver.

Results: A decrease in recorded SRS was noted after the implementation. Pre-implementation data revealed 22 SRS filed from a total of 236 patients discharged to home (9.3%). Post-implementation: 4 SRS filed from a total of 203 patients (2.0%). No specific demographic correlations were identified. According to hospital administrators patients readmitted to the hospital stay approximately three days at a cost of \$10,240.00 per patient. The cost of implementing the bag medication reconciliation intervention was \$1782.00. If the implementation of a medication bag prevented 1 readmission per quarter, there would be cost avoidance of 40,960.00 annually.

Implications: Evidence suggests bag medication reconciliation events decrease medication discrepancies and offer a complete picture of individual medication usage. This community-based bag medication reconciliation project demonstrated effectiveness in evaluating current medication use and identifying medication discrepancies. The bag medication reconciliation project was an overall success. Patients received an intervention which helped with medication reconciliation. Though limitations and potential future projects were identified, the benefit of the intervention was established.

## E 26 - Research and Evidence-Based Medication Administration

### Door to Drug in Obstetrics

---

*Melanie Chichester, BSN, RNC-OB, CPLC, USA*  
*Lynn Elizabeth Bayne, PhD, MSN, BSN, NNP-BC, USA*  
*Katie Vent, USA*  
*Thomas Welde, USA*  
*Emily Villafranco, USA*

#### Purpose

to determine the door to drug interval (DDI) for betamethasone administration for obstetrical patients at risk of a preterm delivery and what affect might the DDI in the obstetric triage department.

#### Target Audience

nurses who seek to streamline patient care in any arena of practice.

#### Abstract

Background: The concept of "door-to-drug" or "door-to-balloon" times as standard of care for care of acute STEMI are well known. We propose using the same concept to review opportunities for improvement in "door-to-drug" for obstetrical patients. A woman with a high risk of delivering prematurely should receive betamethasone (or appropriate alternative) at least 48 hours prior to delivery if she is between 24-34 weeks gestation in order to improve neonatal outcomes. Both the delivery and duration of drug administration of antenatal corticosteroids have been shown to positively improve neonatal outcomes. Currently at our facility, only 61% of women appropriately receive antenatal steroids prior to delivery. Women who are candidates for this therapy may have a delay in presentation, decision for treatment, and initiation of care based on a variety of variables. There can be critical time subinterval variations which affect timely care for these patients where there is potential for improvement. This warrants further investigation in order to improve door-to-drug time regardless of day or time of arrival. We sought to examine both maternal and system issues that may be associated with delayed delivery of antenatal corticosteroids.

Purpose: To examine both maternal and system issues that may be associated with delayed delivery (Door-to-Drug) of antenatal corticosteroids.

Methods: This was a retrospective cohort study of obstetric patients at a tertiary care level suburban teaching hospital with 6500 deliveries/year. Women were included who were evaluated in our OB Triage unit and ultimately delivered less than 34 0/7 weeks gestation in 2011. Our primary outcome was time of presentation to drug delivery (Door to Drug Interval [DDI]). The charts were reviewed for time of arrival, time of evaluation, time of admission, and time of medication administration. Other patient demographics/clinical characteristics were explored for confounding variables. Analysis was performed using Univariable analysis and cox proportional hazard. A second review and analysis was done of women in 2013 after relocation of the steroids to the OB Triage Dept.

Results: A total of 87 women were identified in 2011 and 70 were identified in 2013. Mean door-to-drug times were calculated and logistic regression was used to determine factors associated with longer times. The mean door-to-drug time for 2011 was 195.49 minutes and 180.73 minutes in 2013. There was no significant improvement in achieved time to delivery. Maternal demographics including ethnicity, gravidity, parity, admission diagnosis and gestational age did not alter DDI. Similarly, system factors such as time of day and day of week did not effect DDI. Moving the steroids to the OB Triage area did not significantly reduce the DDI.

Conclusions: There is no standard door-to-drug time for administration of antepartum steroids. We offer the above data as a starting point to stimulate discussion of an appropriate time frame in which steroids should be administered. Though door-to-drug delivery interval is an important outcome, it does not

appear to be affected by demographics or system factors. Future research should seek a larger sample and explore further variables. In both time periods 31% of women did not receive steroids in time to receive optimum benefit for the fetus. Consideration of an early warning system similar to heart- or stroke alert could improve compliance with drug delivery to eligible mothers and to shorten the DDI.

## E 26 - Research and Evidence-Based Medication Administration

### The Literacy in Professional Nursing in Peripheral Venous Catheterization Procedures: A Systematic Review

---

*Joao Manuel Graveto, MSN, PhD, RN, Portugal*

*Ana Catarina Oliveira, RN, Portugal*

*Ana Rita Miraldo Martins, RN, Portugal*

#### Purpose

The purpose of this poster is to enable learners to the importance of mobilizing specific/recent knowledge (based on scientific evidence) on the peripheral venous catheterization procedure for the provision of nursing care. Recognizing the results of The Literacy in Professional Nursing in Peripheral Venous Catheterization Procedures and prevention of nosocomial infections

#### Target Audience

The target audience of this presentation Nurses, Health Educators, Administratores, Studentes, Advance Practice Clinicians

#### Abstract

Introduction: Peripheral intravenous catheterization is a common practice in the hospital context and implies a set of nursing diagnoses and actions with clear therapeutic goals. As invasive procedure, manipulation of peripheral intravenous catheters (PIC) constitutes an increased risk for infection. Nursing care provided to users with PIC should be grounded in scientifically based practice, with a view to production trend of current knowledge. The guidelines presented by the Center for Disease Control and Prevention give clear indications for this procedure. Constant updates of knowledge are fundamental to the safety of the user, in order to optimize and standardize practices, increasing the quality and excellence with regard to the care to the patient with PIC. The concept of literacy translates the capacity to mobilize the skills (taught and learned) in reading, writing and calculation. It can also be defined as the information processing capabilities written in everyday life where the focus is assigned to the mobilization and use of expertise and not the formal level of education that the person may have. Thus, seeks to recognize and systematize the scientific evidence about reality and knowledge, attitudes and health practices (literacy) of nursing professionals on the peripheral intravenous catheterization procedure.

Methodology: The preparation of the systematic review based on Cochrane Handbook, taking as its starting point the research question: in nursing professionals, which is them literacy relative to the procedure peripheral intravenous catheterization with repercussions in the nursing care?

The research was limited by PICOD shape, taking into account predetermined inclusion and exclusion criteria. The survey was conducted in April 2014, in the electronic database EBSCOhost and online Portuguese and international institutional repositories, with a time limit acceded to scientific research results published between 2009 and 2014 were used in the English language, such as search keywords: \* guidelines \*, \* knowledge, nurs \* and peripheral intravenous catheter \*. Data collection was conducted in accordance with three research strategies, resulting 7 investigations included in the analysis.

Results: From the research carried out it appears that only a few empirical studies evaluate the quality of nursing care to clients with PIC's focusing on the relationship between knowledge of national and international recommendations and their applicability in providing nursing care. In fact there are few specific data on the literacy of nurses in relation to peripheral intravenous catheterization. With regard to knowledge of nursing professionals on the scientific evidence in this procedure and its membership in the provision of nursing care, the literature refers that nurses should not be confined to the formation of 'base' or take on a complicating role of applicability of evidence most up to date in the provision of nursing care. Thus, it is the responsibility of the nursing professional look, constantly in the literature, to update their knowledge and answer some questions. Of course nurses should guide their practice under protocols established by national or international studies, for guidelines. But, in this context, nurses should

recognize the importance of constant training, since both the guidelines and theoretical knowledge are undergoing changes. As the expertise of nurses in this procedure, it was found in the investigations that most of the knowledge, though revealed by nurses, were not according to their clinical practice and, although informed of the guidelines, nurses do not always adhere to them. On the other hand, it is also mentioned that the nursing understanding of current guidelines was limited, with some barriers to the provision of evidence-based in nursing care with some lack of knowledge, with some low skills and negative attitudes, with organizational and structural factors underlying, which shows the importance of peer group and professional user interaction in a more targeted and efficient way. Although not always check a practical adherence to guidelines in peripheral intravenous catheterization procedure, it is known that an adequate and effective adherence to recommendations an Guidelines are crucial issues related to the quality of health care, particularly in the art, which represents a important procedure nursing.

The procedure of cleaning hands is considered essential for the prevention of complications, however the investigations shows that the performance of nurses would often be more appropriate. In one study it was found that hand hygiene insertion occurred in 96.7% of PIC's, as opposed to 3.7% of the cases in which it was not documented. In another study, when established training interventions after a first observation and before a second point, there was a significant increase in adherence to hand hygiene, increasing to a rate of 46.3% in the endoscopy unit (82 observations) and 65.2% in the dermatology unit (23 observations). Other authors corroborate saying that, after observation, there was a low adherence to hand washing (non-adherence of 74.8%), and add non-adherence to the use of gloves (non-adherence of 69.4%) and use of antiseptic solution of alcohol-based service available (not 100% adherence). For example, when it is asked about the need of use gloves in the introduction / placement of PIC's, 89.7% of nurses said as needed, but only 30.5% of the observed nurses used gloves, and not always exchanged between users.

On the other hand, also the recommendations on disinfection of the puncture site, the concern of professionals is evident, for the preparation of the skin to puncture, even before the intervention at around 100% adherence to recommendations. In what concerns the non palpation of the puncture site after disinfection percentages, on the accession of health professionals, down to 25.7% and 62.5%, respectively in the endoscopy and dermatology units, before the intervention. After the training, the percentage rose to 63.4% and 69.6% in the respective services.

For the PIC call time, although it is found that most nurses had the knowledge, but 13.8% of PIC's were remained for more than 72 hours, that is, not mobilized for the recommendations for good practice in nursing care, and that most of the cases depended on making some wrong decision by nurses.

In an investigation they study the type of dressing/noun selection. It was analyzed the procedures by nurses before and after the implementation of protocols and it was observable behavior changes in the type of dressing selection recommended. After the adoption of a new protocol, the risk of inappropriate use fastening material decreased from 57.89% to 37.91%.

As regards the maintenance of the permeability of PIC during medication administration was observed that 89.4% of the PIC's were not salinized.

Thus, the realization and implementation, by a multidisciplinary team, of policies that standardize clinical practice and promote the adoption of a harmonious and coherent conduct of health professionals in the peripheral intravenous catheterization procedure, should be measures to take to improve better literacy in the nurses and so a better quality of care. In fact, educational programs should not only focus on learning contents, but should also focus on the importance of following the recommendations for user safety.

Conclusion: Responding to the research question formulated in this review 'in nursing professionals, which is them literacy relative to the procedure peripheral intravenous catheterization with repercussions in the nursing care?', It appears that the literature points out that the vast majority nurses have knowledge of the peripheral intravenous catheterization procedure, however, not always mobilize them knowledge for the provision of nursing care, and not shown to possess a good literacy in this procedure. There are authors who claim that knowledge of nurses is sometimes insufficient, such phenomena demonstrate an

impact on the quality of care because the nurse plays a key role in the prevention and reduction of complications associated with peripheral intravenous catheterization. In this sense, the mobilization of knowledge, based on evidence, for the provision of nursing care, is also crucial to the safety of the user, because only they can prevent complications and, consequently, changes in their behavior with desired impact in the nursing care of patients with PICs.

In order to overcome this barrier to quality of care, the investigations identifies as important the continuing and more focus education of nursing professionals on the national and international protocols, in particular, on the 2011 CDC guidelines and, above all, on ensure their implementation for the provision of quality nursing care. It is evident as soon as educational activities of nurses are done often, allowing reflective moments for your update, designing objective changes in some routine behaviors.

We therefore consider that the results of this review may contribute to the encouragement of debate for achieving future research on the relationship between the knowledge that nursing professionals have on the peripheral intravenous catheterization procedure and their effective mobilization in nursing care (Literacy), with good and natural consequences of that applicability in the quality of health care.

In a final appointment, we recognize that this is an important area of nursing knowledge and it is necessary more contributions sustained in new researches, because the scientific production in this area is still reduced.

## E 27 - Innovative Knowledge in Graduate Studies

### A Phenomenological Exploration of International Nurse's Motivation and Experiences in Pursuing a Master's Degree in Nursing in the United States

---

Carol A. Amann, MSN, RN-BC, CDP, FNGNA, USA  
Elizabeth J. Diener, PhD, MSN, BSN, RN, CNE, USA

#### Purpose

The purpose of this presentation is to bring awareness and cultural competence to nursing faculty related to the international nursing students needs and motivation for degree attainment in the United States. Educational preparation of nurse educators is crucial to advancement of the profession of nursing globally.

#### Target Audience

The target audience for this presentation is nursing faculty and university administrators responsible for undergraduate and graduate nursing programs.

#### Abstract

Educational preparation of nurse educators is crucial to advancement of the profession of nursing globally. Most nurses seek to extend formal education in their country of origin, however an increasing number pursue advanced nursing degrees in the international community. Little is known about the experiences or motivation of nurses studying abroad. This phenomenological investigation will describe the lived experiences and motivation of international nurses enrolled in a Master's Degree in Nursing program at a south central University in the United States.

Using Giorgi's approach to phenomenological analysis, five themes were identified by the researchers: Setting Sail –student motivation and expectations, Innocents Abroad - early experiences in negotiating educational and community experience in English language , Forging Onward - barriers encountered in culture, entering into nursing (employment or observation), Running a Thousand Miles for Freedom - pedagogical differences in education in the US and higher education milieu, and The Land of Far Beyond - student visions of their global role in building a nursing community. An international education experience appears to have value for students in every aspect of their lives. Recognizing the need for improved collaboration between international students and faculty may lead to new and meaningful ways of approaching global education experiences.

### The Short-Term Effects of a Wellness On-Boarding Program with Health Sciences Students on Depression, Anxiety, Healthy Lifestyle Beliefs and Healthy Lifestyle Behaviors

---

*Bernadette Mazurek Melnyk, PhD, RN, CPNP/PMHNP, FAANP, FNAP, FAAN, USA*

*Caitlin Slevin, MHA, BS, CCRP, USA*

*Lisa K. Militello, PhD, MPH, MSN, BSN, CPNP, RN, USA*

*Jacqueline Hoying, PhD, RN, NEA-BC, USA*

*Colleen McGovern, BSN, BSEd, RN, LSN, USA*

*Alice M. Teall, MS, RN, FNP, PNP, USA*

*Laura Szalacha, EdD, MTh, MPhil, EdM, USA*

#### Purpose

Purpose of this presentation is to disseminate information on this type of wellness on-boarding program

#### Target Audience

Target audience would be researchers interested in self-care for their students, faculty who have students who would benefit from this type of on-boarding program and administrators.

#### Abstract

Background: First year health sciences students are subject to high stress levels as they enter their professional programs. Although these academic programs prepare students to deliver excellent care to their patients, few incorporate wellness programs and self-care into their curricula.

Aim: The purpose of this pilot intervention study was to evaluate the feasibility, acceptability and preliminary short-term effects of a wellness on-boarding program for health sciences students, including dentistry, health and rehabilitation sciences, medicine, nursing, optometry, pharmacy, and veterinary medicine, on their healthy lifestyle beliefs and behaviors four months after the intervention.

Methods: A pre-experimental study was conducted with 91 health sciences students at a major public land grant University in the mid-west region of the United States. Within two to four weeks after commencing the first semester academic programs, students completed a personalized wellness assessment, a biometric screen that included height, weight, blood pressure, Hemoglobin A1c and lipid panel, and developed a personalized wellness plan. Valid and reliable measures included the Healthy Lifestyles Belief Scale, the Healthy Lifestyle Behaviors Scale, the Personalized Health Assessment-9 Scale for depression, and the Generalized Anxiety Scale-7. Demographic questions and single item questions regarding healthy lifestyle behaviors (e.g., activity and sleep) also were collected. At the end of the first semester, a follow-up assessment was completed.

Results: At baseline, 25.6% of the graduate students reported elevated symptoms of depression and 22.6% reported elevated symptoms of anxiety. At follow-up, 28.1% of students reported elevated depressive symptoms and 22.9% reported elevated symptoms of anxiety. Although there was no change in healthy lifestyle beliefs across time, there was a significant decrease in healthy lifestyle behaviors ( $p < .05$ ) as well as a drop in physical activity from a mean of 51 minutes per week to 32 minutes. Average hours of sleep across time stayed consistent at six hours. The most frequent barriers student reported that deterred them from engaging in healthy lifestyle behaviors and meeting their wellness goals were time constraints, school, and motivation.

Conclusions: There is a need for more intensive wellness interventions with health sciences students when entering their professional programs. Personalized wellness assessments and completion of a personalized wellness plan alone does not seem to be enough to increase their healthy lifestyle behaviors. Screening for depression and anxiety should occur with all health sciences students when

entering their programs and monitored regularly, with targeted evaluations and interventions provided to those with elevated symptomatology. Since the follow-up assessment, nurse practitioner students have been assigned to these health sciences students to serve as health coaches during their second academic semester along with the texting of healthy lifestyle messages. Another follow-up assessment will occur at the end of the second semester to determine the benefits of adding a health coach to the health sciences' students' wellness programming. Future intervention studies need to be conducted with this population to determine the best evidence-based interventions to enhance health and wellness outcomes.

## E 27 - Innovative Knowledge in Graduate Studies

### Evaluation of the Efficacy of Peer Assisted Learning in a Scale Development Course

---

Areewan Oumtanee, PhD, MS, RN, Thailand

#### Purpose

1. to propose a new teaching method to improve learning achievement of graduate nursing students 2. to evaluate the efficacy of peer assisted learning in a scale development course (Graduate course of nursing science)

#### Target Audience

nursing academic, researcher, and other nurses

#### Abstract

**Introduction:** Based on previous research found that Peer Assisted Learning (PAL) are well established with positive effects on examination scores of undergraduate students. In this regard, School of Nursing, Chulalongkorn University in Bangkok, Thailand, offering only graduate curriculums proceed to create new educational environments which can be delivered at a low cost but improve more level of knowledge for graduate nursing students.

**Purposes:** to compare knowledge scores of experimental group between before and after treating with PAL method, and to compare knowledge scores after experiment between students used PAL method and students used traditional learning method.

**Methods:** A quasi-experimental research with pre-test/post-test both control and experimental groups. The subjects were 45 graduate nursing students in the first semester of the 2014 academic year registered to study a scale development course. The simple random sampling was used to assign students from class section 1 and 2 into experimental or control groups. Thirty students from class section 1 were assigned to be an experimental group using PAL method and fifteen students from class section 2 were assigned to be a control group using traditional teaching method. Both sections were taught by the same faculty member, same number of lecture hours with same contents. After class, students of control group used self-study method for lesson review but students of experiment group used PAL method once weekly for at least 1 hour during 10-week-long academic semester.

Study instruments included knowledge test on a scale development contents (examination scores) at a confidence level of .90, teaching plans with PAL and traditional teaching methods, and a quality survey of PAL evaluation. Data were analyzed by using mean, standard deviation and t-test.

**Results:** the results showed as follows:

1. The post-test scores ( $26.17 \pm 3.61$ ) of the experimental students was significantly higher than the pre-test scores ( $15.77 \pm 3.06$ ) at confidence level of  $<.001$ .
2. The post-test scores ( $26.17 \pm 3.61$ ) of the experimental students was significantly higher than the post-test scores of control group ( $20.93 \pm 3.99$ ) at confidence level of  $<.001$ .
3. The results of the quality survey of the training course also indicated satisfaction of PAL method but students required to select their peer by themselves rather than assigned by a teacher.

**Conclusions:** The results of this study indicate that peer assisted learning is effective in the enhancement of the students' confidence and learning. Peer assisted learning also creates good learning environment.

## F 16 - Research and Improvements in Clinical Care

### The Power of 3: Empowering Patients

---

*Lynda M. Sanchez, MSN, RN-BC, CVRN-BC, USA*

*Lynn E. Cooknell, BSN, RN, CCCC, CVRN-BC, CCRN-Alumnus, USA*

#### Purpose

The purpose of this presentation is to provide an overview of the Power of 3 concept. Suggestions and recommendations for implementing the concept into different settings will be provided as a means for addressing discharge planning options, increasing patient satisfaction, and decreasing 30 day readmission challenges.

#### Target Audience

The target audience of this presentation is clinical staff and hospital leadership.

#### Abstract

Providing effective patient education is a vital part of caring for a patient (Bastable, 2008). Effective patient education empowers patients and families to assume more responsibility for their health as well as improve their ability to manage their illness while decreasing costs to the health care system (Muma, 2012). Patient education strategies need to address the barriers to effective discharge education such as shorter patient stays, health literacy, patient's self-efficacy, and teaching style (Commodore-Mensah & Himmelfarb, 2012).

Health literacy is a national problem with more than 77 million people in the United States having low health literacy (U.S. Department of Health and Human Services, 2008). Health literacy is linked to more readmissions, higher mortality, and an increase in adverse effects (Mitchell, Sadikova, Jack, & Paasche-Orlow, 2012). Factors that contribute to a low health literacy are language barriers, age, education level, and culture (Osborne, 2006).

Learning styles or how a person receives and processes information also affects comprehension (Russell, 2006). There are three learning styles: auditory, visual, and kinesthetic. To address all three learning styles, Fredricks, Ibrahim, and Puri (2009) suggest presenting information in a multi media approach in multiple sessions.

A patient's self efficacy can be addressed utilizing the adult learning theory. Adult learning theory as described by Merriam (2001) combines andragogy and self directed learning. Adult learning theory describes the basic assumptions of an adult learner. The traits of an adult learner include having a life time of knowledge that directs their learning, is internally motivated to learn, expects the knowledge to be immediately applicable and to benefit them, as well as being in control of when the learning occurs.

This newly designed tool is a free standing, laminated patient educational tool provided in English and Spanish. This tool integrates adult learning theory, health literacy, and patient involvement and focuses on daily activity and discharge teaching for a hospitalized patient. This tool consists of a mnemonic alliteration, pictures, different colors, and clock faces. The mnemonic alliteration corresponds to the three most important discharge educational needs to prevent readmission for a specific patient population. For example, the most common reasons for readmission with a patient who has undergone open heart surgery are heart failure and wound infections (AlWaqfi, Khader, Ibrahim, & Eqab, 2012; Fox et al., 2013; Hannan et al., 2003; Hannan et al., 2011; Li et al., 2012). Therefore, the mnemonic alliteration would be weigh (to prevent heart failure), wash (to prevent infection), and walk (to strengthen the heart to aid in preventing heart failure).

Each discharge need has a corresponding picture and color to address the visual learners needs and those patients with low literacy as well as the color aiding in memory recall. In addition, the educational tool has clock faces that encourage goal setting and mobilization of the hospitalized patient. In

compliance with the adult learning theory, this educational tool permits the adult learner to review the information at his/her own pace, allows for repetition as well as provides information that is basic and necessary to know (Rigdon, 2010). This educational tool allows the healthcare professional to repeat and test acquired knowledge throughout the day in short sessions.

In addition to addressing the patient's learning style and educational needs, the tool focuses on movement and/or ambulation with hospitalized patients. This education tool provides a method to visualize the patient's mobility goals and expectations while at the same time communicating these goals between clinicians, caregivers, and patients. This visualization allows coordination in care among caregivers as well as promotes families and patients to be actively involved in achieving those goals. This tool promotes ownership in a patient's care, allows for a continuum of care between healthcare professionals, and helps to standardize common discharge teaching instructions while at the same time allowing for individualized teaching instructions.

This educational tool was implemented with open heart surgery patients in February 2014. This study is complete and data has been collected and analyzed. The hypothesis was by implementing this tool, a patient's self-care will improve thereby leading to an increase in the frequency of mobility/ambulation while hospitalized and a decrease in length of hospitalization and readmission. The educational tool addresses patient educational needs including: individuality, health literacy, adult learning theory, and learning styles.

This presentation will provide an overview of the concepts within the educational tool. Suggestions and recommendations for implementing the concept into different settings will be provided as a means for addressing discharge planning options, increasing patient satisfaction, and decreasing 30 day readmission challenges.

## F 16 - Research and Improvements in Clinical Care

### Healthcare Injustice Experiences or Negative Pain Coping Strategies in Patients with Sickle Cell Disease: Which Comes First?

---

Miriam O. Ezenwa, PhD, MS, BSN, RN, USA

#### Purpose

Educate the audience on the pain coping strategies of patients with sickle cell disease who reported experiencing healthcare injustice compared to those who did not report such experience.

#### Target Audience

Researchers, Clinicians, patients with sickle cell disease and their family.

#### Abstract

**Purpose/Theoretical Rationale:** Healthcare injustice is a psychological stressor that has been associated with adverse psychological (stress) and physiological (pain) consequences in patients with sickle cell disease (SCD).<sup>1</sup> Research evidence suggests that patients with SCD endorse different approaches to cope with sickle cell pain.<sup>2, 3</sup> Little is known about the pain coping strategies of patients with SCD who report experiencing healthcare injustice in their pain control. The purpose of this comparative study was to determine the pain coping strategies of patients with SCD who reported experiencing healthcare injustice compared to those who did not report such experience. We hypothesized that patients with SCD who perceived healthcare injustice from doctors or nurses would use more negative pain coping strategies than those who reported healthcare justice from doctors or nurses.

**Methods:** In a cross-sectional descriptive comparative study, patients (**N=52**, mean age 34 ±11 years [20-70], 92% African American, 79% female, 92% with a high school diploma or higher) completed the valid and reliable PAINReportIt<sup>®</sup>,<sup>4, 5</sup> a computerized version of the McGill Pain Questionnaire,<sup>6</sup> which includes questions to measure patients' demographics. Patients also completed the Healthcare Justice Questionnaire (HJQ)<sup>1</sup> twice, once for doctors and the second time for nurses; and the Coping Strategies Questionnaire-Revised (CSQ-R) for sickle cell disease.<sup>3</sup> We created healthcare justice and healthcare injustice groups using a median score of 3.5 as a cut-off. Patients who scored below 3.5 formed the healthcare injustice group while patients who scored above 3.5 made up the healthcare justice group. The CSQ-R has three major categories containing thirteen subscales (ranges 0-6): **cognitive strategies** (8 subscales), **behavioral strategies** (2 subscales), and **physiological strategies** (3 subscales); and one **effectiveness ratings** category with two subscales (ranges 0-6): control over pain (1-item subscale) and ability to decrease pain (1-item subscale). Patients' responses indicated how often they used the coping strategy to control pain. We analyzed the data using independent t-tests.

**Results:** We found the mean (SD) of the HJQ-doctors total score (ranges 1-5) to be 3.68 (.79) and of the HJQ-nurses total score (ranges 1-5) to be 3.52 (.86). The mean (SD) of the eight CSQ-R **cognitive strategies** subscales were: diverting attention, 2.9 (1.7); reinterpreting pain sensations, 1.4 (1.5); calming self-statements, 3.9 (1.6); ignoring pain sensations, 2.2 (1.5); praying and hoping, 4.3 (0.9); catastrophizing, 2.9 (1.5); fear self-statements, 3.2 (1.5); and anger self-statements, 3.0 (1.2). The mean (SD) of the two CSQ-R **behavioral strategies** subscales were: increasing behavioral activity, 2.9 (1.4) and isolation, 3.2 (1.7). We found the mean (SD) of the three **physiological strategies** subscales to be: taking fluids, 4.3 (1.5); resting, 4.5 (1.0), and heat/cold massage, 3.8 (1.2). For the **effectiveness ratings** subscales, the means (SD) were: control over pain, 3.8 (1.2) and ability to decrease pain, 3.5 (1.1).

Our comparative analysis results showed that there were statistically significant differences between patients who reported perception of healthcare justice from doctors and those who reported experiencing healthcare injustice from doctors on pain coping strategies. Patients who reported healthcare justice from **doctors** were more likely to use a **cognitive strategy**: praying and hoping ( $p=.046$ ); and **2**) trended toward using a **physiological strategy**: heat/cold massage ( $p=.069$ ) than patients who reported healthcare injustice from **doctors**. Patients who report healthcare injustice from doctors were more likely

to use: **1) cognitive strategies:** catastrophizing ( $p=.016$ ); and they trended toward using fear self-statements ( $p=.073$ ) and anger self-statements ( $p=.053$ ); and **2) behavioral strategy:** isolation ( $p=.028$ ) than patients who reported healthcare justice from doctors. For the **effectiveness ratings**, control over pain and ability to decrease pain, the healthcare justice and injustice groups did not differ significantly.

The results of our comparative analysis for the HJQ-nurses showed similar patterns as the HJQ-doctors. There were statistically significant differences between patients who reported experiences of healthcare justice from nurses and those who reported experiencing healthcare injustice from nurses on pain coping strategies. Patients who reported healthcare justice from **nurses** were more likely to use: **1) cognitive strategies:** diverting attention ( $p=.014$ ), calming self-statements ( $p=.005$ ), praying and hoping ( $p=.001$ ), and trended toward using ignoring pain sensations ( $p=.095$ ); and **2) behavioral strategies:** increasing behavioral activity ( $p=.028$ ) than patients who reported healthcare injustice from **nurses**. Patients who reported healthcare injustice from **nurses** were more likely to use: **1) behavioral strategy:** isolation ( $p=.028$ ); and **2) a trend toward using cognitive strategies:** catastrophizing ( $p=.093$ ) and fear self-statements ( $p=.059$ ) than patients who reported healthcare justice from **nurses**. We also found that for the **effectiveness ratings**, patients who reported healthcare justice from **nurses** were more likely to report that they had control over pain ( $p=.038$ ) and showed a trend toward having ability to decrease their pain ( $p=.093$ ) than patients who reported experiencing injustice from nurses.

**Conclusions:** The findings support our hypotheses. Patients reporting healthcare justice from doctors or nurses used **positive** cognitive or behavioral pain coping strategies compared to patient who reported healthcare injustice from doctors or nurses who used **negative** cognitive and behavioral pain coping strategies. Findings provide preliminary evidence of the pain coping strategies of patients with SCD who perceive either justice or injustice from healthcare providers in their attempt to manage their pain. If replicated in future studies, findings will provide evidence to better understand the relationship between healthcare injustice and pain coping strategies in patients with SCD, and likely inform future intervention studies on the topic. It's not clear whether patients with SCD who report experiencing healthcare injustice gravitate towards using negative pain coping strategies because of their personality type or that they use negative pain coping strategies because they appraise situations negatively due to constant exposure to healthcare injustice. Future studies that examine the relationship between personality type and pain coping strategies in patients with SCD who report experiencing healthcare justice or injustice will provide evidence to address this gap in knowledge.

## F 16 - Research and Improvements in Clinical Care

### Sleep Disturbance and Fatigue in Renal Transplant Patients: A Pilot Study

---

*Kandace Landreneau, PhD, MSN, BSN, BSEd, CCTC, USA*

#### Purpose

The purpose of this presentation is to report the findings of this pilot study regarding sleep disturbance and fatigue in renal transplant patients since sleep problems have not been fully studied in renal transplant patients.

#### Target Audience

The target audience of this presentation is clinical nurses and nurse researchers who are interested in sleep studies and/or in research needs of transplant patients.

#### Abstract

**Background:** Renal disease is the ninth leading cause of death in the United States. An estimated 80,000 are diagnosed annually with chronic renal failure, and over 400,000 Americans are receiving renal replacement therapy, dialysis or renal transplantation, to sustain life. When a patient receives a renal transplant (RT), and no longer has renal failure, it has been assumed that any prior sleep problems are resolved. These patients had experienced uremia with symptoms that include fatigue and day/night reversal. Day/night reversal or circadian rhythm disturbances and sleep problems have been recognized as an important issue in dialysis patients. However, the extent to which sleep problems continue after RT remains unclear.

**Purpose:** The purpose of this pilot study was to categorize types of sleep problems in patients who have experienced renal transplantation, test recruitment procedures for a larger study, determine feasibility of questionnaires and actigraphy monitors, and gather preliminary data regarding valid and reliable measures for sleep disturbance and fatigue.

**Design and Methods:** A pilot study was conducted with the screening of 10 participants from a renal transplant clinic in a western U.S. state. Four participants met the criteria for a sleep disturbance and continued the study. In addition to actigraphy monitoring as a measure of sleep, biomarkers included hemoglobin for anemia and hemoglobin A<sub>1c</sub> as an indicator of glucose metabolism related to fatigue level along with relevant personal and treatment variables.

**Results:** Four of the 10 participants had sleep disturbance and continued in the study. Even though there were only 4 participants, self-report of sleep quality correlated with actigraphy in all 4 participants. The better the self-report, the better the sleep efficiency and the more minutes of sleep. The lab values (Creatinine/BUN/Hgb/Hct) and the sleep variables (fatigue, sleep quality, sleep efficiency) revealed that the better the sleep and the more minutes of sleep, the lower the creatinine and BUN.

**Conclusions:** The pilot study aims were achieved and the plan to do a larger study is appropriate. Sleep disturbance and fatigue has not been fully studied in renal transplant patients and further study is needed - in this population - for best and appropriate interventions.

## F 17 - Ethical Issues in Nursing

### Conflict-Related Sexual Gender-Based Violence in DRC

---

*Beth D. Good, PhD, RN, APHN-BC, CNS, USA*

#### Purpose

This presentation will reflect the findings of research on conflict-related sexual and gender-based violence in eastern Democratic Republic of Congo (DRC). A total of 14 interviews of survivors of conflict-related rape were conducted in eastern DRC. The results included a narrative analysis as well as analysis of the narratives.

#### Target Audience

The target audience includes nursing researchers, educators, scholars, and practitioners that have an interest in sexual gender-based violence and a passion for social justice in nursing.

#### Abstract

Globally one in three women experience some form of sexual gender-based violence within their lifetime. In conflict-affected countries, women carry the added burden of becoming targets of sexual violence as a tactic of war. Though conflict-related sexual violence has been a media topic, there is limited research on the subject. The findings of this study describe the experience of women who have survived sexual gender-based violence in conflict-affected countries in an effort to bring awareness to the nursing profession about this health and justice issue.

A narrative research methodology was used to document the stories of women who have survived sexual gender-based violence in the conflict-affected country of the Democratic Republic of Congo where reports of sexual gender-based violence continue throughout the eastern part of the country. Interviews of 14 research participants were digitally recorded and transcribed for analysis. Five themes emerged from the analysis of the narrative data. In addition, narrative analysis was used to extract a common narrative of the combined stories.

Historically, pioneers in nursing have emphasized the need for nurses to play an active role in championing social justice to promote health. Nursing practice has a responsibility to balance the influence of healthcare treatment models with the nursing model that includes an emphasis on social justice issues. However, there has been no clear social justice theory or definition of social justice developed in the nursing literature. This study used a philosophical framework of social justice as a lens through which the stories were heard and analyzed.

Five themes and five subthemes were identified as representative of the research findings. The themes suggest that loss of attachment and respect were among the most difficult issues faced by the survivors. The application of Powers and Faden's Social Justice Theory and the six dimensions of well-being brought further understanding to the findings.

The implications from the study suggest that it is prudent for nursing research, education, and practice to expand the knowledge of how injustice impacts well-being. Nurses must use the knowledge to improve the well-being of individuals and populations and prevent the adverse effects of injustice on well-being. Future research is needed on the topic of conflict-related sexual gender-based violence in order to test and develop nursing strategies for prevention and care of survivors. Research originating from areas where violence is occurring and conducted by local researchers may be of even greater value to reaching a better understanding in order to develop the best response.

## F 17 - Ethical Issues in Nursing

### Making the Hard Decisions: Ethical Issues Encountered By Military Nurses during Wartime

---

*Janice B. Griffin Agazio, PhD, MSN, BSN, RN, CRNP, FAANP, FAAN, USA*

*Diane Padden, PhD, MN, BSN, RN, CRNP, FAANP, USA*

*Sami Abdulrahman Al-Hamidi, MSN, BSN, RN, ICDL, USA*

*Meryia Throop, PhD, DNP, FNP, USA*

#### Purpose

The purpose of this presentation is to share results of a recent study detailing the ethical issues encountered by military nurses during the recent conflicts in Afghanistan and Iraq.

#### Target Audience

The target audience of this presentation is inclusive of nurses and other health care professionals interested in ethical issues and their resolution.

#### Abstract

**Aims:** The purpose of this study was to address the research question: How do military nurses identify, assess, manage, and personally resolve ethical issues occurring in nursing practice during wartime deployments?

**Background:** Ethical issues emerging from the current conflicts in Iraq and Afghanistan have mainly considered those encountered by medical officers in triage and most recently with enemy prisoners of war. Aside from anecdotal accounts, less is known about the ethical issues encountered by military nurses in wartime. Studies prior to the current conflict have focused upon military nursing advocacy and moral distress. One study, conducted prior to the current conflicts detailed the frequency and distress associated with issues emerging from Operation Desert Storm/Desert Shield and humanitarian missions, is dated in light of the intensity and duration of the Iraq and Afghan wars. Little research documents ethical situations encountered primarily by nurses during a military wartime deployment. Many military members are returning from deployment suffering from compassion fatigue, burnout, and PTSD. Yet, the question is perhaps those conditions are as a result of, or compounded by, the lingering uncertainty or distress related to how one, multiple, or recurring ethical situations were resolved or handled. Consequently, this study represents an exploration of these particular issues with a planned direction to take the findings into follow on projects for further exploration and interventions that emerge from the results of this study.

**Methods:** Using grounded theory, 34 Army, Navy and Air Force nurses were interviewed to elicit their experiences with ethical issues while deployed in support of the recent wars. Using a focused interview guide, interviews were conducted until theoretical saturation was achieved. Data analysis was conducted using methods detailed by Strauss and Corbin (1998). Rigor was maintained in study methods and analysis using tenets from Lincoln and Guba (1985) and Morse et al's (2002) verification strategies.

**Results:** Participants represented primarily Army (55%) active duty (83%) female nurses (71%) who had deployed to Iraq (52%), Afghanistan (32%) or both (16%) for at least 3 months duration. The nurses shared stories regarding their experiences during deployment. Ethical issues occurred regarding respect for persons, justice, and beneficence. Many struggled to find internal resolution regarding care of detainees, cultural differences, end of life decision making, pain management, and care of civilian casualties. This presentation would discuss the predominant issues they faced during the deployment experiences.

**Conclusions:** The study provided a description of the ethical issues military nurses encounter during wartime and will contribute to an "ethical issues toolkit" and development of a military ethical issues

instrument. By better understanding how nurses defined, assessed, and managed the ethical situations they encountered, we can better prepare our deploying nurses for future conflicts.

## F 18 - Understanding Challenges when Working with Older Adults

### Transforming Perspective on Older Adults: Conceptualizing the "Silver Tsunami" as a Cultural Paradigm Shift

---

*Katheryn Fernandez, PhD, RN, USA*

*Catherine Maurer Baack, MS, RN, BC, CNS, USA*

#### Purpose

to showcase older adults as their own diverse group. They are so unique, a "one size fits all" answer doesn't fit. To successfully transform nurses working with older adults, a shift to being inclusive in all things diverse needs to occur to meet the needs of this diverse "Silver Tsunami".

#### Target Audience

nurse educators in clinical and classroom settings for student nurses. Their future nurses will be caring for the "Silver Tsunami" and need to see and learn their diversity.

#### Abstract

Teaching a free standing gerontology course to senior nursing students requires unique and innovative ways to engage the students. From the literature and from life, this challenge requires a hard look at the 'culture' surrounding older adults; not only in society, but also in healthcare. Most importantly it requires a hard look at the classroom...at the students and faculty. Culture change, is a challenge and an opportunity. In this senior level course, there is a perfect opportunity to help the students, who are so immersed in acute care, lab values and crisis intervention to come 'full circle' in their nursing education and 'put it all together.' Older adults are the perfect population to do this with as they are, by definition, experiencing normal changes of aging and multiple co-morbid conditions that can be affected, but not cured. Challenges include "putting a face" on older adults so that they are not seen as a homogenous population. The faculty need to be agents of change and do what all agents of change do...shake things up! Faculty need to speak a new language and do new things that entice students to leave their comfort zones of predictable lectures, paperwork and clinical experiences in acute care facilities. The didactic information has to demonstrate to the students how to take what they know and apply it to this very special population. New concepts such as atypical presentation and geriatric syndromes must replace traditional applications of medical information. Subtle ageist beliefs need to be challenged and clinical sites must be a reflection where older adults live in communities.

## F 18 - Understanding Challenges when Working with Older Adults

### Cultural Relevancy of Palliative and End-of-Life Care: Conversations with Indigenous Elders

---

Mary J. Isaacson, PhD, MAN, BSN, RN, USA

#### Purpose

The purpose of this presentation is to share findings from a collaborative study conducted with Indigenous elders and health educators regarding palliative and end-of-life care, and the preliminary framework of a culturally relevant palliative care program founded on the Clinical Practice Guidelines for Quality Palliative Care.

#### Target Audience

The target audience of this presentation is persons interested in conducting community-based participatory research with Indigenous populations, palliative and end-of-life care professionals, designers of healthcare policy, healthcare professionals with an interest in culturally congruent practices, and healthcare administrators.

#### Abstract

**Purpose:** Access to palliative and end-of-life (EOL) care is severely limited for South Dakota (SD) Native American/American Indians [NA/AI] (Isaacson et al., 2014), which is of significant concern given their high morbidity and mortality rates (SD Vital Statistics Report, 2012). Palliative care professionals and NA/AI healthcare providers identify funding, infrastructure, and misperceptions specific to the NA/AI population and palliative/EOL care as barriers to access (Isaacson et al., 2014). Addressing these barriers and feasibility concerns must occur by bringing together key individuals and include persons receptive to the voices and concerns of NA/AIs residing in reservation communities (Isaacson et al., 2014). The purpose of this presentation is to share findings from a collaborative study conducted with NA/AI elders and health educators regarding palliative/EOL care and the preliminary framework of a culturally relevant palliative care program founded on the Clinical Practice Guidelines for Quality Palliative Care (National Consensus Project, 2013) for this SD reservation community.

**Design:** This community-based participatory research (CBPR) design incorporates ecological systems theory's (EST) key ideas of relatedness and a person's ecological environment (Caballero et al., 2003). The ecological environment comprises numerous systems which intentionally and unintentionally impact individuals during their lifespan (Kumpfer, 1999). The microsystem is the individual and considers the interplay between family, friends, or community; the affiliations and bonds with these groups make up the mesosystem (Caballero et al., 2003; Bronfenbrenner, 1979). The exosystem's impact on the individual can either be ambiguous or straightforward, often tied to work or administrative decisions. Cultural values, beliefs, and traditions are the macrosystem, and shape the micro-, the meso-, and the exosystem (Bronfenbrenner, 1979). EST in combination with CBPR provides a solid framework toward discovering a tribal community's assets and vulnerabilities.

The principal investigator (PI), in conjunction with Tribal Health Administration, organized, convened, and facilitated six focus groups over five months. Members of the focus groups comprised one Community Advisory Group (CAG), which included NA/AI elders and NA/AI healthcare professionals from the tribal community. The research questions guiding this study were: What is palliative/EOL care?, and What are the advantages/disadvantages, including cultural considerations, needed to establish palliative/EOL care on the reservation?

Initial meetings centered on defining palliative/EOL care specific to this tribal community and included boisterous discussions related to the challenges of working with the Tribal Council. As the meetings progressed the CAG reviewed the clinical practice guidelines, adding culturally specific recommendations. The PI digitally recorded and transcribed verbatim each CAG meeting. Subsequent analyses of narratives were conducted using thematic content analysis per Sandelowski (2000). The

transcribed narratives were returned to CAG members prior to each meeting. The PI, following the tradition of tribal communities, orally reviewed the major themes identified; following the oral presentation, the CAG would negate or validate the themes.

**Findings:** Cultural applications to EOL clinical practice guidelines were made by the CAG. During this time identification occurred related to opportunities and challenges for growth in caring for NA/Als, not only in reservation communities, but beyond reservation borders within the state and Indian Health Service (IHS). Opportunities included: 1) Mandatory cultural awareness training for all IHS employees; 2) Exploration of tele-health capabilities; 3) Establishment of a homecare program; 4) Palliative/EOL training for IHS personnel; and 5) Advance directive education for elders. Challenges centered on the poor economic conditions and the many small, dispersed, and geographically isolated communities on the reservation.

**Discussion:** This study demonstrates the effectiveness of the CBPR/EST design. The PI, as facilitator, assisted the CAG by reviewing the philosophical underpinnings of palliative/EOL care. The CAG determined congruency of palliative/EOL care principles with their cultural lifeways, dispelling the misperceptions barrier. The CAG concurred that barriers specific to infrastructure and funding are present, and after assessing each reservation district's resources and needs, remained hopeful that delivery of palliative/EOL care could be feasible through ingenuity and collaboration. From the focus group dialogue and continued conversations, the CAG has applied for and received additional funding to begin an advance directive elder education program where elders will become trained advance directive coaches. These new advance directive coaches will provide education to other elders in 12 reservation communities. Additionally, meetings are planned with IHS to share the study results and to initiate discussion regarding the need for a culturally congruent palliative/EOL program in this community.

## F 18 - Understanding Challenges when Working with Older Adults

### The Effect of Cognitive Stimulation on Cognition and Depressive Symptomatology in Elderly Community Dwellers

---

*Joao Luis Apostolo, PhD, MS, RN, RN, Portugal*

*Maria Lurdes Almeida, PhD, MS, RN, RN, Portugal*

*Daniela Cardoso, RN, Portugal*

#### Purpose

The purpose of this presentation is to demonstrate that the implementation of the Cognitive Stimulation (CS) program "Making a Difference" (MD) improves cognition and depressive symptoms of community retired elders.

#### Target Audience

The target audience of this presentation is geriatric nurses

#### Abstract

Background: Population aging has led to an increase in the prevalence of chronic degenerative diseases. Cognitive impairment is increasingly recognized as an important public health issue associated with increased risk for developing dementia. Moreover, clinically relevant depression is one of the most prevalent psychiatric conditions in life at a later stage. Depressive symptoms in the elderly have been associated with cognitive and functional impairment, particularly on memory and executive functions, thus representing a prodrome or risk factor for dementia. Evidence suggests that cognitive stimulation has a positive effect on cognition and depressive symptomatology in elderly people.

Objective: This study aimed to measure the effectiveness of the Cognitive Stimulation program "Making a Difference" in improving cognition and depressive symptomatology in elderly retired community dwellers.

Method: A multicenter quasi-experimental study sampled 44 elderly community dwellers from four day-care centers (rural, semi-rural and urban) of the central region of Portugal. The Montreal Cognitive Assessment and the Geriatric Depression Scale were administered at the following two time points: baseline and post-test.

Results: From baseline to post-test, a statistically significant difference was observed in depressive symptoms ( $F=4.967$ ;  $p=0.031$ ), explaining 10.4% of the variance (Partial Eta Squared -  $\eta^2=0.104$ ), power=0.59, and cognition ( $F=6.368$ ;  $p=0.015$ ), explaining 12.9% of the variance (Partial Eta Squared -  $\eta^2=0.129$ ), power=0.69.

Conclusions: Our results showed an improvement in the cognition and depressive symptomatology of the elderly after a 7-week intervention program. Cognitive stimulation may be a useful tool to be included in the provision of care to older people. It may contribute to prevent depressive vulnerability in the elderly, thus contributing to a higher level of autonomy.

## F 19 - Educational Research Affecting Undergraduate Students

### Motivation and Persistence among BSN Students in Northeast Ohio: A Correlational Study

---

*Christine Lynn Heid, PhD, MSN/Ed, BSN, RN, CNE, USA*

#### Purpose

To describe the relationship between academic motivation and persistence behaviors of nursing students as crucial to success in the nursing major. As the demand for nurses increases and the supply declines, nurse educators must improve student success in the nursing program to graduate more professional nurses to fill this gap.

#### Target Audience

Nurse educators, leaders, policymakers, and other interested in teaching strategies, organizational factors, and policies that may foster behaviors in students that may lead to success. Students, tutors, and advisors may discover the types of motivation and persistence behaviors exhibited by nursing students in order to contribute to nursing student success.

#### Abstract

Objectives: 1) The learner will be able to describe the types of motivation and persistence behaviors reported by BSN students. 2) The learner will be able to identify two key strategies that educators, leaders, or policymakers may use to foster behaviors that may lead to nursing student success.

Introduction/Background: As the demand for nurses increases and the supply declines, nurse educators must improve student success in the nursing program to graduate more professional nurses to fill this gap. Motivation toward nursing studies is crucial to persistence and success in the nursing major. The relationship between specific types of motivation (intrinsic, extrinsic, amotivation) and persistence behaviors have not been studied in BSN students. Understanding the motivation and persistence behaviors of BSN students may inform the student success strategies employed by programs of nursing.

Statement of the Problem: Nursing education issues, including recruitment and retention, have emerged in the nursing workforce and healthcare community. Despite academic, social, and political demands for additional professional nurses, nursing shortages hinder the profession and compromise the ability to meet the healthcare needs of the nation. Nevidjon and Erickson (2009) cited an increased need for nurses as contributory to the latest nursing shortage, placing demands on nursing education programs to graduate more nurses, faster. With a growing geriatric population and improved access to care, the demand for nurses has never been higher (Auerbach, Staiger, Muench, & Buerhaus, 2013). Insufficient new nurse graduates may contribute to this problem, due in part to high attrition rates and poor retention in nursing programs (Newton & Moore, 2009; Waters, 2006). The current study sought to investigate individual and organizational mediators of retention, specifically academic motivation and persistence behaviors of nursing students, using a non-experimental, quantitative method and descriptive, correlational design to better understand the role motivation and persistence played in nursing student success.

Theoretical Framework: Conceptually, the study was guided by three distinct influences from nursing and educational psychology to incorporate the key concepts of interest: motivation and persistence. Deci and Ryan's (1985) Self-Determination Theory (SDT) described motivation to learn and goal-directed behavior among undergraduate students. Motivation was viewed on a continuum of self-determination that formed the basis for the Academic Motivation Scale, which was used to measure motivation among BSN students in the current study. King's (1992) Theory of Goal Attainment provided a nursing theory perspective on student motivation as a secondary concept of goal attainment. King's (1981) Conceptual System described the phenomenon of nursing student motivation through the interpersonal, personal, and social systems of the student nurse and educator relationship. Student goals were described as learning about nursing, succeeding in nursing school, and becoming a nurse. Jeffreys' (2004) Nursing

Undergraduate Retention and Success model identified, supported, and addressed retention among nursing students, specifically distinguishing factors associated with persistence and success in nursing students. In the study, persistence behaviors among nursing students were incorporated into the discussion of goal commitment and attainment.

**Research Objectives:** The current study sought to investigate individual and organizational mediators of retention, specifically academic motivation and persistence behaviors of nursing students. The primary research question was: What is the relationship between student academic motivation and student persistence behaviors in a baccalaureate nursing program?

**Subjects:** One-hundred ninety-five participants from a mid-sized private university in northeast Ohio were selected using a purposive criterion sample that included all levels and tracks of the nursing program. The sample was predominately female (87%, n=161), Caucasian (92.4%, n=171), between the ages of 18-22 (80.43%, n=171), and enrolled in the traditional track of the nursing program (88.6%, n=164).

**Methods:** A non-experimental, quantitative method and descriptive, correlational design were used to better understand the role motivation and persistence played in nursing student success. Data were collected using the 28-item Academic Motivation Scale (AMS), the 69-item College Persistence Questionnaire (CPQ), and a 7-item demographic survey. Descriptive and correlational statistics using the Pearson product-moment coefficient  $r$  were used to describe the sample, variables, and test relationship between motivation and persistence behaviors.

**Results:** Cronbach's alpha was calculated for both questionnaires, indicating acceptable high reliability for the AMS ( $\alpha = 0.798$ ) and the CPQ ( $\alpha = 0.746$ ). The relationship between academic motivation and persistence behaviors was tested using the Pearson product-moment correlation coefficient  $r$ , revealing a statistically significant finding between the academic motivation self-determination index (SDI) and the persistence behavior of academic integration (AI),  $r = .491$ ,  $N = 189$ ,  $p < .001$ . Significant relationships were also found between SDI and the persistence behaviors of social integration, advising, institutional commitment, degree commitment, academic efficacy, and collegiate stress. Findings of this study reveal a significant relationship between all three types of academic motivation (intrinsic, extrinsic, amotivation) and several persistence behaviors in BSN students.

**Conclusion:** The more self-determined motivation leads to meaningful behaviors (Vallerand et al., 1992) and the persistence behaviors of institutional commitment, academic integration and degree commitment have been found to predict retention (Davidson et al., 2009). Autonomous motivations for nursing may include pursuing nursing as a means to care for others, make a difference, achieve in a meaningful way, gain job security, or as self-validation (Bernstein, Turrell, & Dana, 1965; Newton et al., 2009; Rognstad, 2002). These characteristics indicated that autonomous, intrinsically derived motivations for nursing were consistent with students who felt a sense of integration, commitment, and support with their academic endeavors – they could see the relationship between what they were learning and a career in nursing. Participants felt supported in their efforts and committed to their goal, therefore, they may have a greater chance of achieving success in the nursing program.

**Implications:** Nurse educators, leaders, and policymakers are encouraged to develop ways to facilitate behaviors that may lead to student nurse success. Assessment strategies for promoting student success and program improvement are highlighted with specific suggestions offered to enhance student success through the mediation of motivational and persistence behaviors are suggested based upon the current literature and research findings.

**Future Research:** Secondary analysis of study data is currently underway and preliminary findings will be reported.

## F 19 - Educational Research Affecting Undergraduate Students

### Health Promoting Behaviors among RN to BSN Students at Two Public Universities

---

*Kathleen L. Gilchrist, PhD, MSN, BSN, ASN, RN, FNP, PHN, USA*

*Cherie Rector, PhD, RN, PHN, USA*

#### Purpose

Assess the health promoting-behaviors of RN-BSN students from two public universities utilizing the Health-Promoting Lifestyle Profile II (HPLP II) based on Pender's model. Nurses' personal health behaviors may influence their effectiveness in teaching health promotion to clients.

#### Target Audience

The target audience of this presentation is nurse educators who teach in RN-BSN programs.

#### Abstract

**Background:** Healthcare reform has refocused attention on health promotion. Most research in this area has focused on clients. Nurses and nursing students, who are responsible for client health promotion education, are important to the success of this paradigm shift from a disease model to health promotion. With the pressure for RNs to complete the baccalaureate degree in nursing, more students are entering RN-BSN programs. Often, the majority of these RN-BSN students are nontraditional (e.g., older, working, have families) (Bryer, Cherkis, & Raman, 2013). Health promotion has been associated with maintaining enrollment in nursing school (Al-Kandari, & Vidal, 2007), and educational interventions with nursing students have shown promise (Belguzar, 2015).

The Health-Promoting Lifestyle Profile II (HPLP II) was used to assess health promotion in this study. Internal consistency (Cronbach's alpha) for the 52-item HPLP II is reported at .943 (Walker, Sechrist, & Pender, 1987). Answers to questions are formatted on a 4-point Likert scale (never, sometimes, often, routinely), and it takes approximately 15-20 minutes to complete. This tool is based on Nola Pender's mid-range theory of health promotion (Pender, 1996; Sakraida, 2010). Health promotion is different from simply prevention of disease, but is rather a proactive, goal-directed behavior that improves health and wellbeing. Constructs include the value others place on the outcome and if the person feels a sense of self-efficacy. The decision-making phase and the action phase are part of the conceptual framework of health promotion. They include individual perceptions, and modifying factors, along with barriers and cues that can trigger the motivation to act (Duffy, 1988; Sakraida, 2010). Health promoting actions can be influenced by: a) perceived barriers that can hinder commitment, b) environmental influences (peers, situations) that can either increase or decrease commitment, and c) competing and uncontrollable demands that may lead to loss of attention to commitment (McCullagh, 2004; Sakraida, 2010). In addition to the use of the HPLP II, minimal demographic data was requested (e.g., age, ethnicity, gender, family/marital status, highest level of education, years in nursing, shifts worked).

**Selected Literature Review:** The HPLP II has been used in numerous research studies with a variety of populations. However, health promotion research with working nurses is sparse. A study examining health-promoting behaviors in an acute care hospital, nurses revealed differences between nurses working on medical-surgical units and critical care units, with the former exhibiting greater overall scores (McElligott, Siemers, Thomas, & Kohn, 2009). A more recent study found no significant differences between public health nurses and critical care nurses (Rector, & Gilchrist, 2014).

Nursing students have more often been participants in health promotion studies. College nursing students in the US and Kuwait had results on health promotion similar to an earlier study of nursing students in this country (Jackson, Tucker, & Herman, 2007; Al-Kandari, & Vidal, 2007; Stark, Manning-Walsh, & Vliem, 2005). Canadian and Jordanian nursing students' health-promoting behaviors were compared in a 2004 study, with Jordanian students scoring lower on the total HPLP II and on all subscales except Interpersonal Relations. Cultural differences in the definition of health as "absence of

disease,” among other things, were thought to be contributory to the differences in scores (Haddad, Kane, Rajacich, Cameron, & Al-Ma’aitah, p. 88). Bryer, Cherkis, and Raman (2013) examined health-promoting behaviors of traditional with more nontraditional (e.g., older, ethnically diverse, previous education, employed, families) nursing students at a US associate degree program. They noted significant differences on the total HPLP II scores and all subscales, with the exception of Nutrition. A second tool, Barriers to Health Promoting Activities (BHPA), was administered and statistically overall higher scores were found. There were noted differences with traditional students regarding lack of help, time, transportation, and support from family and friends. This is important information, as more nontraditional students are entering nursing education, especially at the ADN and the RN-BSN levels. In a correlational study of Kuwaiti nursing students, a significant relationship was found between those with higher body mass index (BMI) and the total HPLP II scores as well as the Nutrition subscale scores.

A longitudinal study being conducted by Wills in England found that a good number of nursing students are overweight and 40% never engage in physical activity (Gillen, 2014). Data gathering continues through 2016, but early evidence indicates that the health of individual nurses can affect their ability to promote health among their patients and ultimately provide better nursing care. The researcher posits that obese nurses and nurses who smoke are more reluctant to broach these subjects with their patients. A wellness website is being utilized for nursing students to track their progress with weight and exercise. She advocates the need for health promotion at universities in order to achieve better health behaviors among students (Dooris, Wills, & Newton, 2014). A three-year study of 108 female Turkish nursing students found that an educational intervention to promote health behaviors was effective (Kara, 2015). At the end of each year, the HPLP II was administered and significant positive differences were noted on the total score and subscales of exercise, nutrition, stress management, health responsibility and self-actualization.

**Design:** A descriptive, cross-sectional quantitative research methodology was used. A non-randomized, convenience sample from two public universities’ RN-BSN programs was used. Permission was received from both university IRBs to conduct the study.

**Sample, Recruitment, & Consent:** Students in the first two semesters of a three semester online program at both universities were invited to participate through an email invitation from their respective faculty member. A link to SurveyMonkey © was provided, and they could choose to participate or not. Remainder emails were sent after several weeks. The consent form was the first screen available to participants and students could print it for their records. Further participation was deemed as consent, since they had to click on a button to begin the survey. Anonymity was ensured, and participation was voluntary.

**Results:** Forty RN-BSNs completed all or part of the survey. The mean age (n=33) was 33.26 (s d=7.25; range=224 to 49). The majority of respondents (n=40) were Hispanic/Latino (55%), with 20% Asian, 5% Black, and 12.5% White. Over 92% were female, and 51.28% were married or in a domestic partnership with dependents. Over 25% were single with no dependents. The majority had an associate degree in nursing (92.31%), with 15.38% having a bachelor’s degree in another area, and 5.13% reporting a master’s degree in another area. Participants reported a mean of 3.18 years working as an RN (n=39; s d=13.31; range= <1 to 16 years). The majority worked 12-hour shifts (70%), with 47.5% working during the day. When asked how often they left the unit for meals, 32.5% reported “never” and 35% reported “sometimes.” Out of 40 respondents, only two smoked cigarettes (1=10/month; 1=30/month). Most characterized themselves as “overweight” (47.5%), with 32.5% reporting they were at a “normal weight.” The mean height was 64.34 inches (s d=2.69; range=60 to 71) and mean weight was 160.51 lbs. (s d=40.08; range=105 to 280).

Cronbach’s alpha for the total HPLP II was .916 for this sample (n=33 surveys with no missing responses). The mean for the total HPLP II was 2.525 (s d=.35). Subscale means were: health responsibility 2.57 (s d .46); physical activity 2.07 (s d=.57); nutrition 2.57 (s d=.42); spiritual growth 3.08 (s d=.42); interpersonal relationships 2.895 (s d=.44); stress management 2.19 (s d=.39).

**Discussion & Implications:** No prior research on health promotion in RN-BSN students was found. Sadly, these RN-BSNs are not following the health guidelines that they educate their patients on each and every day. By not leaving their units for meals, RN-BSNs are impinging on their nutritional status and possibly affecting their cognitive ability to function as a nurse. In comparing the total mean score to other research with nursing students, this result is only slightly higher than the 2.47 mean among nontraditional ADN students in the Byer et al. (2013) study. The mean for traditional students in that study was 2.74. For junior level college nursing students in the Midwest, an HPLP II total mean score of 2.84 was reported (Stark, Manning-Walsh, & Vliem, 2005). This is somewhat higher than the present study. A Kuwaiti study of second semester college nursing students by Al-Kandari, Vidal, and Thomas (2008) reported overall HPLP II means between 2.5 (17-20 age group) and 3.0 (31-35 age group), with means increasing for each successive age group. Hensel (2012) reported a mean of 2.80 in a study of hospital nurses, and McElligott and colleagues (2009) in their study of hospital nurses reported a mean of 2.6.

Because the majority of RN-BSN students are employed RNs returning to college, they have stressors from both work and school, as their results indicate. They often have family responsibilities and juggle multiple roles. Would a stress management course help to increase their scores? Understanding their health-promoting behaviors and providing interventions to promote healthy behaviors may foster their educational goals and improve their nursing practice. More research is needed on methods that inspire RN-BSNs to be more health conscious and good role models for their patients.

## F 19 - Educational Research Affecting Undergraduate Students

### Empathy Development through Case Study and Simulation

---

*Heidi A. Mennenga, PhD, RN, USA*

*Sue D. Bassett, MS, RN, CNE, USA*

*Libby Pasquariello, MSN, RN, USA*

#### Purpose

The purpose of this presentation is to provide results from a research study exploring whether or not consistent patient exposure during simulation and case studies can impact empathy development in nursing students. Discussion regarding results provide interesting conclusions for faculty members.

#### Target Audience

The target audience of this presentation is nursing faculty members or others interested in empathy development of nursing students.

#### Abstract

**BACKGROUND:** Empathy has been identified as a predictor of positive patient outcomes and is integral to the nurse-patient relationship. Since research indicates that empathy development does not occur through theory and arbitrary experiences, nurse educators are challenged to use evidence-based educational interventions to develop student empathy. The purpose of this study was twofold. The first purpose of the study was to determine whether consistent exposure to a single patient through case study and simulation impacted empathy levels in senior level baccalaureate nursing students. The second purpose of the study was to evaluate patient perceptions of nurse empathy.

**METHODS:** During spring and fall semesters in 2014, senior students in a psychiatric-mental health nursing course were asked to complete a demographic form and the Jefferson Scale of Empathy (JSE). The students were then randomly divided into two groups, a comparison group exposed to multiple, random patients and an experimental group exposed to one consistent, single patient during case studies and simulation. Throughout each semester, all students were exposed to two case studies completed during class time and a simulation completed during clinical time. The student learning outcomes for the case studies and simulations were identical for the two groups. The case studies and simulation completed by the comparison group featured random patients with different names, ages, and backgrounds. The case studies and simulations completed by the experimental group featured one consistent patient with a consistent background. At the end of each semester, students were asked to complete the JSE again. Additionally, the standardized patient used in the simulation completed a brief scale reflecting perceived empathy of and overall satisfaction with each student following the final simulation done at the end of the semester.

**RESULTS:** A total of 127 students participated. Pre-test and post-test results indicated that students in both groups felt they displayed empathetic behaviors. Using analysis of covariance, no significant differences were found between or within groups. Using a t-test for independent groups, no significant differences were found between the students who were exposed to a consistent, single patient and students who had random, multiple patients at pre-test ( $p= 0.760$ ) and at post-test ( $p= 0.575$ ). Additionally, there was no significant difference found between the two groups and the overall patient satisfaction indicated by the standardized patient survey ( $p= 0.964$ ).

**CONCLUSION:** The results provide several interesting conclusions for faculty members and offer a basis for ongoing discussion. First, findings from this study suggest that empathy levels are not affected by the use of a single, consistent patient in case studies and simulation, and, therefore, may impact how active learning experiences are designed by faculty members. Secondly, while findings indicate that faculty members may not be able to teach empathy through consistent patient exposure provided in case studies and simulation, additional strategies that may increase nurse empathy need to be explored. Lastly, this

research study provides a unique perspective of the patient regarding nurse empathy and patient satisfaction that should be further researched.

## F 24 - Understanding Our Youth

### Teen Perceptions of Sexual Activity, Decision-Making, and the Promotion of Safe Sexual Practices: A Focus Group Study

---

*Judith Herrman, PhD, RN, ANEF, FAAN, USA*

#### Purpose

to reveal teen perceptions about sexual activity, decision-making, and the promotion of safe sexual practices.

#### Target Audience

nurses and other health professionals interested in teen health, teen sexual health, and reproductive decision-making.

#### Abstract

**Purpose:** This study is designed to explore teens' perceptions of sexual activity, decision-making, and means to promote safe sexual practices in youth. Teens' thoughts on the supports and challenges associated with sexual decision-making and safe sexual behavior provide the framework for examining this critical area of teen health.

**Background:** Recent research revealed that teens in the state of study report some of the highest rates of sexual activity and pregnancy in the nation. Concerned advocates wonder about the factors behind these startling data and posit that youth-generated interventions are needed to ensure safe sexual practices. The thoughts of teens are unknown and validate the current study.

**Methods:** This qualitative, descriptive study uses focus groups to gather teens' perceptions. Students, ages 14-17 years, were recruited from school-based health centers (SBHCs) and participated in nine focus groups. SBHC staff recruited participants, obtained consents, signed students up for focus groups, and assisted with scheduling focus groups in private rooms at the SBHC. The Focus Group Interview Guide, based on the supports and challenges model and previous research, was used in the semi-structured interviews. Focus groups were audio recorded and transcribed verbatim. Observational notes recorded non-verbal aspects of the focus groups. Analysis included both template analysis, using the Focus Group Interview Guide and thematic analysis assessing for emergent and prominent themes.

**Results:** Iterative analysis yielded support and challenge themes that may be used to inform adult messages, programs, and policies designed to promote healthy teen sexual behavior.

**Conclusions and implications:** Nurses hold pivotal roles in fostering responsible and safe sexual practices in youth. Using teen perceptions to guide interventions related to safe sexual practices ensures meaningful, teen-focused, and developmentally appropriate strategies to enhance safe sexual practices.

## F 24 - Understanding Our Youth

### Dynamics and Identity in Families of Gender Non-Conforming Children/Youth: A Longitudinal Phenomenological Exploration

---

*Christine M. Aramburu Alegría, PhD, APRN, FNP-BC, USA*

#### Purpose

The presentation disseminates information on the dynamics/evolution of families that include gender non-conforming children/youth. In-depth interviews with parents/guardians describe the experiences and identity among family members, the strengths and challenges in navigating society as a diverse family, and the impact upon a family when one member identifies as gender non-conforming.

#### Target Audience

The target audience of this presentation includes all nurses, as health care providers to individuals, families, and communities. Nurses who focus their care in mental health, pediatrics (including schools), and families (for example, family nurse practitioners) may especially benefit from this presentation.

#### Abstract

The present study explores the dynamics and evolution of families that include gender non-conforming children/youth (including transgender children/youth). Through in-depth interviews with parents/guardians, the researcher explores the lived experiences and evolution of identity among all family members, the strengths and challenges in navigating society as a diverse family, and the impact upon a family when one member identifies as gender non-conforming.

In a society that has little more than a superficial knowledge of gender non-conforming individuals, routine activities such as obtaining healthcare or going to school become substantial events with hurdles that the individuals and their families must overcome. Routine activities are no longer routine. Determining which restroom to use, deciding upon a gender-specific bathing suit, choosing extracurricular sports and activities – decisions that most individuals and families take for granted become salient and problematic for the family with a gender non-conforming child/youth.

The extant literature has demonstrated that from the level of the individual to the macrosystem level, gender non-conforming children/youth and their families experience many trials. Family discord, depression, and associated comorbidities and health disparities are rampant. For youth rejected by their families, homelessness, substance abuse, victimization are common. Harassment and victimization is common in schools; teachers and staff often lack knowledge on gender diversity (and may be unwilling to learn). Satisfactory medical care may be inaccessible.

In the knowledge base of healthcare, ground has been made, but there is need for more. There is little education on gender non-conforming issues in nursing, and nurses and other clinicians feel unprepared to care for these individuals and the issues their families face. Yet, healthcare providers, including school nurses, primary care providers, and psych-mental health clinicians, are being increasingly called upon to care for this population. Further, providers such as counselors, including school and family counselors, need to be cognizant of issues. Indeed, a multi-disciplinary approach to care is best.

Cognizant of these gaps in knowledge, influential national bodies have called for more research into the lesbian, gay, bisexual, transgender (LGBT) population. The Gay and Lesbian Medical Association (GMLA) has called for research into environmental factors that contribute to health disparities within the population, and the Institute of Medicine (IOM) has similarly called for increased research within the population. Moreover, the IOM lay out a research agenda, specifically stating, “An individual’s health is affected by community and social circumstances. LGBT health research should consider both the individual and various contexts, including interpersonal relationships, in which the individual lives” (IOM, 2011; p. 7).

Consistent with the gaps in knowledge that this researcher has identified, and with the assessed need as asserted by the GMLA and the IOM, the present study provides needed findings to help improve the environment and healthcare for gender non-conforming individuals and their families. The study takes a social ecological, phenomenological approach towards increasing this understanding. Therefore, to gain insight into the contextual environment of gender non-conforming children/youth, the first research question is:

RQ 1. What are the experiences of families of gender non-conforming children & youth, including in the following areas?

1. Family dynamics
2. Social networks (extended family, peers)
3. School
4. Healthcare (access and quality)

Continuing with the contextual perspective, previous studies have demonstrated that family members of gender non-conforming persons also frequently reexamine their own identity and worldviews, discovering new ways to assimilate reformed perspectives (e.g., through activism). This in turn can strengthen relationships. Hence, the following research question aims explore the psychology of identity that may underlie relational interactions:

RQ 2. How is the identity of family members of gender non-conforming children/youth affected, including the following?

1. Self-view of parent/guardian
2. Parent/guardian view of child

Through in-depth interviews, the present study gains in-depth knowledge on the experiences, including helpful strategies, of gender-diverse families navigating a marginalizing society.

## F 24 - Understanding Our Youth

### Deconstructing Physical Activity Self-Efficacy: A Critical Review of the Literature

---

*Vicki R. Voskuil, MS, BSN, RN, CPNP, USA*

*Lorraine B. Robbins, PhD, RN, FNP-BC, USA*

#### Purpose

The purpose of the presentation is to summarize findings from a review of the literature related to the concept of physical activity self-efficacy among youth. Issues related to conceptual and operational definitions will be identified. Implications for future research to advance the science related to the concept will be provided.

#### Target Audience

The target audience of this presentation is focused on nurses involved in health promotion with children and adolescents and nurse scientists who use theory-based interventions to promote physical activity among youth.

#### Abstract

A global decline in physical activity from childhood to adolescence has resulted in an increased risk for obesity, cardiovascular disease, and diabetes. Physical inactivity among youth has generated increased research directed toward enhancing physical activity self-efficacy to reverse this disconcerting trend. While self-efficacy has been found to be a consistent correlate and determinant of physical activity, these findings are not consistent across studies. Multiple conceptual definitions for physical activity self-efficacy are evident in the literature and measurement of the concept is highly variable, indicating the need for clarification of the concept to ensure adequate translation of research findings into practice. A critical review of the literature was carried out to deconstruct the concept and identify research implications. The PubMed, Cumulative Index of Nursing and Allied Health Literature, PsychInfo, Educational Resources Information Center, and Sociological Abstracts databases were searched for publications from 1990-2013. Search terms included self-efficacy, physical activity, youth, children, adolescent, and teen. A total of 838 abstracts were reviewed including peer-reviewed articles, systematic reviews, and theoretical articles. Additional inclusion criteria were articles published in English, time frame of 1990-2013, and age up to 18 years. Conference abstracts, dissertations, editorials, articles involving adults, and self-efficacy literature related to other health behaviors were excluded. After a review of the abstracts and removal of duplicates, 276 articles were selected for further appraisal. A total of 55 articles meeting inclusion criteria were included in the review. The articles represented a range of disciplines with the majority from kinesiology, public health, and nursing ( $n = 37$ ). A strong international focus was evident in the sample with 23 (42 %) of the selected articles representing 14 countries. The sample included quantitative ( $n = 47$ ) and qualitative ( $n = 2$ ) research, systematic reviews ( $n = 4$ ), and theory-based articles ( $n = 2$ ). Four articles included youth with chronic conditions. Rodger's evolutionary method of analysis was used to collect and analyze the data and social cognitive theory guided the analysis. Data were analyzed with particular focus on the attributes, antecedents, and consequences of the concept. Defining attributes of physical activity self-efficacy were identified as personal cognition or perception, self-appraisal process, related action, power to choose physical activity, dynamic state, and bi-dimensional nature. Antecedents and consequences were consistent with social cognitive theory. Related concepts included competence and confidence. Youth physical activity self-efficacy was defined as a youth's belief in his/her capability to participate in physical activity and to choose physical activity despite existing barriers. Because physical activity self-efficacy is a key concept in many theories aimed at health promotion, consistent conceptual and operational definitions are important for advancing the science related to the concept. Theory-based interventions designed to increase both the antecedents of self-efficacy and the concept directly may have the potential to promote physical activity among youth. Research should be aimed at establishing consistency in conceptual definitions and empirical measurement to further develop the concept across disciplines and ensure accurate translation of findings into practice. Given the heterogeneity of instruments in the literature, research should focus on refining measures to adequately reflect the defining attributes of the concept. Examination of the

development of physical activity self-efficacy as youth age is also warranted as the relationship between age and physical activity self-efficacy was not consistent across studies. Future research should assess gender differences related to self-efficacy, particularly because girls tend to report lower physical activity self-efficacy than boys. These efforts may lead to improvements in the tailoring of interventions for specific subgroups of youth. This comprehensive analysis has resulted in a refined conceptual definition of youth physical activity self-efficacy and has enhanced the clarity of the concept. Continued theory-building involving physical activity self-efficacy is suggested with the ultimate goal of increasing physical activity and promoting a healthy lifestyle among youth worldwide.

## F 25 - Research and Innovations from Africa

### Evaluation of Memory Book Interventions with Orphaned Children in India, Kenya and South Africa

---

*Barb J. Braband, EdD, MSN, MA, BAN, RN, CNE, USA*

*Tamara Lynn Faris, BSN, MS, RN, USA*

*Kaye Wilson-Anderson, DNS, MSN, BSN, RN,, USA*

#### Purpose

The purpose of this presentation is to share the results of a collaborative multi-site research study designed to explore and compare the lived experiences of orphaned children in India, Kenya and South Africa who have utilized the Memory Book intervention.

#### Target Audience

The target audience of this presentation is nurses and other healthcare providers, as well as, care providers of children may benefit from the results of the evaluation of this innovative Memory Book intervention for orphaned children from various global sites.

#### Abstract

Purpose: The purpose of this collaborative multi-site research study was to explore and compare the lived experiences of orphaned children in India, Kenya and South Africa who have utilized the Memory Book intervention.

Background: Circumstances leading to an orphaned state were related to HIV/AIDS or abandonment due to poverty, disease or war. Traditional models for surrogate parenting by extended families have been strained by the frequent loss of one or both parents of affected children resulting in the need for alternative care models such as orphanages. Orphaned children have sustained many threats to their holistic health, including the loss of precious family memories, severed family relationships, and potential significant paralysis in development due to loss and grief. The Memory Book was developed and implemented in 2005 by a nurse leader, with a supportive volunteer base, in a northwestern city in the United States. The books were implemented to facilitate orphaned children in "telling their story" and to foster their sense of well-being and resilience.

Methods: A qualitative phenomenological approach was implemented to evaluate the Memory Book intervention in six children's homes in these three countries. Following university institutional ethics review board approval in the United States, separate focus group interviews with children (n = 65) and their caregivers (n = 6) were conducted. Following data saturation with multiple focus groups at the identified international sites, data were analyzed based on a constant comparison method for narrative themes.

Results: Study findings offer evidence to support the ability of children to work through loss and grief when they are assisted in preserving and telling their story through the use of Memory Books. Common themes offered by orphans between the six sites as a result of the intervention included support for their identity, awareness of family or relationships, and emotional expressions.

Implications: The Memory Book intervention assisted children to chronicle their lives and demonstrated the potential to guide future interventions for orphaned children by care providers, nurses and other healthcare providers in this context.

## F 25 - Research and Innovations from Africa

### Does a Bachelor of Nursing Programme in the Western Cape, South Africa, Adequately Prepare Graduates for Their Professional World of Work?

---

*Felicity M. Daniels, PhD, MPH, RN, RPN, CHN, RNE, South Africa*  
*Penelope D. Martin, PhD, MACur, BACur, RN, RM, CHN, RPN, RNE, RNA, South Africa*  
*Lorraine P. Fakude, RN, RM, CHN, RNEd, RNAdmin, South Africa*  
*Lydia E. Richards, MA (HlthSt), BCur, RGN, RM, ICU, Paeds, NAdmin, NEd, South Africa*  
*Lindy S. van der Berg, MCur, BCur, RN, RM, RPN, RCHN, South Africa*  
*Ntombizodwa S. B. Linda, MNEd, RN, RM, RNE, South Africa*

#### Purpose

To present the views of graduates of a Bachelor of Nursing programme and their professional nurse supervisors on whether the graduates are adequately prepared for their job as new professionals and to establish the patient's satisfaction with the care they received from these graduates.

#### Target Audience

Nurse academics /faculty, nurse graduates, student nurses, professional nurses, nurse administrators, clinical facilitators / preceptors and researchers.

#### Abstract

**Introduction:** The success of a country's economy increasingly depends on the quality of its human resources which, in turn, is inextricably linked to the effectiveness and efficiency of programmes offered by its education and training institutions. Preparation of students for employment in the labour market is generally viewed as one of the major functions of higher education.

Current concerns however exist, nationally and internationally, about the quality of the programmes offered by higher education institutions, which seemingly produce less competent graduates which therefore questions their employability. Further concerns about the lack of alignment and relevance of the education programmes to the job market; the consequent gap between the competencies and level of competence expected by the employer and those which graduates possess and challenges with regards to the graduate's transition from higher education to practice has led to the need for evaluations of programmes through graduate tracer studies (Griesel & Parker, 2009).

Graduate nursing programmes are not spared the concern that the nurse's level of competence needs to be sharpened and nursing programmes made more relevant to nursing practice to ensure improved patient outcomes.

**Aim:** This study aimed to trace graduates from a Bachelor of Nursing programme offered at a university in the Western Cape, South Africa, to establish the adequacy and relevance of the programme to the graduate's world of work; and to identify potential gaps and measures to address these gaps towards improving the nursing programme.

**Methods:** The research method was quantitative, using a non-experimental survey design. The survey was conducted during 2014. All graduates who completed the Bachelor of Nursing programme in December 2013 at the identified university, their professional nurse supervisors at the clinical facilities during 2014 and patients who received direct care from the graduates were purposively selected to participate in the survey. The survey for graduates focused on the graduate's biographical and education background; and the relevance of the Bachelor of Nursing degree to their current job. The professional nurses completed a survey which established the discipline / type of health care facility in which the graduate was being assessed; the skills required for the graduate to perform competently in that facility; and the skills which the graduate lacked to perform competently in the facility. The questions were a combination of single-item and multiple-item closed-ended questions, filter and follow up questions as well as ranking questions. The patient survey was developed from Larrabee and Putman's (2006) Caring

behaviour Inventory and included sections on the patient's biographical and health information and a section on patient satisfaction rating.

Data was analysed quantitatively using SPSS version 21. Frequency distributions and measures of variability were established from the data. Correlation and covariance were done. Chi square test were used to test for associations. The confidence interval was set at 0.95.

**Results:** Graduates and their professional nurse supervisors provided insight into the adequacy, relevance and gaps in the programme with reference to the four disciplines for which graduates qualify at the end of the programme, namely, general nursing science, community nursing science, psychiatric nursing, midwifery and clinical nursing practice.

A total of 37% of the students reported that they fared best theoretically in discipline general nursing science while 28% reported that they did not fare well in the same discipline. The discipline that students reported enjoying the most was midwifery 40%, followed by community nursing science at 28%.

The discipline in which students reported faring best clinically was psychiatric nursing science while 19% of the students reported that they did not fare well clinically in the same discipline. Students reported that the clinical learning opportunities, during the 4<sup>th</sup> year of study, were excellent 30% while 44% reported that it was good. Only 2% reported it as being unsatisfactory.

Forty two percent (42%) of the 4<sup>th</sup> year students reported that they received excellent support from registered nurses at the clinical facilities. Cumulatively, 77% reported that the support they received was either excellent or good.

Forty two percent of the students reported that by the 4<sup>th</sup> year of study, the Bachelor of Nursing programme had adequately prepared them for their role as a registered nurse, while 44% reported that their preparation was good. Only 2% reported that their preparation was inadequate. Overall, their satisfaction with being a student in B Nursing Programme was reported by 26% of the students as being very happy 26%; 37% were happy 37% and only 2% were unhappy.

The finding of professional nurse confirmed the students rating of themselves as being adequately prepared. The patient's rating of the care they received from the graduates were both positive and negative.

**Conclusion:** It is hoped that the findings of this study will facilitate the alignment of Bachelor of Nursing programmes in the country to the needs of the job market and that graduates from this programme will in future be more employable and meet the patient's needs for care.

**Recommendations:** The alignment of the educational programme to the skills required to practice as a professional nurse is the main recommendation to strengthen the programme further and to ensure positive patient outcomes. While recommendations from the patient satisfaction survey highlighted the need to enhance the soft skills required for patient care.

## F 25 - Research and Innovations from Africa

### Strengthening the Preparation of Student Nurses to Participate in the Provision of Nurse Initiated and Monitored Antiretroviral in South Africa

---

*Regis Rugira Marie Modeste, PhD, MN, BN, RN, RM, NE, South Africa  
Oluyinka Adejumo, DLittetPhil, MSc, BScN, RN, RPN, RNE, South Africa*

#### Purpose

The purpose of this presentation is to present how nurse initiated and monitored antiretroviral can be integrated in the four year pre-service nursing curriculum to prepare new nurse graduates as prepared in one university in South Africa.

#### Target Audience

The target audience for this presentation is nurse educators, those practising in the field of HIV and AIDS, those involved in curriculum development

#### Abstract

Background: As the worldwide fight against Human Immunodeficiency Virus (HIV) continues, incidence and mortality rates are being reduced, with an increase in the number of people living with HIV infection and needing care. This increase is partly attributed to advances that have been made with regard to the management of HIV and Acquired immunodeficiency syndrome (AIDS). The Joint United Nations Programme on HIV/AIDS (UNAIDS) has set the 90-90-90-target, striving to ensure that, by the year 2020, 90% of those who are infected with HIV know their HIV status; 90% of those with HIV diagnosis are receiving continued antiretroviral therapy (ART); and viral suppression is attained for 90% of those receiving ART (UNAIDS, 2014). The South African Government has made the fight against HIV one of its priorities, and developed strategies and policies targeting the HIV epidemic, with the aim of reducing infections and providing the best treatment as promptly as possible, all in line with global efforts to deal with the HIV epidemic (South African Department of Health, 2010; Johnson, 2012; Motsoaledi, 2014). In South Africa, the current policy related to the management of HIV and AIDS recommends ART initiation at a CD4 count of 500, providing opportunity to increase the number of people who are initiated and monitored on ART. Nurses' role in the initiation and management of ART is crucial, and has been documented to be effective. However, literature notes that in Sub-Saharan Africa, it's not clear how this aspect is covered in the pre-service training of nurses (Zuber et al 2014). Furthermore, Relf et al. (2011) stress that it is important to prepare new nurse graduates in a holistic manner so that they can acquire the essential competencies that relate to HIV and AIDS. In the 2013 South African's United Nations General Assembly Special Session on AIDS mid-term report, one of the programmatic actions that are reported to be necessary for achieving the target related to reaching 15 million people living with HIV on ART by the year 2015, is strengthening the capacity of nurses to initiate and monitor people living with HIV on ART. The report notes that the ability of new nurse graduates to manage adults and children living with HIV will be enhanced by inclusion of nurse initiated and monitored ART (NIMART) in the pre-service training (Republic of South Africa, 2013). This paper presents attempts to strengthen South African student nurses' preparation for NIMART, by integrating such aspect in the pre-service nursing curriculum at one university in South Africa.

Methods: Working within a constructivist paradigm and applying a qualitative approach, 8 group discussions using the nominal group technique and 7 individual interviews were conducted with 52 nurse educators in seven provinces in South Africa, and 2 members of the Nursing governing body. Using volunteer and purposeful sampling techniques, a total of 54 participants contributed to the study until data saturation was achieved. During the data collection, there was a discussion of competencies related to HIV and AIDS for nurses including NIMART and how NIMART can be integrated in the pre-service training for nurses in South Africa. Workshops were conducted to discuss how the competencies can be integrated into the four year nursing program, and a verification process provided the final list of competencies and how they can be integrated. The collected data were transcribed verbatim and analysed using the steps of multiple group data analysis for nominal group technique, and content

analysis. The study received ethical clearance and permissions from the institutions where participants were recruited. The study was conducted in English, all participants signed informed consent and ethical considerations were adhered to. Member checks, prolonged engagement and data audit are some of the strategies applied to ensure trustworthiness.

Results: Of the 52 participants in the group discussions and interviews, 59% were aged 50 years and less, with about 6% who were over 60 years of age, and 89% were female. Up to 69% of the participants reported being involved in the teaching of HIV in the pre-service program. 48% of the participants held a master's degree, while 20% were PhD holders. The participants agreed that NIMART is an important aspect in the fight against HIV, and literature supports that nurses' care in NIMART is on par with the care provided by doctors. However, there seemed to be two different views, with some nurse educators preferring to have NIMART in the post-graduate programme, while another group noted that it can be done at a pre-service level as the current legal framework is enabling. Participants raised concerns related to knowledge related to pharmacology, and gaining experience to be able to provide NIMART upon graduation. Aspects related to knowledge of ART, side effects and interpretation of results were noted as weaknesses in practicing nurses, and these will need special attention in the curriculum. This study developed outcomes that relate to participation in initiation and monitoring of ART, which will require the student nurse to have the opportunity to participate in ART initiation and monitoring during the training. This inclusion of NIMART in the pre-service training of nurses will facilitate the new nurse graduate to improve the competency after graduation. Furthermore, prior exposure to NIMART during pre-service training will enhance reduction of reliance on in-service training, while speeding up provision of ART to people living with HIV by nurses. Various outcomes were developed, and these outcomes can be integrated into the four year nursing undergraduate program. The outcomes related to the development of required competencies for NIMART include understanding the various medication used in the treatment of HIV, how they work and their side effects. The outcomes also include interpretation of results and enhancing adherence.

Conclusion: The study developed competencies that will enable student nurses to participate in the NIMART program during their training, facilitating quicker functioning upon graduation. Such competencies could be integrated vertically and horizontally throughout the four year programme, facilitating thorough preparation of nurses. Furthermore, the developed outcomes can be transferred in other pre-service nursing programs in various settings, as the fight against HIV continues worldwide. Considering the shortage of nurses in many countries, efforts such as this in other nursing programs will improve nurses' ability to participate in the provision of ART, hence the opportunity to reach 90-90-90 target set by the UNAIDS.

## F 26 - Culturally Diverse Health Practices

### The Lived Experience of Nurses in Rural Uganda

---

*Linda Johanson, EdD, MS(n), RN, CCNE, USA*

#### Purpose

To convey results of a recent qualitative research study that explored the lived experiences of nurses in rural Uganda

#### Target Audience

registered nurses and other interested health care givers.

#### Abstract

In order to investigate the lived experience of nurses in rural Uganda this qualitative study was conducted in the summer of 2014. The researcher traveled to three bush villages in rural Uganda and interviewed seven nurses working in community clinics until data saturation was achieved. The interviews were taped and transcribed, then analyzed for themes. Three major themes emerged. Nurses in rural Uganda maintain a positive outlook in spite of harsh realities, they persevere out of a desire to help others, and they perceive nursing to be a notable and respected career in their country. The results relating to overall work satisfaction are interesting in the context of third world conditions.

## F 26 - Culturally Diverse Health Practices

### Secondary Analysis of Cultural Domains among Filipino Nursing Students

---

*Mariquit C. Hadwiger, MS(N), RN, USA*

*Stephen C. Hadwiger, PhD, MS(N), RN, USA*

#### Purpose

The purpose was to describe the cultural domains of communication, family, pregnancy & childbearing, spirituality, and death rituals according to cultural assessments completed by nursing students during a study-abroad program in the Philippines.

#### Target Audience

The target audience of this presentation is clinical or faculty nurses working with the Purnell Model for Cultural Competence.

#### Abstract

The purpose of this study was to describe the commonality and variability within cultural domains of communication, family roles & organization, pregnancy & childbearing, spirituality, death rituals, and health practices according to cultural assessments completed on Filipino nursing students during a study-abroad program in the Philippines.

During a study-abroad nursing program in the Philippines, nursing students from the United States were required to complete a cultural assessment of a Filipino based on questions from Purnell's Model of Cultural Competence. Being paired with Filipino nursing students, all American students completed their assignments interviewing their Filipino partners. Having reviewed these narrative cultural assessments from the past two years, the authors requested IRB permission from Truman State University to conduct a qualitative secondary analysis, using a template approach based on the cultural domains from Purnell's Model of Cultural Competence.

From cultural assessments of 25 Filipino nursing students representing the Visayan culture around Iloilo City, the authors mapped out commonalities and variations in cultural beliefs and practices according to categories constructed from Purnell's domains of communication, family roles & organization, pregnancy & childbearing practices, death rituals, spirituality, and health practices. Comparisons between informants' primary characteristics of culture for gender and religious affiliation were made of the variations in cultural beliefs and practices.

The authors concluded that variability of cultural beliefs and practices existed in these domains among a fairly homogeneous sampling of Filipinos (young, educated, nursing students, Visayan).

## F 26 - Culturally Diverse Health Practices

### Transitions of South Sudanese Refugees: Reaching for a Better Life in America

---

*Rebecca Randall, EdD, RN, USA*

*Paula Carson, PhD, RN, TNCC, CCRN, ACLS, USA*

*Thomas E. Stenvig, PhD, MPH, RN, NEA-BC, USA*

*Marlys J. Bohn, PhD, RN, CNL, USA*

#### Purpose

describe the transition process of former refugees from South Sudan upon resettlement. Participants will learn how a grounded theory was developed to describe this process. Participants will have improved understanding of the challenges encountered by refugees.

#### Target Audience

nurses who work with refugees, community health nurses, and researchers. This presentation will provide insight for nurses who work with refugees. It will also be of interest to nurse researchers who seek to better understand the transition process and a grounded theory approach.

#### Abstract

A qualitative approach was used to develop grounded theory that describes the transition process of South Sudanese refugees who have resettled in the United States. Three focus groups, attended by a total of 18 participants, explored the transition process. The data was analyzed using constant comparative methods which included open, axial, selective, and theoretical coding. Results indicated that brought beliefs, expectations, and abilities conflicted with the reality of resettlement, including social and cultural aspects of the resettlement process. Former refugees identified reaching for a better life amidst the clash of being understood and understanding. Resources from others and losses and gains influenced the ability to navigate within the new environment. Results from this study help to understand the life transitions of former South Sudanese refugees as they resettle in the United States. These findings provide opportunities for further community participatory research and implications for health and social services program design to meet the needs of former South Sudanese refugees.

## F 27 - Maternal Best Practices

### Continuing Professional Development in Maternal Health Care: Barriers to Applying New Knowledge and Skills in the Hospitals of Rwanda

---

*Germaine Tuyisenge, MA, BSc, NA, Canada*

*Yolanda B. Babenko-Mould, BScN, MScN, PhD, RN, Canada*

*Isaac Luginaah, PhD, MSc, MES, BSc (Hons), Canada*

#### Purpose

The purpose of this presentation is to present the results of a study conducted to explore the barriers that hospitals face in their efforts to get health professionals to apply the knowledge and skills learned from the maternal health in-service training into practice

#### Target Audience

The audience of this presentation is : maternal health researchers, clinical nurse educators, clinical maternal health educators, continuing professional development providers and administrators involved in in-service training

#### Abstract

Improving maternal health, the fifth United Nations' Millennium Development Goal, is one of the main health concerns of many developing countries, where 90 % of the world's maternal mortality occurs (World Health Organization [WHO], 2010). Very few countries will achieve the target of reducing maternal mortality by two thirds, as set to be achieved in the year 2015 (WHO, 2010). However, nations such as Rwanda rank among the countries that have made significant efforts to reduce maternal mortality. The United Nations Population Fund (2012) reports that the maternal mortality rate for Rwanda fell from 1071 deaths per 100,000 live births in the year 2000 to 750 deaths in 2005, then to 540 in 2008 and further decreased to 383 in 2010.

Strategies that were used to reduce maternal deaths in Rwanda include the training of maternal health professionals. The emphasis has been put on educating health professional students during their pre-service education. Such strategies appear to be making a significant impact in Rwanda. The WHO (2010) states that the proportion of births assisted by formally educated healthcare providers in Rwanda has increased from 26.7 percent in 2000 to 38.6 percent in 2005 and to 69 percent in 2010. Unlike pre-service training and its efforts of facilitating the empowerment of graduating health professionals in Rwanda, similar efforts are being enacted to strengthen in-service training for healthcare providers who focus on maternal, newborn, and child health. In 2009, the WHO indicated that health professionals need to acquire new skills to manage pregnancy-related complications, and that educational efforts should focus on continuing professional development programs (CPD).

In a number of African nations, CPD has been formalized and the oversight is directed by medical, nursing, and midwifery councils (Arunachalam, 2009; Gallagher, 2007). In South Africa, nurses believe that CPD needs to be embedded into professional practice at an organizational and personal level in order to address changing health issues within the country (Arunachalam, 2009). In Ghana, CPD has been cited as a factor in nurses' consideration of selecting staff positions in rural settings (Kwansah, et al., 2012). In this case, CPD could be seen as an intervention to support a more equal distribution of human resources in a nation and hence improve health care quality.

The Maternal, Newborn and Child Health in Rwanda (MNCHR) project was initiated in 2011 and continues until April, 2015. This project has been funded by the Canadian International Development Agency and one major aim was to provide CPD education programs to health professionals involved in the care of women and newborns. The Advanced Life Support in Obstetrics (ALSO) course is one of the education programs that was provided to health professionals (nurses, midwives, physicians) in nine hospitals of the Eastern Province in Rwanda. For each of the participating hospitals, nine health professionals were educated in a 'train the trainer mentorship approach. ALSO training aims to equip

health professionals with adequate knowledge and skills to effectively manage obstetrical emergencies. Given that the WHO (2009) reports that among countries with critical maternal health care; only 22% of them have near to sufficient number of midwives with adequate training to provide appropriate maternal health care and that only 18.5% maternal health providers are equipped to provide obstetrical emergencies, it was deemed imperative to facilitate education initiatives that could be sustainable through ongoing mentorship. It has been demonstrated that well-educated midwives working in a well-systematized health system can offer up to 90% of needed maternal health care, reducing maternal deaths by two-thirds (Campbell & Graham, 2006).

**Purpose of the study:** The research literature on CPD for health professionals in Africa in general, and particularly in sub-Saharan Africa is limited in nature, which might be attributed to factors such as limited resources to carry-out CPD related research. Little is known about the barriers to the success of CPD related activities. The purpose of this study was to explore the barriers that hospitals face in their efforts to get health professionals to apply the knowledge and skills learned from the ALSO CPD training into practice.

**Methods:** This research used a mixed methods approach with primary data collected by the researcher in the hospitals of the Eastern Province of Rwanda, where ALSO CPD was provided. This includes qualitative data involving sixteen purposive interviews with ALSO trainees (nurses, midwives and physicians). Descriptive quantitative data on turnover of ALSO trainees was obtained from hospital directors. The turnover of interest for this study was from the period of October 2012 to June 2014, corresponding to the period ALSO training have been running in the hospitals of the Eastern Province.

**Selection of study population:** To arrange interviews with ALSO trainees, information about the study was circulated through the hospital administrators, who then shared the study information with health professionals. Those who expressed an interest in participating in the study called or emailed the researcher, and a meeting time was set up for individual interviews. To arrange interviews with hospital directors, an information meeting was scheduled with each of them to explain the purpose of the study. Thereafter an interview date was scheduled for those who accepted to participate in the study.

**Study procedures:** Qualitative data were gained using semi-structured interview guides that included open-ended questions to elicit views from ALSO trainees about barriers to apply ALSO related knowledge and skills into practice. The interviews proceeded in a conversational manner to facilitate open dialogue. Interviewees were given the option to answer in English, Kinyarwanda or French, depending on which language they are more comfortable with. The interviews were audio recorded with the participants' permission, and were approximately 30- 45 minutes in length. Interviews took place in a room that was provided by the hospital.

Quantitative data were obtained from hospital directors, using a short questionnaire. They were asked information on: the total number of ALSO trainees, the number of those who have left from the time the training was provided until the time of the interview and the reasons of turnover.

**Ethical considerations:** Ethical approvals to conduct this study were obtained from the Research Ethics Board in Rwanda. Oral and written informed consent was obtained from the participants immediately prior to involvement in the interview or completing the study questions.

**Data analysis:** For qualitative data, the audio recordings were transcribed verbatim, translated as required into English by the researcher prior to coding. Each participant's data was assigned an ID number that was used for analytical purposes. Initial coding of transcripts was done by the researcher engaging in reflection and highlighting key data (Prince, 2008). Data analysis involved line by line, open, and axial stages of coding in a constant comparative, iterative manner to capture emergent themes. Data management and analysis were supported by NVIVO™ software. For quantitative data, the Basic Quantitative Analysis program with Excel was used. Data on turnover were gathered and grouped into three variables (Total number of ALSO trainees, total number of turnover and reasons for turnover).

**Results:** Results from this study showed that ALSO trainees felt that they did not receive enough opportunities to apply their new knowledge and skills after the CPD education. This is due to working on the rotation shifts basis, which results in not spending enough time in maternal health care services for any lengthy period of time. Due to limited means, the ALSO course was offered to only nine health professionals per hospital. In addition to this limitation, ALSO participants did not get the opportunity to train their colleagues to share the knowledge among additional health professionals. With this situation, only ALSO participants could practice related knowledge and skills when they were appointed to work in maternal health services. Participants revealed that when they did not work in maternity services, they forget the new practices and reverted back to their routine form of care by the time they are reappointed to the maternity services. Results of this study also showed that 45 of 72 ALSO trainees from the study participating hospitals had moved to other work placements. The reasons of turnover were: higher studies (n=19), better position (n=12) and other reasons (n=14).

**Implications and Recommendations:** It is important for those delivering maternal health education to create sustainable mentoring systems that could help to strengthen the application of ALSO knowledge and skills in hospitals to improve maternal health. Measures that could give ALSO participants the opportunities to apply the related knowledge and skills include: expanding ALSO education to many health professionals and having an adequate mentorship of ALSO participants, formalize ALSO CPD into hospital in-service programs, and develop enhanced health professional retention strategies.

## F 27 - Maternal Best Practices

### Developing a Research Focus in Implementing Continuous Support during Labour as Best Practice

---

*Karin C. S. Minnie, PhD, RN, RM, South Africa*

*Hester C. Klopper, PhD, MBA, RN, RM, FANSA, South Africa*

#### Purpose

to describe the development of a focused research programme.

#### Target Audience

academics who need to develop focused research programmes. Clinicians interested in research about implementation strategies. Clinicians interested in research about continuous support during labour.

#### Abstract

**Purpose:** The purpose of this presentation is to describe the development of a focussed research programme in a LMIC. It is expected of researchers to establish focussed research, however in LMIC this is a challenge due to vast needs for development and capacity building. This presentation will describe the process followed in a supported project to assist researchers to develop focussed research programmes.

**Problem statement:** Nurse researchers in LMIC often find it difficult to do focussed research. Several challenges exist amongst others that nurse researchers often have to supervise postgraduate students from a variety of nursing fields because of limited experienced supervisors; lack of recognition of researchers from other disciplines who do not have to be 'generalists'; and lack of available resources – financial and human. . A further challenge is that nursing schools in LMIC need to develop their research agenda's to embrace research as a critical element of their core activities.

**Methods:** The Forum for University Nursing Deans in South Africa (FUNDISA) and the South African National Research Foundation (NRF) identified the need to develop nursing schools to be more research intensive and in the process assist upcoming nurse researchers at universities to develop focussed research programmes. The PLUME project was developed as intervention to build research capacity both for nursing schools and for identified lead researchers.

This presentation describes the establishment of the research programme 'Knowledge to action strategy to facilitate continuous support during childbirth'. Continuous support during labour is an example of a best practice for which the evidence is clear but which is still not universally implemented. A research programme was developed where different aspects of the programme could build on each other and in which a number of students could contribute.

**Conclusions:** The impact of the PLUME program to develop a focussed research programme enabled the researcher to assist other researchers in the nursing school to develop or adjust their own research programmes to be more focussed. If their research programmes are developed early in their academic careers, researchers have a better opportunity to be recognised as a quality researcher. The specific research programme has the potential to make a difference in practice and improve the quality of care women receive during childbirth.

## F 27 - Maternal Best Practices

### The Relationship between Vitamin D Levels in Pregnancy and Blood Glucose at the Gestational Diabetes Screening

---

*Jeanine L. Senti, MSN, BSN, APRN-BC, IBCLC, CNS, USA*

#### Purpose

Vitamin D has been shown to influence glucose metabolism in the non-pregnant population. The purpose of this presentation is to present the findings of original research which examined the relationship between vitamin D at three points during pregnancy and the blood glucose level at the routine gestational diabetes screening.

#### Target Audience

The target audience of this presentation is perinatal researchers and clinicians interested in improving health of mothers and their offspring, especially those looking at hyperglycemia in pregnancy and/or vitamin D.

#### Abstract

Hyperglycemia during pregnancy is associated with adverse maternal and fetal outcomes so interventions which can reduce this harm are needed. Hypovitaminosis-D has been associated with impaired glucose metabolism in the non-pregnant population but there are conflicting results on the effect of vitamin D on glucose metabolism in pregnancy. The key research question is if vitamin D influences glucose homeostasis in pregnancy when controlling for the known confounding variables of body mass index (BMI) and maternal age. This prospective study used a convenience sample of 52 nulliparous women. Serum vitamin D levels were obtained through laboratory measures at three predetermined points during pregnancy. The medical record was utilized to obtain the blood glucose result from the routine gestational diabetes screening, BMI, and demographic information. Eighty-five percent of the participants had hypovitaminosis-D during pregnancy and vitamin D levels did not statistically improve even though all reported taking a daily prenatal vitamin with the recommended amount of vitamin D. There was no evidence of a statistically significant relationship between vitamin D levels at any of the three points and the blood glucose levels when controlling for the known confounding variables of BMI and age (R square .084, .071, and .075 respectively). However, the high percentage of hypovitaminosis-D resulted in inadequate variance in this sample to show the differences. There was a statistically significant correlation among the three vitamin D levels ( $p=0.01$ ). There was a statistically significant relationship between BMI and the first ( $p=0.05$ ) and second ( $p=0.05$ ) vitamin D levels. The findings suggest that 1) the amount of vitamin D in prenatal vitamins is inadequate to improve serum vitamin D levels during pregnancy, 2) women with a higher BMI need additional vitamin D during pregnancy, and 3) there is a need for further research on this topic.

## G 16 - Roles of the Nurse Educator

### Teaching Nursing Leadership in Liberia

---

*Magdeline C. Aagard, BAN, MBA, EdD, RN, PHN, USA*

#### Purpose

to provide insight into the cultural context of teaching leadership for nurse educators in Liberia.

#### Target Audience

nurse leaders and educators interested in transcultural nursing contexts.

#### Abstract

Teaching nursing in a global context necessitates an understanding of the material being taught, as well as an understanding of the cultural context. Liberia's civil war ended 10 years ago, but the impact is still felt in the challenges in the healthcare infrastructure (Varpilah, Safer, Frenkel, Baba, Massaquoi, Barrow, 2011). Liberia's health care and nursing infrastructure was woefully understaffed and new nursing educational institutions are continually opening to meet these needs (Flomo-Jones, n.d.). The nursing educators in Liberia are typically diploma or bachelor's prepared, with a lack of master's prepared nursing faculty and no doctorally prepared faculty (Flomo-Jones, n.d.).

The Master's in Nursing Education (MSN) program at Mother Patern College of Health Sciences in Liberia was developed to increase the educational foundation of nurse educators in Liberia. The Master's program began in 2012 with the first of three cohorts, the most recent finished in June, 2014. Approximately 50 nurse educators have completed the MSN program and returned to their nursing schools to improve education in the country.

The MSN curriculum was developed by doctorally prepared nurses in the US who adapted their courses to the Liberian context. The leadership and management in nursing course entailed significant adaptation based on the Liberian nursing leadership context to assure the development of strong culturally appropriate leadership skills (Rowe, Brilliant, Cleveland, Dahn, Ramanadhan, Podesta and Bradley, 2010). Though nurses provide a significant amount of the healthcare in Liberia, it is still seen as a low ranking profession. Nurses are mostly female, though the numbers of men in the profession is growing. Nurses do not hold Ministry of Health and Social Welfare positions, nor county health positions, these are all held by medical doctors. Leadership for nurses in Liberia needs to come from cohesion and support of those in the profession. The leadership and management course was tailored to facilitate learning to work together. Evaluating the cultural context relevant to each course was critical to creating a transculturally appropriate curriculum.

A variety of leadership theories were taught through lecture, powerpoint as well as group activities. The group activities were created to foster cohesion among the cohort that could be transferred into their workplace on their return (Rowe, Brilliant, Cleveland, Dahn, Ramanadhan, Podesta and Bradley, 2010). Examples of activities included developing criteria for nursing school accreditation; expanding the role of the Liberian Nurse and Midwifery Association; advancing nursing school programs from diploma to bachelor's degree and improving the role of the Chief Nurse of Liberia to a position on the cabinet of the Ministry of Health and Social Welfare. Subsequent to the completion of their coursework, graduates have taken up roles in the President's Task Force for Ebola, the Ministry of Health and Social Welfare Ebola Education and Training, as well as within the Ebola Treatment Units. With the loss of healthcare workers to Ebola, the leadership role of the nurse has become even more critical.

## G 16 - Roles of the Nurse Educator

### Facilitating Reflective Learning in Students: Understanding the Role of the Nurse Educator

---

*Peggy K. Naicker, MA (HlthSc), AdvDipNursEd, DipICU, BSoc (Nur), RN, CCRN, South Africa  
Gisela H. Van Rensburg, D Litt et Phil, MA Cur; BA Cur(Hons); BA Cur, General nurse (RN), Midwife,  
Community nurse, Psychiatric nurse, Nurse educator, Nurse manager and Orthopaedic nurse, South  
Africa*

#### Purpose

the purpose of the presentation is to increase the understanding and knowledge of nurse educators in preparing students to become reflective nurse practitioners in the modern healthcare setting.

#### Target Audience

The target audience of this presentation are educators, leaders and managers of education institutions especially in the field of nursing. The presentation will also be of interest to researchers focussing on the role of reflection in nursing.

#### Abstract

Modern healthcare is characterised by frequent change, high turnover of patients, various disease profiles and treatment modalities as well as limited staffing and resources available. The nursing professional practicing in this environment has to be flexible, resilient and dynamic to remain competent and provide quality nursing care. Current literature supports the use of reflection by nursing professionals to help them adopt, adapt and align practices. A quantitative, explorative, descriptive study was conducted in nursing education institutions in one of the nine provinces in South Africa. A total of 121 nurse educators completed a structured questionnaire. The findings revealed that, although nurse educators agree with the importance of reflective practices in the teaching and learning environment they do not necessarily place emphasis on developing their own reflective practices. Reflective learning was not identified as a formal learning approach in the programmes the nurse educators facilitated but the educators did attempt to include reflection in the teaching and learning activities planned. Not enough emphasis is placed on the creation of a teaching and learning environment that will enhance reflection in a non-threatening context. The deeper understanding of reflective learning comes with continued personal reflective practices. Nurse educators should be taught how to facilitate reflective learning activities and how to create an environment conducive to reflection. Through reflective teaching practices students could be supported in developing into critical thinkers hence reflective learning should be a formal teaching and learning approach in nursing curricula.

## G 16 - Roles of the Nurse Educator

### From Bedside Care Expert to Novice Educator: Perceptions of New Nurse Educators

---

*Kathy Jean Roth, MSN, BSN, RN, USA*

#### Purpose

The purpose of this presentation is to illustrate perceptions of nurses who recently transitioned to the nurse educator role. This presentation will provide insights of transitions to the nurse educator role. This information may facilitate role transition for future nurse educators and may help alleviate the shortage of nurse educators.

#### Target Audience

The target audience of this presentation is nurses who are transitioning into the role of nurse educator. It also offers insight for the academic institutions who provide nurse educator graduate degrees and institutions who hire new nurse educators.

#### Abstract

Few studies address nurses' perceptions of the transition from the role of staff nurse to the role of nurse educator in an academic setting. Understanding how nurses make the transition from the role of staff nurse to the role of nurse educator is an area that needs to be studied. While the role of nurse faculty member can be very rewarding, it can also be a very challenging and daunting role, especially for new faculty members. The nurse faculty shortage is an ongoing and future problem. The shortage of nurse faculty is established as a reason that schools turn away undergraduate nursing applicants. Addressing the faculty shortage may help to alleviate the nursing shortage. The purpose of this study was to explore the perceptions of a sample of newly employed nurse educators regarding their transition from the role of staff nurse to the role of nurse educator in an academic setting. The theoretical framework for this study was the concept model of novice to expert by Patricia Benner. This study utilized the qualitative research design of phenomenology. Semi-structured interviews were conducted. The sample consisted of six nurses who had worked less than three years in academic settings and worked at least 30 hours per week as nurse educators. The Master's prepared nurses graduated from three different nurse educator programs and were employed by four different undergraduate nursing programs. Three major categories that were derived from the interview data included: The Interest Is Sparked, Realities of the Nurse Educator Role, and Recommendations for Success for Others Who Become Nurse Educators in Academic Settings. The majority of interviewees indicated that they had positive attitudes toward educating students and acting as preceptors while they were staff nurses. They became interested in becoming nurse educators because of these experiences. After becoming nurse educators, the participants then experienced positive aspects, as well as challenges which seemed overwhelming at times, related to the nurse educator role. The interviewees readily gave recommendations for improvements for nurse educator graduate curricula and for employers to help others transition to the role of nurse educator in academic settings. Recommended changes to both graduate curricula and orientation programs for academic institutions that hire new nurse educators were formulated. Recommended changes for graduate education programs to better prepare prospective nurse educators include: more time spent in classroom settings, more extensive job shadowing experiences, and increasing opportunities to assimilate the multi-faceted role of the professional nurse educator. Recommended changes for the academic setting include incorporating a formal orientation process for new nurse educators, and providing mentoring experiences for new nurse educators. Equally important in the academic setting for new nurse educators is the ability to teach class content that is familiar to the new educator, and the ability to teach the same class content each year if they choose. This information can improve the transition for new nurse educators in academic settings. Implementation of these measures may help decrease the ongoing and pending shortage of nurse educators; addressing this transition could positively, though indirectly, impact the current and future staff nurse shortage.

## G 17 - Keeping the Lines of Communication Open: Interprofessional Teams

### Team Communication and Collaboration: Debriefing after Acute Obstetric Clinical Events

---

*Suzanne Lundeen, PhD, RNC-OB, NEA-BC, USA*

*Maureen S. Padilla, DNP, RNC-OB, NEA-BC, USA*

*Monique Rhodes, MSN, BSN, RN, USA*

#### Purpose

The purpose of the presentation is to discuss the effects of inter-professional team debriefing after acute obstetrical events on the safety attitude of the health care workers. Safety attitude includes: teamwork climate, safety climate, job satisfaction, perceptions of management, stress recognition and working conditions.

#### Target Audience

The target audience of the presentation are clinicians, administrators, policy makers and educators seeking data and descriptions of successful implementation of evidence-based methods to improve inter-professional collaboration.

#### Abstract

**Intro/Background:** In 1999 The Institute of Medicine released To Err is Human and healthcare institutions and organizations began developing processes to improve patient safety. Creating a culture of safety begins with effective teamwork and communication. Root cause analyses of poor obstetrical outcomes have linked poor organizational culture and communication to perinatal death and injury. Formation of effective teams has become a priority in healthcare and debriefing after acute clinical events is a highly regarded tool for team building that has been shown to have a positive impact on teamwork.

Highly reliable industries such as aviation and the military developed debriefing to improve team performance and safety. Pioneers of debriefing use in medicine taught and encouraged debriefings for simulation and real patient care events. Debriefing after simulation scenarios has become the gold standard and sufficient literature exists on this topic. However, only a few studies have revealed the outcomes of debriefing real-time events.

Prior researchers have studied the effects of debriefing using checklists and facilitated feedback with residents in an ICU setting and reported that the debriefing process was helpful and resident performance had improved. Researchers have also studied team learning in the adoption of minimally invasive cardiac surgery, and debriefings were seen as one of the key success factors of the surgical team because they yielded the fastest learning curve and best clinical outcomes. Debriefings were also studied in the Labor and Delivery setting and those results revealed that team debriefing after obstetric hemorrhages resulted in a 33% decrease in massive transfusions and a 78% decrease in unplanned hysterectomies.

Although there is limited literature on the topic of real patient care debriefings, available evidence suggests that debriefings have the potential to improve collaboration, communication and patient safety. The site of this research study is a large, safety-net academic facility which average approximately 350 deliveries a month. Of those deliveries, 50% are considered high-risk deliveries (trial of labor after cesarean section, hypertensive disorder of pregnancy, diabetes, placenta previa, etc). Furthermore, the facility serves as the primary teaching institution for Obstetricians, OB Anesthesiologists, Neonatologists, Medical Students and Nursing Students. The practice environment includes Emergency Room residents, Family Practice residents, Neonatology fellows, Maternal-Fetal Medicine fellows and Certified Nurse Midwives. Because Individuals can often learn better as active participants responsible for their own learning, engaging in debriefings provides opportunities for these professionals to develop the ability to critically analyze their performance retrospectively.

The purpose of the IRB approved study was to examine the effects of debriefing after acute obstetrical events on the safety attitude of the health care workers. Safety attitude is a 'snapshot' of the safety culture from the perception of the frontline healthcare worker. Safety attitude includes the following dimensions: teamwork climate, safety climate, job satisfaction, perceptions of management, stress recognition and working conditions.

**Methods: Setting/Participants:** The longitudinal study took place over 13 months. Participation in the study was voluntary; all staff within the clinical areas that either influence or are influenced by the working environment were invited to participate. Inclusion criteria included working in the labor and delivery unit for at least one month. Potential participants included: registered nurses, unlicensed staff, respiratory therapists, OB/GYN faculty and residents, Maternal Fetal Medicine faculty and fellows, Anesthesia faculty and residents and Neonatology/Pediatric faculty and residents. There were no exclusion criteria based on age, race, ethnicity or gender.

Prior to designing the study, the Chief of Obstetrics, OB-Anesthesia and Neonatology were included on discussions and agreed to the plan to implement team debriefings to promote teamwork and a culture of safety. Prior to IRB approval, the study received approval from the Senior Nurse Executive Council.

**Research Design:** A descriptive, correlation design was chosen for this study. At the onset of the study, the safety attitude of participants was measured and then the intervention of inter-professional team debriefing was implemented. The safety attitude of the participants was measured again at six months and one year after the intervention was implemented. Safety attitude was assessed using a validated tool, the Safety Attitudes Questionnaire – Labor and Delivery (SAQ- L&D). The SAQ-L&D has 57 items and demographic information; the six constructs measured by the SAQ – L&D include: teamwork climate, safety climate, job satisfaction, perceptions of management, stress recognition and working conditions.

Reliability of the Safety Attitude Questionnaire has been reported in literature as robust, with a p value of 0.90; the internal reliability of the SAQ-L&D version is adequate with a p value of 0.78. To maximize response rates, the instrument was distributed to all potential participants electronically. The study consent was on the first page of the electronic survey and to begin the survey, each participant "agreed" to participate in the study. The electronic survey included instructions that participants could decline to answer any, or all, questions. The notice also

provided a statement to assure participants that responses were anonymous, as results are reported in aggregate.

**Procedure:** Debrief training occurred in October 2013 and was based on the teamSTEPPS philosophy. The training objectives included:

1. Identify appropriate situations for obstetric debriefings.
2. Identify who participates in debriefing.
3. Discuss the debrief "checklist".
4. Demonstrate debriefing as a facilitator (simulation)
5. Demonstrate documenting the debriefing record.

The debrief facilitators include 14 Registered Nurses; members of nursing leadership and nurse clinician bedside leaders.

Upon IRB approval, potential participants were recruited via an introductory e-mail beginning November 1, 2013 (T1), May 1, 2014 (T2) and November 15, 2014 (T3). The introductory e-mail and all subsequent communication to participants was sent from the Administrative Director, Research & Sponsored Programs to remove the risk of coercion to participate as the PI and co-investigators have leadership roles with the potential participants.

Beginning November 15th, team debriefings occurred after acute obstetrical events, including but not limited to: shoulder dystocia, hemorrhage, cord prolapse, acute placenta abruptio, emergent (stat)

cesarean section, breach vaginal delivery, maternal respiratory or circulatory collapse and neonatal code. Information regarding team debriefing was disseminated to all staff that work in Labor and Delivery through their supervisor.

Debriefing takes approximately 5-10 minutes and is conducted as closely as possible to the time of the critical event. The debrief facilitator documented the debriefing on the "debrief checklist"; the PI collected lists and tracked the events. In situations of high patient census and/or high patient acuity, available staff attended the debriefing. As a reminder and to encourage active participation, posters with the debriefing process were placed in high traffic areas.

**Results:** Responses were received from 51/258 of health care workers in T1 (19 % response rate), 86/258 in T2 (33 % response rate) and 39/258 in T3 (15 % response rate). Mean scores were compared by ANOVA and percent-positive scores by chi-square. Overall, factor scores were moderate to high across all factors (range across administrations: 43.4–74.9 mean scores, 25-85 percent positive). Mean and percent-positive scores did not differ significantly across the three administrations. The dimensional positive scores were found to be average to high on T1 and T2 administrations, T3 dimensional positive scores were found to be low to average. The lowest positive scoring dimension on all three administrations was "stress recognition" (28%). The dimensions of "job satisfaction" and "teamwork climate" generated the highest percent positive scores (60%).

**Conclusion:** The perception of the safety culture of healthcare workers that participated in this study did not change significantly over time after implementation of inter-professional debriefings. However, the research intervention of inter-professional team debriefing did lead to actionable initiatives. Once such initiative was developing and implementing an obstetric emergency response team with a goal to improve communication and teamwork during an obstetrical emergency.

Effective teamwork is a necessity for safe care in high-risk settings such as Labor and Delivery where transition to an emergency is quick. Utilizing debriefings can help structure communication and increase inter-professional team predictability. Consistent use of debriefings is one way to embed desired professional behaviors and improve safety culture for all members of the team. Also, debriefings can provide a method for all team members to have a voice in reliable delivery of safe patient care.

# G 17 - Keeping the Lines of Communication Open: Interprofessional Teams

## Nurses Work Engagement in Medical-Surgical Services in Portugal

---

*Aida Cruz Mendes, PhD, MsC, RN, MsC, Portugal*

### Purpose

The purpose of this presentation is to describe the perception of the nurses of medical-surgical services of Portuguese hospitals regarding the work engagement levels and their association with some socio-demographic and professional variables.

### Target Audience

The target audience of this presentation are nurses managers and teachers

### Abstract

**Background:** Work engagement may be defined as a persistent, positive, work-related affective-cognitive state of mind that is characterized by vigor, dedication and absorption. Studies have shown that the organizations with high levels of engagement among their employees usually have better quantitative and qualitative results, as well as higher levels of satisfaction, health and well-being of their clients and employees. Nevertheless, broader studies are still required, particularly in the nursing field.

**Objective:** To describe the perception of the nurses of medical-surgical services of Portuguese hospitals regarding the work engagement levels and their association with some socio-demographic and professional variables.

**Material and Methods:** A cross-sectional, analytical, observational, quantitative study was conducted with a sample of 2235 nurses of adult medical-surgical services of 31 Portuguese Hospitals. Data were collected using the Utrecht Work Engagement Scale (UWES) and a socio-demographic questionnaire, and analyzed using analytical and descriptive statistics.

**Results:** The participants showed mean levels of engagement; however, different levels were found between regions, hospitals and services. A clear difference in age, professional experience and gender was also observed. Female nurses showed significantly higher levels of work engagement ( $p \leq 0.01$ ), as well as individuals at the extremes of the age groups and professional experience.

**Conclusion:** Despite the high mean levels of engagement, the differences observed between regions, hospitals and services reveal the importance of organizational conditions in explaining this phenomenon. On the other hand, given that this sample was mostly composed of females and that the critical years to decrease engagement coincide with the life stages in which there may be more conflicts regarding to the performance of familiar and professional roles, the clear differences in age, professional experience and gender regarding the levels of engagement should receive special attention from the various institutions providing nursing care and the leaders of the profession. Longitudinal studies on cases of success/failure and in other care settings should be developed.

## G 18 - Culturally Diverse Health Behaviors in the Diabetic Patient

### Sugar in the Blood: The Meanings of Diabetes among Newly Arrived Filipinos in the United States

---

*Reimund Serafica, PhD, MSN, RN, USA*

*Susan Lane, PhD, MSN, RN, USA*

#### Purpose

The purpose of this presentation is to educate the audience on the following: 1. To describe the meanings of diabetes as defined by the recent Filipino immigrants. 2. To describe healthy lifestyle, and barriers to healthy lifestyle as described by the recent Filipino immigrants.

#### Target Audience

The target audience for this presentation are practitioners, researchers, and educators that provides culturally appropriate interventions to recent immigrants.

#### Abstract

Background: The prevalence of type 2 diabetes mellitus (T2DM) is increasing in the United States, particularly among immigrant populations. Primary prevention programs for diabetes must be designed to address the cultural beliefs of the populations they target. Little research has investigated the beliefs of those immigrants who do not have T2DM. Filipinos are at high risk for developing diabetes, especially T2DM. There is a need to highlight in improving diabetes management and prevention with efforts in primary prevention among those at risks for developing T2DM.

Purpose: The purpose of this qualitative ethnography study was to explore the knowledge, perception, and beliefs of newly arrived Filipino immigrants about T2DM, healthy lifestyle, and perceived barriers to healthy lifestyle.

Theoretical Framework: The theoretical framework for this study was based on Leventhal's illness representative model. This illness representation model was developed in an attempt to understand people's cognitive representation of the nature of the threat. It was the illness representation model of self-regulation that provided the understanding of perceptual factors in response to a wide variety of chronic illnesses such as T2DM.

Research Design: This qualitative descriptive ethnography study used face to face interviews, which were conducted using an interview guide. No further interviews were conducted after data were saturated. The data sources were field notes and audio-recorded interviews, which were transcribed verbatim by the researcher. A sample of newly arrived (less than six years in United States) first generation Filipino immigrants (N=46), not diagnosed with T2DM, living in southeastern part of United States was used in the study. This study complied with the protocol for human subjects protection as obtained from the institutional review board. Content analysis was conducted using the NVivo 8 software. Prior to analyses of the transcripts, each transcript was read at least twice and compared to the recordings to ensure accuracy and completeness. To ensure trustworthiness, selected transcripts were reviewed and coded by two experience qualitative ethnography researchers to ensure intercoder reliability.

Results: A significant number of the participants had little knowledge and few beliefs about T2DM. The perceptions of T2DM were varied, but several beliefs were widely held: (a) T2DM is a "sugar disease" that is based on sweet food intake, (b) T2DM can result from several factors, including strong emotions and lifestyle characteristics (an unhealthy diet, not taking care of oneself), (c) beliefs about strong emotion and the importance of blood are related to diabetes causes, symptoms, and treatment, and (d) a major and undesirable outcome of T2DM is weight gain. One of the major findings in this study was the low diabetes literacy among the participants.

Conclusions/Implications to Nursing: Although immigration brings opportunities, there are also numerous risks. Some of the diabetes beliefs that this study delineates provide anchors for future culturally appropriate intervention programs for recent Filipino immigrants. Immigrants with low diabetes literacy may have lower awareness of the disease condition, which may have a negative impact on their disease prevention behaviors. Migratory background is also an important factor in influencing beliefs about disease prevention in a diverse community. These results provide information for the design of health programs within the context of global health and nursing for the prevention of T2DM.

## G 18 - Culturally Diverse Health Behaviors in the Diabetic Patient

### Do Older Hispanic Diabetics Use the Internet for Health-Related Information?

---

*Kathleen Nokes, RN, PhD, FAAN, USA*  
*Judith Aponte, RN, PhD, USA*

#### Purpose

The purpose of this presentation is to describe a mixed methods research study that explored experiences of older Hispanic diabetics (N=20) and use of the internet to access health-related information. Studies show that Hispanics seem to use the internet for health-related information less than other racial/ethnic groups.

#### Target Audience

The target audience of this presentation is researchers and clinicians who are interested in learning more how different ethnic groups use the internet to access health-related information.

#### Abstract

Diabetes is a major cause of morbidity and mortality and a growing public health concern. In 2012, Hispanics comprised 16.9% of the total 313.9 million US population; and 12.8% had diabetes. Persons with diabetes and limited health literacy have worse health outcomes since they have less knowledge about their diabetes, difficulty in reading medication labels, and a poor understanding on ways to better management their health. Health literacy influences a person's ability to engage in self- management and the internet can be a resource for providing diabetes-related information for people to self-manage their diabetes more effectively.

The purpose of this mixed methods descriptive study was to provide insight about older Hispanics' with type 2 diabetes use of the internet to access diabetes-related information. Inclusion criteria included: 1) residing in East Harlem, a New York City community characterized by poverty and a large Hispanic population; 2) able to access the internet; 3) aged 60 or older; 4) either English or Spanish speaking; and 5) diagnosed with type 2 diabetes.

A convenience sample of 20 Hispanics participated in both phases of the research; the sample was equally divided between men and women; the average participant was 74 years; born in Puerto Rico; preferred to speak in Spanish; lived with diabetes an average of 17 years and took medications to manage their diabetes. Since access to the internet could be an issue, respondents were asked if they had a smart phone with internet access and the average participant had a smart phone for 3 years; made or received 3 calls daily; texted less than once daily; and 75% were either very or somewhat concerned with privacy and texting.

During the quantitative phase, participants completed a demographic (i.e., age, gender, country of origin), diabetes-related information, and smart phone use to access the internet survey along with the E-Health Literacy Scale (e-Heals) which measures comfort and skill in using internet technology for health information. They then participated in the qualitative phase which was a focus group with questions framed around the E-Health literacy items using a diabetes orientation.

The mean score on e-Heals was computed as 22.35 (SD=12.96) with a range from 8 to 40; respondents reported the most difficulty with knowing how to use the Internet to answer questions about their health. Recognizing the small sample size and the descriptive purpose of the research, univariate exploratory analysis were conducted to determine if there were differences in electronic health literacy based on age or gender. No significant differences were found based on age ( $F=.76$ ,  $p=.66$ ) but an independent sample t-test found highly significant differences based on gender ( $t=-2.67$ ,  $df=18$ ,  $p=.015$ ) in that the e-Heals scores of men were significantly lower than those of women (means=13.85 (9.69) and 25.77 (10.22) respectively).

Using applied thematic analysis, five themes were identified from the responses provided by focus group participants who were asked about their experiences with the internet as a source of health-related information. The five themes were: Useful information source; Family and friends help; Complex and confusing; Type words and get information; and Improved self-management.

This research identified significant barriers in accessing the internet for health-related information about their diabetes self-management although all had a smart phone which provided internet access. Older Hispanic men seemed to rely on family and friends rather than search the internet independently. Use of different venues by culturally diverse groups and subpopulations within relatively homogeneous groups based on demographic variables such as gender – and perhaps gender roles – need to be explored in order to optimize the use of technology in populations who could benefit from enhanced self-management strategies but who may lack the technical skills to use available information.

## G 18 - Culturally Diverse Health Behaviors in the Diabetic Patient

### Worry, Psychological Well-Being, and Health Behaviors in Asian and Pacific Islanders with Diabetes

---

*Du Feng, PhD, USA*

*Jillian Inouye, PhD, APRN, FAAN, USA*

*Lorrie Wong, PhD, MS, RN, USA*

#### Purpose

The purpose of this presentation is to investigate the relationship between worry, psychological well-being, and health behaviors in Asian and Pacific Islanders (API) with diabetes, and to compare subgroups (i.e., clusters) of patients based on their levels of and types of worry in terms of psychological well-being and health behaviors.

#### Target Audience

The target audience of this presentation is researchers who are interested in self-management of chronic diseases and practitioners who work with ethnic minority patients (Asian and Pacific Islanders, in particular) with diabetes.

#### Abstract

**Background:** Self-management of diabetes mellitus (DM) involves complex modifications of daily life. Patient education that can increase knowledge of the disease and disease management skills may or may not lead to transformative health behavior changes. One of the barriers to behavior change is patients' worries. People with diabetes have worries about their disease and these are related to worries about being able to carry out family responsibilities in the future, worries about their financial future, worries about weight, and worries about risk for hypoglycemia (Peyrot, Rubin, Lauritzen, Snoek, Matthews, & Skovlund, 2005). Asian Americans tend to score higher on social and diabetes-specific worries; however, investigation into the effects of worry on health has focused primarily on worry's motivational properties and little is known about how worry affects self-management adherence and psychological well-being in various ethnic groups of people with diabetes.

**Objectives:** The purpose of this secondary data analyses was to investigate the relationship between worry, psychological well-being, and health behaviors in Asian and Pacific Islanders (API) with diabetes, and to compare subgroups (i.e., clusters) of patients based on their levels of and types of worry in terms of psychological well-being and health behaviors.

**Method:** The study sample included 197 patients with diabetes, who were enrolled in the ENHANCE project. Baseline data of this two arm randomized controlled intervention trial were used for the current analyses. All patients were Asian American (72%) and Pacific Islanders (28%). Participants ranged in age from 18 and 76 years (M=57.3 years, SD=10.9 years). The majority of the participants were female (54%), married (67%), and had at least some college education (79%). Participants self-reported their worries on two subscales of the Diabetes Quality of Life Scale (DQOL), diabetes specific worries (DW) and social/vocational worries (SW) (higher adjusted subscale scores indicate highest levels of worry on a scale of 0 to 100), as well as Item 16 of the Multidimensional Diabetes Questionnaire (MDQ), which asked to what extent the patient "worry about your diabetes?" (0 = low, 6 = high).

**Results:** Independent t-tests on worry variables by ethnicity indicated that the Hawaiian and Pacific Islanders in the current study experienced significantly higher level of worries than the Asian participants (DW group means were 34.89 vs. 23.82,  $p < .05$ ; SW group means were 20.76 vs. 11.99,  $p < .05$ ; MDQ16 group means were 4.68 vs. 3.88,  $p < .01$  for HPI and Asian patients, respectively). K-means and two-step cluster analyses using DW, SW, and MDQ16 revealed three clusters: 1) Cluster1 (n = 30) consisted of patients who scored high on social and diabetes related worries, 2) Cluster 2 (n = 88) scored low social worries, but high diabetes related worries, 3) Cluster 3 (n = 79) included patients scoring low on social and diabetes related worries. A chi-square test showed significant ( $p < .01$ ) association between

cluster membership and ethnicity: a higher percentage of HPI participants (26.4%) were in Cluster 1 compared to Asian (10.9%), whereas a lower percentage of HPI participant (20.8%) were in Cluster 3 compared to Asian (48.2%). Chi-square tests results further indicated that patients in Clusters 1 are more likely to be a) depressed ( $p < .05$ ), b) so depressed that they “couldn’t function well” ( $p < .01$ ), and c) current smokers, compared to Clusters 2 and 3.

**Conclusion and Discussion:** Findings of this study suggest that levels and types of worry have an effect on psychological well-being (i.e. depression) and self-management adherence (i.e., smoking) among Asian and Pacific Islander patients with DM. In addition, this study supported the understanding that worry perception and impact may differ among ethnic groups (Awang-Hashim, O’Neil, & Hocevar, 2002; Huang, et al., 2009). Future research is needed to examine the effects of worry perception on other psychological well-being and physiological outcomes.

## G 19 - Perinatal Innovations in Healthcare Promotion

### Determinants of Perinatal Food Choices among African-Caribbean Immigrant Women in Canada: A Photo-Voice Study

---

*Josephine B. Etowa, RN, PhD, Canada*

*Helen Vallianatos, PhD, MSc, BA, BSc, Canada*

*Janki Shankar, PhD, Canada*

#### Purpose

1. To describe ethno-cultural food choices of Canadian Immigrant women of African and Caribbean descent during perinatal period. 2. To discuss how do health beliefs and practices of immigrant women affect their food choices and practices during the perinatal period

#### Target Audience

Health professionals such as nurses, physicians, dietitians and nutritionist as well as social workers. Administrators, managers in health care organizations as well as nurse educators will also benefit from this paper.

#### Abstract

**Background:** Food practices are an important component of marking individual and group identity. How an individual reproduces or resists normative practices is a means of understanding their social location. Migration, provides both opportunities and disjunctions for maternal health practices, including food practices. Post-migration women may aspire to achieve acculturation in part by adopting a Western diet. For many immigrant women, however, Western diets and patterns of food consumption differ considerably from those in their country of origin. Many maternal health and birth outcomes, however, are influenced by food consumption thus making education in perinatal nutrition important. The need for culturally safe and competent care is especially great during the perinatal period, since the maternal health characteristics and birth outcomes of immigrant women are often affected negatively. This is particularly important in western nations such as Canada, whose ethno-culturally diverse population calls for effective cross-cultural health care.

**Purpose:** This paper presents the findings of a recent study that examined how the health practices of immigrant women affect their food choices and practices during the perinatal period. The study aimed to elicit understanding of ethno-cultural food choices and practices and to develop and evaluate cultural competency of maternity care.

**Methodology.** A focused ethnography informed by the theoretical lens of postcolonial theory guided the research process. Postcolonial theory helped to explicate how the intersectionality of ethnicity, gender, social class, and culture shapes immigrant women's beliefs and practices related to food choices and health practices in the perinatal period. The research was implemented in four phases comprising of photovoice, interviews, KT tool creations and focus groups to evaluate tool implementation and practices. Study participants comprise of six ethno-cultural groups in this study; Sudanese, Indian, Pakistani, Chinese, African, and Caribbean, however, this paper will focus on the African and Caribbean women data set. Photo-assisted interviews were transcribed verbatim and coded. Thematic analysis was completed guided by Roper and Shapira's analytical framework for ethnographic data, to identify key patterns and themes. Atlas ti facilitated data management and storage. Member-checks

**Results:** The paper will discuss two major themes: a). Personal determinants of food choices and practices including, general health beliefs and practices, knowledge and beliefs about foods, and cravings and aversions; b). Other determinants of perinatal food choices and health practices including the role of others in supporting and enforcing health beliefs and practices, socio-economic factors, temperature and religion.

**Implication:** The paper will conclude with key recommendations for policy decisions including the need for national food guide with due consideration of ethno-cultural foods. It will also discuss ways of improving health care providers' access to study findings such as education tools for health care the health professional, public health, and obstetrical communities using multiple formats and media.

## G 19 - Perinatal Innovations in Healthcare Promotion

### Exploring Symptom Experiences in Women with Peripartum Cardiomyopathy: A Mixed Method Study

---

*Harshida Patel, PhD, RN, MNSC, Senior Lecturer, Sweden*

#### Purpose

The purpose of this study was to describe and explore women's experiences of symptoms in PPCM.

#### Target Audience

The target audience of this presentation is specialist nurses, midwives, leaders and researchers working in the maternity care.

#### Abstract

**Purpose:** The aim of this study was to describe and explore women's experiences of symptoms in PPCM.

**Methods:** A triangulation of methods was performed comprising individual interviews with 19 women in Sweden with PPCM, and data were also collected from their medical records. Qualitative data from interviews were analysed by inductive content analysis, and quantitative data using descriptive statistics.

**Results:** The meaning of onset and occurrence of symptoms is captured in the metaphor: being caught in a spider web, comprising the invasion of symptoms and feeling of helplessness. Symptoms related to PPCM started at gestational weeks 14-38 (median 32) and time from symptoms to diagnosis varied between 3–190 days (median 40). The physical symptoms were: shortness of breath, excessive fatigue and swelling, bloatedness, tachycardia, nausea, but also palpitation, coughing, chest tightness, bodily pain, headache, fever, tremor, dizziness, syncope, restless and tingly body and oliguria. Emotional symptoms were: fear, anxiety, feelings of panic, and thoughts of impending death.

**Conclusion:** Symptoms of PPCM are debilitating, exhausting and frightening for women. Health care professionals, especially midwives, should be equipped with the skills needed to identify PPCM for early referral to a specialist. More research to elaborate midwives' knowledge and attitude about PPCM is essential.

Key words: Peripartum Cardiomyopathy; Pregnancy; Heart disease; Symptoms; Qualitative methods; Content analysis; Childbirth

## G 19 - Perinatal Innovations in Healthcare Promotion

### Kangaroo Mother Care Effect on Crying Time during Clustered Painful Procedures in Full Term Neonates

---

*Raouth R. Kostandy, PhD, MSN, RN, USA*

#### Purpose

The purpose of this presentation is to provide a research study report on the effectiveness of non-pharmacological pain management intervention, Kangaroo mother care, on clustered painful procedures in healthy full term neonates.

#### Target Audience

The target audience of this presentation is nurses and health care providers who provide care for neonates and pediatric population. Also it is of interest of all nurses who are looking for innovative pain management interventions.

#### Abstract

**Background:** Full term neonates face many painful procedures shortly after birth. Repeated unrelieved procedural pain is related to detrimental physiologic and behavioral outcomes including long-term heightened pain or hyperalgesia, increased stress sensitivity, altered neurobehavioral development, and life threatening physiological reactivity. Pain management for full term neonates undergoing clustered painful procedures has not been tested. The Joint Commission mandates that interventions to reduce procedural pain in neonates be administered. One such intervention is Kangaroo Mother Care (KMC). The **purpose** of this study was to test the effect of KMC on crying time during clustered painful procedures (Hepatitis B vaccine injection and metabolic screening heel stick) in healthy full term neonates. **Design and setting:** A pilot randomized controlled trial was conducted in the postnatal department of a tertiary urban hospital. **Sample:** Sixteen healthy full term neonates were randomly assigned to either the intervention group (being with the mother in KMC before, during, and after the clustered painful procedures) or the control group (the neonate were in the crib in the nursery before, during, and after the clustered painful procedures). **Methods:** After obtaining the IRB approval, the department case manager daily screened the unit for the neonates who met the study inclusion criteria. The case manager recruited and provided the mothers with a brief explanation of the study. When a mother agreed on learning more about the study, the case manager contacted the researcher who visited the mother and provided a full explanation of the study. After the mothers signed the consent forms they were provided with a pre-sealed envelope that contained the study group in which the neonate will be assigned to. Intervention group neonates were held in KMC position before (10-15 minutes), during (injection and heel stick), and after (30 minutes) the clustered painful procedures. Control neonates were taken in their cribs to the nursery before (10-15 minutes), during (injection and heel stick), after (30 minutes) the clustered painful procedures. One staff nurse administered all painful procedures for neonates in both groups. A video camera was set up to record the whole procedure. For the intervention group, the camera was set up in the mother's room. For the control group, the camera was set up in the nursery. After data collection was done, a research assistant viewed all the video tapes and recorded the crying time in seconds for each phase of the study using a stop watch. Data were entered to the SPSS for data analysis. Descriptive tests will be completed to provide a description of the sample. An independent t-test will be conducted to investigate the differences in the mean crying time between the two groups. **Conclusion:** KMC has been used as an effective non-pharmacological pain management intervention in full term neonates for one painful procedure. The results of this study could provide some evidence on the effectiveness of KMC during clustered painful procedures.

## G 23 - Supporting Nurses and Faculty

### Facilitating Organizational Socialization of Adjunct Clinical Nursing Faculty

---

*Julie Kientz Elting, EdD, MSN, BSN, APRN, RN, CNE, USA*

#### Purpose

The purpose of this presentation is to communicate findings from a qualitative research project investigating how common onboarding practices utilized with adjunct clinical nursing faculty facilitated their organizational socialization.

#### Target Audience

The target audience of this presentation is nursing educators, nursing program administrators, and faculty administrators responsible for recruiting and orienting new clinical adjunct faculty.

#### Abstract

Organizational socialization of newly hired employees is facilitated by onboarding strategies that increase the employees' role clarity, occupational self-efficacy, and feelings of acceptance by insiders. In most settings onboarding strategies are thought to promote role adjustment in newcomers and lead to both increased job satisfaction and employee retention. Typically, employee productivity is increased and organizational expenditures reduced when onboarding activities are successfully implemented. However, in collegiate nursing programs little is currently known about the onboarding needs of clinical adjunct nursing faculty. Given that adjunct faculty typically spend the bulk of their working hours in clinical settings, with a relatively small portion of time spent at the parent academic institution, it is reasonable to assume the onboarding needs of adjunct faculty could be unique and that planned onboarding activities could be of particular importance.

This presentation reports results from a qualitative research project examining the onboarding practices of three universities in a major metropolitan area with recently hired clinical adjunct nursing faculty. The study was designed to identify which onboarding practices clinical nursing adjunct faculty identified as beneficial and why they perceived these practices to be helpful.

Eight clinical nursing adjuncts with less than two years of employment in their current positions were recruited to participate. All taught medical-surgical clinical courses and four were novice nursing educators in their first teaching position. Each participant completed an online pre-interview survey using Klein and Polin's Onboarding Activities Checklist of best and common onboarding practices. The checklist had been modified for nursing education, for example, substituting "dean or department chair" for "senior leaders." Using the checklist results, a semi-structured interview protocol was created. Participants rated the perceived benefit of each onboarding practice using a Likert-type scale and then expanded on their responses. The interview results were compiled and analyzed within the Inform-Welcome-Guide structure in the Activities Checklist. In addition, an administrator with responsibilities for newly hired adjuncts from each of the three universities also completed a modified version of the Onboarding Activities Checklist, identifying the occurrence and perceived importance of each activity.

The onboarding experiences of participants varied but they identified consistent benefits of onboarding practices, even when not directly experienced. These adjuncts desired role clarity at hiring and a need to feel effective as educators. They wanted relevant resources made available and responsive staff to answer questions or offer support. While not expecting fanfare when hired, they wanted to be welcomed and valued part of their nursing programs. Altruistic obligation to students and the nursing profession helped participants overcome challenges in their new teaching roles. Each believed previous nursing and teaching experience should be considered when determining onboarding needs.

While these results are consistent with and lend additional support to current theories of organizational socialization, they also suggest that some onboarding activities are of greater relevance to clinical adjunct faculty than others. Participants found benefit to most onboarding practices as employees or educators.

Those who experienced the practices as part of their own onboarding process reported more indicators of positive organizational socialization.

Limited time spent at the parent academic institution limits opportunities for informal interactions that provide information and guidance to adjuncts, increasing the need for well conceived and implemented onboarding practices that promote role clarity and occupational self-efficacy. Issues related to insider acceptance are nuanced and onboarding activities need to be tailored to the unique circumstances of clinical adjunct faculty.

Results from administrator surveys demonstrated a general appreciation for the importance of onboarding activities. However, the pattern of differential importance of various activities revealed in the data from adjunct faculty was not found. This finding should be interpreted with some caution due to limited administrator sample size and the absence of data from semi-structured interviews. Further research is needed to determine administrator perceptions regarding the need to tailor onboarding practices to the unique needs of clinical adjunct faculty.

Further refinement of the Onboarding Activities Checklist to align with nursing education can provide a straight-forward process for clinical adjunct onboarding. Understanding the needs of clinical adjuncts promotes role adjustment and may lead to higher retention rates and enhanced educational outcomes.

## G 23 - Supporting Nurses and Faculty

### Supporting Early Career Nurses: The Key to Enhancing Professional and Personal Excellence

---

*Tracey L. Moroney, PhD, BN (Hons), Australia*

#### Purpose

The purpose of this presentation is to highlight the lack of support for early career nurses in the beginning years of practice.

#### Target Audience

The target audience of this presentation is educators and registered nurses, particularly those involved in supporting nurses during the beginning years of practice

#### Abstract

**Background:** Mentoring in essence is the relationship between two individuals designed to achieve personal and professional growth. In the early career stage, a supportive relationship can be critical to assisting early career nurses (ECN) to consolidate knowledge and practice required of a registered nurse. There is evidence that many ECNs struggle during their early years of practice and this may be associated with increasing numbers of ECNs who leave the profession.

**Methodology:** Using a Grounded Theory methodology, this study explored the concept of mentoring in ECNs. In particular the study explored what types and level of support was provided, how ECNs identified potential mentors and the ways in which mentors were used to support and develop practice. Eight ECNs were interviewed using semi structured interview techniques. Grounded theory methods were applied throughout the study, including constant comparative analysis. Categories developed included graduate feelings, ways of support, finding mentors, the mentor and the non-mentor.

**Results:** The results suggest that formalised mentoring was rarely used; formalized supportive programs were uncommon and were perceived by participants as being unhelpful. In lieu of formalized mentoring or support, participants sort alternative ways to support themselves. This included finding their own mentors and using non- formal ways of supporting themselves in their graduate year.

One of the surprising elements to emerge was the role ECNS had in supporting each other. This may have been because they could not find an appropriate mentor, but ECNs perceived each other as an ideal support network because they shared experiences, solved problems together, debriefed and offered support particularly when other forms were unavailable.

**Discussion:** Support for the ECN was sporadic and many of the participants struggled to find any level of support during their transition to practice. This was very distressing and challenging for some participants. Many participants felt abandoned by a system and felt alone and uncertain. This led those participants to seek support outside the workplace and some turned to friends and family for support.

The effect of a lack of support during the early stages of practice is not known but it is realistic to suggest that a lack support may affect knowledge and practice development. This in turn may affect professionalism and the ability to provide effective patient care.

**Recommendations:** While the support that ECNs provided to each other is certainly collegial and valuable –ECNs at a critical stage in their development must be supported through mentoring and other initiatives. It is clear that if we are to assist ECNs in their transition to practice, innovative strategies to supporting ECNs must be implemented in order to ensure professional and personal excellence.

## G 23 - Supporting Nurses and Faculty

### Quality of Nursing Faculty Activities for Prevention Nursing Student's Medical Accident and Association to Their Attributes in Japan

---

*Wakako Sadahiro, DNSc, RN, Japan*  
*Naomi Funashima, DNSc, RN, Japan*  
*Toshiko Nakayama, PhD, RN, DNSc, Japan*  
*Yasuhiro Matsuda, RN, DNSc, Japan*

#### Purpose

The purpose of this presentation is to discuss the necessary qualities of the faculty for the prevention of medical accidents by students during the nursing clinical practicum with nursing colleagues in various countries and to identify the international prospects for the realization of effective practice instructions.

#### Target Audience

The target audience of this presentation is the nursing faculty and clinical instructors who are interested in teaching activities of nursing clinical practicum and hope patient safety.

#### Abstract

**Purpose:** The purpose of this research is to clarify the current quality status of teaching activity of the nursing faculty for the prevention of medical accidents by students during the nursing clinical practicum as well as the attributes of the faculty having a high quality of teaching activity.

**Measures: Quality of nursing faculty activities for prevention nursing student's medical accident:** Teaching Activities of Nursing Faculty for Prevention Medical Accidents by Nursing Students in Clinical settings -Original form- (TANFPA-O) was developed based on a qualitative inductive research.(Sadahiro & Funashima et.al. ,2013)It has 56 items with 5-point Likert scale with a total score ranging from 56 to 280. Higher scores indicate perception of better teaching activity for prevention nursing student's medical accident. Criterion-related validity was demonstrated by significant correlations with ability of nursing practice. Content validity was ensured through a panel of expert and a pilot study. The Internal consistency was ensured thorough Cronbach's coefficient alpha as 0.954.

**Attributes of the Japanese nursing faculty:**Nursing Faculty Attributes Questionnaire (FAQ) consists of 26 items measuring of demographic variables, attributes as a teacher and attributes as a nurse. It's including Self Evaluation Scale of Oriented Problem Solving Behavior in Nursing Practice (OPSN) for measuring of attributes as a nurse. The "OPSN" was developed based on qualitative inductive research. (Sadahiro & Funashima et.al. ,1997) It has 25 items with 5-point Likert scale with total score ranging from 25 to 125. Higher score indicate perception of better ability of nursing practice. Validity and Reliability of the "OPSN" was ensured through research for Japanese Nurses. (Sadahiro & Yamashita, 2002) The Construct Validity in the present study was ensured through factor analysis. The Internal consistency was ensured thorough Cronbach's coefficient alpha was 0.959.

**Data Collection Procedure:** After obtaining the ethical approval from the Sapporo City Universities' Organization of the Ethics Committee, 462 directors of nursing education randomly sampled from baccalaureate programs, associate degree programs and diploma programs in japan were asked by mail to participate in the study. The instrument packets were distributed to 2028 nursing faculty who belonged to nursing educational institutions , and they agreed to participate in the study. The instrument packets in self-addressed envelopes were returned anonymously.

**Statistical Analysis:** The Statistical Package for Social Science ver.20 (SPSS) was used for the analysis of data. Descriptive analysis was conducted for the background characteristics of the participants. Spearman's correlations were employed to examine the relations among total score of the "TANFPA-O"

with the "OPSN". Pearson's correlations were employed to examine the relations among the age, the years of teaching experiences. T-test and ANOVA were employed to examine other variables.

**Results:** A total of 881(43.4%)nursing faculty returned the instruments by mail, and 786 of them were valid and analyzed. 214 nursing faculty in BSN/ ADN and 540 in diploma programs participated. The mean age was 46.1 (SD=8.2). The mean year of teaching experiences was 9.8 (SD=7.5). The mean year of clinical experiences was 13.7 (SD=7.9). The "TANFPA-O" scores ranged from 148 to 277 points, with a mean score of 227.0 (SD=25.7) . The "OPSN" scores ranged from 37 to 123, with a mean score of 107.0 (SD=12.6) The "TANFPA-O" scores had significantly intermediate correlations with The "OPSN" scores ( $r=0.545, p<.01$ ). Relationship of The "TANFPA-O" scores and Faculty's Attributes were as follows. The "TANFPA-O" scores of the faculty in the Tokai region were significantly higher than those in Shikoku region. The "TANFPA-O" scores of the faculty who were not qualified as a public health nurse were significantly higher than those who are qualified. The "TANFPA-O" scores of the faculty who were aware that clinical instructors in hospital were conducting the practical training in collaboration with the faculty were significantly higher than those of the faculty who were aware that nurses in hospital were mainly conducting the practical training. The "TANFPA-O" scores of the faculty who were satisfied with their practical teaching were significantly higher than those who were not. The "TANFPA-O" scores of the faculty who were aware that nurse is an important profession were significantly higher than those who were not. The "TANFPA-O" scores of the faculty who were aware that they had someone to consult with about their practical training were significantly higher than those who were not. The "TANFPA-O" scores of the faculty who belonged to academic societies were significantly higher than those who did not.

**Conclusion:** In this study it was suggested that the faculty having a high quality of teaching activity for the prevention of medical accidents by students have the following attributes. They possess a high capability in terms of nursing practice and have established a system to conduct practical trainings in cooperation with clinical instructors. In addition, they understand that nursing is an important profession and feel satisfied with their work as a teacher and the practical training. They also have someone to consult with about the nursing clinical practicum, belong to academic societies, and are engaged in research activities. The followings are important to improve the quality of faculties' teaching activity for the prevention of medical accidents by students during the nursing clinical practicum: First, the faculty should create an environment in which they can consult with/work on about the nursing clinical practicum. Second, they should strengthen the collaboration with clinical instructors in hospital. Lastly, they should try to maintain/improve the nursing practice ability.

## G 24 - Maternal-Child Health: Research into Practice

### The Association between Maternal Health Literacy and Assessment for Developmental Delay in Low-Income Latino Children

---

*Eileen K. Fry-Bowers, PhD, JD, RN, CPNP, USA*

#### Purpose

to disseminate research findings regarding the relationship between maternal health literacy and developmental assessment and referral for additional evaluation among low-income Latino children.

#### Target Audience

health care providers, particularly nurses and advanced practice nurses, who provide pediatric and family practice ambulatory care services to populations at risk for low health literacy.

#### Abstract

##### **Purpose:**

The purpose of this study is to explore the relationship between the level of maternal health literacy and perceptions of assessment and referral for developmental concerns for low-income Latino children aged 3 to 48 months when seeking pediatric primary care services.

**Background:** Early identification of developmental disorders is paramount for ensuring optimal wellness for young children. Appropriate assessment is an integral function in providing primary care for children and the responsibility of all pediatric health care providers (PHCP). Specifically, the American Academy of Pediatrics and the Bright Futures Guidelines for well-child care recommend that pediatric development be incorporated at every well-child preventive care visit routinely assessed in order to identify developmental risk factors, provide parents with appropriate anticipatory guidance, and secure adequate intervention to support optimal development. Moreover, this surveillance should include asking about parents' concerns, obtaining a developmental history, making observations of the child, identifying risk and protective factors, and documenting the findings. Concerns should be addressed promptly with developmental screening tests.

National data however suggest that PHCPs do not adequately address parental concerns regarding pediatric development, behavior and mental health, and many children with developmental and behavioral problems remain undetected or do not receive referral to an early intervention program until problems escalate. This is particularly true for children from low-income families or children of color. In fact, Latino children are diagnosed with autism spectrum disorders 2.5 years later than white children and exhibit more severe symptoms at time of diagnosis. Similar delays are noted for other developmental, behavioral or mental health conditions for this population. Importantly, evidence indicates that children with developmental disabilities who are identified early and begin receiving appropriate and coordinated intervention services demonstrate gains and advantages not shown by their peers who do not participate in these programs. Moreover, these interventions can positively impact outcomes across several developmental domains.

During the pediatric well child visit, parents are expected to provide information, and respond to questions, which should inform the PHCP's assessment and plan of care. Research indicates that individuals with low health literacy (HL) experience challenges in communicating with providers, demonstrate poor comprehension of provider instructions, ask few questions within a clinical encounter, and report poor satisfaction with patient-provider communication. Recent evidence also links low parental HL to suboptimal pediatric health outcomes. However, whether parental HL plays a role in the reciprocal transmission of information needed for developmental assessment and action remains poorly understood.

**Methods:** Low-income English- and Spanish-speaking Latina mothers of children aged three months to four years were recruited from WIC sites in Southern California (n= 124) to participate in this cross-sectional, correlational study. Maternal HL was assessed using the Newest Vital Sign. Perception of

pediatric developmental screening and receipt of information or referral was measured with the Promoting Health Development Survey. Demographic data included maternal acculturation status and preferred language, child health insurance status, and whether the child received care from a regular place and regular provider. Data analysis was completed using SPSS version 22.0.

**Results:** Overall, 61 mothers identified their child to be at high risk for a developmental concern, but only 32 reported being asked by their PHCP if they had such concerns, while 34 reported being provided with information to address these concerns. Fifty-three mothers were identified as having a high likelihood of limited HL, 43 with the possibility of limited HL, and 28 with adequate HL. Chi-square analysis revealed a significant association with moderate effect size between the level of maternal HL and maternal concern that their child was at risk developmentally  $\chi^2(6) = 15.185$ ,  $p = .019$ ,  $\phi = .238$ .

**Implications:** Low maternal HL may be a risk factor for incomplete pediatric developmental assessment and referral among low-income Latino families. Children who receive timely and appropriate assessments are more likely to receive other needed developmental services. Culturally appropriate screening and dissemination of culturally relevant anticipatory guidance materials to Latino families may be a key tool for improving timely assessment and referral for high quality early intervention services, which can improve a child's developmental trajectory, and reduce racial and ethnic differences in pediatric health care.

## G 24 - Maternal-Child Health: Research into Practice

### Comparing Mothers' Postpartum Concerns Over Time

---

*Jean Hannan, PhD, ARNP, USA*

*Dorothy Brooten, PhD, RN, FAAN, USA*

*Ali Marie Galindo, MSN, ARNP, ARNP-FP, USA*

#### Purpose

The purpose of this presentation is to compare mothers' postpartum concerns over time (delivery to 8 weeks postpartum) in 2 different randomized clinical trials 20 years apart that examined Nurse Practitioner (NP) follow up care on maternal and infant outcomes and health care costs post delivery.

#### Target Audience

Maternal child health, Nurse practitioners

#### Abstract

**Background:** Low-income mothers of full-term infants experience early postpartum hospital discharge, little to no routine follow-up after hospital discharge, low social support, unmet learning needs, increased stress and difficulty accessing the healthcare system (Britton, 2006; Loprest et al., 2007). However, changes to the healthcare system over the past 2 decades have effected the outcomes of postpartum mothers and their infants. Recent legislative acts and changes in health care reimbursement are forcing hospitals to eliminate many health care services in the community, especially those in maternal child health (Abraham, 2011). These changes are posing significant challenges for mothers and their infants in receiving healthcare.

**Aims:** The purpose of this secondary analysis was to compare mothers' postpartum concerns over time (delivery to 8 weeks postpartum) in 2 different randomized clinical trials 20 years apart that examined Nurse Practitioner (NP) follow up care on maternal and infant outcomes and health care costs post delivery.

**Methods:** Data set 1, a randomized clinical trial carried out in 1992, was compared with data set 2, a randomized clinical trials is currently ongoing. In both trials, NPs providing follow up care to low income minority mothers recorded, as close to verbatim as possible, discussions with mothers during telephone contacts and in the first trial in home and clinic visits in interaction logs. The logs documented care provided by NPs during each contact. Recorded data consisted of reason for contact, issues identified during contact, response of APN, woman's response and outcome of contact. The mother's concerns from both datasets were coded as 1. Mother concern 2. Infant concern or 3. Situational concern. The data was entered into SPSS.

**Results:** There were more maternal concerns in High Risk Pregnancy study vs. First Time Mother study (142 vs. 46). No help/support was a main concern in the First Time Mother study (43.5%). Body image changes was a main concern for the High Risk Pregnancy study (18.3%). Feeding was the main concern in both studies (21.7% vs. 23.9%) for infant concerns. Situational concerns included had financial concerns (23.8% vs.17.1%) in both stuidies. First Time Mother study had more than half(51.2%) had concerns about obtaining healthcare coverage while the High Risk Pregnancy study had concerns about obtaining WIC (21.4%).

**Conclusion:** Mothers' post partum concerns have changed over the 2 studies. There are continuing concerns about obtaining healthcare for herself and her infant. There were fewer concerns about the health of the mother. Healthcare providers need to be aware of the challenges new mothers have including social support, financial problems, difficulty in accessing the healthcare system. It is essential to ask about the health of new mothers since this may be overlooked by the mother herself.

## G 24 - Maternal-Child Health: Research into Practice

### Recognizing Ethical Issues Experienced by Maternal Nurses and Their Need for Ethics Education

---

*Gayle Taylor, EdD, MSN, RNC, CNL, CCE, USA*

#### Purpose

The purpose of this presentation is to enhance the ethical issues faced by maternal nurses and how these issues can be resolved through increased ethics education.

#### Target Audience

The target audience of this presentation is nurses working in a maternal setting who need increased ethics education.

#### Abstract

Ethical issues, experienced daily by maternal nurses, can be uniquely specific and may involve the inadequacy of workplace resources to help resolve human rights issues. Recognizing patients' rights and respecting human dignity should be a universal belief held by all nurses, but the need for ethics education for maternal nurses may include specific issues not found in other areas of nursing. Issues recognized as important for maternal nurses are; substance abuse during pregnancy, impaired neonates and their rights, cultural belief practices concerning neonatal resuscitation, a lack of proper ethics education for the nursing staff, and religious beliefs. Issues critical to maternal patients are; abortion rights, the right to life of the fetus, a woman's right to control her own body, and choosing to carry a pregnancy to full term.

Even experienced maternal nurses continue to be perplexed by ethical questions. Should a court order be obtained to force pregnant women to comply with healthcare policies? Should women who abuse drugs while pregnant be legally charged with abusing the fetus? When presented with a pregnant woman in a critical state of health, who has the primary right to life, the woman or her baby? A study conducted by Boston College demonstrated that maternal nurses are bombarded with ethical situations on a daily basis for which they are not educationally prepared. Learning to deal with ethical issues can prove to be of primary importance for these nurses. Heinz R. Pagels (1988) stated "Science cannot resolve moral conflicts, but it can help to more accurately frame the debates around those conflicts". Nurses have a right to receive ethics education, and more importantly, that education needs to contain universal knowledge as well as specific workplace resources.

*Charles Anyinam, RN, Canada*

*Rick Vanderlee, EdD, RN, Canada*

*Hilde Zitzelsberger, BScN, MSc, PhD, RN, Canada*

*Leslie L. M. Graham, RN, BScN, MN, Canada*

#### Purpose

The purpose of this presentation is to describe the findings of a mixed-method, multi-site analysis of student performance and behavior in different models of nursing bridging education programs.

#### Target Audience

The target audience of this presentation is nursing educators and academic researchers interested in educational evaluation.

#### Abstract

Education of nurses from one level to another is a global phenomenon that is increasing in visibility (Cook, Dover, Dickson & Engh, 2010; Cubit & Lopez, 2011; Rapley, Davidson, Nathan, & Dhaliwal, 2008). However, it is not without challenges. Within the North American context, educational innovation continues to be met with resistance. For example, some nurse educators still believe that Registered Practical Nurses (RPNs) should not be able to bridge into a BScN Program, while being awarded credit for Practical Nursing courses. Nursing bridging education is often referred to disparagingly as a 'backdoor' route to becoming a Registered Nurse. In this sense, old politics of post-secondary education have infused the debate, with the college/university traditional divide rearing its head. This is an unsettling context within which to offer an RPN to BScN Bridging Program, prompting the need for rigorous evaluation of this type of educational offering. This presentation provides an overview of an expanded, six-partner evaluation of RPN-to-BScN bridging education in Ontario, Canada. Using a mixed-method design, student and faculty perceptions of barriers, facilitators, and outcomes of this type of educational innovation across a variety of program offerings was explored. Qualitative analysis of student perceptions of the impact of bridging education on personal and professional levels will be summarized. Quantitative analysis of student performance and behaviours will be discussed, including indicators such as transfer credit, time to program completion, attrition/retention rates, and average years out between the completion of a Practical Nursing diploma and the start of a bridging program. Academic performance of nursing bridging students compared to other nursing students and health sciences students will be described. Finally, this presentation will discuss the merits and challenges of creating meaningful lifelong learning opportunities for nurses that lead to both enhanced professional development for individual nurses and overall advancement of the nursing profession.

## G 25 - Outcomes of Professional and Student Nursing Practice

### Drinking Patterns and Outcomes of Alcohol Use by LGBT Students at a Minority-Serving University

---

*Sandra "Sande" Gracia Jones, PhD, MSN, MEd, ARNP, ACRN, ACNS-BC, FAAN, USA*  
*Beatriz Valdes, MSN, MBA, RN, USA*  
*Eric Fenkl, PhD, RN, CNE, USA*

#### Purpose

The purpose of this presentation is to discuss the results of a 2014 study that explored drinking patterns and negative outcomes of drinking by LGBT college students at a minority-serving university.

#### Target Audience

The target audience of this presentation is faculty members and health care practitioners engaged in the care of young adults.

#### Abstract

**BACKGROUND/PURPOSE:** The Institute of Medicine report (2011) on the health of Lesbian, Gay, Bisexual and Transgender (LGBT) persons noted that sexual minority youth may have higher rates of substance use than heterosexual youth, and that LGBT youth may have an elevated risk for attempted suicide and depression. Substance use has been linked to HIV infection because both casual and chronic substance users are more likely to engage in high-risk behaviors, such as sex without a condom, when they are under the influence of drugs or alcohol (CDC, 2013). Unsafe sexual practices among college students are often associated with the use of alcohol or other drugs, placing them at risk for HIV and other sexually transmitted diseases (STDs). The purpose of this study was to explore drinking patterns and negative outcomes of drinking by LGBT college students. This study was part of a larger study funded through the HIV and Substance Abuse Prevention initiative for Minority Serving Institutions, Center for Substance Abuse Prevention, Substance Abuse and Mental Health Services Administration (SAMHSA).

**METHODS:** A convenience sample of male and female LGBT students was used. After IRB approval was received, participants were recruited from two sites: 1) on campus at a minority-serving South Florida university from March - September 2014 and 2) from community venues on Miami Beach during Spring Break March-April 2014. Inclusion criteria for participants included: self-identity as LGBT, ages 18-24, enrolled as a college student, and able to speak and read English. After giving verbal consent, the participants completed a self-administered survey. The instrument used was the Core Alcohol and Drug Survey for Two- and Four-Year Universities (University of Southern Illinois, 2000). A variety of strategies were used to recruit participants.

**RESULTS:** The sample included 213 self-identified LGBT participants, ages 18-24, of which 114 (53.5%) were female, 91 (42.7%) were male, 4 (1.9%) were transgender female, 3 (1.4%) were transgender male, and 1 (0.5%) did not report their gender. In regards to drinking patterns, thirty five percent (n = 74) of the participants reported that over the last 2 weeks they had one to ten occasions of drinking 5 or more alcoholic beverages at a sitting, i.e., binge drinking. Sixty five percent (n = 138) of the participants reported that they consumed 1 to 69 alcoholic beverages a week. In terms of outcomes, the LGBT students reported that they experienced the following related to alcohol or drug use in the last year. In terms of academic performance, one-third of the students (n = 50; 33%) had performed poorly on a test or important project, and over one-fourth of the students (n = 58; 27%) had missed a class. There were also negative outcomes related to physical health. Over a third of the students had been nauseated or vomited (n = 79; 37%) and had suffered a hangover (n = 94; 44%), and one-fourth of the students (n = 54; 25%) had suffered a memory loss. Almost 20% (n = 41; 19%) of the students had driven a car while under the influence, and 27% (n = 58; 27%) had done something they later regretted. In terms of mental health and outcomes of use of alcohol and other substances, some students had seriously thought about suicide (n = 22; 10%) and some students had seriously tried to commit suicide (n = 17; 8%).

CONCLUSION/IMPLICATIONS: Findings of this study will add to the knowledge base of risk behaviors for LGBT college students. Information derived from this study will be used to develop a campus-based HIV and substance abuse prevention program for LGBT students.

## G 25 - Outcomes of Professional and Student Nursing Practice

### Nursing Students' Caring Behavior as an Outcome of Instructors' Caring: First Results from an International Study

---

Denise M. McEnroe-Petitte, PhD, MSN, BSN, AS, RN, USA

#### Purpose

The purpose of this presentation is to correlate between instructors' and students' caring behaviors. Through data collection in seven countries, findings identified statistical significance. Instructor's caring behavior affects nursing students' caring behavior. Through positive faculty modeling and role modeling, nursing students' can develop the competence of caring.

#### Target Audience

The target audience of this presentation are nurse educators who want to enhance the caring of nursing students' through their instructors' actions of caring. The use of positive faculty modeling and role modeling may be effective in dealing with the role of caring in different cultures.

#### Abstract

Theoretically, caring relationships between faculty and student generates a caring moment. However, there is a scarcity of empirical evidence about how caring interactions with faculty can enhance students' caring outcomes. The aim of this study was to identify the levels of students' and instructors' caring behavior and to investigate if there is a correlation between instructors' and students' caring behavior. A descriptive, non – experimental design was used in this study. Data Collection was based on interviews using two standardized questionnaires; the Nursing Students' Perception of Instructor Caring (NSPIC) and the Caring Behavior Inventory (CBI). Respondents consist of nursing students from identified schools and colleges of nursing in different countries. Descriptive statistics such as frequencies, means, percentages and standard deviations are been utilized. Inferential statistics such as pearson r correlation and regression analysis have been used to determined correlations between relevant variables. Level of significance accepted is  $p < 0.05$ . The sample consists of 368 nursing students (91% female, 9% male) from seven countries (26% Philippines, 31.5% Greece, 1% Kenya, 0.5 Oman, 35.5% India, 5% Nigeria, 0.5% Saudi Arabia). Forty two percent of students are in the second years of studies, 13% in the third year and 45% in the fourth year. The mean score of NSPIC is  $4.02 \pm 0.30$  and the mean of CBI is  $4.56 \pm 0.13$ . The mean for each factor of NSPIC is  $4.39 \pm 0.13$  for the factor "instills confidence through caring",  $3.92 \pm 0.212$  for "supportive learning climate",  $4.06 \pm 0.06$  for "appreciation of life's meaning",  $3.66 \pm 0.11$  for "control versus flexibility" and  $4.01 \pm 0.48$  for "respectful sharing". The mean for each factor of CBI is  $4.63 \pm 0.11$  for the factor "assurance",  $4.58 \pm 0.06$  for "knowledge and skills",  $4.55 \pm 0.18$  for "respectful" and  $4.47 \pm 0.14$  for "connectedness". Correlation analysis showed statistically significance between relevant variables. Instructors' caring behavior affects nursing students' caring behavior. Through positive faculty modeling and role modeling, nursing students can be professionally trained to develop the competence of caring. Moreover, when the climate of nursing education is perceived as caring, students acquire a professional way of being and learn to care as a professional nurse.

## G 26 - Issues with End-of-Life Education and Care

### Cultural Issues in End-of-Life Care: Unmet Needs of Indians in Australia

---

*Sujatha Shanmugasundaram, PhD, RN, MACN, Australia*

#### Purpose

to disseminate the research findings to an international audience

#### Target Audience

nurses - academics -researchers - students

#### Abstract

**Background:** Globally, people with terminal illness facing many challenges including cultural issues at the end of life. In recent years, increasing in ageing population and diverse population in Australia puts lot of pressure on the health care system in providing culturally sensitive care. Cultural factors may influence the patient's reaction to illness and decisions about end of life care. It is estimated that the Indians sharing the second largest migrant group after United Kingdom.

**Aim:** The main aim of the study is to explore the cultural needs of the Indian patients receiving end of life care services in Australia.

**Methods:** The Constructivist grounded theory research approach was utilised for the study. Snow ball sampling technique was used to recruit the participants. Both hospital and home based patients interviewed by using semi-structured interview guide. Data collection was done over a period of one year after obtaining ethics approval. Data was analysed and themes were developed using Boyatzis thematic analytic technique.

**Results:** After analysing the data three major themes were emerged: Health system issues; cultural issues; and caring experiences. Under each themes there were sub-themes developed.

**Conclusion:** There is still a long way to go in meeting the cultural needs of the patients in end of life care settings. Healthcare professionals need to be provided with adequate education and training on how to provide culturally sensitive care to the minority patients.

## G 26 - Issues with End-of-Life Education and Care

### Improving Attitudes and Perceived Competence in Caring for Dying Patients: An End-of-Life Simulation

---

*Megan E. Pfitzinger Lippe, MSN, RN, USA*

#### Purpose

to disseminate results from a study assessing learning outcomes from a simulation emphasizing communication, assessment, and basic nursing skills in providing care to a critically ill patient from whom care is ultimately withdrawn, and to share a new instrument for assessing perceived competence in caring for dying patients.

#### Target Audience

academic or hospital-based nurse educators interesting in using simulation to teach undergraduate students about end-of-life care or in learning about strategies to enhance perceived competence and attitudes in caring for dying patients. The target audience is also researchers seeking an instrument to assess perceived competence in caring for dying patients.

#### Abstract

**Purpose:** End-of-life care education is critical for nurses, especially in today's healthcare climate. The End of Life Nursing Education Consortium (ELNEC) has established clear competencies for professional nursing practice regarding the care of patients at the end of life. Yet, undergraduate education about end-of-life care seems to be inadequate. Student's knowledge and attitudes about caring for dying patients have been shown in the literature to be positively impacted by education on end-of-life care. Although didactic education can improve students' end-of-life care knowledge and skills, real-world experiences/approximations are still needed to translate the content into practice to ensure quality patient care is provided. Simulations serve as a reliable proxy for real-world experiences, and can be useful in providing end-of-life care experiences. Current studies describe how hospice focused simulations can positively impact student learning about end-of-life care, but no studies have explored learning outcomes from simulations of adult patients who have unexpectedly become ill and are at the end of life. The purpose of this study was to assess learning outcomes from a simulation emphasizing communication, assessment, and basic nursing skills in providing care to a critically ill patient from whom care is ultimately withdrawn.

**Methods:** A simulation was created in which three different cohorts of undergraduate nursing students provided care for a critically ill patient and his family whose rapidly declining condition results in the decision to withdraw care. The simulation consisted of four parts: continuation of care for a stable patient in critical care, assessment and communication with physician regarding a change in status, withdrawal of care, and a final cumulative debriefing. A pretest–posttest design compared perceived competence and attitudes in caring for dying patients with students performing the simulation.

**Results/Findings:** After the simulation, the cohorts had significantly improved scores on the perceived competence ( $p < .001$ ) and attitude ( $p < .01$ ) measures. Reliability for a new instrument to assess perceived competence in caring for dying patients, Perceived Competence in Meeting ELNEC Standards, was established,  $r_{diff} = .93$  (pretest Cronbach's  $\alpha = .94$ , posttest Cronbach's  $\alpha = .93$ , and  $r = .04$ ). Factor analysis of the PC-ELNEC showed that the first component accounted for 53 percent of the variance, suggesting that the measure can be considered a unidimensional construct.

**Conclusions:** All three cohorts had improved competence, and two cohorts had improved attitudes toward caring for dying patients after completing the end-of-life simulation. Students also expressed positive comments following the simulation, particularly highlighting how useful the simulation was in providing them with the opportunity to care for a dying patient before entering professional practice. The outcomes of this study indicate that the simulation is robust in improving students' perceived competence and attitudes about caring for dying patients. The simulation seems to have achieved its objective of providing

students with a safe, real-world-like experience to explore attitudes and perceived competence about caring for dying patients.

Acknowledgement: Thank you to Scott Hudson, Sharon Carter, and Raquel Reynolds for their support in running this simulation. Special acknowledgement is also given to G. Kay Pfitzinger for her Excel expertise and verification of data accuracy.

## G 27 - Global Effects of Viruses

### Fatigue, Physical Fitness and Quality of Life in Patients with Hepatitis C Virus Infection during the Combination Therapy

---

*Shiow-Ching Shun, PhD, RN, Taiwan*  
*Chen-Hua Liu, PhC, MD, Taiwan*

#### Purpose

The purpose of this study were to (1) examine the changes of physical fitness component (e.g., muscular strength and cardiopulmonary fitness), fatigue, and quality of life (QOL), and (2) explore the significant factors related to change of QOL over the 24 weeks of combined treatment.

#### Target Audience

researcher and clinical nurses

#### Abstract

**Introduction:** An increasing incidence of liver cancer mainly attributed to Hepatitis C Virus (HCV) infection has been observed in Taiwan over the last 20 years. The current mainstay of treatment for patients with chronic HCV infection is the combination therapy of pegylated interferon  $\alpha$  (peginterferon  $\alpha$ ) plus ribavirin. Most patients experience multiple symptoms along with the therapy and fatigue is the most distressed symptoms with decreasing physical function that might affect their quality of life. However, there is no study to examine the changes of fatigue, physical fitness, and their relations with quality of life during the treatment.

**Objective.** The aims of the study were to (1) examine the changes of physical fitness component (e.g., muscular strength and cardiopulmonary fitness), fatigue, and quality of life, and (2) explore the significant factors related to QOL over the 24 weeks of combined treatment.

**Methods.** A prospective correlational and longitudinal design was used. Patients with chronic hepatitis C infection who are scheduled to receive the combined therapy were recruited from a medical center at outpatient settings in Northern Taiwan. Data were collected from patients through interviews using a set of structured questionnaires and measuring physical fitness by using 6-minute walk test, hand dynamometer, and hand-held dynamometer at four time points: baseline (before treatment, T0), and at 8 weeks (T1), 16 weeks (T2), and 24 weeks (T3) during treatment. Descriptive statistics and generalized estimating equations analysis were used to explore the changes of the measured variables.

**Results.** A total of 139, 134, 131 and 122 patients have completed the procedures at T0, T1, T2, and T3, respectively. The majority of HCV gene type was type I (49.7%). Fatigue was the most distressed symptoms and its intensity reached the peak at T1 and decreased following the treatment and significant decreased in mental related quality of life. All the measures of physical fitness decreased during treatment but only hand grip and 6-minutes walking distance (6-MWD) were significantly decrease. The 6-MWD was positively related to change of physical related QOL. Lower level of the hip muscle strength was related to change of mental related QOL.

**Conclusions:** Decreasing the 6-MWD and the hip muscle strength were the factors associated with decreasing the level of QOL. During the treatment, exercise enhancement on hip muscle strength and walking distance are suggested to improve their quality of life during combined therapy.

## H 15 - Working with Communities: Culturally Appropriate Research and Practice

### The Petal Project: Bringing the Community Together through Service

---

*Karen M. Parker, DNP, RN, FNP-C, USA*

*Natalie A. Masco, DNP, RN, FNP-C, USA*

#### Purpose

provide an overview of grass roots effort to help girls in developing countries to remain in school as well as promote health and wellness. Participants in the session will learn of the Initiative known as the 'Petal Project' and of ideas for initiation of similar programs within their own institutions.

#### Target Audience

Nurses/nurse educators who are interested in developing service projects with nurses/nursing students within their institutions and communities which support the mission of Sigma Theta Tau International

#### Abstract

As we increasingly become a global community, one of the challenges faced by schools of nursing today is building awareness of and an opportunity for responsiveness to global healthcare needs (Memmott, et. al., 2010; Burgess, et. al, 2014). Since May of 2011, the student nurses and faculty at the Wegmans School of Nursing (WSON) at St. John Fisher College (SJFC) have been involved in an initiative to keep young girls in the developing world in school. The Petal Project began following a medical mission trip with undergraduate students to a school and health clinic in a rural town in the western province of Kenya. It was there that faculty became aware of a pervasive problem many of the school girls faced; lacking necessary supplies such as underwear and adequately absorbent sanitary products to effectively cope with their menstrual flow. Faculty and student travelers learned many young girls do not come to school for a week or more each month due to embarrassment and teasing (McMahon, et. al, 2011). Others obtain the money for sanitary supplies by having sex with men. Many would subsequently never return to school due to a resultant pregnancy ([www.girleffect.org](http://www.girleffect.org)). WSON faculty were committed to returning on the next medical mission trip with a possible intervention for the students and women in the community.

Several options were researched and ultimately with the help of funds from the WSON STTI Delta Sigma chapter and the student nurses' association (SNA), faculty and students began an initiative sewing reusable sanitary pads and purchasing packages of girls' underwear (Sommer, 2009; McMahon, et. al., 2011). In addition, cycle beads were made to help in both the teaching about the menstrual cycle, and then for the girls and women to be able to track their cycles and anticipate onset of menstruation each month. As word of the Petal Project grew we found and appreciated strong support by the larger campus and surrounding community in form of monetary donations as well as helping hands during sewing parties. These parties, funded by Delta Sigma and the WSON SNA, were held throughout the semester and attended by students and faculty from all disciplines across the campus. Since the May 2011 trip, over 900 bases, thousands of pads and pairs of underwear have been distributed to girls in the western province and Maasai Mara in Kenya. Students traveling on medical mission trips also provide education to the girls about their bodies, how to track their cycles, and important hygiene measures during their menses and throughout the month. Due to the recent outbreaks of violence in Kenya, students have not been permitted to travel to Kenya the last 2 years. However, sewing parties have continued and, through the help of a local NGO and interested others, delivery of pads and other supplies have also continued. Currently, faculty and students are preparing pads, cycle beads and teaching plans that will be delivered in April, 2015 to 6<sup>th</sup> grade girls in schools in Costa Rica.

Realizing our responsibility to help sustain supplies of pads in these communities and build capacity, in 2013 we also began efforts to raise funds toward the purchase of sewing machines for the Kenyan schools (United Nations, 2013). In May 2014, two sewing machines were purchased and delivered to a

school where 10 students were waiting to learn how to use the machines and sew. Twenty six other students, also waiting, learned to sew reusable pads by hand. In fall 2014, a sewing room to house more machines and host more sewers will be constructed. It is our belief and lived experience that each person who contributes to the Petal Project becomes part of a protective circle empowering girls to effectively deal with this natural, predictable part of their lives. By participating in this initiative, students, faculty and members of our larger community in Upstate NY enable girls in the developing world to stay in school; to become more educated; to make decisions about when and whom they marry and when they will start a family. Campus-wide this unique initiative has brought people together, created awareness and rallied a response to the needs of women and girls in distant communities.

## H 15 - Working with Communities: Culturally Appropriate Research and Practice

### Examining the Phases of the Community-Based Collaborative Action Research Framework through an Unfolding Case Study

---

*Norma Krumwiede, EdD, RN, USA*

*Stacey Ann Van Gelderen, DNP, RN, USA*

*Kelly Krumwiede, PhD, RN, USA*

#### Purpose

To disseminate how the Community-Based Collaborative Action Research (CBCAR) framework, an innovative approach to action research, can be used by nursing faculty and community partners to address social action processes by examining the phases of the methodology using an unfolding case study.

#### Target Audience

Nurse educators, researchers and administrators interested in improving the health of the community.

#### Abstract

**Purpose:** To explore the Community-Based Collaborative Action Research (CBCAR) framework, an innovative approach to action research, by applying the six phases of the methodology through an unfolding case study involving a rural community.

**Background/Significance:** To support the need of a critical access hospital in completing a community health needs assessment required by the Affordable Care Act. The CBCAR framework was chosen to guide the project because it promotes long-term commitments with on-going social action processes within communities, and served as the research process that used relationships to value the community narrative, validate community concerns, and engage people to better understand health patterns and their meanings. The CBCAR framework has been shaped by participatory action researchers and blends the unitary participatory paradigm and social-ecological perspective with the tenets of human rights and social justice.

**Theoretical/Conceptual Framework:** The CBCAR framework was originally published in 2012 and is a relatively new nursing approach that requires the collaboration to explore underlying assumptions, identify population strengths and describe barriers toward improving community health outcomes. The CBCAR framework was successfully implemented with public health and clinical nurses, community leaders, nurse researchers and nursing students to create a process where all voices were heard and understood.

**Methods:** The CBCAR methodology was utilized and each of the phases were described through specific examples from an unfolding case study. The six phases of the CBCAR framework are: 1) Partnership: Collaboration; 2) Dialogue: Research question and direction determined; 3) Pattern recognition: Data collection and analysis; 4) Dialogue on meaning of pattern: Representation of research findings; 5) Insight into action: Community dialogue about meaning of research findings-Action planning; 6) Reflecting on evolving pattern: Evaluating actions and considering new questions.

**Results:** The CBCAR framework methodology supported research methods that assisted the community access hospital to meet the federal mandate by conducting a community health needs assessment, examined health disparities and social justice issues within the community and enhanced the nursing students' understanding of research. Nurse researchers summarized the findings of the community within a report that was made public on the critical access hospital's website.

**Conclusions:** The CBCAR framework provided a safe environment where open, non-judgmental dialogue encouraged and strengthened community voices which had not always been heard by health care professionals. CBCAR created space where meaningful work by community members, nursing students and nurse researchers could collaborate to enhance the health and wellness of the rural community. CBCAR provided gratifying work for nursing students and nurse researchers which benefited community growth through dialogue, and promoted meaningful long-term relationships with those involved in the process.

# H 15 - Working with Communities: Culturally Appropriate Research and Practice

## Conducting Research within a Somali Refugee Community

---

*Jane M. Dyer, PhD, MBA, MS, BS, CNM, USA*

### Purpose

The purpose of this presentation is to present the challenges and rewards of conducting research within a specific African refugee community. Issues discussed will include accessing the community, methodological and ethical challenges, practical considerations, and successful researcher attributes will be presented. Examples of challenges experienced by researchers will be shared.

### Target Audience

The target audience of this presentation is nursing researchers who are interested in being successful in conducting research in diverse communities, especially African refugee communities. The information provided will apply to conducting research in any community different from the researcher's own community.

### Abstract

Increasing numbers of Somali refugees are resettled in the U.S., particularly the intermountain west. As a result, nurse researchers have unique opportunities to engage in research within this diverse population. Recruitment issues for most refugee communities include difficulty in locating participants, challenges to developing relationships within the community, and reaching possible participants. These issues are especially difficult when initiating research within the Somali community, due to major differences in language, culture and trust from most researchers. These differences also contribute to methodological issues, ranging from selection of research site to gathering accurate data. Gaining actual informed consent is also challenging, as research may be a new concept, difficulty with translation due to multiple languages spoken by people from Somalia, and fear of disclosure. However, these challenges can be overcome by researchers with careful planning, further study of the community, becoming involved in the community and a realistic approach to a long term commitment to involving the community in the research process. Learning about the history of Somalia, the various groups that comprise the people of Somalia, Somalia's culture and religious practices, and Somali health practices is required to conduct meaningful research in this community. Conducting research in this community offers researchers the opportunity to learn about racial diversity, master lessons in patience and flexibility, understand a unique culture, build trust, and become active in a new community.

## H 16 - Transforming Research into Nursing Practice

### Advanced Practice Nursing Models of Care: Results from a National United States Survey

---

*Ruth M. Kleinpell, RN, PhD, FAAN, FAANP, USA*

#### Purpose

The purpose of this presentation is to present the results of a national web-based survey of over 1300 nurse practitioners conducted in 2014.

#### Target Audience

The target audience of this presentation is nurses interested in advanced practice nursing models of care and components of practice.

#### Abstract

**Overview:** Advanced Practice Nurses (APNs) including nurse practitioners (NP) are an increasingly important component of the nation's healthcare workforce. Although the NP role is an established one, there remains limited information on the specific care models across the diverse hospital and clinic settings within healthcare systems. This information is crucial in order to objectively evaluate the effectiveness of APN roles – data that is currently lacking. To address this gap, a national survey was conducted targeting NPs working in hospital and clinic settings.

**Aim:** Describe the types of NP models of care currently in use in hospital and clinic practice settings.

**Methods:** Focus groups of 26 nurses from 8 US states was conducted to inform revision of a national survey used in a prior 5 year longitudinal survey of NPs. The 34 item survey addresses 4 domains including role components (i.e. direct care management; care coordination; performing procedures; education; quality assurance; research); role responsibilities (i.e. practice autonomy, prescriptive authority, credentialing and privileging delineations) unit-level organization (i.e. physician staffing models, components of the multidisciplinary care team); and hospital organization (i.e. academic status, bed size, location, payer-mix). An online survey was distributed to NPs who were members of a national NP organization and an international multiprofessional organization

**Results:** 1350 NPs responded to the national survey and reported working in a variety of settings including hospitals, clinics, urgent care centers and specialty practice sites. Main role components included patient care management, teaching to patients, families and healthcare staff; involvement in quality improvement and research initiatives and administrative components such as committee work. Specific aspects include conducting history & physical exams ordering and interpreting diagnostic test/labs; providing care coordination, performing specialty procedures such as wound care or other specialty care. Major areas of impact that were identified included continuity of care, improving evidence based practice care, reducing hospital length of stay, preventing hospital readmissions and promoting patient, family and staff satisfaction.

**Implications:** The results of the study provide information from a large national sample of NPs that identifies the comprehensive care components of the role as well as areas of impact, highlighting the value of APN care.

**Acknowledgement:** Funding from the American Association of Critical Care Nurses Impact Grant is gratefully acknowledged

## H 16 - Transforming Research into Nursing Practice

### How to Critically Appraise Systematic Reviews in Order to Inform Clinical Decision Making

---

*Susan Buchholz, PhD, RN, ANP-BC, FAANP, USA*

#### Purpose

The purpose of this presentation is to demonstrate how to critically appraise systematic reviews in order to inform clinical decision making. Systematic reviews are being used as best research evidence in informing clinical decision making. It is important that nurses know how to determine the rigor of a systematic review.

#### Target Audience

This presentation is for clinical nurses, nursing faculty, and nursing students that are using best research evidence, including systematic reviews, to inform clinical decision making.

#### Abstract

Globally, published peer-reviewed health care literature has grown exponentially, making it unrealistic for nurses to review the literature in a timely manner. Systematic reviews now provide a tool for nurses to be able to quickly access literature that is part of the evidence-based tools needed to inform decisions in clinical practice. However, in order to be able to fully and appropriately use systematic reviews to inform clinical decisions, nurses need to have an understanding of what a strong systematic review is, what the steps are in conducting a systematic review, and how to use existing tools to critically appraise systematic reviews. This presentation will address each of these three points.

Systematic review is the overarching name given to a review that examines and synthesizes the findings from multiple studies that are retrieved in response to answering a specific research question. Systematic reviews are to be conducted using a rigorous process that is transparent, and therefore can be replicated with similar results. Dependent on the research question, systematic reviews can be comprised of quantitative or qualitative studies, or in some cases, review both quantitative and qualitative studies within the same systematic review. With both quantitative and qualitative research methods, results can in part be presented in a narrative and tabular format. With quantitative studies, results are also typically determined statistically, using different statistical methods including effect sizes and meta-analyses. Several different synthesis approaches are used when reviewing the findings from qualitative studies.

In the systematic review process, specific steps are used to conduct a systematic review. In order to understand how to appraise a systematic review, it is important to understand the steps that occur in the systematic review process. These are the basic steps in a systematic review:

1. Determine who will be on the systematic review team
2. Determine a clear research question
3. Develop a study protocol that will guide the systematic review process
4. Choose the databases that will be searched, which key words will be used, and decide upon the inclusion and exclusion criteria that will be used for study retrieval
5. Literature retrieval
6. Complete a dual blinded review
  1. Title review
  2. Abstract review
  3. Full-text review
7. Extract data from full-texts that meet inclusion criteria
8. Synthesize data
9. Report and provide implications on the findings

When critically appraising a systematic review to be used for clinical decision making, essentially the nurse is seeking to find out if a clearly focused question was addressed, if valid methods were used in the

review, what are the results of the review, and if the results are useful for clinical decision making. There are multiple tools that already exist in the international literature, that are available for nurses to use when appraising systematic reviews. For example these tools include the “10 questions to help you make sense of a review” sheet from the Critical Appraisal Skills Programme. The Centre for Evidence-Based Medicine “Systematic Review Appraisal Sheet” sheet asks five questions to determine if the results of the review are valid, and one question that examines how the results are presented. AMSTAR is a tool that uses 11 questions to assess the methodological quality of systematic reviews. A seven step checklist to analyze systematic reviews is provided by Ressing, Blettner & Klug (2009). Joanna Briggs Institute provides an eight step table “Critical Appraisal of a Systematic Review” in their “Appraising Systematic Reviews” information sheet.

Although each of these tools presents a different approach to critical appraisal, with some presenting very specific questions and others questions that are broad, briefly a critical appraisal of a systematic review for clinical decision making is guided by asking these types of questions:

1. Was there a clear question that guided the systematic review?
2. Was an ‘a priori’ study protocol used?
3. What were the inclusion and exclusion criteria in the systematic review?
4. Was the literature search comprehensive and described in detail?
5. Were there at least two reviewers working independently to determine study inclusion and data extraction?
6. Was the scientific quality of individual studies assessed?
7. Was heterogeneity between studies assessed?
8. Were the statistical methods used appropriate and precise?
9. Was the synthesis of the studies appropriately conducted?
10. Were limitations of the review provided?
11. Were the results presented clearly?
12. Are the results of the study applicable to guide clinical decisions?

Systematic reviews provide a rigorous appraisal and synthesis of large bodies of original research. Systematic reviews provide an efficient method for clinicians to quickly access healthcare literature that can be used to inform clinical decision making. However it is important for nurses to be able to quickly appraise systematic reviews to determine if these reviews are trustworthy and reliable sources of evidence-based research. By understanding what comprises a strong systematic review, the steps that are used to conduct a systematic review, and questions that are typically asked in appraising systematic reviews, nurses can confidently determine when and how systematic review results can be used to inform day-to-day clinical decisions.

## H 16 - Transforming Research into Nursing Practice

### Self-Reporting of Health Perceptions among Former Uranium Workers, Their Families and Decendants Living in Rural Settings

---

*Harold William Smith, PhD, USA*

#### Purpose

The purpose of this presentation is to disseminate preliminary findings of an ongoing study of self-reported health perceptions among rural elderly and their families who have been exposed to uranium and other environmental hazards.

#### Target Audience

The target audience of this presentation is health care professionals looking to enhance systems of service and care focused on increasing patient and family participation in their own managed care.

#### Abstract

The purpose of this ongoing study is to conduct an assessment of the health needs of communities in New Mexico that have been exposed to uranium and other naturally occurring environmental hazards, and to understanding whether or not there is a significant relationship between self-reporting health statuses, individuals' perceptions of their overall health, and uranium exposure in uranium mine workers and their families. An individual's perception of their own health has been found to be a predictor of how they access health care, as well as level of proactivity of adherence to health and healing regimens. The rural elderly are at particular risk of neglect and apathy towards seeking health monitoring and interventions that save lives or improve the quality of life for many seniors. Data gathered from initial surveys and one-on-one interviews with members of this population are enabling classification of family health pedigrees not assembled in previous studies. These health histories provide family members along the entire age horizon with information that may avert, eliminate, or better manage illnesses resulting from primary and secondary, as well as intergenerational exposure to uranium and radon gas and related harmful environmental substances. Preliminary findings suggest a more expanded sampling of extended family members will provide additional data that may assist health care providers in these regions in creating more responsive and systemically integrated health care and family support systems for rural elderly and their families.

# H 17 - Nursing Scholarship and Our Potential Impact

## Innovative Teaching/Learning Strategies for Healthcare Education

---

*Gayle Taylor, EdD, MSN, RNC, CNL, CCE, USA*

### Purpose

to improve the teaching/learning strategies employed by healthcare educators who strive to make learning more effective.

### Target Audience

healthcare educators who need innovative strategies for improving their teaching methods.

### Abstract

For years, the template for teaching healthcare courses has been comprised of one instructor in front of a class lecturing to students who may or may not feel vested in the information being given. Students cannot be held at fault for finding little interest in a lecture-based format. Changing modes of communication used by students dictates the need for a changing format of instruction. In order to deliver an ever increasing amount of training needed by today's nurses, teaching strategies have to change.

Engaging students in an active learning process may be the most important key to improved healthcare education. By providing exemplars of critical thinking strategies and activities, educators can come out from behind the podium and allow active learning to take place. Students will benefit from diverse learning strategies that allow subjective interpretations, while discovering new information through evidence-based practice. Some examples of teaching/learning strategies are; discovering suitable nursing strategies through the use of case studies, improving reasoning skills through debate, analysis of relationships through the use of concept maps, enhancing the understanding of concepts through analogies, using teamwork as a tool for group problem solving techniques, and employing simulation that includes role playing as a method of comprehension.

By providing clear instructions and including interesting subject matter, students may find themselves learning despite any reluctance felt about utilizing different learning concepts and techniques. Getting students up out of their chairs and involved in the learning process has to be the key to increased participation in their own education.

### Global Scholarship: The Challenges for Nursing and the Value of STTI

---

*Elizabeth Anne Rosser, DPhil, MN, DipRM, DipNEd, RN, RM, United Kingdom*

*Ann L. Bevan, PhD, MScN, RN, RSCN, United Kingdom*

*Vanora Hundley, BN, MSc, PhD, RN, RGN, RM, FHEA, United Kingdom*

*Janet M. E. Scammell, DNSci, MSc (Nsg), BA (SocSci), DipNEd, RGN, SCM, RNT, England*

#### Purpose

To report the views of members of Phi Mu Chapter (England) as to the value of the global nursing honor society Sigma Theta Tau International (STTI) as an organisation, and how members would like to see the Chapter develop in the context of STTI's 2020 vision to become intentionally global

#### Target Audience

All STTI members

#### Abstract

**Background:** Globally, professional nursing is facing a number of significant and complex challenges. Issues such as workforce shortages, increasing patient acuity, ongoing reduction of resources and poor quality of professional work life combine to have a greater influence on patient care than the effect of each one in isolation (Mannix et al, 2013; Aitken et al, 2013). Although not just a nursing issue, evidence from various reports, especially in the United Kingdom (UK), indicate that in combination these challenges can result in gross failure in the 'system' leading to unacceptable and in some situations, inhumane, patient care (Francis 2010, 2013; Rudman et al, 2012). Although there is no simple solution to this failure, learning from our colleagues worldwide, seems a reasonable way forward to strengthen nursing leadership (Jackson & Watson 2009) and support change through the use of evidence-based practice (Tame, 2013).

**The aim** is to report the views of members of Phi Mu Chapter (England) of the global nursing honor society Sigma Theta Tau International (STTI) as an organisation, and the resources they provide, and how they would like to see the Chapter develop in the context of STTI's 2020 vision to become intentionally global.

**Design and methods:** All members of the Phi Mu Chapter (England) (n=71) were invited to participate in the study by way of an email invitation containing a link to the online survey. Participant information was provided and consent obtained on the "landing page" for the survey. The online questionnaire delivered through the SurveyMonkey tool was designed to mirror a European Regional survey conducted in 2012 and contained a series of closed and open questions.

**Findings:** Responses were received from 31 of the 71 members (44%). The majority of participants joined STTI because they believed in its mission and it offered them the prospect of networking with like-minded individuals. The potential for global reach was attractive as a potential to influence the profession world wide. The three themes arising from the survey were: a) the promotion of scholarship b) the value of networking and c) communication and the development of culturally sensitive organisations.

**Conclusions:** From the England perspective, this paper summarises evidence of members' views of the value of STTI to nursing. There was strong support for the Chapter to energise stronger links between education and practice to promote scholarly inquiry and evidence-based practice. Through effective collaboration, strong leadership could be encouraged. Given the complex and significant challenges to nursing, this new chapter is keen to embrace the global agenda and support the wider society in becoming more culturally sensitive.

**Clinical Relevance:** Whilst the immediate access to a real and available global community through the world wide web might negate the need for an honour society, the Phi Mu Chapter (England) offers the

opportunity to connect real individuals to join in their collaboration to strengthen clinical leadership and scholarship to improve the health of the world's people.

## H 18 - Researching Practice Changes in Patients with HIV/AIDS

### Systematic Review of Human Immunodeficiency Virus (HIV) Knowledge Measurement Instruments Used on the Arabian Peninsula

---

*Maram Alghabbashi, BSN, MSN, RN, USA*  
*Barbara J. Guthrie, PhD, RN, FAAN, USA*

#### Purpose

The purpose of this presentation is to provide a critical review of existing human immunodeficiency virus (HIV) knowledge measurement tools developed for Saudi Arabia and other Arabian Peninsula populations.

#### Target Audience

The target audience of this presentation is health researchers and educators who work with Arabian populations toward prevention of sexually transmitted infections.

#### Abstract

**Introduction:** In 1984, the Kingdom of Saudi Arabia (KSA) began surveillance for human immunodeficiency virus (HIV) incidence and prevalence. In October 1991, the Saudi Minister of Education directed all educational regions and school health units to implement AIDS education in secondary schools. Until this point, the level of public knowledge about acquired immune deficiency syndrome (AIDS) was generally not addressed in the Kingdom of Saudi Arabia (KSA) for several reasons. At the time, AIDS was an emerging disease with a relatively low prevalence in the KSA compared to other countries, and public discussion of it was taboo. However, beginning with the World AIDS Day in December 1992, measuring the KSA public's knowledge of AIDS (and later human immunodeficiency virus (HIV)) became more important to the KSA government, spurring the development of instruments to measure AIDS and HIV knowledge in addition to related topics, such as attitudes toward infected individuals.

Today, the highest rate of HIV prevalence in KSA has been consistently found among the non-drug using heterosexual population. However, no culturally-appropriate standardized questionnaire has been developed to measure HIV prevention knowledge in this population. Evidence exists that married Saudi women are especially at higher risk for infection, but lack knowledge of HIV modes of transmission and underestimate their personal risk of becoming infected.

**Purpose:** To: 1) enumerate appropriate HIV/AIDS knowledge questionnaires that could inform a current study of HIV/AIDS knowledge in the KSA population (especially women), and 2) analyze them for their strengths and weaknesses in terms of reliability, validity, and cultural compatibility.

**Methods:** To select appropriate studies and instruments about HIV/AIDS knowledge to review, the following criteria were applied: 1) Must include discussion of a quantitative survey instrument used, 2) quantitative survey must be given either as an interview or self-reported questionnaire, 3) survey must include questions about knowledge HIV or AIDS in specific, but can include questions about other constructs (e.g., attitudes), and can include questions about other STIs, 4) survey must be given in either English or Arabic, but can be given in additional languages, 5) survey must be done in a population in the KSA or other countries bordering the KSA on the Arabian Peninsula, including: Kuwait, Oman, United Arab Emirates (UAE), and Qatar. Google Scholar and Google Web were utilized to search for and identify articles in all of the following databases: PubMed, PLoS, WHO publications, UN publications, news, and other peer-reviewed publication databases. Search terms used include the following: Saudi Arabia, HIV, "HIV knowledge", questionnaire, instrument, survey, AIDS. Articles were assessed manually for meeting criteria, and articles that met the study criteria selected for data collection, which consisted of the following: primary author, year of publication, population studied (in terms of gender as well as other characteristics), total sample completing the instrument, the response rate (if reported), how the

population was sampled, description of the questionnaire used, language of the questionnaire, and results of any reliability or validity studies reported.

**Results:** The initial search for articles identified 4,410 results. Most studies did not qualify because they did not concern the population of interest. A smaller proportion of studies were disqualified because they did not include a survey, or they did not study HIV or AIDS knowledge. Ultimately, 16 articles met the criteria for this study.

Of these, 10 (63%) were conducted in a KSA population, and the rest were in neighboring countries (Kuwait n=2, Yemen n=2, UAE n=1, and Oman n=1). A majority of the articles studied students of primary, secondary, or post-secondary schools (n=9, 56%), while others studied certain occupational cohorts, such as physicians and bus drivers (n=3) and others studied the general population (n=3). Five studies included only men, while the other 11 included both sexes. Only one study was done on a clinical population. A response rate was either unavailable or not reported for over half the studies (n=9, 56%), but all studies that did report a response rate reported rates of least 80%, and three studies even achieved 100%. A variety of sampling approaches were used, the most common being some type of cluster sampling (n=6, 38%). Sampling approaches were unavailable or not reported for three studies.

Information about the measurement instruments used in these studies was unavailable or not reported for four studies (25%), and the language of the questionnaire was unavailable or not reported for seven studies (44%). Six studies (38%) used a measurement instrument based on a questionnaire developed by a health agency, such as the World Health Organization (WHO) Knowledge, Attitudes, Beliefs, and Practices (KABP) survey. Two employed a questionnaire previously used in non-Arabic populations, and two developed their own questionnaire for the study. Eight studies (50%) reported administering the questionnaire in Arabic only. One study translated it into multiple languages to accommodate its multi-lingual population. Information about the language of the questionnaire was unavailable or not reported for seven studies (44%).

Of the 16 studies, only one commented on validity studies, and two commented on reliabilities studies. However, descriptions of reliability and validity studies as reported in the articles were not clear, in that they did not provide a description of how reliability or validity were assessed or evaluated in the study or previous studies.

**Discussion:** This review found 16 HIV/AIDS knowledge questionnaires that could inform a current study of the KSA population. The most important weakness identified in the studies reviewed was the appropriateness of the population subject to the HIV or AIDS knowledge questionnaire. Given the culture of the KSA as described earlier, where most young people do not experience sexual intercourse until after an arranged, legal marriage in accordance with the Saudi expression of the Islamic religion, it is unclear as to why over half the studies reviewed (n=9, 56%) surveyed students, as this would likely constitute a low risk population for sexual transmission of HIV.

Next, it is interesting to note that despite an avoidance of gender-mixing in the Arab world, an instrument targeting women or men only with respect to HIV and AIDS prevention knowledge was not developed during this time span. In fact, 5 of the 16 studies reviewed did not even include women, and no attempt was made to create gender-specific instruments when surveying men or mixed groups.

In addition to concerns over the appropriateness of particular surveyed populations, criticism can be leveraged regarding the choice of instruments used in these studies. It is reasonable that six studies selected questionnaires developed by health agencies, but two studies used questionnaires based on non-Arabic populations, two used questionnaires that the authors developed for the study (and therefore, they had not been tested or reported on previously), and information about the questionnaire used was not available for 4 studies. This means that in 50% of the studies reviewed, the questionnaire was likely of low quality.

None of the instruments used were provided the results of reliability or validity studies, so evaluating their quality is difficult. Unfortunately, most of the HIV and AIDS knowledge instruments developed by health

agencies, such as the WHO-KABP, are inappropriate for even high-risk populations in the KSA. The WHO-KABP was used in four studies and includes questions about HIV and AIDS pertinent to transmission by intravenous drug use (IDU) and homosexual activity. These questions are inappropriate for the KSA's population, given its low HIV prevalence, low rates of IDU and homosexuality, and KSA's strict expression of Islam.

**Conclusion:** In summary, 16 papers were reviewed that included HIV knowledge measurement in the KSA or bordering populations. On the positive side, all studies report high response rates, but other features of these reports indicate challenges. First, the absence of a culturally-specific KSA instrument has resulted in the inability to reliably and accurately measure HIV knowledge in KSA populations. Next, studies examined employed a variety of instruments, but they generally did not report reliability and validity studies, so their relative quality could not be compared. Further, gender-specific instruments were not developed, although transmission patterns in the KSA suggest that transmission modes are potentially much more gender-specific than in other countries. Finally, these articles generally reported on low-risk populations in the KSA. The KSA's public health goals should more specifically focus on measuring and improving knowledge in high-risk populations such as married women—an option currently limited by commonly available measurement instruments.

## H 18 - Researching Practice Changes in Patients with HIV/AIDS

### Do Nurses Know the TB and HIV/AIDS Policies They are Expected to Implement? A Case of Health Facilities in a Rural Sub-District of the Western Cape

---

*Deliwe Rene Phetlhu, PhD, MHS, BA, RN, RM, South Africa*

#### Purpose

To give the participants an opportunity to understand the dynamics at play that affect policy implementations in priority programs in South Africa and how these impact on the nurses' performance and consequently on the patient's outcome. The methodology used can be applied to other settings intending to do similar measures.

#### Target Audience

All nurses, students, educators and policy makers interested in the improvement of health systems through policy implementation in different health component but especially in TB and HIV/AIDS.

#### Abstract

Tuberculosis and HIV/AIDS epidemic has been on the international agenda for more than three decades. Though some achievements have been marked, sub-Saharan Africa is still grappling with moving towards the Millennium development goals. South Africa is one of Sub-Saharan African countries reported to have a high burden of both these diseases. Increase in political commitment has seen changes been made in the health system resulting in some achievements. However a lot still need to be done as the prevalence rates of both these diseases are still high especially in the rural areas.

Implementation of TB and HIV/AIDS policies has been highlighted as one of the challenges in the health system. It has been noted in the policy analysis and implementation fields that for successful policy implementation to happen, all the actors in the health system need to be involved. In the South African context nurses are the largest cadre of health workers and have been described as the first line of contact with patients in health facilities especially in the rural areas thereby major actors in the policy implementation process. Therefore nurses plays a pivotal role in the implementation of TB and HIV/AIDS policies hence their knowledge of policies, how they implement the policies and the barriers that influence implementation in their context need to be analysed so as to develop intervention strategies that could improve policy implementation. The objective of this presentation is to describe the knowledge of the nurses with regarding to the policies they are expected to implement in the TB and HIV/AIDS programs in South Africa. This presentation is part of a bigger study done to analyse the implementation of TB and HIV policies in the health facilities of a rural sub-district in the Western Cape so as to develop interventions for improvement. Walt and Gilson's model of health policy analysis which focuses on the actors' knowledge, practice and context was used as a theoretical framework to guide the research question, the design and intervention development process.

Mixed method approach with concurrent transformative design was followed wherein the data was given equal priority. The knowledge measure focused on policy components related to patient diagnosis, testing, prevention of the spread of diseases and initiation treatment as defined in TB and HIV/AIDS national and/or provincial guidelines. The target population of this study comprised of all categories of nurses (Enrolled nursing assistants, Enrolled nurses and Registered nurses) working in the health facilities in the selected sub-district (n ~ 87). However the accessible population was drawn from four clinics and one day hospital (n~60) out of the eight available facilities. This decision was based on the size of the clinic in terms of patients' head count and activities undertaken in the clinic in relation to the study focus. Non-probability purposive sampling was used because the accessible population in this setting was small and well defined thus all legible participants were recruited. The inclusion criterion was that the participant should have been working in the sub-district for at least three months at the time of data collection. In the quantitative phase, a self-administrative questionnaire was used as a data

collection tool and semi structured interviews were conducted in the qualitative phase. Data was analysed using SPSS statistical package and thematic coding for quantitative and qualitative data respectively.

The results showed that nurses were at different levels regarding the level of knowledge they have based on aspects like training and exposure to the policies. Managerial support was also reported as an enhancer to acquisition of knowledge while work load was seen as an impediment. It was also noted that although training opportunities were available, they were not used optimally. The study was also able to highlight what knowledge the nurses specifically rated higher in when assessed on the different spectrum of the policies activities which has a possible impact on patient care. The study concluded that increase in nurses' knowledge regarding the importance of the policies and implications of improper practices due to lack of awareness need to be increased if successful policy implementation and better patients outcomes is to be achieved.

## H 19 - Exploring Cultural Diversity in Maternal-Child Health

### How African-American Nulliparous Women Construct Birth

---

*Marianne Frances Moore, PhD, MSN, BSN, RN, CNM, USA*

#### Purpose

Discussion of the findings of a focused ethnography describing the cognitive constructions about birth among nulliparous Black women in a Southwestern US urban area, and how these constructions are reconciled with the actual birth. Does our current care adequately address their fears and concerns, which have not been well-researched?

#### Target Audience

Faculty who teach both undergraduate and graduate nursing students, clinicians who provide maternity care to African-American women, and those working in social services who provide guidance and service to this population.

#### Abstract

**Purpose/Aim:** A focused ethnography was conducted to describe cognitive constructions about birth among nulliparous Black women in a Southwestern US urban area, and how these constructions are reconciled with the actual birth.

**Significance/Background:** African-American women suffer significant disparities in outcomes such as preterm birth, Cesarean section rates, maternal mortality and infant mortality, in the United States.

**Methods:** Women, 16 or older, 17 - 33 weeks carrying a singleton fetus without anomalies or medical problems and scheduled for an anatomy scan were recruited, and semi-structured interviews were conducted before and then after the birth. Eleven women participated: 17 to 30 years old, 11 to 22 years of education (2 college graduates) and 17+5 to 31+5 gestation. Three women were employed; all used Medicaid. Seven women received SNAP and/or WIC benefits. Three women had absent mothers. Post-delivery interviews (25-54 minutes) occurred 13 to 25 days postpartum. The researcher transcribed all interviews.

**Findings:** Women described views of birth that grew from ideas shared by their mothers. Themes included the predominant view "birth is painful", followed by "birth damages you and/or the baby" Two women identified "birth changes you." Ideas obtained from friends, family, the media and popular culture, as well as care providers were evaluated in light of these maternal ideas. Women also evaluated their own births using these maternal ideas. Beyond describing birth as their mothers had described it, women concluded that birth was essentially unknown to them, and they had limited expectations about what would happen during the birth.

**Discussion:** Further investigations into the expectations and birth experiences would help practitioners to provide more relevant care. Findings will expand what is known about how African-American women experience first deliveries. The role of the woman's mother and extended family during her first birth presents another avenue for research, and for care.

## H 19 - Exploring Cultural Diversity in Maternal-Child Health

### Women's Reproductive Knowledge and Their Ability to Teach Their Daughters about Reproductive Changes

---

*Yenupini Joyce Adams, BSN, RN, USA*  
*Adejoke B. Ayoola, PhD, RN, USA*

#### Purpose

The purpose of this presentation is to present findings on the association between women's reproductive knowledge and their perception of their ability to teach their daughters about the reproductive changes occurring in their bodies.

#### Target Audience

The target audience of this presentation is nurses and nurse practitioners, researchers, women, public health workers.

#### Abstract

**Purpose:** Life span approach to promoting reproductive health requires initiating reproductive education early, during the pre-pubertal and early adolescent period. Mothers tend to have close relationships with their daughters and could be the earliest and best source of information for their girls on reproductive education. But women could only effectively teach their daughters if they have good reproductive knowledge. This study examined the association between women's reproductive knowledge and their perception of their ability to teach their daughters about the reproductive changes occurring in their bodies.

**Methods:** The social cognitive theory informs this study. A convenience sample of ethnically diverse women completed a self-administered questionnaire to assess their reproductive knowledge. The "Knowledge of the Female Body" (KFB) scale assessed women's knowledge of the female reproductive system and hormones, ovulation and its timing, menstrual cycle, signs of pregnancy, and mechanism of action of common birth control methods. Statistical analyses entailed univariate and bivariate analyses using STATA 13.

( $\chi^2 = 11.46$ ; Fisher's exact  $p = 0.021$ ).

**Results:** One hundred and twenty-five women aged 18 to 51 years ( $M = 30.48$ ,  $SD = 7.35$ ) completed the questionnaire. 58.4% were not married and 69.6% had one to three children. Majority (70.4%) of the women had a household income less than \$20,000.00. There were 52% Hispanics, 36% African American, and 12% White women. The mean correct reproductive knowledge score was 16 ( $SD = 5.73$ , range 0 to 27) for the 27 items analyzed in this study. Forty percent of the women had low knowledge (scored 15 and below). The average knowledge score for African Americans was the highest at 19.36 ( $SD = 3.8$ , range 11 to 26). The lowest knowledge score was among Hispanic women--13.57 ( $SD = 5.51$ , range 0 to 27). Women with no prior birth had higher mean reproductive knowledge scores than women with four children or more (19 vs. 17), ( $\chi^2 = 7.22$ ;  $P = 0.022$ ; Fisher's Exact Test, FET). There was a significant relationship between women's knowledge and their perceived ability to teach their daughters about reproductive changes occurring in their bodies ( $P = 0.01$ ), and about how to keep a menstrual calendar to monitor their ovulation ( $P = 0.03$ ). Women with higher knowledge scores (Mean = 17.05,  $SD = 5.41$ , range 1 to 27) were confident they could teach their daughters about reproductive changes occurring in their bodies and women with lower knowledge scores (Mean = 13.63,  $SD = 5.65$ , range 0 to 23) were not confident about their ability to teach their daughters about reproductive changes.

**Conclusion:** Higher reproductive knowledge is associated with higher confidence in mothers' ability to teach their daughters about the reproductive changes occurring in a girl's body. Educating mothers about their reproductive system will provide opportunities for women to teach relevant reproductive content to younger girls early in their developmental years.

## H 19 - Exploring Cultural Diversity in Maternal-Child Health

### Cultural Diversity in Childbirth Practices in a Rural Community in Southern Nigeria

---

*Ekpoanwan E. Esienumoh, PhD, MPH, BSc, RN/RM, FWACN, Nigeria*

*Idongesit I. Akpabio, PhD, MSc, MPA, BSc, RN/RM, FWACN, Nigeria*

*Josephine B. Etowa, RN, PhD, Canada*

*Heather Waterman, PhD, BSc, RN, England*

#### Purpose

The purpose of this presentation is to remind the global community of nurses/midwives of the existence of cultural challenges in a typical nurse/midwife – client interaction in multicultural/ethnic communities. This knowledge will contribute to existing knowledge on cultural diversity and guide nursing/midwifery practice. It is expected to stimulate further research.

#### Target Audience

The target audience is the international community of nurses and midwives and other healthcare providers as well as students of nursing. This includes various categories of nurse specialists and leaders ranging from policy-makers to policy-implementers who are in the position to promote culturally-competent care and bridge the gap of diversity.

#### Abstract

Cultural diversity refers to the differences between people based on shared ideology and valued set of beliefs, norms, customs and meanings evidenced in a way of life. Knowledge of cultural diversity is important at all levels of nursing and midwifery care as this addresses ethnic and racial differences where applicable. Additionally, such knowledge can strengthen and broaden the healthcare delivery system through conceptualization of illness and development of treatment models.

It is acknowledged that in a typical nurse/midwife-patient/client encounter, there is interplay of three cultural systems namely, the culture of the nurse/the profession, culture of the patient/client and culture of the setting. Therefore, nurses and midwives have to be culturally competent to facilitate the delivery of good quality healthcare in settings with diverse health values and practices. Nigeria is marked by people with diverse cultures which consequently create a challenge to the healthcare providers. These cultural variations also are thought to influence birth practices. Diversity in birth practices is also globally acknowledged in literature.

The overarching aim of this study is to acquaint nurses/midwives and other healthcare providers with the cultural birth practices of community members in Bakassi Local Government Area in Southern Nigeria and their diversity from the nursing/midwifery culture. Reported in this presentation, are the findings from the fact-finding phase of an action research project on the prevention of maternal mortality in that rural community.

Ethnography design was utilised. Data were generated through in-depth individual interviews of twenty-nine women of childbearing age to gain understanding of their cultural beliefs and practices on childbirth. Four focus group discussions were held with some other women of childbearing age, menopausal women/ mothers-in-law and traditional birth attendants. Observations of five traditional birth attendants and one midwife in their places of practice were also undertaken. Participants were selected through purposive and snowball sampling.

Thematic data analysis was undertaken and diversity in birth practices between the traditional indigenous culture and nursing/midwifery culture depicted in the following themes emerged: child pregnancy; nutritional taboos; imposition of decision on care; preference for traditional birth attendants; prayer as source of safety in childbirth; position for delivery; utilisation of traditional sanitary towels; care in delivery

emergencies; midwives ethnocentrism and culture imposition. The findings were inputted into the planning phase of the action research project for critical reflection and action.

It is concluded that cultural diversity explicitly exists in the nurse/midwife and client interaction in this setting. Therefore, to create a positive impact on maternal care, nurses, midwives and other healthcare providers should deliberately seek to understand the culture of the people and adopt the harmless ones. This would require flexibility in professional practice. Where the culture is inimical to health, the health providers should democratically and collaboratively motivate the clients to critique their practices with the hope of possible repudiation. This study has implication for the provision of culturally competent care for women of childbearing age.

## H 23 - Transitions in Nursing

### A Focused Ethnography: Nurses Transitioning to a Nursing Specialty

---

*Mary A. Brinkman, PhD, RN, CNOR, USA*

#### Purpose

The purpose of this presentation is the importance of having a well structured orientation program implemented by a advanced nurse educator to facilitate nurses' transitioning orienting new specialty. A focused ethnography studied the influences that facilitated and hindered nurses transitioning to a new area of nursing practice.

#### Target Audience

The target audience of this presentation are nurses who have or are educating, precepting, or mentoring nurses transitioning to a new nursing specialty. Understanding the factors that influence nurses transitioning to new areas of nursing practice will promote positive outcomes for recruitment and retaining new nurses.

#### Abstract

Transitioning to a new area of practice whether it is as a recent graduate nurse or a nurse transitioning to a different specialty area in nursing, there occurs many feelings associated with the adjustments in learning a new area of practice. As there is a projected nursing shortage in the next five to ten years, the need for experience nurses to prepare and educate nurses as they transition to new areas of nursing is essential to maintain a safe and productive nursing workforce. As hospitals educate their own OR nurses, retention following orientation becomes a priority.

The purpose of this study was to explore nurses' experiences as they transition to a new area of nursing practice, the operating room. A qualitative focused ethnography was conducted using Leininger's ethn nursing research method. Fourteen RNs transitioning to the OR agreed to participate in this study. The OR was a first time experience for the RNs. The setting was a large teaching hospital located in an urban area. Observations and interviews were conducted with the RNs to explore their experiences as they transitioned in the OR.

The RNs' transition included learning the didactics of OR nursing through the web-based AORN Nursing 101 online computer course, practicing skills learned in a simulation laboratory, and rotating through surgical specialty areas under the supervision of an RN preceptor. Influences that facilitated the RNs transition to the OR were the positive learning experience, perception of belonging and acceptance into the OR culture, stimulating environment, supportive personnel, collegiality among peers, and presence of nursing in the OR. Influences that hindered the RNs' transition to the OR were inconsistency in precepting, being in a hostile environment, limited exposure to the OR prior to the RNs' transition, and an overwhelming environment. Meleis' Transition model emerged in the RNs' experiences of transitioning to the OR.

The need to educate nurses in the operating room is essential to assure safety and positive outcomes for the surgical patient. Structured perioperative courses implemented by hospitals or with partnerships with nursing programs can enhance the education, transition, and retention of nurses new to the OR. The importance of a nurse educator having an advanced degree with experience in the OR specialty was essential in coordinating and mentoring nurses transitioning to this new practice area. RNs who are prepared to precept were vital in the education and retention of these RNs. The need for consistent preceptors was recognized as an essential factor to the RNs' successful transition. The findings contribute to evidence-base practice for the design and implementation of perioperative programs for new nurses.

## H 23 - Transitions in Nursing

### The Registered Nurse Exchange Program

---

*Tangee Pruitt, MHSA, USA*

*Pamela Petto, MEdHRD, BSN, RN, USA*

*Renee Roberts-Turner, MSN, DHA, RN, NE-BC, CPHQ, USA*

#### Purpose

This project provides a description of structure, processes, outcomes and benefits of establishing a formalized Nurse Exchange Program from a professional development perspective.

#### Target Audience

The target audience for this presentation includes educators and nurse leaders.

#### Abstract

**Background:** In an environment where healthcare delivery continues to evolve, it is imminent that practitioners and administrators remain on the cutting edge of best practices. Institutions must seek opportunities to decrease cost and increase quality. As a response, an initiative was put forth to enter into a nurse exchange collaborative with similar hospitals; the Registered Nurse (RN) Exchange Program (RN Exchange Program) is an innovative program where professional pediatric nurses have the opportunity to learn best practices from other pediatric hospitals through witnessing them in action. After being invited into the RN Exchange Program, the hospital created a plan to provide structure and processes to ensure its success.

**Purpose:** This project provides a description of structure, processes, outcomes and benefits of establishing a formalized RN Exchange Program from a professional development perspective. The RN Exchange Program created an opportunity for an organized visit to a similar healthcare institution (i.e. a children's hospital) for experienced nurses to learn and share best practices; it promotes nursing professional development advancement and enhances opportunities for improvement in professional practice. The program design allows for the inclusion of hospitals across the nation as well as around the world. The Nurse Exchange Program is important for professional growth of the visiting nurse and provides opportunities for nurses at the host organization to engage in dialog to address operational efficiencies and explore approaches or ways to improve care models.

**Methods:** Structured processes were essential for the success of the RN Exchange Program. A business and education approach was taken to lay the foundation, which included a program plan with financial and marketing projections, timelines for each task and an evaluation mechanism for process improvement. The program plan also included establishing participant criteria, developing the application process, and designing the selection process for participants. The program plan was provided to nursing leadership and approval was received. Upon approval of the plan, a marketing campaign began with sending communication to all nurses using various venues detailing the purpose and providing information about the program. The RN Exchange Program was built specifically for an individual nurse based on his/her interests and occurs over a five day period. To be eligible for the exchange, nurses must meet the following criteria: 1) Direct Care Provider/ Staff Nurse, 2) Two Years of experience, 3) Active participation within nursing committees (unit or system level), and 4) In good standing as verified by unit leadership. The application process requires nurses to declare interest, complete an application, obtain manager approval, undergo a written application review, and complete a panel interview with the home hospital. Within the application, nurses state proposed goals that further provide an outline for learning objectives during the exchange. Applicants with the highest interview scores are chosen to represent the organization. Action learning principles are implemented as participating nurses use the learning objectives to guide their visit and identify best practices. Upon return from the exchange, the nurse is required to provide an overview of the experience to his/her peers and identify a project to implement as a best practice. As a host hospital, evaluations are provided to the visiting nurse and onsite participants at the conclusion of the exchange to receive feedback for program improvement. In addition, the home and

host institutions have a continual discourse to address any challenges the nurses may have encountered and for further collaboration in any specific best practice content areas.

**Results:** During the presentation to peers, nurses exuded with energy as each relayed his/her experience. These nurses also acknowledged a desire to increase participation in hospital affairs and a motivation to share findings: two of the nurses have accepted invitations to become a part of the nurse exchange selection committee; the Neonatal Intensive Care Unit (NICU) has begun laying the foundation for a developmental care committee; and there has been a proposal to review ampicillin administration guidelines with the pharmacy department for potential savings. A status update for each project is ongoing.

**Conclusion:** Creating a formalized nurse exchange program enhances professional development and permits growth opportunities for the home and host hospitals. Outcomes of nurse experiences with the nurse exchange program have translated into improvements in the nurses' work environment (or in improved patient outcomes).

## H 23 - Transitions in Nursing

### Challenges with Nurse Licensing and Mobility

---

*Linda Mc Gillis Hall, PhD, MNSc, RN, FAAN, FCAHS, Canada*

#### Purpose

The purpose of this presentation is to discuss the results of a funded research study examining nurse migration and mobility.

#### Target Audience

Registered nurses; nurse academics; nurse managers; nurse researchers

#### Abstract

**Objectives:** Considerable literature exists on the immigration of internationally educated nurses (IENs) in other countries, but little information exists to guide the development and implementation of policies that promote the safe integration of IENs in Canada. The objective of this study was to gain a better understanding of the employment practices of IENs in Canada and their experiences with integration into healthcare work environments within the context of quality patient care.

**Methods:** A comparative research design of a random sample of IENs and Canadian-educated nurses (CENs) was conducted. The survey gathered information on professional/demographic characteristics, employment, job experiences, workplace integration and measures of patient care quality provided by both groups of nurses. The sample was comprised of 2,107 IENs (RR= 42%) and 1,172 CENs (RR =40%).

**Results:** Considerable differences were noted between the groups on work experiences and perceptions of work. IENs had statistically significantly higher perceptions of satisfaction with nursing as a career and their current job, quality of care provided, amount of orientation and ongoing opportunities provided for updating their skills. In addition IENs identified concern with being unable to complete their work by shift end and had significant concern that the job was negatively affecting their health.

**Discussion:** This study provides the first information on experiences in hiring and employing IENs; strategies used to integrate IENs into the work environment; and perceptions of IEN competencies, contributions to the work environment, and quality of care in the Canadian context. The study uncovered new information on IENs integration into work settings.

## H 24 - Respiratory Related Illness and Care

### Fewer Ventilator Days with Dexmedetomidine Use for Patients Difficult to Extubate Implementation Study

---

Susan Becker, DNP, MSN, BSN, RN, CNS, CCRN, CCNS, USA

#### Purpose

The purpose of this presentation is to share a protocol to decrease the length of stay for mechanically ventilated patients by implementing a dexmedetomidine protocol for difficult to extubate patients during the weaning process.

#### Target Audience

The target audience of this presentation is nurses working in critical care areas with mechanically ventilated patients.

#### Abstract

**Background** Traditional sedation for mechanically ventilated patients causes delirium which increases the patients' length of stay while hospitalized. When extubation is attempted, these medications must be discontinued due to the side effect of respiratory depression, leaving patients anxious and agitated, delaying extubation and prolonging the need for mechanical ventilation. Dexmedetomidine is an alternative sedative that does not cause delirium or respiratory depression. During the weaning process, dexmedetomidine can be continued, allowing the patient to remain calm and successfully extubated.

**Objectives** To decrease the length of stay for mechanically ventilated patients by implementing a dexmedetomidine protocol for difficult to extubate patients during the weaning process.

**Methods** A pre/post design study was done comparing the patient mean of length of stay on mechanical ventilation. A Mann-Whitney U-Test was used due to the small sample size.

**Results** Over the three-month implementation period, 15 patients received dexmedetomidine. None of the patients experienced adverse reactions while on dexmedetomidine. There was a trend of decreasing mechanical ventilation length of stay but no significant difference was noted between the pre-implementation group and the post.

**Conclusion** Dexmedetomidine was a safe alternative to traditional sedation for difficult to extubate patients when a bolus dose was not given.

## H 24 - Respiratory Related Illness and Care

### The Impact of Various Influences on Self-Management of Adult African-Americans with Asthma

---

*James Daniel Holland, PhD, MSN, RN, CNL, RRT, RCP, USA*

#### Purpose

The purpose of this presentation is to discuss the affects of asthma control, self-management, medication adherence, sleep quality, self-efficacy, social support, asthma knowledge, health literacy, on asthma quality of life in the adults African Americans with asthma. Data from a seven day asthma diary and questionnaires, research questions were answered.

#### Target Audience

The target audience of this presentation is anyone that works with asthmatics, diverse patient population and especially African Americans, health care providers, Nurse educators at Acute and Chronic care facilities, and Nurse and Allied Health faculty that teaches future/current health care providers.

#### Abstract

There are approximately 22.2 million Americans who are living with asthma and of those 18.4 million are adults. African Americans are more likely to be diagnosed with asthma compared to Caucasians and experience more asthma attacks. This research study used the Social Cognitive Theory to examine relationships among personal characteristics, environment factors, asthma self-efficacy, self-management behaviors, and quality of life (QOL) in African Americans adults with asthma. A correlational design was used. Data were collected from a non-random sample of adult African Americans with asthma (N=39) using the following self-report questionnaires: the Knowledge, Attitude, and Self-Efficacy of Asthma Questionnaire (KASE), the short form of the Rapid Estimate of Adult Literacy in Medicine (REALM-SF), the Medical Outcomes Study (MOS) for social support, the Asthma Trigger Inventory (ATI), the Morisky Medication Adherence Questionnaire, Asthma Self-Management (ASMQ), the Modified Pittsburgh Sleep Quality Index (PSQI), the Asthma Control Test (ACT), and the Asthma Quality of Life Standardized (AQLQ-S). Data analyses included descriptive statistics, Pearson Product correlations, and hierarchical multiple regression. On average, participants (N=39) were middle aged (M=55.9±7.9) years, female (65%), did not smoke (87%), did not use a peak flow meter (PEFR) to self-manage their asthma (72%) and were obese (M = 34.96, SD=10.78). Participants reported high confidence in asthma self-management; however, had low medication adherence and scores indicating uncontrolled asthma (M=16.10, SD = 4.29). More than half (67%) of the participants reported poor sleep quality (PSQI). BMI and sleep quality accounted for significant variance (38%) in asthma QOL (F (2,38) = 7.08, p = .001). Social support was an independent predictor of asthma self-efficacy (F (2,38) = 5.65, p = .02). Better control of weight and asthma symptoms may improve sleep quality. Health care providers need to address the ongoing challenges of asthma self-management and monitor sleep quality. Encouraging the use of peak flow meters, which have been shown to improve self-management and asthma control, may result in better quality of life for African Americans with asthma.

## H 24 - Respiratory Related Illness and Care

### Evaluating Self Care Management Skills among Adult Asthmatics: A Randomized Controlled Study

---

*Varalakshmi Manchana, MSN, MBA, PGDBE, (PhD), RN, RM, RPHN, India*

#### Purpose

The abstract is part of the investigators' PhD Research work; would like to contribute and share to the Nursing professional community regarding importance of empowering patients with chronic diseases on self care management which enables them towards enhancement of their Quality of life.

#### Target Audience

Nursing and Health care professionals

#### Abstract

"When you can't breathe, nothing else matters", is the mantra of American Lung Association. Asthma is the most prevalent, chronic respiratory disorder that can impair the quality of life of individuals if not controlled appropriately. Though the scientific, pharmaceutical, technological advancements brought notable advancements in the therapeutic strategies, asthma still remains uncontrolled with raising prevalence. Asthma management remains to be the public health challenge globally, especially in developing countries like India. Aim: The study aims to assess the effectiveness of structured educational nursing intervention on self care management of Bronchial asthma. Methods: Study was conducted to assess the effectiveness of structured teaching on Peak flow monitoring and Right way of Using Inhalers and Deep breathing and coughing exercises in asthma management. Design: Experimental Pre test-post test control group design was chosen. Sample were selected randomly in to experimental (n=100) and control (n=50) groups. The Pre-test means between experimental (7.030) and control (6.500) groups were not much significant. There is a significant improvement within the pre test (mean 3.81; S.D 1.656)) and Post test scores in the experimental group (mean 6.91/S.D 0.831) in use of inhalation technique. The post test means between experimental (6.94) and control groups (4.92) supports the significant enhancement in the performance of inhaler use. Knowledge of the experimental group after asthma education is significantly raised in both Peak flow meter use (mean 3.5 and 7.71) and Deep breathing and coughing exercises (mean scores of 4.79 and 9.3). Conclusion: Patient education to equip them with self management skills yields behavior modification to make asthma management effective.

## H 25 - Translating Cardiovascular Research into Practice

### Cardiovascular Health Gender Disparities: The Pathway to Policy

---

*Tammy C. Lu, BSN, RN, USA*

*Nicole J. Wollard, BSN, RN, USA*

*Eric T. Tobin, BSN, RN, USA*

*Diane M. Solic, MSN, RN ACNS-BC CPAN CAPA, USA*

*Joseph F. Burkard, DNSc, MSNA, BSN, RN, CRNA, USA*

#### Purpose

The purpose of this presentation is to discuss cardiovascular disease disparities in women, analyze the current health policy process using A Problem-Centered Public Policy-Making Process Model, and provide recommendations for Registered Nurses (RNs) and Advanced Practice Registered Nurses (APRN's) to participate and influence health policy reform.

#### Target Audience

The target audience of this presentation consists of registered nurses (RN) and advanced practice registered nurses (APRNs) who would like to learn more about the current state of women's cardiovascular research and how to become more involved in health policy reform.

#### Abstract

**Background:** Despite public awareness of cardiovascular disease, morbidity, and mortality for women continues to be a public health concern. Gaps in current female cardiovascular health research has led to assumptions in treatment, which may have resulted in suboptimal management.

**Purpose:** The purpose of this presentation is to discuss cardiovascular disease disparities in women, analyze the current health policy process using A Problem-Centered Public Policy-Making Process Model, and provide recommendations for Registered Nurses (RNs) and Advanced Practice Registered Nurses (APRN's) to participate and influence health policy.

**Conclusions:** Current health policy needs to address the specific health care needs of women with cardiovascular disease. This presentation addresses the recommendations for RNs and APRNs who positively contribute to health policy development and influence social determinants of health.

**Implications for Practice:** Nurse leaders are influential to shape health policy to include support of gender specific comprehensive cardiovascular care through health promotion, disease prevention, early diagnosis, and gender specific treatment. Lobbying for effective health policy changes will ensure Nurses provide patient-centric and gender-based care. Health policy changes made in the United States can encourage other nations to influence and adopt gender specific cardiovascular health care practices. The nursing profession plays a pivotal role in influencing, leading, and supporting legislative health policy efforts.

## H 25 - Translating Cardiovascular Research into Practice

### Enhancing the Clinical Patient Care of Adults with Congenital Heart Disease (CHD) by Understanding Family Planning Decisions in this Population

---

*Kathryn A. Osteen, PhD, MSN, BSN, RN, USA*

#### Purpose

The purpose of this presentation is to describe family planning decisions of the adult with congenital heart disease (CHD) in order to increase awareness and promote enhanced clinical, patient, and educational outcomes for this population

#### Target Audience

The target audience of this presentation is nurse researchers, educators, administrators, and clinicians.

#### Abstract

**Background:** Sister Calista Roy first developed the Roy Adaptation Model (RAM) during the 1960's, and has continued to further refine, clarify, and extend the concepts over the years (Roy, 1997; 2009). According to Roy, the purpose of nursing is to understand people in order to maximize health and living to the individual's full potential. The goal of nursing is to promote adaptation. The RAM guides the understanding of how an individual adapts to a situation (Roy, 2009; 2011; Roy & Andrews, 1999). The RAM has guided both quantitative and qualitative research in numerous settings (Perrett, 2007; Phillips, 2002; Roy, 2011).

Cardiovascular congenital defects affect 1% of all infants born in the United States regardless of race (Hoffman & Kaplan, 2002; Xu, Kochanek, & Tejada-Vera, 2009). Congenital heart disease (CHD) patients are living longer into adulthood, increasing the possibility of childbearing (Gilboa, Salemi, Nembhard, Fixler & Correa, 2010; Warnes et al., 2008). Family planning decisions include any decision regarding pregnancy, surrogacy, adoption, or sterilization. Family planning decisions can elicit feelings of fear and anxiety, necessitating adaptation to the personal situation of the adult with CHD. This study described the personal narrative experience of adult women with CHD, of childbearing age, and their family planning decisions. This presentation will use the RAM to describe family planning decisions of the adult with CHD in order to increase awareness and promote enhanced clinical, patient, and educational outcomes.

**Methods:** Narrative inquiry, guided by the RAM, was chosen for this study because it is appropriate to describe the reproductive decisions of adults with CHD. The underlying assumptions associated with the theory, and the RAM's focus on the individual experience, guided the development of the interview schedule. Interview questions were derived from the major concepts of stimuli, coping mechanisms, adaptive modes, and output behaviors in the RAM. The cognator coping process and the four cognitive emotive channels also guided the interview, along with the role function, and self-concept modes of adaptation.

**Results:** The final sample included 17 adult females, between 24 and 41 years of age, living in 10 U.S. states. The majority of participants were White, married, and had severe types of CHD. Findings from this study, suggest that the stimuli, or circumstances and influences that determine family planning, was wanting children. The coping mechanism from the RAM used for the study, was the cognator subsystem. This subsystem stores, relates, and responds to the stimuli through perceptual and information processing, learning, judgment and emotion (Roy, 2009). Having children is an emotional decision, however the women in the study chose to gather information and learn more about options for family planning, in order to make a family planning decision.

Adaptation is the use of conscious awareness and choice to respond and integrate to environmental changes (Roy, 2009). The woman with CHD must be consciously aware of any information regarding family planning in order to choose an option and adapt to any changes in health condition. The adaptive mode concepts of role function and self-concept identity were included in the study. Role function, as a

part of adaptation, is concerned with how one feels they are expected to behave in society (Roy, 2009). The self-concept identity mode of adaptation includes beliefs about the physical and personal self and self-ideal (Roy, 2009). The women in the study, considered their familial and societal role, and any personal self and self-ideal beliefs when making a family planning decision. These women had concerns with how their personal self and self-ideal fit into social, familial, and spousal expectations. The output behavior of the family planning decision was an ineffective response or an adaptive response. An ineffective family planning decision could potentially threaten survival. An adaptive family planning decision would promote the health and integrity of the women with CHD.

**Conclusions:** The findings from the study support the need for more research regarding family planning and information communicated to the adult with CHD. Women with CHD must be aware of their condition and the personal and physical consequences of each choice, to make an informed adaptive family planning decision. Women with CHD desire more information regarding family planning options. To maximize the clinical, patient, and educational outcomes, family planning should be incorporated into primary care. Managing care with the inclusion of a holistic viewpoint for this growing population is increasingly important.

## H 25 - Translating Cardiovascular Research into Practice

### Education as a Heart Failure Intervention: What Providers Taught Patients in One Hospital Setting

---

*Theresa D. Galakatos, MSW, MSN, DNP, PhD, RN, USA*

#### Purpose

The purpose of this presentation is to illuminate an understanding about the health care provider (HCP) and the heart failure (HF) patient interactions in the acute care setting as it relates to HF teaching. Teaching must include effective communication and patient centered care otherwise patient and organizational outcomes are compromised.

#### Target Audience

The target audience of this presentation is nurses who care for patients with heart failure. Instruction must become normalized in every patient-provider interaction. Whether performing a physical examination or administering medications, nurses should be teaching. Utilizing AHA Guidelines would ensure a more comprehensive coverage of important information.

#### Abstract

Heart failure (HF) affects approximately 5.7 million people in the United States (US) and by 2030, projections show a 25% increase in prevalence (Go et al., 2012, 2013). For patients with HF, there are few solutions to this highly morbid, disabling, and costly disease. To reduce the risk of complications and disease progression, patients hospitalized with HF require education prior to discharge. There is compelling evidence for utilizing educational instruction that includes evidence-based guidelines from the American Heart Association (AHA). This study examined what HF information was provided to patients by health care providers (HCPs), what instructional content taught went beyond the AHA Guidelines, and what HF education expert providers viewed as critical for their patients to receive. No studies were found that compared and contrasted these AHA Guidelines with the instructional content provided to hospitalized patients. Using naturalistic inquiry, 10 HF patients (New York Heart Association functional class of III or IV) and 161 HCPs were observed. Results showed that not all AHA topics were consistently covered; 70% (n = 10) patients received less than one hour of instruction, compared to the AHA standard of 60 minutes; AHA Guidelines did not include instructional content on the patient's current plan of care which nearly equaled the time spent on AHA topics; brochures and handouts were rarely used and the topics within these materials were not inclusive of AHA standards; a sequence of education provided on medications, symptom recognition, diet, and follow up care, was congruent with AHA Guidelines and reinforced by the expert panel; and physicians and nurses delivered the most instruction (AHA or non-AHA). The findings of a study of this nature are not generalizable yet patient and organizational outcomes are compromised without effective and efficient HF instruction. Recommendations included: to provide peer reviewed feedback to HCPs on the appropriateness in teaching to literacy level, cultural and socio-economic realities, and where the patient will be discharged to (home, another health facility, etc.); to incorporate patient instruction into curricula and clinical experiences of health professional schools; and to include instruction in each and every patient – provider interaction. The results of this study should create an impetus for other comprehensive patient education instructional strategies.

## H 26 - Can Informatics and Technology Work for Your Students and Patients?

### Video Recorded Versus Instructor Proctored Evaluation for Student Check-Offs: Second Pilot

---

*Benjamin A. Smallheer, PhD, MSN, RN, ACNP-BC, CCRN, USA*

#### Purpose

The purpose of this activity is to discuss the second pilot study, successes, and hurdles, associated with implementing an alternate method for evaluation of intervention skills check-offs associated with a Fundamentals of Clinical Nursing course.

#### Target Audience

The target audience for this presentation are program directors, course coordinators, and faculty who engage students in teaching of fundamental clinical nursing skills to whom implementation and utilization of an alternate format of evaluation is applicable.

#### Abstract

Introduction: As the use of technology and alternate formats of evaluation are being utilized within institutions of higher education, the concepts of student self-evaluation and self-awareness continue to grow in popularity. Providing students with the opportunity to engage in such reflective practices has been seen in several schools of nursing for assignments such as physical examination check-offs or psychomotor skills validation (Houghton, 2012; Yoo, 2008; Yoo, 2010). An expanded pilot study capitalized on strengths and weaknesses of a prior project, evaluating the effectiveness of video-recorded evaluation of interventional skills check-offs. Through video-based self-assessment, a beneficial and effective instructional method exists for training nursing students to develop confidence, awareness of psychomotor strengths and weaknesses, and to improve both clinical and communication skills.

Background: The concepts of student self-evaluation and self-awareness continue to grow in popularity and benefit. Providing students with the opportunity to engage in such reflective practices regarding physical examination check-offs and psychomotor skills validation affords the opportunity to observe and reflect on individual performances, motivation and learning. Additionally, self-evaluation of communication skills and patient encounters improve motivation while student satisfaction with the video assessment method is higher than with traditional methods based on the ability to visually recognize strengths and weaknesses in individual performances, which otherwise might have gone unnoticed. Self-assessment, however, is not intuitive. It must be taught and practiced to be refined. The use of audio visual tools to support self-assessment gives students the opportunity to gain insight into their competency, and the ability to practice holistically. By affording students an opportunity to observe and reflect on their own individual performances, motivation and learning have been shown to be enhanced. Additionally, observance and reflection of a student's own communication skills, and personal satisfaction of the encounter helps to motivate students to a higher level of performance.

Methods: The means for providing this self-evaluation and self-awareness of individual performances is through the usage of audiovisual recordings created by the students. Additionally, student satisfaction with the video assessment method was higher than traditional methods based on the ability to visually recognize strengths and weaknesses within individual performances which may have otherwise gone unnoticed.

Currently, students engage in a faculty proctored check-off process intervention skills. A group of students who consented to the study were offered the opportunity to record and submit their interventions skills check-offs in an alternate format utilize their own personal video recording devices. Participants were placed in groups of 3 students. In each group, the students took turns being the videographer, performing the skills, and serving as a peer reviewer of the skill performed. The intervention skills were

videotaped by the student functioning as the videographer, without interruption, not to exceed a time period of 10 minutes per skill. The participating students were provided the opportunity to review, self-evaluate the video, and receive peer to peer feedback prior to submission to their faculty. Students were provided the opportunity to repeat their performance until they are satisfied with the accuracy and completeness of their video recording. The video files were then submitted to the faculty member through an internet based drop box system. An open-ended questionnaire was then completed asking likes, dislikes, and perceived benefits of the video recording method.

**Findings:** Students report a therapeutic and authentic environment created by the use of video recording technology. Less stress and anxiety existed around the need to correctly perform the skill the first time. Students felt less fear with peer feedback which represented a friendly eye compared to a critical eye. The luxury of redoing the video-recorded performance eased anxiety and improved proficiency. Weaknesses include technical aspects of recording device available memory, and uploading of large video files.

**Conclusion:** In conclusion, utilization of alternate methods of evaluating student performance during skills check-offs show significant promise for adoption as an alternate method of grading. Implications would be to allow students a choice of preferred methods for evaluation suiting individual learning styles. This variability would meet the student's needs based on fear, stress, objectivity, and peer versus faculty feedback.

## H 26 - Can Informatics and Technology Work for Your Students and Patients?

### Improving Population Health through Interprofessional Leadership: The Case for a Professional Practice Model

---

*Melanie Brewer, DNSc, MS, BSN, FNP-BC, FAANP, USA*

*Maria O'Rourke, PhD, RN, FAAN, USA*

*Jeffrey Francis, BSN, RN, USA*

#### Purpose

This presentation describes how patient outcomes management is supported by a professional practice model that is a cohesive, role-based, interprofessional approach to care delivery, and by healthcare informatics that uniquely organize administrative and quality data to produce a more precise patient picture, and valid and reliable data for improved decision-making.

#### Target Audience

The target audience includes members of the interprofessional team, both clinical and managerial, each of whom have the opportunity in their professional role to impact patient and organizational outcomes.

#### Abstract

A professional practice model is foundational to the development of a results-oriented clinical enterprise (O'Rourke & White, 2011). This model draws attention to the need for clinicians, managers, and other members of the healthcare team to work together synergistically as interprofessional leaders in order to ensure sustainable improvements in patient outcomes. The model also serves as the structure for evaluating patient care improvements based on the decision making actions of clinicians and managers. Each element of the professional practice model is an important link to organizational effectiveness and each must be evaluated as to the extent of its impact. In the era of the Affordable Care Act, population health is linked to improving the quality of care (Stoto, 2013). This makes population health an important element of a professional practice model and emphasizes the need for population health management to be viewed as essential to organizational effectiveness. Healthcare informatics is a critical aspect of defining the patient population served. This presentation focuses on population health as a key driver for understanding the link among diagnostic related groups (DRGs) and comorbidities, clinical practice, and outcomes, specifically nurse sensitive indicators.

In a three-hospital tertiary health care system (875 total beds), a major initiative to improve outcomes through a more refined use of health informatics was undertaken. The initial work of building the template for analysis was conducted at the largest of the system facilities with 430 beds. In collaboration with members of the clinical analytics team, DRG and comorbidity data were examined through an analysis of administrative and quality outcomes data from Horizon Performance Manager by McKesson and the Midas Plus Care Management system. Patient profiles were developed that aligned the discharge DRG with associated comorbidities on a hospital-wide and then on a unit-specific basis. This study explores the link between the patient profile using DRGs and comorbidities (ICD-9 codes) and the occurrence of nurse sensitive indicators. Data including 100% of discharged patients for a particular unit for a given 12-month period were used. Data were then sorted according to the top DRGs and comorbidities to produce a DRG profile for each unit. DRGs and comorbidities were sorted so as to create a dataset organized into "buckets" to create an 80-20 percent split of the patient population. The bucketed data set was rank ordered to produce a profile that represented 80 % of the patients on the particular unit. Associated comorbidities were aligned with these DRGs. The same process of analysis was used for the remaining 20% of the DRGs and comorbidities. This methodology sorts out the patient population that is typical (80 percent) and consistently seen on each unit. Level of nurse competency is viewed as high due to the predictability of characteristics of patients admitted to the units. This research hypothesizes that there is a higher likelihood of poor outcomes on nurse-sensitive indicators due to the existence of patients who make up the 20% of the patient population.

DRG and comorbidity data were summarized for each hospital unit (26 units). Correlations were conducted among the DRGs and comorbidities with nurse-sensitive outcomes for the 80% patient population and links to the nurse-sensitive indicators were evaluated. The same analyses were conducted on the 20% patient population. The analysis completed on this specific unit was limited on the number of cases with nurse sensitive indicators and therefore was insufficient to determine significance. The variety of DRGs and comorbidities within the unit was telling and revealed important implications for patient safety, nurse staffing, and patient education. A key outcome of this analysis is the identification of patients with more comorbidities that were identified as part of the case profile. These cases were associated with falls. This analysis produced micro level data about the patient condition that can now be linked to specific patient populations at the micro rather than macro level. These micro level data are critical as they inform manager and clinician decision making. Analyses on 26 additional units and across the 2 other hospitals are in progress and will be reported out as part of the presentation of this study.

An important finding is that, based on the current health information systems, there may not be a clear cut means to analyze the link of DRG and comorbidity data with nurse-sensitive indicators due to limitations of the existing data in quality and administrative datasets. This finding is important for clinical analytics improvement as it is vital that they build the capacity to retrieve the correct information from existing data systems in an efficient and useable manner.

This unique approach to population health and the organization of data that generates a more refined patient profile will serve to improve the quality of care and clinical and management decision-making, decision making that impacts resource allocation for education, staffing, patient placement, RN competency, and interprofessional collaboration.

## H 27 - Research Related to End-of-Life

### Good Death as Perceived by the Critically Ill Patients' Family Members

---

*Wanlapa Kunsongkeit, PhD, RN, Thailand*

#### Purpose

The purpose of this presentation is to share and exchange the body of knowledge in palliative care.

#### Target Audience

The target audience of this presentation is health care professionals.

#### Abstract

The qualitative research based on Heideggerian phenomenology aimed to describe good death as perceived by the critically ill patients' family members. Five informants who were the critically ill patients' family members at hospital in Chonburi were purposively selected. Data were collected by in-depth interview, observation and critical reflection during January, 2014 to March, 2014. Cohen, Kahn and Steeves steps guided data analysis. Trustworthiness was maintained throughout the study following Lincoln and Guba's guidelines. Four themes were emerged, which were no suffering, acceptance of imminent death, preparing for death, and being with the family. This findings provide deep understanding of good death as perceived by the critically ill patients' family members. It can be basic information for nurses to provide good death nursing care and further explore for development of knowledge regarding good death nursing care.

## H 27 - Research Related to End-of-Life

### The Use of Religious and Spiritual Coping Strategies by Parents after a Child's ICU Death

---

*Dawn Marie Hawthorne, PhD, MSN, BSN, RN, USA*

#### Purpose

Identify the relationship between spiritual and religious coping strategies parents used one month following their child's death in the ICU and the impact on parent's grief, mental health and personal growth at three months

#### Target Audience

Healthcare professionals who provide support and anticipatory guidance to bereaved families in their early grief

#### Abstract

**Background:** The death of a child is unimaginable since most parents expect not to outlive their children. Stress created by this traumatic event disrupts parent's emotional and social world and causes severe and prolonged mental distress. In response to grief, parents may choose to use spiritual coping strategies to cope with their loss. Little is known about the types of spiritual strategies used and whether these strategies are effective over time

**Purpose:** The purpose of this study is to identify the relationship between spiritual and religious coping strategies parents used one month (T1) following their child's death in the ICU and the impact on parent's grief, mental health and personal growth at three months (T2).

**Methods:** A convenience sample of 108 mothers and 49 fathers completed the Spiritual Coping strategies scale, Hogan Grief Reaction Checklist, Beck Depression Inventory II, and Impact of Events Scale-Revised questionnaires at T1 and T2. Pearson correlation coefficient was used to identify if a relationship exists between the independent variable at T1 and dependent variables at T2.

**Findings:** Mothers greater use of spiritual coping strategies (finding meaning and purpose in the situation, seeing the positive side of life, living day by day and accepting current life situation) and fathers greater use of spiritual coping strategies (maintaining friendship and confiding in friends, discussing the difficulties) at T1 resulted in lower levels of grief, symptoms of mental health and experience personal growth at T2 after the death of their child. Bereaved parents use of religious coping at T1 was only effective in greater personal growth at T2.

**Conclusion:** Spiritual coping strategies used at T1 helped parents cope with their grief, maintain their mental health, and experience personal growth through 3 months after their child's death. Use of religious coping strategies was only related to personal growth.

These research findings are beneficial for health care personnel in providing support and anticipatory guidance to bereaved families in their early grief. While religious strategies might be helpful in increasing personal growth, use of spiritual strategies may be more helpful to parents over time.

## H 27 - Research Related to End-of-Life

### Exploring the Factors that Influence the Interprofessional Delivery of Palliative Care in Long-Term Care Facilities

---

*Kathryn A. Pfaff, PhD, MSc, BScN, RN, Canada*

*Jean Echlin, MSc, BSN, RN, Canada*

*Lisa A. Hamilton, Canada*

#### Purpose

To report findings of a regional Canadian study that examined the perceived facilitators and barriers of interprofessional palliative care among care providers (professional and non-professional) in long-term care.

#### Target Audience

All individuals who are interested in improving how palliative care is delivered in long-term care settings.

#### Abstract

The implementation of palliative care is considered the 'gold standard' for care at end-of-life (Department of Health End of Life Care Strategy, 2008). Palliative care is an interprofessional approach that improves the quality of life for individuals with life-threatening illness, by early identification and management of pain and other physical symptoms. It integrates the psychological and spiritual aspects of patient care, offering a support system to help individuals live as actively as possible until death, and addresses the coping needs of individuals and families through illness and bereavement (World Health Organization, 2011). Nevertheless, there are many barriers and challenges associated with delivering palliative care in long-term care. Recruitment and retention of care providers in all disciplines is a challenge in long-term care institutions in Canada (Long-Term Care Task Force on Resident Care and Safety, 2012). Although volunteers and non-professional staff play a key role in providing palliative care in hospice settings, they are often not well-integrated in resident care in long-term care facilities. Non-professional staff often perceive their assessments to be undervalued, their roles to be less important, and lack of recognition as members of the interprofessional care team (Franchi, 2011). To be successful, interprofessional collaboration must be understood at the individual, team and organizational levels.

The purpose of this exploratory cross-sectional survey of professional and non-professional long-term care providers was to understand the factors that predict the delivery of interprofessional palliative care in long-term care. The background, research questions, methods and analysis will be briefly reviewed prior to reporting the statistical findings. The latter will be reported and interpreted within the context of the individual care provider, the team, and the organization. Implications for practice, education, policy, and research will be discussed.

## Image of a Nurse: 8th Graders' Perception

---

*Abigail Mitchell, DHEd, MSN, RN, CNE, USA*

### Purpose

The purpose of this research study was to look at 8th graders perception of the nursing image.

### Target Audience

nurses in education

### Abstract

Purpose of the Study: The image of nursing has been positive and negative throughout the years. The images included Nurse Ratched, Hot Lips Hoolihan, Nurse Pomfrey, and Nurse Jackie. We as a profession have been struggling with the public's attitude towards the nursing profession. As we are encouraging high school students to excel in math and sciences to be productive in their college years, we need to look at the middle school students to see what career choices they are thinking about and course work they are going to choose for High School, and how images impact their decision. The purpose of this research study was to look at 8th graders perception of the nursing image.

Methods: A triangulation approach was used. Both qualitative and quantitative research was incorporated in this study. Fifteen Eighth grade students from a Middle School participated in this study. Students completed a questionnaire and created artwork by drawing their perception of a nurse.

Results and Conclusions: The majority of the students felt that nurses help people, perform unpleasant tasks, work long hours, is a feminine profession, and television does not portray real nurses and does not encourage 8th grade students to want to be a nurse.

Implications for Practice: The data suggests that 8th graders perceive nurses as female and the artwork suggests that the image of the nurse is friendly, they wear a nursing cap and/or stethoscope, and nurses work with various types of patients and settings. The perception of a nurse's image has not changed much when looking at literature and previous studies, and this could influence nursing education later on. High school students are recruited for colleges/schools of nursing and a negative image could influence students when they decide on a career path. We as nurses need to strive to make nursing a profession for males and females and portray a positive image, in all areas of nursing.

### Engaging Pre-Nursing Students into an Awareness of Nursing as an Art Form: Using IPAD Technology

---

*Elizabeth Nix, PhD, MSN, APRN-BC, ET, CDE, USA*

#### Purpose

This purpose of this presentation is to provide information on how to use IPAD technology in the real world classroom but at the same time using computer based blackboard technology to discuss using video and discussion board platforms.

#### Target Audience

The target audience of the presentation is academic faculty teaching both online and face to face courses in the freshman pre-nursing year experience or for nursing programs who engage in introducing students to the art of nursing through an exercise of using other mediums to develop a well rounded nurse.

#### Abstract

University Freshman are tomorrows nurses and to have well rounded intelligent nurses it is often necessary to think outside of the box by providing higher level of thinking exercises to engage and provide learning opportunities which can set the tone for their nursing school experience. Faculty at a Mid-Southern University developed an innovative way of using the IPAD when discussing Nursing as an Art. The freshman experience at the University divides students up into their major areas of study and these classes function as cohorts. The Pre-Nursing major's classes were asked to visit two specific buildings on campus which house thirty-nine pieces of artwork. The students were asked to work with a partner and to pick out a piece of artwork of their own choice to discuss. The students then described the artwork and how they felt it related to the profession of nursing using their IPAD by developing a short video along with a still picture of their artwork using the IPAD. Students viewed the artwork and interacted with classmates in an online discussion board. Students responded favorable to the experience and found it to be very three dimensional by providing an opportunity to mix technology with art.

## Reflecting on Reflections to Discover Myself as a Leader

---

*Ladonna Michelle McClave, MSN, BSN, RN, USA*

### Purpose

to provide learners to view clinical reflection from a different perspective. This presentation will offer not only the view of the nursing student, but also the view of the nurse educator. Finally, the nurse educator will describe her own growth as a result of reflecting on clinical reflections.

### Target Audience

nursing students, nursing faculty, and practicing nurses who are interested in using clinical reflection to expand their own professional horizons.

### Abstract

This presentation will discuss the mechanism one nurse educator used to focus on her perspective of leadership by looking through the lens of a creative expression. This nurse educator compiled clinical reflections she required in a variety of nursing education domains as a means to reflect on her own growth and development as a leader in both nursing and education. Excerpts from actual student reflections, as well as the nurse educator's reflections will be provided. There will also be connections made to other creative expressions of growth and development of leadership capabilities. The overriding purpose of this presentation is to provide attendees to view clinical reflection from a different perspective. This presentation will offer not only the view of the nursing student, but also the view of the nurse educator. Finally, the nurse educator will describe her own growth as a result of reflecting on clinical reflections. Any nursing students, nursing faculty, and practicing nurses who are interested in using clinical reflection to expand their own professional horizons should benefit from attending this presentation.

### Using Images to Examine Student Nurse Perspectives about Acute Care Nursing, Community Health Nursing and Mental Health Nursing

---

Lori E. Steffen, MA, BSN, RN, PHN, USA  
Vicky Larson, PhD, RN, CNE, USA

#### Purpose

The purpose of the poster presentation is to explore the perspectives, using words and images, of Junior student nurses about acute care nursing, community/public health nursing and mental health nursing at the beginning and end of baccalaureate nursing courses that integrate these nursing specialties.

#### Target Audience

The target audience of this presentation is nurse educators, nurses working in community/public health, mental health or acute care nursing, nursing students, deans and directors, as well as nursing administrators. Other health care professionals may also find this research interesting.

#### Abstract

**Purpose and Background:** Based on changes in health care delivery that demand greater integration of nursing specialties across the continuum of care, a new baccalaureate nursing curriculum was created with concurrent acute care, mental health, and community health nursing content. The purpose of this research was to explore the perspectives of junior student nurses about acute care nursing, community health nursing and mental health nursing at the beginning and end of baccalaureate nursing courses that integrate these nursing specialties.

**Theoretical Framework:** Qualitative inquiry based in the theoretical approach of constructivism served as a foundation for this research. After nurse educators become aware of the meaning and value that beginning students have about nursing roles, and how this changes during nursing courses, then nurse educators can role model and further define the complementarity of various nursing specialties during the remaining years of the educational program.

**Methods:** An anonymous, qualitative survey conducted at the beginning and end of the junior year of a new baccalaureate nursing curriculum. Participants were asked to write descriptions of acute care nursing, community health nursing and mental health nursing, and to draw a sketch of relationships among these specialties. Two researchers conducted individual survey review for themes prior to collaboration for the final analysis.

**Results:** Subjects included student nurses in a new junior level baccalaureate curriculum: Pre-survey n = 50, Post-survey n = 41. Pre-surveys demonstrated a literal interpretation of acute care, community, and mental health nursing according to location; an emphasis on the value of acute care nursing; and images of nurses with hats and patients lying in bed. Post-surveys suggested that students developed greater understanding of nursing roles and interventions, and a sense of equality among these nursing specialties. Post-surveys included drawings of patients standing, equal in size to nurses, and no patients in beds.

**Conclusions:** Nurse Educators need to address students' misconceptions about nurses and nursing specialties in order to promote professionalism and collegiality among future nurses.

## CRT ART - Creative Arts Submissions: Heart of Nursing

### The Art of Poetic Construction in Narrative Analysis: Representing Rural Malawian Women's Experiences of Polygamy

---

*April L. Yerges, BSN, RN, CPN, USA*

*Patricia E. Stevens, RN, PhD, FAAN, USA*

*Lance S. Weinhardt, PhD, MS, USA*

#### Purpose

This presentation illustrates the context and steps taken in poetic construction depicting women's experiences in polygamous marriages. Arts-based research techniques are applied in the narrative analysis of qualitative interview data from a mixed methodology study of the pathways linking poverty, food insecurity, and HIV in rural Malawi.

#### Target Audience

The target audience of this presentation is researchers, academics, students, clinical professionals, and members of the public interested in arts based research, narrative analysis, women's health, or global health.

#### Abstract

Narrative Inquiry and Arts Based Research: Encompassing fluid boundaries, context, and construction; narrative inquiry holds vast promise in a world of infinite possibilities for understanding personal experience. Narrative research can include spoken, written and visual materials; as well as artistic expression. Innovative arts-based research methods such as poetic construction are increasingly being used in narrative research to help bridge the gap between research and practice. By engaging in poetry, one can "extend beyond the limiting constraints of discursive communication in order to express meanings that otherwise would be ineffable" (Barone & Eisner, 2012, p. 1). Poetic construction is a research approach that re-presents research findings through poetry. By definition, poetry is a literary work that emphasizes the expression of feelings and ideas through style, form, and rhythm (Oxford Dictionary, 2014; Riessman, 2008). Poetic construction aims to preserve and promote participants' voices (Nichols et al., 2014), presenting authentic and rigorous data while maintaining the context and emotions of the original raw data (Rapport & Sparkes, 2009).

The poetic construction we will present is based upon data from the NIH funded study "Pathways Linking Poverty, Food Insecurity, and HIV in Rural Malawi" (2008-2014). This inter-professional initiative partnered several academic institutions and a non-governmental organization in a longitudinal, mixed methodology, quasi-experimental study that is evaluating the impact of a multilevel economic and food security intervention program (Weinhardt et al., 2014). The intervention encompassed several diverse yet interconnected areas including: participatory training in farming, micro-finance through village savings and loans, local governance, and lessons on HIV/AIDS and gender empowerment. Using both qualitative and quantitative data, primary outcomes of HIV vulnerability, economic status, and food security were evaluated. Using stratified purposive sampling, the qualitative data collection involved 90 individuals from intervention households. Both focus groups and individual in-depth interviews were conducted and audio-recorded in Chichewa (the local language), then transcribed and translated into English by cultural insiders. These in-depth interviews were analyzed using narrative analysis (Mkandawire-Vhalmu & Stevens, 2007; Riessman 2008; Stevens and Galvao, 2007) focusing on the personal stories of how participants obtain food on a daily basis, secure income, and attempt to manage HIV risk.

The Story of Constructing the Poem: In the Fall of 2014 when reviewing interview transcripts for a narrative analysis exercise, one woman's voice stood out from the others because of the poignancy with which she described a phenomenon unfamiliar to me (first author) as a Western woman- polygamy. This woman, pseudonymed Grace, continued to distract me during subsequent days' events. In an attempt to honor Grace's voice, I focused on her interview, analyzing, breaking down, and restructuring her story of marriage. Due to the nature of Malawian culture and language, stories are rarely told in a time-oriented

structure, and are often found spread throughout an entire interview. Thus, the story was reorganized into a general framework over time and place (Creswell, 2007). Using Labov's method of narrative analysis (1982) Grace's story was plotted across a time-line of events. To maintain authenticity, her translated words were used, with only minor changes to allow flow and proper use of English language tenses. A modified version of Gee's method of analyzing oral narrative (1991) was then used, where the narrative was imagined as spoken, with pauses and intonation helping to create interpretation. The participant's words were structurally placed on the page by how they might be spoken thus creating lines and stanzas, forming the content of the narrative.

Grace's poem begins as she enters into marriage. As time passes, her husband gains wealth and subsequently takes a second wife. With a second family to support, her husband's wealth is stretched beyond its limits. Problems ensue for Grace and her children- they have less money to manage school fees and take care of the household, and less food. There is more tension in the home as wives vie for limited resources, and Grace becomes ill from the worry and pain of it. Strengths and positive aspects that existed in previous generations, and may still exist in African traditional polygamous family patterns have been eroded in the era of HIV. For Grace, HIV "entered the house" with the second wife.

Grace's echoing words became the refrain: "Two wives, two families." Repetition of this clause began as an attempt to 'ritualize' the everyday (Riessman, 2008). As the poem took shape these four words proved to be the soul of the narrative. Hawkins (2014) illustrates that poetic narrative construction can reveal the multiple layers of a process under investigation - in this instance the life course of a polygamous marriage in rural Malawi. Through this poetic construction we gain a deeper and more complex understanding of polygamy in Malawian culture, noting the nuanced and interconnected lives it affects.

Reflexivity: Do we have the right to re-present Grace's story as poem? We are interpreting an oral interview conducted in the Chichewa language that has been translated into written English. Yet, I can 'hear' Grace's voice- intonation, pauses, and meaning- even across these layers of distance. The poetic performance of her story is meant as a bridge to her experience. I have re-presented the voice I 'heard', but readers may 'hear' a completely different voice. As Riessman (2008) notes, "Readers are inherently part of the interpretive process, bringing their positioned identities and cultural filters to interpretation" (p. 111).

I find myself worrying about my representation. Did I interpret too much? In the words of Chimamanda Adichie (2009), have I unknowingly presented a "single story" of a complex life? My initial purpose was to show how a single act in marriage (marrying a second wife) impacts one woman over the life course. But, I worry about my Western white viewpoint, and if I have portrayed a negative outlook on polygamy. Have I done an injustice to Grace with this poetic re-construction? In the end, I recognize that Grace's artful expression of her experience is what called me to her story. I hope that my art-based response facilitates understanding in those who read or hear the poem.

Implications: As readers vicariously experience Grace's poetic narrative, disequilibrium may be produced (Barone & Eisner, 2012), forcing deeper contemplation. Poetry allows researchers to use "the expressive qualities of an artistic medium to convey meanings that are otherwise unavailable" (Barone & Eisner, p. 20). Poetic construction can enrich the study of people's lives, providing new insight and research questions. This poetic construction has brought a new level of analysis to the research team's approach to the data, and has led to a full narrative analysis of polygamy using the entire dataset of interviews (in process). Other poems may evolve, inspired by the narratives of additional participants. Arts-based research offers a vital new window of research inquiry, thought, and results.

# CRT ART - Creative Arts Submissions: Heart of Nursing

## What's Your Major?

---

*Crystal Scott, BSN, USA*

### Purpose

The purpose of this presentation is to reevaluate what nursing means for the individual nurse and how each personal journey is truly a unique experience. It is imperative for nurses to understand why they stay passionate about healthcare and how their career choice has helped define a purposeful life.

### Target Audience

novice nurses and new graduate nurses, however any nurse who reflects on their career path and why they chose nursing to begin with.

### Abstract

It was a great honor to be elected by my bachelor of science in nursing senior classmates to speak at our recent commencement ceremony.

It was a challenging, difficult journey, completing my BSN degree -- one I could not have made without my faith, family, friends, and the faculty that supported me along the way. I am persistent in everything I do, and quitting is never an option. Having entered the nursing program four months pregnant, and with my husband far away at boot camp, pursuing my dream of being a registered nurse seemed daunting. After taking only nine days off when my son was born, I jumped right back into my academic program. My final semester, assigned to a clinical site in a busy emergency department at a large, county teaching hospital was the most stressful semester of them all. I did 12-hour shifts, completing over 216 hours. Often I would come home physically exhausted and in tears with an overwhelming feeling of helplessness; of feeling like I could never do enough. By the second shift I felt as if I had picked the wrong specialty area and that I should 'throw in the towel'.

I took what I developed as my 'nursing way', the drive behind my choice to join and stay in this profession, and asked others what their 'nursing way' was. I asked my classmates and faculty what moments made them vulnerable and how they rose above those moments. As nurses, it is important that we do not conceal the pain we experience everyday but to embrace it and use it as a force for good so that we can carry on.

I created this poem after reflecting on my experiences, those shared with me by peers, nurse mentors, and shared it at commencement. It is a tribute to every nurse who has ever felt helpless, and yet realized his/her individual and collective power in the healthcare field.

### **What's Your Major?**

*What's your major?*

Nursing. You say.

*Oh wait, isn't that gross?*

*Aren't you wiping butts and vomit all day?*

No. It's so much more than that.

*Why didn't you become a doctor?*

*Couldn't get into med school?*

No, I chose this evidence based practice profession,

And for your information, nursing's pretty cool.

I'm not afraid to educate

Or explain

The purpose and point of BSN after my name.

Nurses go way back in history, ya know?

Like Florence Nightingale, Clara Barton,  
A few to show.  
That nursing is so much more than  
Baths and meds.  
So much more than feeding trays and  
Making beds.  
Nursing is HARD.  
If it was easy, everyone would do it.  
But we applied.  
We got in.  
We went through it.  
Remember semester 1 and how it was sooo intense?  
Diving into nursing,  
Balancing life and making new friends?  
But overall, the program was an adventure  
Studying theory, practicing skills  
Going out maybe once a month  
Trying to convince yourself that studying 20+ hours a week was normal now  
It was a true battle of wills.  
Think back to your first clinical  
Did you really feel ready?!  
Stomach in knots, heart tachy,  
Palms all sweaty?!  
I remember how hard it was for me  
To get that first set of vitals.  
Now we are here, at the END of nursing school!  
Ready for that BSN title!  
To be honest, in the beginning, I didn't know why  
Nursing was such a big deal.  
But after that first semester of clinical  
I learned what it meant to feel.  
When you step out onto that floor  
You are the nurse.  
You are the one with the patient  
Whether it be for 8, 10 or 12 hours,  
Watching for better or for worse.  
I'll never forget our clinicals.  
When you got to hold and smell a new newborn,  
And marvel at the number of daily diaper changes.  
Or our peds rotation  
Desperately trying to remember the various vitals and growth stages!  
How public health taught us to meet patients where they're at,  
Whether they lived in a big house or on the floor on a mat.  
And realizing that in mental health we had nothing to fear,  
That in reality, many just needed someone to listen to them,  
An unbiased ear.  
And some days, nursing just feels perfect!  
Some days are the best!  
Meds are on time, you get to sit down,  
Your patients even say "thank you"  
(GASP)  
You bet.  
But some days...  
In some ways...  
It's the worst day ever.  
Right until the bitter end.

Because...  
No matter how many compressions  
Or late night colleague confessions  
Will bring that infant  
That you did CPR on  
For over an hour...  
Back.  
And listen when I say,  
We are NOT trying to blame,  
A nurse who has lost someone on their shift.  
We are acknowledging that it comes with the territory,  
A type of cruel healthcare gift.  
And we're just expected  
To  
Deal  
With  
It.  
Nurses are trained,  
To carry around all of these memories of pain,  
And then come home to our loved ones,  
As if everything's fine?! The same?!  
That if the intense events  
Of our daily routine leave our HEARTS and our MINDS and our SOULS unchanged?!  
But we aren't unchanged.  
We aren't the same.  
Constantly growing and evolving to the chaos  
Lest we go insane.  
But.

But.

But.

We don't go insane.  
We keep calm.  
And we carry on.  
Because  
We. Are. NURSES.  
When we signed up for this,  
We didn't know what was coming for us.  
We didn't ask for our hearts to be ripped apart  
And put back together  
Over and over and over again,  
But that is nursing my friends.  
When it's bad, it's bad, oh so bad.  
But when it's good, it's better than good.  
When you nurse that patient back to health,  
You remember why you joined, like you should.  
You can't help but feel an overwhelming sense of pride  
When you slip on your sneakers  
With a twinkle in your eye  
Because you are now  
A BACHELOR PREPARED NURSE!!!  
And in saving lives,  
You are well versed.  
And now we begin the next step  
As a new grad.  
I know the job forecast looks bleak and a total drag  
Yet...

We all will get jobs in due time.  
Because I know everyone here worries too much  
With our type "A" personalities  
Now we need to focus on passing the NCLEX  
And the rest  
Will fall in line.  
Because once we get our new jobs,  
That first year will be incredibly hard.  
We will start to feel desperate and exhausted,  
Like we've fallen from our shooting star.  
But don't. Hold on. We are family now.  
Remember to lean on each other.  
Your nurse sister. Your nurse brother.  
So that wherever you go,  
You can hold your head up high,  
Reach for the top, the limit is the sky!  
Remember your achievements  
Ignore the naysayers and their nonsense,  
Because in the words of Eleanor Roosevelt  
"No one can make you feel inferior without your consent".\*  
Congratulations to the Nursing Fall Class of 2014!

\*<http://quoteinvestigator.com/2012/04/30/no-one-inferior/>

# CRT ART - Creative Arts Submissions: Heart of Nursing

## Creative Reflections

---

*Kristina L. Leyden, PhD, APRN, FNP-BC, USA*

### Purpose

The purpose of this poster is to highlight student work as a means to use creative reflection as a tool to help students reflect on actions, events, or experience in a different medium.

### Target Audience

The target audience of this poster presentation is students and professors.

### Abstract

Purpose: The purpose of this poster is to highlight student work as a means to use creative reflection as a tool to help students reflect on actions, events, or experience in a different medium.

Methods: Students were asked to do a creative reflection in response to any encounter they experienced during their clinical rotation. Options to the creative reflection included, but not limited to, painting, sketching, short story, poetry, collage, photography, and music.

Conclusions: Numerous student work will be displayed, including paintings, poetry, short stories, and sketches. In addition, student music composition will be played during the presentation.

### Creative Expression as a Self-Care Strategy for Nurses Working with Women Who Have Experienced Emotional or Physical Violence

---

*Linda R. Garner, PhD, MSN, BSN, RN, APHN-BC, CHES, USA*

#### Purpose

The purpose of this presentation is to describe how creative expression in the form of crafting can buffer the effects of vicarious trauma while working with women who have experienced emotional or physical violence

#### Target Audience

The target audience of this presentation is professional nurses who have frequent or ongoing interaction with female trauma survivors, especially those nurses who facilitate groups.

#### Abstract

## Divers-Abilities: Just a Part of the Everyday World

---

*Melissa Schwartz Beck, PhD, MSN, BSN, RNC-OB, USA*

*Cheryl Vinyard Elhammoumi, MSN, BSN, BA, RN, CCRN, USA*

### Purpose

The purpose of this presentation is to share how persons with intellectual and/or developmental disabilities have the same feelings, desires, and goals as most everyone else. With this knowledge, we share how each of us can promote an inclusive culture through the use of inclusive language.

### Target Audience

The target audience of this presentation is all people who may interact with individuals who have intellectual and/or developmental disabilities.

### Use of Public Murals to Impact Perceptions of Strength-Training among Elder Latinas with Diabetes

---

Adrienne S. Martinez-Hollingsworth, MSN, RN, PHN, USA

#### Purpose

To explore the use of murals, a traditional, Mexican/Mexican-American, public art form, as a method for encouraging strength-training exercise in older Latinas with Diabetes.

#### Target Audience

The target audience of this presentation is nurses, Diabetes educators, public health professionals and those interested in engaging with the elder, Latina community on an inclusive, culturally-invested level.

#### Abstract

*Mujeres Fuertes son Mujeres Sanas* (2015)  
Strong Women are Healthy Women  
A. Martinez-Hollingsworth

This adaptation of a famous Diego Rivera painting has several features that redefine the Latina female role:

- Hair is lightened and streaked with gray, reflecting aging
- Figure is wearing active wear (t-shirt and shorts, tennis shoes)
- Pose is more active/ assertive and implies movement
- Pose itself is reminiscent of lunges, a strength-training exercise used to build muscle in the quadriceps, hamstrings and gluteus muscles
- This image is designed to be displayed as a public mural, but may be incorporated into health education literature.

*Vendedora de Flores* (1944)  
Flower Seller  
Diego Rivera

This famous Diego Rivera painting has several features that promote a more traditional Latina female role:

- Woman appears to be young
- Figure is wearing traditional peasant dress and is shoeless
- Pose is passive; figure is on knees with semi-bowed head
- Pose itself is reminiscent of praying or reflection; figure appears calm in her passivity
- This famous image is well-recognized among Mexican and Mexican-American persons, and frequently appears in public murals-making it an ideal image for transformation.

### Purpose

Identify a community of Saltillo, Coahuila prevalence of chronic diseases, signs and symptoms thereof.

### Target Audience

Health cannot be measured in terms of presence or absence should also assess aspects of healthy habits in adults as this may mean maintaining their functional ability or presence of other conditions.

### Abstract

Purpose” Identify a community of Saltillo, Coahuila prevalence of chronic diseases, signs and symptoms thereof.

Introduction: Health cannot be measured in terms of presence or absence should also assess aspects of healthy habits in adults as this may mean maintaining their functional ability or presence of other conditions.

A survey in a community of Saltillo, Coahuila in which 30 adults surveyed was applied. The results were only 10% (f = 3) is 65 or more, of the total population 65.7% (f = 17) are overweight. Only 23.3% (f = 7) have high blood pressure and take medication. 46.7% (f = 14) refers having a sibling with diabetes and 53.5% (f = 16) states that a parent also has diabetes. 23.7% (f = 7) of the women surveyed reported having had babies over 4 kilograms at birth. Only 30% (f = 9) were kept physically active with activities like walking or zumba.

### The Effects of Age, Ethnicity, Sexual Dysfunction, Urinary Incontinence, Masculinity, and Relationship with the Partner on the Quality of Life of Men with Prostate Cancer

---

Suha Ballout, PhD, RN, USA

#### Purpose

The purpose of this presentation was to examine relative contributions of age, ethnicity, sexual dysfunction, urinary incontinence, masculinity, and perception of the relationship with the partner on the quality of life in men diagnosed with prostate cancer.

#### Target Audience

The target audience of this presentation are nurses and healthcare professionals who care for ethnically diverse men diagnosed and treated for prostate cancer.

#### Abstract

Prostate cancer, the leading cause of cancer in men, has positive survival rates and constitutes a challenge to men with its side effects. These men are generally around 50 years of age and older, do not look or feel sick, but endure urinary and sexual dysfunctions as a result of their prostate cancer. Consequently, the normalcy of their life is disrupted, and their quality of life (QOL) is disputed. Studies have addressed the bivariate relationships between prostate cancer treatment side effects masculinity, partner relationship, and QOL. However, few studies have highlighted the relationships among prostate cancer treatment side effects (i.e., sexual dysfunction, urinary incontinence), masculinity, and relationship with the partner together on QOL in men. Most studies were conducted with predominately Caucasian sample of men. South Florida, being a multiethnic region, constituted an interesting setting for this study. Miami is a unique multiethnic setting that hosts Cuban, Columbian, Venezuelan, Haitian, other Latin American and Caribbean communities that were not represented in previous literature. The purpose of this study was to examine relative contributions of age, ethnicity, sexual dysfunction, urinary incontinence, masculinity, and perception of the relationship with the partner on the QOL in men diagnosed with prostate cancer. Data were collected using self administered questionnaires measuring demographic variables, sexual and urinary functioning (UCLA PCI), masculinity (CMNI), partner relationship (DAS), and QOL (SF-36). A total of 117 partnered heterosexual men diagnosed with prostate cancer were recruited from four urology clinics in Miami, Florida. Men were 67.47 (SD = 8.42) years old and identified themselves to be of Hispanic origin (54.3 %, n = 63). The ethnic distribution mirrored that of South Florida where the most men identified themselves as White Hispanic (n = 39, 33.6 %), Black Hispanic (n = 24, 20.7 %), and Black Caribbean (n = 19, 16.4%). The majority of men participating in this study were diagnosed with prostate cancer more than one year (n = 70, 59.9%) ago. Findings demonstrated that there was a significant moderate negative relationship between urinary and sexual functioning of men. There was a significant strong negative association between men's perceived relationship with partner and masculinity. There was a weak negative relationship between the partner relationship and QOL. Results showed that men with stronger masculine norms, usually aligned with the concepts of hypermasculinity and machismo, were less satisfied with their relationship. Hierarchical multiple regression showed that the partner relationship ( $\beta = -.25$ ,  $t(91) = -2.28$ ,  $p = .03$ ) significantly contributed overall to QOL. These findings highlight the importance of the relationship satisfaction in the QOL of men with prostate cancer. Findings from this study provide an understanding of the perceived factors that influence the QOL in a sample of older men diagnosed with prostate cancer and from a multiethnic and multiracial sample. Nursing interventions to enhance QOL for these men should consider strengthening the relationship and involving the female partner as an active participant.

## The Use of Art in the Classroom and Labs to Teach Medical Surgical Nursing Students

---

*James Daniel Holland, PhD, MSN, RN, CNL, RRT, RCP, USA*

### Purpose

The purpose of this presentation is to inform the participants of the ways art is used in the classroom and lab settings to teach medical surgical nursing to students.

### Target Audience

The target audience of this presentation is nurse educators, researchers, and practitioners.

### Abstract

This presentation will focus on the use of art in teaching medical surgical nursing students in the classroom and lab. The presenter will present the various methods used in the teaching of the medical surgical nursing students in the classroom and lab. Specific examples that were developed by the faculty and/or students will be presented. The impact on the students learning will also be described. Lessons learned during the history of using art will be described. Finally, recommendations for the future will be discussed.

## Living not Dying

---

Ali Marie Galindo, MSN, ARNP, ARNP-FP, USA

### Objectives

To understand our role in palliative care

### Purpose

The purpose of this presentation is to reflect on the beauty of palliative care. Through music and poetry, one can contemplate their own views about death and dying and become inspired to experience a different perspective on dying.

### Target Audience

The target audience of this presentation are health care professionals in all disciplines as well as anyone who has lost a loved one to terminal illness or tragic circumstances.

### Abstract

Nursing is not merely a profession it is a vocation. Being a nurse means giving of oneself even in difficult circumstances. Our society has made it difficult to age, to become ill and to die. Yet death is inevitable and how we treat those who are terminally ill is reflective of the values that our society holds. Accepting death means that the quality of life improves. As a nurse with the lived experience of seeing mothers hold their stillborn babies in their arms to holding my terminally ill father in my arms, I have come to realize that death can be beautiful. If we remove all the fear, the anger, and frustration and focus on the beauty of the life that blessed our hearts, we understand a little more of what life is truly about.

A beautiful woman who battled cancer three times in her life inspired this song. Upon her third diagnosis, I asked her, "Do you ever wonder why? Do you get angry and question God's motives?" Her reply was humbling to me. "No, I never do...If I do, then I lose sight of all my wonderful blessings." I realized, that as a nurse, I am called to help patients focus on their life...not their illness. The butterfly goes through a transformation, a period in time where there is self-reflection and solitude with oneself. A time to decide if one will focus on life or death. Once the realization is made, the butterfly has the option to come out of its transformational place and fly. May every butterfly you see be a reminder that life is precious, fleeting and that love carries on, transcends death and makes this journey bearable. To those who have lost loved ones, please rest assured, they are not far from here, for they and their love reside in our hearts.

### Butterfly: A song about Living with Love not Dying from Disease

Once upon a time, there was an angel in disguise  
A precious little lovely butterfly  
Though she had reasons to be frail, you would see her flying high  
Spreading love and hope to all who passed her by

#### Chorus:

Although she may seem far from here, the love will never die  
From this precious little lovely butterfly  
She was one to count the blessings for the simple things in life  
And she never let her pain disrupt her flight  
She was blessed, so highly favored, you would often hear them say  
She was a soldier in God's army everyday

#### Chorus:

Although she may seem far from here, the love will never die  
From this precious little lovely butterfly  
She lived her life for Jesus, not for glory, not for fame

Yet she touched so many lives along the way  
Then this precious little butterfly, flew through heaven's gates one day  
When God Our Father proudly called her name

Chorus:

Although she may seem far from here, the love will never die  
From this precious little lovely butterfly  
Mommy, our precious butterfly...our love will never die  
We'll be loving you for the rest of our lives  
We'll be loving you our Precious Butterfly

## Eight Infernal Generals

---

*Chin-Nu Lin, PhD, MSN, MA, RN, USA*

### Purpose

The purpose of this presentation is to introduce the folk religious temple activity “Eight Infernal Generals” and its relationship between religion and health in Taiwan.

### Target Audience

The target audience of this presentation are the participants who are interested in understanding better about religious activities and practices in the context of Taiwanese health care.

### Abstract

This illustration represents the “Eight Infernal General Troupes” pilgrim in Taiwan. The actual art work was suggested not to be uploaded by the submission instructions.

### References

### Improvements to the Hospital Wide BCMA Process through the Collaborative Efforts of the Nursing and Pharmacy Departments

---

*Theresa Farrell, AAS, RN, USA*

#### Purpose

The purpose of forming our multidisciplinary task force for post go live Bar Code Medication Administration (BCMA) was to identify potential problems and come up with solutions to improve patient satisfaction and patient safety.

#### Target Audience

The target audience for this poster would be nurses, pharmacists, patient care associates and pharmacy technicians. It may also include nursing and pharmacy administration trying to improve workflow problems.

#### Abstract

The learner will be able to understand that collaboration between pharmacy and nursing will result in an increase in patient safety.

The learner will also see that workarounds develop after implementation of a new process and that attention needs to be given to workflows to prevent this from developing.

Successful transition to BCMA requires a collaborative effort of many teams in the hospital, particularly nursing and pharmacy. The Institute of Medicine (2007) reports that hospitalized patients are subject to one medication error per day and the BCMA process has the potential to reduce dispensing and administration errors.

The target audience for this poster would be nurses, pharmacists, patient care associates and pharmacy technicians. It may also include nursing and pharmacy administration trying to improve workflow problems.

### Poetic Analysis of Perceptions of Newly Graduated Nurses Regarding Their Experiences of Academic Incivility between and among Nursing Students in Undergraduate Nursing Education

---

*Tatiana K. Penconek, MN, BScN, BSc, RN, Canada*

#### Purpose

The purpose of this presentation is to invite the audience to experience the researcher's reflections through poetic expression regarding nursing student-to-student incivility as described by newly graduated nurses. It is anticipated that the audience will add to their knowledge about civility in nursing education.

#### Target Audience

The target audience of this presentation is nurse educators, nurse academics, nursing students, nurses working with new graduates, and any nurse who enjoys the sound, feel, and expression of poetry.

#### Abstract

##### Poem #1

Poem #4  
We are the voices

We are the voices  
The voices that never spoke  
That never said no  
That never said stop  
That never said why?  
That stayed silent

We are the persons  
Who knew it was wrong  
Who cared  
But who wanted to remain  
    unnoticed

Who sat  
And did not stand  
Stand up

We feel guilt  
We feel uncertain  
We are cautious  
Not safe

We want  
We will  
And Have  
Now  
Said something  
And stood

Stood straight up

Poem #5

Survival of the Fittest

I went to nursing school

Excited

Nervous

Wanting to learn

To care

To nurture

No one said it would be this way

Jumping hoops

Facing challenges

Staying Quiet

Stressed

Will I survive?

Will I make it to the end?

Is this what awaits me

When I become a nurse?

Poem #6

A Letter to My Nursing Instructor

There have been times

When I can't hear you

There are too many distractions

I want to learn

That is why I am here

But I can't hear

There have been times

When some students

Say mean things to others

It's not right

It doesn't feel right

It makes me uncomfortable

And sometimes mad

But I am afraid to say anything

To stand up

These are my peers

And I haven't found my voice yet

But you are a nurse

An experienced nurse

And a teacher with a voice

Please say something

Please do something

I have waited

And waited

I am waiting

Can you see what is happening?

It is not right  
Do you think it's right?  
I want to learn  
I want to learn to stand up  
Can you help me?  
Can you show me?

Can you show us all?

Sincerely,  
A Nursing Student

Poem #7  
I have learned this...

I have learned that the classroom  
Can be a very noisy and busy place  
Where some students engage  
And others do not  
It is wise to sit in front of the class

I have learned that students  
Are not always civil to one another  
There are negative comments  
And remarks and sometimes anger  
It is best to work together

I have learned that some students  
Are afraid to speak up  
About what they see and hear  
And others feel isolated  
But most want to fit in

I have learned that incivility  
Has many effects on the students  
And on the places where they learn  
There are emotions and fears  
It affects their nursing practice too

I have learned that students  
Look to their faculty  
To address incivility  
To fairly enforce the rules  
And ensure a learning environment  
That is safe  
That is positive  
That is civil

Poem #8  
I watched...

I watched while the student left  
left my office  
after sharing with me  
the pain and humiliation  
of negative remarks

and comments  
from other students  
on a social media site  
shared by so many other students

I watched  
the hurt  
the tears flow  
the eyes redden  
the shoulders deflate  
and the stress rise

I watched

I offered silence  
and kind words  
some advice  
not much else

and I watched you leave

I would like you  
to know  
this is why I  
studied what I studied  
and wrote what I wrote  
so that  
I don't have to watch  
you leave again  
but can walk out with you  
and  
help

### Use of SBAR Tool to Improve Nurse-Physician Communications

---

*Christina E. Gresh, MSN, BSN, RN, USA*

#### Purpose

The purpose of this presentation is to make healthcare professionals aware that the use of SBAR (Situation, Background, Assessment, and Recommendation) in communication interactions between nurses and physicians can help to significantly reduce negative outcomes. Research shows that ineffective communication can impact nursing practice, patient care, and overall patient outcomes.

#### Target Audience

The target audience of this presentation is registered nurses, physicians, and all other healthcare professionals.

#### Abstract

**Purpose:** The purpose of this action research study is to examine if the use of SBAR improves communications between nurses and physicians on a 56 bed medical-surgical unit in a suburban teaching hospital.

**Methods:** An action research approach was utilized to educate nurses on use of the SBAR tool in their communication interactions with physicians. After implementing SBAR, the effectiveness of the tool was evaluated by the number of Serious Safety Events (SSE) which have occurred. A SSE is an incident that causes harm to the patient. Using SBAR can help diminish the occurrences of SSEs. The goal is to have 365 days without an SSE.

**Results:** The findings in this preliminary study reveal that the SBAR tool can help improve nurse-physician communications. When SBAR is implemented in nurse-physician interactions, key information is able to be transmitted efficiently, thus reducing the chances of negative outcomes.

**Conclusion:** Given the number of adverse events which can occur in the healthcare setting, the use of SBAR in communication interactions between nurses and physicians can help to significantly reduce negative outcomes. Nurses need to be encouraged to continue communicating with physicians in the SBAR format in the future. Effective communications between nurses and physicians is valuable, due to the beneficial results it generates for patients and healthcare professionals.

### Computer Gaming to Improve Learning Outcomes in Baccalaureate Nursing Students

---

*Deborah Ann Halliday, MSN, RN, USA*

#### Purpose

The purpose of this quasi-experimental one group pre and posttest designed study was to compare test scores utilizing an innovative computer game to improve learning outcomes. The convenience sample consisted of junior-level baccalaureate students (n=32). Significant differences were found between the test scores ( $t = 2.627$ ,  $p = .013$ ).

#### Target Audience

The target audience of this presentation are nurse educators who wish to incorporate innovative technological strategies in the classroom as a means to engage students and improve learning outcomes.

#### Abstract

The digital environment in which the millennial generation was raised may provide challenges for educators to develop engaging pedagogy using technology. Technology may provide contemporary educators with tools to enhance teaching and provide learning opportunities that incorporate critical thinking and collaboration to improve learning outcomes. The purpose of this quasi-experimental one group pre and posttest designed study was to compare test scores utilizing an innovative computer game to improve learning outcomes.

**Key Words:** Millennial generation, digital environment, engaging pedagogy, technology, learning outcomes.

### Pre-Exposure Prophylaxis (PrEP) for HIV Prevention: A Clinical Practice Review

---

Yeow Chye Ng, PhD, MSN, BSN, BSE, RN, FNP-BC, NP-C, NRCME, AAHIVE, USA  
Rebecca M. Gaines, BSN, MSN, RN, FNP-BC, USA

#### Purpose

The purpose of this presentation is to provide the audience with an understanding of how to implement Pre-Exposure Prophylaxis (PrEP) for HIV prevention, including efficacy results, dosing strategies, safety measures, and counseling. The implementation is based on the current recommendations from CDC, FDA, NYSDOH, and USPHS.

#### Target Audience

The target audience of this presentation is nurses, health care providers, and other health care workers responsible for the daily clinical aspects of prevention and treatment modalities in the field of HIV.

#### Abstract

**Background:** Primary care providers should possess current, evidenced-based knowledge in order to provide competent and compassionate patient care. According to research evidence, there is a wide variance with respect to HIV/AIDS knowledge, attitudes, and behaviors among healthcare providers. Unfortunately, knowledge deficits and preconceived ideas may create major barriers for HIV-positive patients seeking care. Due to the recent availability of PrEP medication guidelines, nurse practitioners should expect more patients to present to clinical sites, requesting information on HIV prevention and treatment modalities measures. In fact, a recent nurse practitioner conference survey showed that 85% of providers were unaware of the 2014 Clinical Practice Guidelines for the PrEP program and agreed that the new guidelines would present several challenges due to lack of standardization.

**Methods:** A review of the literature was conducted on PrEP articles published between 2011 and 2014 from four major organizations: Centers for Disease Control and Prevention (CDC), United States Food and Drug Administration (FDA), New York State Department of Health, AIDS Institute (NYSDOH), and the United States Public Health Service (USPHS).

**Findings:** In 2011, CDC released an interim guidance titled PrEP for Men who have Sex with Men (MSM). July 2012, FDA approved two combination drugs (TDF/FTC) for PrEP treatment. August 2012, CDC released another interim guidance on PrEP program for heterosexuals. June 2013, CDC further expands the guidance on PrEP program for Injecting Drug User (IDU) population. January 2014, the NYSDOH released an online guidance for PrEP program. May 2014, USPHS officially published the first clinical practice guideline for PrEP program. Recommendations from these organizations were synthesized, based on appropriate clinical practice guidelines for advanced practice nurses.

**Summary/Implications for Practice:** Primary prevention is unmistakably the solution to reducing the prevalence of new HIV cases. After many years of research, the PrEP program was FDA-approved in 2012; therefore, it is the responsibility of advanced practice nurses to know current, evidenced-based prevention and treatment recommendations as they take their place as a vital member of the healthcare team.

## CLIN PST 1 - Clinical Poster Session 1

### A Review of the Literature: The Relationship between the Playground Environment and Physical Activity Levels of Children

---

*Ipuna E. Black, PhD, MSN, BSN, RN, USA*

#### Purpose

The purpose of this presentation is to understand the relationship between the playground environment and children's physical activity levels using the Ecological Model of Four Domains of Active Living to guide the review.

#### Target Audience

The target audience for this presentation is anyone interested in health promotion in children, especially at the community level.

#### Abstract

**Introduction:** Almost 20% of American children aged 6 to 11 years are obese. A decrease in physical activity (PA) has been associated with an increase in obesity. The school environment is one place where many children can be reached. The purpose of this paper was to review interventions aimed to improve PA on the playground environment in elementary school children, and make recommendations to develop related best practices.

**Method:** The extensive literature review guided by the Ecological Model of Four Domains of Active Living was conducted to include all primary research articles between January 2001 and November 2014 evaluating policy, individual, social, and physical environmental variables with PA as an outcome during leisure time in the elementary school setting.

**Results:** The included 26 articles represented both settings within the U.S and internationally, among elementary/primary schools. Policy positively influenced access to PA opportunities in the elementary school setting. Boys spend more time in moderate to vigorous PA than girls, but it is important to provide playground environments that are inviting for increased PA for both genders. The association among weather, supervision, playground markings, fixed equipment, and supervision with PA levels was undetermined. The association among loose equipment, offering an organized PA program with PA levels in children predominately had a positive relationship with PA levels in children.

**Conclusions:** Research in the area of the playground physical environment and its association to PA levels in children is growing. There are several low-cost strategies that can be implemented to maximize the PA levels of children during offered leisure time while at school. Long-term follow-up studies are needed to identify sustainability of such interventions and policies that influence PA levels in children.

### Cervical Tuberculous Lymphadenitis in a BCG Vaccinated Child

---

*Sandra Cecilia Esparza Gonzalez, PhD, RN, Mexico*

*Pedro Enrique Trujillo-Hernandez, RN, Mexico*

*Angeles Villarreal-Reyna, PhD, RN, Mexico*

*Mauricio Salinas, PhD, RN, Mexico*

#### Purpose

The purpose of this presentation was to analyze epidemiology and evaluate clinical features (symptoms) of BCG children vaccine, whom develop primary tuberculous lymphadenitis, resulting from possible contact with an adult pulmonary TB patient in treatment

#### Target Audience

The target audience of this work is health-related staff, mainly personnel related to children including nursing.

#### Abstract

**Objective:** Our aim was to analyze the epidemiology and evaluate clinical features (symptoms) to search efficient tools helping to diagnose extra-pulmonary and pulmonary childhood tuberculosis.

**Methods:** We retrospectively reviewed medical records of patients aged less than 17 years, treated for active tuberculosis (TB) from January 2000 to January 2008 at Hospital Universitario Dr. José Eleuterio González.

**Result:** Total of 45 patients with active TB were identified. Thirty- three children (73%) had extra-pulmonary TB (EPTB); the remaining had pulmonary TB (PTB).Mycobacterium tuberculosis was isolated mainly in the central nervous system and the meninges (27%). According to clinical observation, fever, cough and weight loss were present in most patients with pulmonary TB. Fever was the only symptom related within extra-pulmonary cases. Different analyses were performed to confirm diagnosis, such as direct microscopic screening of stained slides for acid-fast bacilli (AFB), culture, PCR, TST and chest radiography.

**Conclusion:** The majority of patients had extra-pulmonary TB. Fever was associated with both EPTB and PTB. Only cough and weight loss showed a significant difference between EPTB and PTB.

### Assisting Haiti Nurse Educators in Port-au-Prince, Haiti, with Strategies to Expand Their Nursing Knowledge and Practice

---

*Ellen L. Palmer, PhD, RN, USA*

*Becky M. Baird, MS, RN-BC, CNE, CMSRN, USA*

#### Purpose

The purpose of assisting Haiti Nurses Educators was in response to their request for information in order to create nursing symposium, to building nursing student scholarships, to make strategies for advanced nursing degrees and to begin a simulation laboratory for student instruction and testing.

#### Target Audience

The target audience for this presentation is nurse educators, student nurses and health care international volunteers.

#### Abstract

With collaboration of Haiti and U.S. Nurse Educators, thirteen symposium were implemented. Initially, the training was designed to teach event planning details. Included in this phase were topics such as targeted marketing, budgeting, venue, programs, form development. Secondly, topics were developed in response to Haitian Nurse Leadership. Included were topics covering infectious diseases, team building, and evidence based practice. Future topics planned will include nursing research and simulation education.

As a result of the successful collaboration, Phase Two was implemented. A nursing student scholarship program was established at the Haiti National School of Nursing, [www.haitinursingstudents.org](http://www.haitinursingstudents.org)

A needs assessment was developed and implemented at a recent symposium. Armed with this information. the nurse educators began creating strategies for advanced nursing degrees, and began the process of developing a simulation laboratory for education and testing. The first 7 manikins arrived March 18, 2015 at Grace Children's Hospital Education Center in Port-au-Prince, Haiti

### Transformational Teams: Examining the Relationship of Nursing Teamwork to Patient Outcomes

---

*Debbie J. Rahn, MSN, EdD, RN, FABC, USA*

#### Purpose

The purpose of this presentation is to provide the results of a research project investigating the relationship of teamwork within acute care medical-surgical nursing units to specific nurse indicator patient outcomes including pressure ulcers, patient falls, and catheter-associated urinary tract infections.

#### Target Audience

The target audience of this presentation is all Registered Nurses practicing in nursing practice, education, or leadership who have an interest in examining the relationship of nursing teamwork and the occurrence of nurse-sensitive patient outcomes.

#### Abstract

Over one decade ago, a landmark study in healthcare identified the need for the healthcare industry to address a widespread problem of preventable adverse patient outcomes. The problem of preventable negative patient outcomes continues to pervade American healthcare, and there is an identified need to better understand the relationship of soft skills, such as nursing teamwork, and the occurrence of patient outcomes. The success of future educational and leadership interventions to improve patient outcomes is dependent on first identifying key factors associated with the negative patient outcomes.

The purpose of this research was to investigate the relationship of nursing teamwork within acute care medical-surgical nursing units and specific nurse-sensitive patient outcomes including pressure ulcers, patient falls, and catheter-associated urinary tract infections. The primary research question of this study was: How does nursing teamwork affect nurse-sensitive patient outcomes? The study builds upon a theoretical framework entitled The Donabedian Model of Patient Safety which describes a linear progression from input concepts to outcome concepts, implying that each input component (such as teamwork) has a direct influence on the outcome. In addition, more contemporary research by Salas, Sims, and Burke in 2005 defined teamwork by identifying eight constructs or elements of teamwork, and provided the foundation for a theoretical understanding of nursing teamwork.

The non-probability convenience sample included in this research was that of nursing team members currently employed in acute care medical-surgical environments. Participants were derived from a single 735-bed acute care community hospital located in mid-eastern United States. The methodologies utilized in this study included the following datasets: (1) teamwork survey (quantitative), (2) nurse-sensitive patient outcome data secured from the research site's pre-existing National Database of Nursing Quality Indicators (NDNQI) data (quantitative) and (3) sequential follow-up focus group interviews (qualitative). The mixed methodology design utilized comparison of means and correlational statistical analysis to compare eight medical-surgical nursing units' teamwork data (collected using the teamwork survey) with each unit's NDNQI nurse-sensitive patient outcome data. The nurse-sensitive outcome data incorporated as dependent variables included pressure ulcers, falls, and urinary catheter associated infections.

Strategies for assurance of ethical standards focused on securing informed consent, protecting the participant's right to withdraw, anonymity of survey data, confidentiality, and conducting the study with integrity and the avoidance of deceptive practices. The primary limitation associated with the proposal was related to the single-site study design. The lack of a strict scientific empirical framework and unit-based data analysis also limited causal inferences among the variables.

The raw data supported the premise that a pattern exists whereby medical-surgical nursing teams with higher levels of teamwork as measured by the teamwork survey is accompanied by a pattern of fewer

negative nursing outcomes. The clinical impact and clinical significance of this raw data finding is important to discuss.

Several important correlations were noted between constructs of teamwork and patient outcomes. Examples include the correlational findings between the independent variable of intra-shift teamwork and the dependent variable of unassisted falls. The two variables were moderately correlated,  $r(8) = -.618$ ,  $p < .05$  (two tailed) and demonstrated an inverse relationship as represented by the negative correlation value. A second finding was the result of correlational data analysis between a teamwork construct and unassisted falls. The Kendall's Tau-b correlation between the teamwork construct and unassisted patient falls was  $-.571$ . The finding was statistically different from zero ( $\tau_b = -.571$ ,  $n = 8$ ,  $p = .048$ ) and indicated a moderate inverse relationship between the two variables.

Additional statistical analysis was conducted to identify specific variables as described in each teamwork survey question. Analyzing each question as an independent variable provided more specific information regarding teamwork behaviors which may be associated with outcomes. These relationships were computed utilizing the Pearson Product-Moment Correlation Coefficient to determine if a relationship existed between the variables. Several findings were significant in all three types of negative patient outcomes.

These relationships, along with the prior evidence established in nursing and healthcare literature, as well as the already established high personal and organizational stakes for negative patient outcomes, lead one to believe that the null hypothesis should be rejected. The clinical relevance of that finding is that there may be value in investing time, energy, and resources in educational and leadership strategies aimed at improving teamwork within the medical-surgical nursing sector, with the goal of improving patient outcomes.

The research also provided rich qualitative data regarding the role of nursing teamwork in the provision of high quality patient care. The research data suggests that according to the nurse's perspective, teamwork is a critical influential factor of patient outcomes. The research findings suggest that teamwork in the medical surgical nursing teams mirrors the research completed in other areas of healthcare demonstrating a relationship between teamwork and outcomes.

Key findings induced through triangulation of the quantitative and qualitative data included differing levels of teamwork among teams, transitory nature of nursing team membership, three descriptive themes related to high quality teams, the importance of team leadership, barriers to teamwork, the lack of skill in dealing with conflict between team members, and the unmet educational needs of nursing team members. Four primary conclusions provide a framework for teamwork education, interventions, and future research. Four major conclusions relate to the impact of teamwork on nurse-sensitive patient outcomes, the lack of a standard theoretical model of team performance within the nursing profession, the need to adapt team training strategies to address the unique needs of nursing teams, and the need for implementation of additional strategies related to the educational needs of nursing team members.

The concept of Transformational Teamwork emerged from the evidence and conceptualizes teamwork within a system where a transformational leader influences not only individual followers, but influences the team as a whole to perform optimally, resulting in high quality outcomes. Each team member within a transformation team has a positive influence on the team and other team members, and the success of transformational teamwork is measured by quality outcomes.

The research has important clinical and practical implications for the nursing profession and healthcare consumers. Recommendations for the future address nursing practice, education, and leadership as well as define additional future research. Although the design and methodology of the research prevents making any generalizable connections, the research has generated an interest in further exploring the connection between nursing teamwork and nurse sensitive outcomes including pressure ulcers, falls, and catheter associated infection. In addition, the findings reveal some areas for potential improvements, curriculum development, and educational and leadership interventions.

It is critical that the nursing profession examine the incidence of negative patient outcomes occurring within the nursing sector's locus of control, and implement educational and leadership strategies to protect patients from the resulting increased morbidity and mortality commonly associated with negative patient outcomes.

## CLIN PST 1 - Clinical Poster Session 1

### Influencing Today's Psychiatric Mental Health Nursing Students for Practice Tomorrow

---

*Stephanie T. Wynn, DNP, RN, USA*

#### Purpose

to provide a resource to enhance students' learning in the area of electronic documentation in the clinical setting in an effort to prepare them for practice after graduation and to gain feedback related to the students' perception of the integrated support of a simulated EHR system into the nursing curriculum.

#### Target Audience

clinical faculty and nursing students.

#### Abstract

**Purpose:** The presentation is to provide a resource to enhance psychiatric mental health (PMH) nursing students' learning in electronic documentation to prepare them for practice after graduation.

**Summary of the Evidence:** Federal directives, nursing and nursing education associations, as well as accrediting bodies emphasize the importance of integrating health information technology and electronic health care record (EHR) into nursing practice. Additionally, information management and the application of technology in patient care is a required competency of baccalaureate nursing graduates. Content needed in the curriculum to meet this requirement includes the utilization of EHRs, decision support tools, and databases in the health care system. Key professional nursing associations, as well as a national nursing informatics coalition, have created policy statements that support competency in nursing informatics for all practicing nurses, as well as nursing students. Documentation and planning of patient care through an EHR is a relevant skill necessary in achieving this competency.

Unfortunately, in the clinical setting, students are rarely afforded the opportunity to document on patients electronically. Most facilities are equipped with computers at the nurse's station or in patient care rooms. Some have computers on wheels (COWS). These computers are primarily for the nursing staff to use to deliver care to patients. Therefore, faculty and students have limited access on these computers. Furthermore, because of time restraints, faculty are not able to adequately review all students' documentation daily in the clinical setting. In addition, students spend a limited amount of time in an assigned clinical agency; consequently, many organizations believe that the sensitivity of medical records and the resources needed for training outweigh the benefits of allowing students to utilize the EHR system. Therefore, students are often prevented from documenting in permanent EHRs.

**Description of Innovation:** As a part of the project, nursing faculty received an electronic tablet. Orientation to the resource and its use as a teaching tool occurred during a specified meeting time prior to the beginning of the clinical component of assigned courses; all faculty were oriented at the same time. Faculty who planned to use the electronic tablet as a teaching tool and were unfamiliar with the technology received additional orientation to the device by a Technology Services Manager prior to beginning clinical. All faculty accessed a Health Insurance Portability and Accountability Act (HIPPA) compliant, web-based EHR simulation software via his/her tablet. The students utilized the educational simulation EHR in the clinical setting as assigned. Students used the electronic tablets and EHR simulation software to demonstrate electronic documentation of patients cared for in the clinical setting. Documentation was submitted related to the patients as if they were making real-life decisions. The instructor evaluated student documentation and provided immediate feedback for each documentation activity. At the end of the semester, all students involved in the project completed a questionnaire of the teaching tool's accessibility, practicality, and impact on performance and patient care.

**Change Brought About by Innovation:** As a result of the project, nursing students were afforded the opportunity to practice real-time electronic documentation on patients at a clinical site in a safe

environment. As the EHR simulated software utilized also provided students with peer-reviewed information on evidenced-based practice, medications, and applicable practice guidelines, they use this information to assist with clinical reasoning. Therefore, the students were better prepared to enhance patient comfort and prevent undesirable outcomes. By creating a simulated EHR in the clinical setting, nurse faculty were able to improve the documentation skills of pre-licensure students. Overall, students provided positive feedback related to the utilization of simulated electronic documentation and voiced the necessity of the technology in the nursing curricula. Students generally acknowledge the potential of electronic document to improve patient safety. In addition, faculty reported improvement in students' point-of-care and real time charting.

**Implications and Significance for Practice and Education:** For the most part, a nursing student's documentation is a hand-written account of the student's fulfillment of the professional and legal duty of care. This documentation process provides an overview of the communication between health care professionals, a plan of patient care, an analysis of health care, a source for education and research, and the patient's medical position. In the clinical setting, students are required to bring resources such as lab books, pathophysiology books, and course specific books as well as calculators, drug cards, and concept maps to assist in planning in documenting this care of patients in the health care setting. Access to an overview of patients' current data, medication history, and alerts for drug incompatibility can dramatically increase the quality of nursing care. Often, documentation is not reviewed and graded until after the clinical experience; allowing the loss of great "teaching moments." Clear, concise, instantly accessible information stimulates critical thinking, resulting in better clinical decisions grounded in evidence-based care. Access to technology via an electronic tablet affords students the opportunity to practice documentation electronically and learn simultaneously.

**Recommendations:** Resources to enhance students' learning in the area of electronic documentation in an effort to prepare them for practice after graduation is essential in influencing nursing education. Simulated electronic documentation teaches students to think critically about documentation in a safe environment while enabling faculty to measure their progress. The knowledge acquired by integrating simulated electronic documentation into nursing curricula will provide students a valuable educational experience as well as real-world practice.

## CLIN PST 1 - Clinical Poster Session 1

### Relationships between Ryodoraku Measurements and Lifestyle, Based on the Concepts of Oriental Medicine

---

*Shu Chun Chien, RN, PhD, Japan*  
*Toshie Yamamoto, PhD, RN, PHN, Japan*  
*Takashi Matumoto, MSN, Japan*  
*Yoshiko Wazumi, PhD, RN, Japan*  
*Akiko Nagata, MN, RN, Japan*  
*Fusako Kawabe, PhD, RN,, Japan*

#### Purpose

This presentation aims to discuss how to grasp the relationships between Ryodoraku measurements and lifestyle, and the benefits that his understanding has been shown to have for nursing students.

#### Target Audience

The target audience is researchers and educators with an interest in developing courses that promote the health of students.

#### Abstract

**Purpose:** Uncomfortable symptoms or signs heralding the approaching onset of a disease constitute an important stage of human health in the field of oriental medicine. If these symptoms or signs during such a “pre-disease” stage (before an illness is diagnosed) can be alleviated by natural, noninvasive care methods, then the illness can be prevented. Uncomfortable symptoms or signs are related to individual lifestyles. The purpose of this study is to identify the relationships between Ryodoraku measurements and the lifestyles of nursing students who have physical chief complaints, based on the concepts of oriental medicine.

**Methods:** The subjects for this study were five female nursing students. A combination of data-collecting wearable wrist bands, personal documents, and interviews were used to record daily life data, including such information as their waking and sleeping times, diet, and exercise, for at least six months. Aside from uncomfortable symptoms or signs being confirmed through interviews, the physical condition of the subjects was also measured through Ryodoraku – a technique developed by Dr. Nakatani Yoshio that employs a machine to measure the electric potential difference of meridians on the skin in order to ascertain physical strength and the balance of the autonomic nerve system. Furthermore, an acupuncturist examined each student’s pulse and advised them concerning how to apply finger pressure on acupuncture points to alleviate their discomfort. The relationships between the uncomfortable symptoms or signs, the results of the Ryodoraku measurements, and the daily life data were analyzed by time-series on an individual basis.

**Results and Conclusions:** Two of the participants were undergraduates and three were graduate students (in their 20s and 30s). Their common symptoms were problems with menstruation, constipation, and gastrointestinal symptoms. The Ryodoraku results indicated that the kidney and spleen meridians were suppressed, while the bladder and gallbladder meridians were excited. Their lifestyles were all characterized by hard schedules replete with studies and extracurricular activities from their junior high school days until the present.

One example that illustrates the correlation of symptoms and signs, Ryodoraku measurements, and daily life records is that of an undergraduate student, A. When she began her participation in this study, A complained that she suffered from irregular menstruation and leg edema. The eldest daughter in her family, she had a brother and sister, and all three had spent their childhood daytimes with their grandparents as their parents both worked. She had her sister were afflicted with serious skin allergies at the time. In spite of developing suppuration on her legs, she attended track club activities when she was a junior high school student. After entering high school, she also joined a theater club due to developing an

interest in theater. She went to high school every morning at seven a.m. for regular track club training. After school, she attended theater club rehearsals until nine p.m. Because she did not have time to eat dinner before going to the theater club, she would eat two rice balls in her mother's car on the commute.

Owing to this demanding schedule, sometimes A could not get up in the morning. Upon entering university she began living by herself. She attended a dancing club and also had a part-time job four days every week. The trend of her Ryodoraku measurements revealed that her kidney meridian was suppressed, and her spleen, heart, and pericardium meridians were all excited. This meant that A's daily activities were too demanding for her. The condition of the kidney meridian influences female menstruation and the excretion of water. However, after practicing finger pressure on the acupuncture points which the acupuncturist had advised, her irregular menstruation improved and the leg edema disappeared. In addition, the Ryodoraku measurements showed that A's physical strength and the balance of her autonomic nerve system had become better than before.

Physical symptoms are affected by personal lifestyle, and are also reflected in an individual's Ryodoraku measurements. Educating nursing students so that they can understand the relationship between symptoms and signs, lifestyles and Ryodoraku measurements is helpful for enabling them to change their lifestyles based on the concepts of oriental medicine. This, in turn, will aid them in helping patients to improve their physical condition through natural, noninvasive care methods. It can also be a benefit to medical expenses.

### Participating in the Graduate Nurse Education Demonstration Project: The Students' View

---

*Robert Gordon Hanks, PhD, MSN, BSN, RN, USA*  
*Cheryl D. Loudd, MHA, USA*

#### Purpose

The purpose of this presentation is to inform the audience of results from a research study focusing on student perceptions of participating in the Graduate Nurse Education grant.

#### Target Audience

The target audience of this presentation is nursing education professionals, advanced practice nurses, and the general nursing population.

#### Abstract

**Background:** The Graduate Nurse Education Demonstration Project (GNE) is a new federally funded demonstration project directed at increasing the number of primary care nurse practitioners in concert with the implementation of the Affordable Care Act. Since this program is new and only recently funded in 2012, there is no published literature about the perceptions of students that participate in the GNE.

**Aims:** The aim of this study is to explore the student nurse practitioner (NP) perceptions regarding participation in the GNE. Research questions for this study include: 1) what are the students' perceptions of participation in the GNE; 2). what are the students' perceptions of the benefit of the GNE; 3) what are the students' perceptions of the negative aspects of participation in the GNE.

**Methods:** An online survey was distributed to graduating NP students at the conclusion of their program. The survey consisted of 17 Likert items and 3 narrative questions. Descriptive analysis was performed on the quantitative data; content analysis was performed on narrative data. Results: 56 responses were received with proportional representation from all three NP tracks. Item analysis reveals overall agreement with item statements. Narrative responses indicate that students perceived the GNE as helpful with placements, but needs further refinement. Other narrative responses indicate that the GNE is a positive as long as preceptors aren't precepting only for payment. Participants noted that GNE is beneficial for the profession.

**Conclusions:** This study helps to explore student perceptions of the GNE project. The overall response to the GNE from the student perspective was positive for the first year. The results will be compared to results from subsequent graduating cohorts in the 4 year funding cycle of the GNE. Results will be used to improve GNE processes and GNE information for students.

## CLIN PST 1 - Clinical Poster Session 1

### Moral Distress in South African Professional Nurses: Instrument Development

---

*Richelle Van Waltsleven, PhD, MCur, BSocSc, RN, South Africa*

#### Purpose

The purpose of this presentation is to present an instrument that was developed based on the attributes of moral distress to determine whether nurses experience moral distress.

#### Target Audience

The target audience of this presentation is nurses working in the clinical field of nursing.

#### Abstract

Nurses experience stress, fear and anger while they are trying to reconcile their ideals/ goals about health care with its inadequacies and abuses, while at the same time trying to stay true to their convictions. Moral distress is experienced when nurses cannot adhere to these goals. Conflicting moral principles, stress-provoking and contradicting demands weaken the nurse's sense of control, power and autonomy. The current descriptions of moral distress inadequately define the concept, and this might lead to the inconsistent use of the term moral distress. Therefore, conceptual clarity is needed. Current available instruments measure antecedents and situations causing moral distress. Therefore, an instrument measuring the attributes of moral distress is urgently needed. Such an instrument might be used in a variety of clinical departments because it is not based on department-specific situations but on the attributes of moral distress. Moral distress has a great impact on the nurse, patient care and the organization.

This research used Benson and Clark's method of instrument development as a theoretical framework. It is the aim of this study to develop and validate an instrument to measure moral distress in the clinical health care context of the professional nurse. In order to attain this aim the following objectives were set: To conduct an integrative literature review to identify antecedents, consequences, attributes and empirical indicators of moral distress; to conduct interviews to explore professional nurses' experience of moral distress; to develop an instrument to measure moral distress in professional nurses; to validate the instrument. A qualitative and quantitative research design with explorative, descriptive and contextual strategies was used.

The research process was divided into phases. During Phase One, an integrative literature review was conducted and the population included all available national and international data on moral distress in nurses/ nursing and sampling included all-inclusive sampling. Data analysis was performed through descriptive synthesis. Phase One also included semi-structured interviews and the population included professional nurses working in hospitals and clinics in the North-West Province in South Africa. The sampling method applied was purposive sampling. Tesch's method was used as data analysis method. During Phase Two, a content validation was conducted and the population included experts in the field of moral distress and instrument validation, and purposive sampling was applied. Data collection was done through the instrument that was developed and data analysis was the content validity index. Phase Two also included a qualitative evaluation which was conducted and the population consisted of professional nurses working in hospitals and clinics in the North-West Province in South Africa and purposive sampling was applied. Data was collected through the developed instrument and a focus group session. Data analysis was conducted through a consensus discussion. During Phase Three, a pilot study was conducted and the population was professional nurses working in a hospital with different departments and clinics in the Free State Province. All-inclusive sampling was applied and the instrument that was developed was used as data collection. Data analysis included: Descriptive statistics, factor analysis (exploratory, confirmatory and Bartlett's test of sphericity), Cronbach's alpha coefficient, correlations and ANOVA. According to the results from the face-, content-, exploratory and confirmatory, discriminant- as well as divergent validity, the instrument has been shown to be valid. The Cronbach's alpha for the Moral Distress Instrument was deemed reliable. Finally, the research was

evaluated and limitations were identified. Recommendations for nursing education, -practice, research and policy were formulated.

## CLIN PST 1 - Clinical Poster Session 1

### Clinical Faculty Debrief: Bridging the Gap for Clinicians New to Education

---

*Mary Ann Sedlacek, MSN, RN, USA*

*Terry R. Brennan, MSN, RN, APN, FNP-BC, USA*

#### Purpose

The purpose of this presentation is to demonstrate the significance of providing a consistent end of session clinical faculty debrief for adjunct clinical faculty. The debrief provides a connection to the campus, transition to expert clinical educator, enhances faculty confidence, and helps improve the students clinical experience.

#### Target Audience

The target audience of this presentation are clinical faculty new to education, and both clinical and academic faculty who are responsible for mentoring them. This presentation would also be valuable for those in a leadership position to help them understand the importance of orientation and mentoring of new faculty.

#### Abstract

Summary of Project/Conclusions: Clinical nursing faculty are considered experts in their specialty but novice in clinical education. They are uncertain regarding clinical policies and procedures, promoting student critical thinking, completing student evaluations, and making meaningful student assignments (Hinderer, Jarosinski, Mister, & Seldomridge, 2013). In addition clinical faculty are often part time employees and work at designated clinical sites with little contact on the campus (Roberts & Glod, 2013). At Chamberlain College of Nursing we demonstrate Chamberlain Care by our commitment to caring for ourselves, our colleagues and our students (Chamberlain College of Nursing, 2014). This clinical debrief program was developed as an extension of that care to our adjunct clinical colleagues. It is essential that nursing education programs provide superior clinical experiences for their students (Roberts, Glod, 2013). During the debrief clinical faculty are provided information and resources on quality, safety, education in nursing, initiatives for promoting critical thinking, Blooms Taxonomy, clinical student evaluation, and patient centered care. During the clinical debrief faculty can share student success stories and challenges. Because the debriefing is held on campus and done on a consistent basis, clinical faculty experience a connection to the campus. Clinical faculty are a valuable component of nursing education and the results of having a consistent clinical faculty debrief on our campus for the last 2.5 years have been very positive. Clinical faculty express that they feel a connection to the campus and more confidence in their role as clinical instructor. They are engaged in a more meaningful way with their students and have many resources to take advantage of for their clinical practice.

Limitations: One of the limitations we have come across is that adjunct clinical faculty are usually employed either part time or full time somewhere else. This can cause a problem with their availability to attend the debriefing consistently. Many of the part time clinical faculty are not fully committed to this part time position. Another limitation we have identified is there are clinical faculty who just don't utilize the resources provided.

Implications: The clinical debrief helps to define clinical faculty expectations and provide resources for pre and post conferences. It also helps build confidence and a sense of value and connectedness. "Scholars have identified that student's clinical practice and their experiences with clinical instructors play an important role in shaping their professional values" (Dahlke, Baumbusch, Affleck, & Kwon, p. 692). With the need for quality clinical faculty increasing due to the nursing faculty shortage, the clinical debrief can be a valuable avenue used to bridge the gap and transition the adjunct clinical faculty from novice to expert. The clinical debrief ultimately provides a higher quality clinical experience for both faculty and students.

# CLIN PST 1 - Clinical Poster Session 1

## Using 3 Dimensional Simulation in Nursing Education

---

*Renee R. Wright, EdD, RN, USA*

### Purpose

The purpose of this presentation is to demonstrate an alternative teaching modality using virtual simulation case study.

### Target Audience

The target audience of this presentation is nursing faculty and nurse educators.

### Abstract

Simulation has been used since the 1960's in aviation and the armed forces. Today simulation is emerging as a teaching pedagogy. Simulated patient scenarios provide students with experiences they may not be exposed to in an actual clinical setting. Virtual simulation allows students to observe and care for patients in real life context. Thus allowing students to practice in safe and nonthreatening environment. Anxiety is decreased because no actual harm will to come to a live patient. Students can learn from their errors without putting the patient at risk. During this simulated clinical experience students integrate and synthesize core concepts and knowledge. Students also apply appropriate interpersonal and psychomotor skills.

This presentation will discuss different pedagogical strategies used to incorporate simulation into nursing education. By sharing with participants the process of development of a three-dimensional stroke scenario that was used as continuing education module and for undergraduate baccalaureate nursing students.

### Factors Influencing Health-Related Quality of Life in Thai Patients with Rheumatoid Arthritis

---

*Sirinya Chumtem, MSN, RN, Thailand*  
*Chanokporn Jitpanya, PhD, MSN, RN, Thailand*  
*Areewan Oumtanee, PhD, MS, RN, Thailand*

#### Purpose

The purposes of this research are to examine health-related quality of life and to analyze selected factors affecting health-related quality of life. The selected factors composed of joint pain, pain coping, depression, fatigue, sleep quality, functional ability and illness beliefs.

#### Target Audience

clinical nurse, researcher

#### Abstract

**Introduction:** Health-related quality of life is one of the indicators to identify whether a person could live in a society happily with life. Especially, patients with rheumatoid arthritis are suffered from signs and symptoms. The illness has various impacts on the physical, psychological, social well being and general health perception. Those are affected on their health-related quality of life. Thus, nurse should enhance the patients' health-related quality of life.

**Purposes:** The purposes of this research are to examine health-related quality of life and to analyze selected factors affecting health-related quality of life. The selected factors composed of joint pain, pain coping, depression, fatigue, sleep quality, functional ability and illness beliefs.

**Methods:** A sample of one hundred and fifty out-patients with rheumatoid arthritis aged 20-59 years old, who follow up at the Department of Rheumatology of the Police general hospital and Faculty of Medicine Vajira Hospital by a multistage random selection. Questionnaires were composed of The Demographic Patients' Data, The short form of the McGill Pain Questionnaire, the Pain Coping Inventory, Beck Depression Inventory, the Multidimensional Assessment of Fatigue, the Pittsburgh Sleep Quality Index, Health Assessment Questionnaire Disability Index, the Brief Perception Questionnaire, and the Short Form Health Survey-36. All questionnaires were tested for content validities by five panel of experts, and the alpha Cronbach reliabilities were .70 to .93. Descriptive statistics (Percentage, mean, and standard deviation), Pearson's production-moment correlation and Stepwise multiple regression were used to analyze data.

**Results:** the results showed as follows:

1. Mean score of health-related quality of life in patients with rheumatoid arthritis was in good level. ( $X=440.36$ ,  $SD=173.10$ )
2. Model 1: The variables that explained health-related quality of life were illness beliefs, fatigue, functional ability, depression and sleep quality were the variables that significantly predicted health-related quality of life at the level of .05 ( $F=68.58$ ). The predictive power was 71.8% ( $R^2 = .718$ ) of the variance.
3. Model 2: The variables that explained illness beliefs are fatigue, depression, functional ability, joint pain. It was accounted for 50.7% of the variance.
4. Model 3: The variables that explained depression are illness beliefs, passive pain coping, sleep quality, fatigue. It was accounted for 43.7% of the variance.

According to path analysis, we found that illness beliefs, fatigue, functional ability, depression and sleep quality were both direct and indirect effects on health-related quality of life while joint pain and

passive pain coping were only indirect effects on health-related quality of life by passing illness beliefs and depression respectively.

**Conclusions:** The results of this study indicated that nurses should promote health-related quality of life in patients with rheumatoid arthritis not only physical signs and symptoms but also psychological signs and symptoms of patients.

## CLIN PST 1 - Clinical Poster Session 1

### Using an Instructional Design Model to Develop a Framework to Guide Leadership in Nursing Education

---

*M. Anne Longo, PhD, MBA, RN-BC, NEA-BC, USA*

#### Purpose

Leaders are accountable for the performance of their direct reports and thus responsible for providing a framework by which to evaluate education. The purpose is to demonstrate how to use the ADDIE model that results in better patient experience, decreased cost, and improved health for specific patient populations.

#### Target Audience

The session's intended audience are leaders of education practicing in clinical settings. The use of an instructional design model assists the leader in developing a framework that supports a healthy work environment. Accountable leaders need to be able to demonstrate integration of how education initiatives meet the facilities strategic goals.

#### Abstract

Leaders are accountable for the performance of their direct reports and thus responsible for providing a framework by which to evaluate staff education. Yet it is difficult for the leader to find examples of how to implement an overall framework that guides the development of the education. Reviewing the components of the ADDIE model with the goal of a healthy work environment, the learner will be able to evaluate if using the ADDIE model can help them meet their personal, departmental, facility and ultimately the goals of the IHI Triple Aim.

**Analysis:** are all programs/projects for which the leader is responsible for aligned with the Triple Aim or strategic goals? Are staff aware of their role in applying the new/updated knowledge/skill/behavior to the specific patient population? Has the leader been able to obtain the measurements by which the education project will be evaluated? Does the leader have buy in from those who will be administering the education and the learner themselves?

**Develop:** How can using the ADDIE model lead to the creation of a healthy work environment for staff? Do the educators developing education understand the importance of integrating new content/skill/behavior into current practice?

**Design:** Is the leader at the table when decisions are being made with regard to the use of new technology? How will changing how staff communicate effect education design/implementation?

**Implement:** Has the leader informed the facilities interprofessional leaders of their role in supporting/communicating the goals of education? Is there economy of scale in the expense of education by combining efforts of nursing with other disciplines?

**Evaluate:** How does the leader demonstrate the value of education to administration, including return on investment? By having a framework to drive the leader's overall strategy for education, can the leader prove that education contributes to the success of the facility?

Learners will have an opportunity to begin to outline how to meet a strategic goal of their own facility using the ADDIE model.

## CLIN PST 1 - Clinical Poster Session 1

### Changing a Clinical Nursing Unit Culture to Include Nursing Research as Part of Nursing Care

---

*Pamela C. Spigelmyer, PhD, RN, CNS, USA*  
*Christine Broschious, RN, CRRN, CMT, USA*  
*Diane Breckenridge, PhD, MSN, RN, ANEF, USA*

#### Purpose

The purpose of this presentation is to demonstrate the feasibility of changing a clinical nursing unit workplace culture to involving staff nurses in the implementation of a nursing research project.

#### Target Audience

The target audience of this presentation is nurses practicing in all areas of healthcare and will focus on nursing research and its application in a clinical nursing setting with staff nurses. The participant will be able to identify ways in which nursing research can be introduced in clinical practice areas.

#### Abstract

A pilot study was conducted in an acute care hospital inpatient on a rehabilitation unit as a means to introduce staff nurses to nursing research. The project was based upon Watson's (2008; 2012) theory of caring. The quasi-experimental design to introduce a 3-minute slow back massage during evening nursing care for inpatient rehabilitation patients was developed. Nurses were instructed in the research process and the intervention of a 3-minute slow back massage for their patients in the experimental group. The pilot project was designed to compare inpatient rehabilitation patients' perceptions of nursing caring during evening nursing care in both the experimental and usual care groups. Patients were allocated to either the experimental or usual care treatment group by admission date. They were asked about their perceptions of pain and nurse caring during their evening nursing care each evening of their inpatient stay. Data collected included pain scale ratings before and after evening nursing care and a nurse caring survey using the Caring Behaviors Inventory (CBI-24). At the time of discharge each patient enrolled in the study was also asked to provide information on their overall perception of nurse caring during their hospital stay. An open-ended question survey format was used to obtain this information. Analysis of the data revealed three themes relating to nurse caring. These included providing hygienic and comfort care, demonstrating nurse caring behaviors, and being relaxed and comforted. In addition to the study findings, nurses assisting with the research project learned first-hand how to conduct a research project on an inpatient rehabilitation unit. They also learned that it was possible to incorporate parts of the research process into their routine nursing care of patients on the rehabilitation unit. The completion of this pilot research project demonstrates the feasibility of conducting a small research project utilizing staff nurses to carryout parts of the research process while performing normal caregiving activities for their patients.

### Nurse-Technology vs. Nurse-Patient Relationships: Implications for Education, Practice and Nursing's Future

---

*Patricia A. O'Malley, PhD, RN, CNS, CCRN emeritus, USA*

#### Purpose

The purpose of this presentation is to explore how nursing is impacted by technology. History reveals that the promises of technology have been met in great part to nursing's unconditional acceptance of responsibility for successful technology integration into care. How much more can nurses take on and keep patients safe?

#### Target Audience

The target audience of this presentation includes educators, clinicians, nurse leaders and advanced practice nurses.

#### Abstract

The purpose of this presentation is to explore how nursing has changed with the continuous introduction of technology over the past thirty years. Positive as well as negative consequences will be explored within educational, clinical and theoretical paradigms. History reveals that the promises of technology have been met in great part to nursing's continued acceptance of the increased work load associated with technology integration into clinical care. With so much technology adoption, nursing's "plate" is nearly full and as nurse leaders know, nurses leave nursing because of out of control technology. Possible future events emerging from the increasing demand for nurse-technology relationships vs. the nurse-patient relationship will be explored. Nursing must drive the education, practice and research agenda to drive best practices for technology integration at the bedside to make care safe and keep nurses in nursing.

## CLIN PST 1 - Clinical Poster Session 1

### Advanced Practice Nurse (APN) Intensivists: A Model for Generating Potential Revenues and Cost-Effective Healthcare Delivery in the ICU

---

*Frank Guido-Sanz, PhD, ARNP, ANP-BC, USA*

#### Purpose

to document the potential for generating revenues and cost-effective healthcare delivery by APN Intensivists in an ICU.

#### Target Audience

Advance Practice Nurses working as clinicians in acute and critical care areas.

#### Abstract

**Background:** Intensive Care Units (ICUs) account for over 10 percent of all US hospital beds, have over 4.4 million patient admissions yearly, and account for close to 30% of acute care hospital costs. ICUs that use a physician intensivist model of care have improved patient outcomes, less resource use, and lower mortality rates (up to a 40% reduction), large reduction in in-hospital mortality following trauma, particularly in the elderly and may help save almost 54,000 Americans in the U.S. each year. The need for critical care services has continued to grow due to an increased aging population and medical advances that have extended life expectancy. This increased demand for ICU services has resulted in efforts to improve patient outcomes, optimize financial performance, and implement models of care in ICUs that will enhance the quality of care and reduce health care costs. By the year 2020 an estimated 22% shortage of intensivists is expected as a result of the aging population and a growing demand for intensivists. This will have increased to an approximate 35% shortage of intensivists by 2030. Over 5 billion dollars in healthcare costs could be saved annually by implementing changes in physician staffing just in non-rural U.S. hospitals. The compounded effect of this projected shortage of physician intensivists and physicians practicing in critical care in smaller hospitals may be larger. This shortage will negatively impact small hospitals and rural communities putting more at risk certain vulnerable populations. In contrast to the shortage of intensivist physicians and critical care trained physicians, Advanced Practice Nurses (APNs), sometimes referred to as mid-level practitioners or non-physician providers, are increasing in acute care both in the United States and globally. In the U.S., APNs have increased in numbers and expanded their roles over the past decades, becoming an important link in healthcare systems and organizations. The largest group of APNs is nurse practitioners. Some APNs function as Acute Care Nurse Practitioners (ACNPs) in hospitals and in ICUs. In spite of this increased visibility and participation in the healthcare arena, healthcare providers and potential employers are still unfamiliar with the scope of practice of APNs. Since the early 1980s, the role of APNs in providing high quality care and low cost has been documented. Care provided by APNs in acute care has been documented in numerous studies examining quality of care, morbidity, and mortality. Results of these studies have indicated that the quality of care provided by APNs is equal to that of physicians as well as being cost efficient. However, studies in the ICU documenting the role of APNs in reducing the costs of care on specific patient outcomes are very limited. In ICUs, the role of APNs has been evolving to replace physicians (input substitution) and support patient care rather than providing traditional nursing care. APNs function as members of multidisciplinary teams in closed (intensivist lead) or semi-closed (intensivist shared lead) ICUs. Collaborative practice rather than individual or autonomous practice is the norm in both instances. However, APNs have continued to enjoy autonomy in decision making and treatment modalities as permitted by the scope of their respective collaborative agreements. The APN Intensivist is a healthcare provider with a high level of independence and specialization in the management of critically ill patients in critical care settings. Very little has been published on this relatively new sub-specialty role of APNs. The lack of literature to explain the role of APNs as intensivists and of research to evaluate the effectiveness of this APN role made the need clear for research to examine the role economically and for its effect on quality of care and patient outcomes. The empirical evidence of the effects of APN Intensivists on patient outcomes and healthcare costs remains scarce compared to the well documented effects of APNs in other areas and models of healthcare delivery. In

light of this dearth of the literature examining the effects of APN Intensivists on patient outcomes and healthcare costs, research is needed to fill this gap in our knowledge.

**Objective:** The purpose of this study, using a retrospective chart review of 816 randomly selected patients during the 3-year study period, was to examine the dose effect of APN Intensivists in a surgical intensive care unit (SICU) on healthcare revenues generated by APN Intensivists services for the unit when the SICU was staffed by differing APN Intensivist staffing levels. The study also explored different procedures performed by these providers.

**Method:** The sample consisted of post-operative patients admitted to a teaching hospital SICU during a 3-year period. Of approximately 1,000 charts meeting the study criteria 816 were randomly selected for the 4-time periods of the study (204 charts T1-T4). Each of the four time-periods represented a different level of APN Intensivist staffing. Power was calculated with a total N of 204 for the research question. A t-test analysis with a sample of 200 per group, medium effect size and alpha of 0.05 provided > 85% power. The charges for APN Intensivists' services were obtained from a financial report generated by the hospital Financial Office on SICU APN Intensivists' charges. These amounts reflected charges attributed to SICU APN Intensivists from the inception of billing for services in the SICU to the date of the report generated. The report tallied the number of units (procedures) paired with corresponding charges for each billing period. It was not possible to obtain data on APN Intensivists' charges for procedures for individual patients.

**Results:** Study findings indicated no statistically significant difference in the SICU length of stay among the time-periods ( $M = 3.27$ ,  $SD = 3.32$ ),  $t(202) = 1.02$ ,  $p = .31$ . Charges for APN services (generated revenues) increased over the 4 time periods from \$11,268 at T1 to \$51,727 at T4 when a system to capture APN billing was put into place. For each of the four study time-periods (T1, T2, T3, and T4), total healthcare charges for APN Intensivists' services for the sample were \$90,478. Study revealed potential areas for revenue generation and the implications for practice advancement. Study also documented various procedures associated to APN Intensivist practice in the SICU.

**Discussion:** Study results suggest a dose effect of APN Intensivists on important patient health outcomes and on the number of APNs initiatives to prevent health complications in the SICU. Study also suggests potential of APN Intensivists in generating revenues through performance of procedures related to their skills and competencies.

## CLIN PST 1 - Clinical Poster Session 1

### Teaching Nursing Care for Those with Intellectual/Developmental Disabilities: A Service-Learning Format

---

*Cherie S. Adkins, PhD, RN, USA*

#### Purpose

The purpose of this presentation is to increase nursing educators' awareness of the need to teach about intellectual/developmental disabilities (I/DD), how to do so using a service-learning format, and to report on implementing such a course for pre-licensure nursing students in partnership with those supporting community-dwelling adults with I/DD.

#### Target Audience

The target audience of this presentation is nursing educators, particularly those teaching in pre-licensure baccalaureate nursing programs.

#### Abstract

Individuals with intellectual/developmental disabilities (I/DD) constitute a vulnerable population worldwide. Despite health care disparities and co-morbid conditions many with I/DD face, few nursing schools include formal course-work addressing the health care needs/issues and nursing care for this population. When this content is taught using a service-learning format, students not only gain knowledge but practical experience interacting with these individuals. This presentation addresses the rationale for including a course on I/DD in nursing school curricula and how to implement such a course using a service-learning format.

## **Clinical Poster Presentations Session 2 (CLIN PST 2)**

## CLIN PST 2 - Clinical Poster Session 2

### Infusing Caring for Abnormal Prenatal Ultrasound Findings

---

*Jeanne Gottlieb, PhD, MSN, BSN, APRN, CNM, USA*

#### Purpose

The purpose of this presentation is to prepare nurses in infusing human caring ways of being, knowing and doing for advanced prenatal technological environments. The presentation will disseminate findings of a phenomenological study of women experiencing an abnormal prenatal ultrasound and abandoned as they experienced misunderstandings and emotional anguish.

#### Target Audience

The target audience of this presentation is nurses and advanced practice nurses providing women's health who seek a greater understanding of caring in technology.

#### Abstract

**Purpose:** Purpose: The purpose of this presentation is to provide an interpretation of qualitative research for clinical practice. The specific aim of this research was to describe and interpret the meaning for women who experienced an abnormal prenatal ultrasound indicating a risk for a congenital, chromosome and/or genetic disorder. The calls for technological competent care are often not heard by advanced practice nurses, nurses and other health professionals. The investigator sought to unfold stories of these women's experiences to gain understanding within the context of their beliefs, values and attitudes.

**Methods:** Methods: The method selected was van Manen's hermeneutic phenomenology to explore the meaning of the lived experience of having an abnormal ultrasound. The method describes and interprets the meaning through the process of written transcribing, translating and interpreting.

**Results:** Results: Ten essential themes were illuminated during the data analysis. These themes were: "Blindsided by Unexpected Findings," "Fear," "Loss," "Threatened Safe Passage," "Blocking," "Alone in Silence," "Detachment," "Searching for Higher Powers," "Watching and Wanting to Know," and "Unresolved Reflection." Each of these themes was supported by sub-themes, which created the richness of the experience. These sub-themes represented the diversity of the participants in their lived experience. The stories of each participant shared the complexity of their life worlds. The life worlds of lived time, lived space, lived human relation, and lived body gave insight to the existential dimensions and complexity of participants.

The themes highlighted the essence of the lived experience of having an abnormal prenatal ultrasound. This routine non-invasive screening tool yielded many unexpected and profound experiences to the participants. Women were blindsided by the unexpected findings in ultrasound technology. They sought a pleasurable experience, but suffered with shock and disbelief. Some experiences resulted in a healthy birth of a newborn, while others had a perinatal loss. The participants remembered their journeys through the experience. The journeys were of suffering through this experience.

The participants wanted to know more about the condition and searched for answers. However, they were also cautious within their search, as they did not want to add to the burden of knowing. They coped by blocking information. Many participants experienced the burden of the risks in silence and isolation. They had lived relations with others, but did not use these relations for support. They felt guilt and shame in not carrying a healthy baby. The participants felt that they had the sole responsible for carrying a successful pregnancy. The lived world of body reflected upon their changing bodies and desire to protect their self-image and babies. Many women actively sought information about their baby's condition. They suffered from the lack of knowledge for their decision-making. Their coping ranged from faith and hope to detachment in protecting themselves from harm. In reflection of their experience, they expressed missed opportunities. Participants resented the lived time that they experienced in feeling fear and anxiety. They resented not having knowledge and opportunities for decision-making. The women missed the

experience of enjoying their pregnancy. Participants all reported contacts with specialists and genetic counseling sessions, but continued their search as they were not satisfied with the responses or available information. The women described the technological supervision of their care, but recognized that health care providers lacked the recognition of their feelings and emotional turmoil.

**Conclusion:** Conclusion: When women reflected upon their experiences of having an abnormal ultrasound, they shared a universal meaning of suffering. They used coping mechanisms or enduring that did not always relieve the suffering. For those that had healthy outcomes, they reflected upon the lost joy in pregnancy and birth. Women that had perinatal losses regretted not having the support they needed. Professional nursing was not present in the experiences of women. Caring was not present from technologists and medical health providers in their experiences. They were alone in suffering. Providers in not recognizing their misunderstandings and emotional fears abandoned women in their psychosocial and cultural needs.

Reproductive genetic technologies will continue to emerge in today's health care. The ambiguity of findings provides a complex pathway for women and families for decision-making. As there is a threat to the infant, emotional turmoil erupts throughout the pregnancy. Knowledge of new technology and interpretation of results is essential for nursing in our highly technological society.

Nursing can advance upon nursing technology in becoming technologically competent and caring. Technology must be used to come to know the other, but not to infuse a barrier in human caring. Understanding the need for empathetic touch in technology will bring a reduction in suffering.

In conclusion, the results reveal that nurses and health providers need to infuse human caring ways of being, knowing and doing within advanced technological environments. The recommendations for caring include both a nursing presence and use of a variety of supportive and educational tools to alleviate their suffering.

## CLIN PST 2 - Clinical Poster Session 2

### A Taiwan's National Survey of Nursing Home Staff's Cognition, Attitude and Barrier on National Incident Reporting System

---

Shu-Yuan Lin, PhD, RN, Taiwan

#### Purpose

The purpose of this study is to explore the degree of nursing homes staff's incident reporting cognition, attitude and barrier on the Taiwan Patient Safety Reporting System (TPR).

#### Target Audience

The target audience of this presentation is professionals who are interested in long-term-care quality improvement and resident safety, such as administrators, head nurses, managers, nurses and nursing assistants.

#### Abstract

**Background:** A national incident report system named as the Taiwan Patient Safety Reporting System (TPR) has established in Taiwan since 2006. Taiwan's hospital accreditation has mandated hospitals to report medical incidents regularly for assuring patient safety. However, participating national incident reporting system is not mandated in long-term-care facilities in Taiwan. Safety culture in nursing homes can be improved by incident reporting and incident learning.

**Purpose:** The purpose of this study is to explore nursing home staff's incident reporting cognition, attitude and barrier toward the TPR.

**Method:** A questionnaire survey with a random sample was conducted. The researcher used questionnaires that included "incident reporting survey", "TPR reporting cognition scale", "TPR reporting attitude scale" and "TPR reporting barrier scale" to collect data from 336 staffs among 37 nursing homes island wide.

**Results:** A mean age was 36.3( $\pm$ 9.3) for all participants. The average of work year was 4.8( $\pm$ 4.8) years. Fall incident was the most common incident during last 12 months, and it accounted for 94.6% of all incidents. The frequency of incident occurrence was ranged from less happening (54.1%) to occasional happening (35.1%). Paper reporting was primarily found in 78.4% of facilities. Staff demonstrated positively on incident reporting cognition (M=70) and incident reporting attitude (M=77) toward the TPR. Staff also showed some barriers (M=54) on the TPR. The most common barriers in nursing home staffs included "Do not know how to participate in the TPR", "Fear of medical disputes", "Fear of information leak", and "Worry about time consuming".

**Conclusions and implications:** Nursing home staffs have demonstrated positively incident reporting cognition and attitude on the TPR regardless many barriers are identified. Decreasing incident reporting barriers and increasing incident reporting cognition and attitude can enhance safety culture in nursing homes. The study results could be a reference for professionals and long-term-care facilities that have compassion to improve an incident reporting system and implement education program of resident safety. Furthermore, facilities could transform a culture of punishment to a culture of learning through peer learning by participating in the TPR.

## CLIN PST 2 - Clinical Poster Session 2

### Simulation for Leadership and Management

---

*Julie A. Beck, RN, DEd, CNE, USA*

#### Purpose

The purpose of this presentation is to propose a new way of learning leadership and management using simulation in the classroom.

#### Target Audience

The target audience of this presentation is for academicians who are seeking new ways to implement new ways to enhance the teaching styles of new nurses using simulation for leadership and management instruction.

#### Abstract

New nurses often struggle with delegation tasks upon graduation and one way to overcome this struggle is to apply what is learned in texts into the classroom by practice/experience. Nursing is a field of education heavily laden with experiential learning; we “practice what we preach” so to speak. Teaching in the classroom time is spent mostly on topics such as theory, pathophysiology, pharmacology, biology, chemistry, anatomy & physiology, etc. When it comes to clinical (time that is spent with patients), students are to be ready to produce a skill set that build upon the classroom learning. However, as students progress in their education, more critical thinking is required. This is an opportunity for simulation. This is incorporates high-definition mannequins that respond to clinical scenarios based on students’ actions and priority setting. For instance, if a student chooses the patient care incorrectly, the patient (mannequin) may code at any minute. This application of experiential learning, leveraging technological advances, gives the student the opportunity to build upon their concrete learning and become more proficient critical thinkers; the skills necessary to pass their credentialing exam – National Credentialing Licensing Exam (NCLEX). The purpose of this case study is to illustrate how one simulation strategy was used to strengthen critical thinking, delegation and skills in a nursing leadership course.

### Incivility: Nursing's Dirty Little Secret and Cognitive Rehearsal as an Intervention

---

*Laura Marie Schwarz, DNP, RN, CNE, USA*  
*Nancyruth Leibold, EdD, MSN, RN, PHN, LSN, CNE, USA*

#### Purpose

to provide background information on incivility in nursing including prevalence and ramifications, disseminate findings of a study on incivility including impacts of education on nurses' ability to recognize incivility, and teach the cognitive rehearsal method as an intervention to combat it.

#### Target Audience

nurses who are in academia or clinical practice and wish to know more about the prevalence and impacts of incivility as well as cognitive rehearsal as a method to combat it.

#### Abstract

The American public has consistently rated nursing as the most honest and ethical profession every year for the past decade (Riffkin, 2014). Yet nursing has a dirty little secret; incivility. Incivility is rampant in the nursing workplace with 82% of nurses witnessing it daily or weekly (Dumont, Meisinger, Whitacre & Corbin, 2012). It causes nurses psychological and physical trauma, and frequently to leave their jobs and sometimes nursing altogether. The consequences are severe and destructive not only to nurses, but also to patients who suffer decreased safety, and healthcare facilities which experience lost money and time orienting new nurses. Cognitive Rehearsal is one method nurses can use to combat incivility. According to Griffin and Clark (2014) "cognitive rehearsal is an evidence-based strategy to effectively communicate and deliver a message to uncivil or laterally violent colleagues that it is not okay for them to behave in an uncivil manner" (p. 539-540). Addressing uncivil behavior when it occurs may be the most successful in getting it to cease. Cognitive rehearsal is a method used to immediately address the uncivil behavior when confronted with it. It typically entails three parts: 1) instruction on the method; 2) learning and repeating verbal responses that can be used when encountering incivility; and 3) practicing to reinforce the instruction and rehearsal. Several studies conducted over the past 10 years have confirmed that cognitive rehearsal is an effective method for addressing incivility and lateral violence in the nursing environment (Griffin & Clark, 2014). The authors of a mixed-methods study on incivility in nursing (N=27) will present background information on incivility and disseminate study findings. Findings include nurses' ability to recognize incivility in nursing pre versus post education, and the effectiveness of education on ability to deal with it. Further, the presenters aim to teach learners the basics of the cognitive rehearsal method for dealing with incivility.

### A Picture is Worth a Thousand Words: Using Pictographs to Address Limited Health Care Literacy

---

*Elizabeth J. Winokur, PhD, MSN, BSN, RN, CEN, USA*

#### Purpose

to describe use of pictographs as an alternative method of emergency department discharge instructions. This project resulted from a nurse-lead study on healthcare literacy which demonstrated English and Spanish speaking clients at risk for low health care literacy. Positive post-discharge client feedback supports the efficacy of pictographs for this purpose.

#### Target Audience

targeted to clinical staff and administrators interested in innovative methods of delivering educational instruction to clients as well as academic faculty with an interest in vulnerable populations with limited health care literacy

#### Abstract

Limited healthcare literacy hinders care provision and contributes to worse patient outcomes. Inability to comprehend discharge instructions can adversely affect outcomes among Emergency Department (ED) clients. Literature has demonstrated poor comprehension of discharged instructions by emergency department patients.

As a result of homecare practices that were expressly different from routine discharge instructions among repeat clients, a community emergency department undertook a project to determine the cause. Over a 3-month period, 150 emergency department clients were asked to participate in an IRB approved study. A bilingual translator administered the Newest Vital Sign, a 6-item validated scale designed to assess healthcare literacy among English and Spanish patients. Results demonstrated statistically significant differences between the selected language and healthcare literacy ( $p < .001$ ). Both English (3.82 out of 6) and Spanish speaking (2.61 out of 6) clients were assessed to be at risk for limited healthcare literacy.

Study results demonstrated the need for an alternative form of discharge instructions. Nurses selected pictographs, pictorial depictions, as an adjunctive method to provide home care instructions. High volume diagnosis and discharge instructions were selected to be converted to pictographs; limited text written at less than a third grade level was included to enhance illustrations. Available pictographs include fever care, abdominal pain, gastroenteritis, and orthopedic conditions. Contents of the pictographs were selected based on a review of the literature and current discharge instruction contents.

At visit completions clients received standard discharge instructions and the language-appropriate pictograph version. Quality and helpfulness of pictographs was determined by post-discharge phone calls by registered nurses. Positive post-discharge client feedback supports its efficacy. More pictographs are under development.

### Urgent Care Nurse Data Capture: Impact on Diabetes Outcomes

---

*Leslie D. Dela Cruz-Torio, MSN, RN, USA*

#### Purpose

The purpose of this study is to examine the reciprocal relationships between behavioral, environmental and personal factors related to an Urgent Care (UC) nurse's documentation of diabetes pay for performance data in their current Electronic Health Record (EHR) system.

#### Target Audience

The target audience of this presentation is namely Urgent Care staff, leadership, providers and owners. However, this study may also have implications for both students and individuals interested in diabetes quality of care or Electronic Health Records. Finally, behaviorists may also find this study interesting.

#### Abstract

**Purpose:** The purpose of this study was to examine reciprocal relationships between behavioral, environmental and personal factors related to UC nurses' documentation of diabetes pay for performance (P4P) data in the current Electronic Health Record (EHR) system.

#### **Research Questions**

1. What is the relationship between Urgent Care (UC) nurse's attitudes towards the EHR and their compliance with documenting diabetes P4P data in the EHR?
2. What is the relationship between UC nurse's perceptions of positive formative feedback from their supervisor and their average percentage compliance of P4P data entered?
3. What is the relationship between the UC nurse's attitudes towards the EHR and their perceived formative feedback from their supervisor?
4. What other personal or environmental factors influence an UC nurse's documentation within the EHR?

**Background and Significance:** Diabetes is a deleterious disease affecting 347 million people worldwide (WHO, 2012). Diabetes mellitus is one of the top twenty reasons patients sought outpatient care (CDC, 2009). Sixty-seven percent of type two diabetics have elevated blood pressures (BP) (Suh et al., 2009). The projected prevalence of diabetes mellitus will increase by two-thirds between 2008-2030 (WHO, 2012).

Through the Affordable Care Act (ACA), UC visits could increase exponentially (UC Association of America, 2012). UCs can offer episodic care to diabetic patients. They have the potential of easing burdens on Emergency Rooms (ER), saving patients and insurance companies money while upholding the same quality.

Research demonstrates that nurses contribute to improved diabetes outcomes (Philis-Tsimikas & Walker, 2001; Philis-Tsimikas et al., 2004; Ishani et al., 2011). Available research regarding the role of ambulatory care nurses on diabetes quality of care is minimal. Research regarding the impact that UC nurses have on diabetes quality of care could not be located.

Nurses play the most important role in documenting patient's care because they are at the patient's side most (Langowski, 2005). Nowadays, nurses are responsible for documenting patients' care in an EHR. In California alone, \$124.6 million is budgeted for health care IT (HHS, 2011). There are conflicting reports on whether EHR-using sites fair better in diabetes patient care and outcomes than those without EHRs. JCAHO endorses the use of EHRs (2007) because they can enhance the accuracy of patient data collection and ease of retrieval (Green & Thomas, 2008).

No published research could be located that focused on EHR usage in UCs and amongst UC nurses. Furthermore, it has been more than ten years since research has examined the attitudes of nurses towards EHRs. Technology has since progressed and more organizations have thus adopted EHRs. Lacey (1993) wrote that, "As with any type of innovation, change is more easily facilitated if end-users have positive attitudes about the change". Huryk & Eneh have demonstrated that positive feedback from management led to more positive attitudes amongst employees (2010; 2012).

UC nurses can have a strong impact on the documentation of and quality of outpatient diabetes care within the EHR, but have been neglected in current research literature. It would be prudent to have a current study on the attitudes of these nurses towards EHRs as well as what motivates or demotivates them to document important diabetes data.

**Research Design and Methods:** A descriptive correlational design was used to examine the reciprocal relationships between behavioral, environmental and personal factors as they relate to the quality of diabetes care rendered by UC nurses. The target population included all RNs who have worked in one of the UCs within the past year. The UC leadership team as well as employees who have assisted with the development of the EHR were excluded.

The research was approved by the UC and University Institutional Review Board (IRB). Written approval was obtained from all related leaders. Email invitations were extended to all full-time, part-time per diem, and internal staffing UC RNs. The invitations provided an overview of the study, including potential risks, benefits, inclusion and exclusion criteria, as well as details about provisions undertaken to ensure participant privacy. RNs who participated completed the attached secretly coded surveys.

Surveys included the researcher-developed demographic questionnaire, Stronge & Brodt's (1985) Nurses' Attitudes Towards Computerization (NATC) questionnaire as well as Palomo's (2010) Supervisory Relationship Questionnaire (SRQ). Completed surveys were returned to the researcher in person, via fax, email or interoffice mail. Four weeks were provided for participants to complete and return questionnaires. However, due to low enrollment, the researcher extended the enrollment period another four weeks upon IRB approval.

The researcher then audited charts of diabetic patients who had been seen in the UC and triaged by the nurse participants within the past year. The researcher assessed whether or not the UC nurse met the diabetes P4P BP quality data such as: was (1) a baseline BP taken, (2) patient's BP greater than 140/90, (3) patient's BP rechecked manually after at least 5 minutes rest and (4) did the nurse inform the provider of abnormal BPs within 5 minutes of identification. Patient charts were excluded that had the following active diagnoses, which are usually exempt from P4P guidelines (IHA, 2012): polycystic ovary disease, steroid induced diabetes and gestational diabetes.

**Data Analysis:** Currently in progress. However, descriptive statistics will be used to describe the sample of UC RNs. Some of the descriptors about the population under study that will be reported include, but are not limited to: the percentage of males versus females, percentage of regular staff versus registry as well as the numbers of full time, part time and per diem RN participants.

Inferential statistics will be utilized to help make educated generalizations about the UC RNs in the health care organization that was studied. Furthermore, the researcher will also test for correlations between variables. These statistics will uncover whether variables such as gender, age, education, employment status, computer experience and number of years working in the UC affect an employee's attitude towards the EHR, their propensity of recording P4P data within the EHR and whether they perceive receiving formative feedback from their supervisor.

The two instruments that were used in this study have previously established reliability and validity. However, the SRQ is a fairly new tool and it's psychometrics have not yet been verified amongst U.S. nurses. Additionally, the researcher could not locate any research publications where the SRQ and NATC have been used in combination. Therefore, the researcher will do psychometric testing on the two tools in this study.

An improved understanding of the relationships, if any, between the trifecta of behavioral, personal and environmental factors surrounding EHR usage may improve a healthcare organization's investments in outpatient EHR adoption, training and technology. All of which can ultimately impact the quality of care rendered amongst the increasing number of outpatient facilities using EHRs.

## CLIN PST 2 - Clinical Poster Session 2

### Assessment and Prevention of Geriatric Functional Decline

---

*Jessica Tully, MSN, RN-BC, CMSRN, CNML, USA*

#### Purpose

The purpose of this presentation is to provide recent results of a quality improvement project in an Acute Care of Elders (ACE) Unit that used the Katz Index of Independence in Activities of Daily Living tool with outlined interventions in order to prevent functional decline in the geriatric population.

#### Target Audience

The target audience is novice and experienced bedside nurses who care for the geriatric population. Administrators will benefit from the recommendation tool and interventions provided.

#### Abstract

The geriatric population continues to grow. At an acute care hospital, the Katz Index of Independence in activities of daily living tool was implemented to identify patients at risk for functional decline. Outlined nurse-initiated interventions were created to prevent the incidence of functional decline while hospitalized in the Acute Care for Elders (ACE) Unit. This quality improvement initiative required nurses to assess the function of the patient during various stages of the patients' illness. The nurse used the Katz tool upon admission to assess the patients function 3 months prior to admission, on the date of admission, and upon discharge. The completed Katz tools (N= 31) were compiled after an eight week period to measure the effectiveness. This poster presentation will provide the overview of the Katz tool and the nurse-initiated interventions. The result of this study reveals interesting outcomes that will impact the geriatric population in the acute care setting. Administrators will gain knowledge in strategies for development and incorporation of a geriatric functional assessment tool with prevention interventions at the bedside. Staff nurses will be able to identify and discuss the importance of assessing geriatric function and implementing interventions to prevent functional decline while hospitalized.

### Diabetes Screening In India: A Family's Global Efforts

---

*Mary Anne Theiss, MSN, BSN, JD, PhD, RN, CNE, USA*

#### Purpose

The purpose of the presentation is to promote awareness of the incidence of diabetes in the Asia Indian population. Through a family effort 350 people of Indian decent were screened pursuant to the American Diabetes Association's guidelines. The effort engendered a family desire to continue global work and disease prevention.

#### Target Audience

The target audience is nurses interested in doing global work in the area of diabetes. Additionally, nurses that have an interest in disease detection and prevention.

#### Abstract

Diabetes is an issue worldwide. The incidence is high in the Asian Indian population. Many people in India do not have access to basic health care. A screening of approximately 350 people in Bangalore and Devanahalli, India was undertaken by a family using blood glucose testing and The American Diabetes Screening Tool. The screening was done with the help of the nursing staff of the Baptist Hospital. The equipment used for the screening was donated by various groups and the efforts of a Sigma Theta Tau chapter. Identification of people at risk and basic education on diet and exercise was conducted over a three day period. Persons with a blood sugar reading over 140 and a score of 5 or higher on the risk test were counseled by the staff of the Baptist Hospital. Individuals that were identified to be at risk with higher blood glucose levels were immediately seen by an endocrinologist for further testing and treatment. All individuals were given information on the benefits of diet control, exercise and the signs and symptoms of diabetes. It is the intent of the presenter to continue these efforts and to identify grants to extend the testing and treatment.

## CLIN PST 2 - Clinical Poster Session 2

### CaTCH Protocol: Correctional To Community Healthcare – Facilitating Post-Incarceration Follow up for Released County Inmates

---

*Robin L. Stacy, DNP, MSN, BSN, RN, FNP-C, USA*

#### Purpose

The purpose of this presentation is to describe an evidence-based project to facilitate community-based transitional healthcare for inmates after they are released from a local Correctional Facility.

#### Target Audience

The target audience of this presentation includes registered nurses, clinical nurse leaders, advanced practice nurses, clinic administrators, physicians, and mental health providers.

#### Abstract

Each year, millions of incarcerated individuals fill state, federal, and local jails in the United States. Released inmates return to their communities with little or no access to healthcare. This lack of access to healthcare places former inmates at risk for serious consequences of their chronic physical and mental health problems. Eighty percent of the released individuals describe using the Emergency Department rather than a primary care provider as their source for health care for their chronic psychiatric or medical conditions, and/or significant substance abuse. A landmark study, cited in multiple research articles, found released inmates are at a 12 times greater risk of death within the first two weeks after their release as compared to individuals of the same race, sex, and, age. Causes of death included: suicide, drug over dose, cardiovascular disease, and homicide.

The current reentry program for follow-up primary care of newly released inmates from a local correctional facility is inadequate in providing continuity of post-release healthcare. A process improvement project, based on the components of Dr. Mary Naylor's Transitional Care Model (TCM), was designed to improve inmates' transition from correctional facility to community healthcare. Using the TCM provides structure to develop comprehensive discharge plans, follow-up care, improve coordination of care, and improve quality outcomes. Naylor has successfully shown the TCM enhances patient satisfaction, reduces hospital readmissions, and reduces healthcare costs.

The development of a discharge protocol and referral process to establish a community-based health clinic network will potentially result in fewer inmates being lost to follow-up care and will increase positive outcomes in inmates' health. Data analysis of this process improvement will be both quantitative and qualitative. Summary of data will support that by implementing a discharge protocol and referral process for released inmates, the transition from correctional to community healthcare (CaTCH Protocol) will improve and will provide better management of inmate's chronic health conditions.

## CLIN PST 2 - Clinical Poster Session 2

### Piloting a Monthly Problem-Based Learning Discussion Using a Secure Social Media Based Collaboration Platform in a Busy Neuro Critical Care Unit

---

*Briana Witherspoon, DNP, MSN, BSN, RN, ACNP-BC, CNRN, USA*  
*Avinash Kumar, MD, FCCM, FCCP, USA*  
*Kathryn Braunlin, MSN, RN, AG-ACNP- BC, USA*

#### Purpose

The purpose of this presentation is to share our findings and experience with piloting a monthly "social media like" problem based nursing education forum in the critical care setting

#### Target Audience

The target audience of this presentation includes anyone interested in learning about an innovative and effective strategy for positively engaging nurses in education initiatives as well as enhancing and promoting safe clinical practice.

#### Abstract

**Purpose:** The specific aim of this study is to evaluate the feasibility and effectiveness of implementing a social media based online discussion forum for complex case based discussions for nurses in a busy Neuroscience ICU.

**Background/Introduction/Literature Review:** Systems to meet the on-demand learning needs of nurses in the critical care setting are not well studied outside the traditional classroom models. However, it has been observed that online discussions positively enhance critical thinking among students in an academic setting. Time constraints and challenging staffing models prompted us to pilot this novel point of care learning platform. This online forum was designed for instructors/facilitators to effectively aid learners with knowledge acquisition and development of reflective learning. This collaborative forum serves as a hybrid model to positively engage nurses in education initiatives and to enhance the safe clinical practice in the critical care environment.

**Methodology:** A baseline educational needs survey was performed prior to initiating the pilot project. This helped us identify the areas of educational need in our ICU. To meet this need, we used a password protected social media/discussion forum that is supported by the medical center. Our forum was called "All things NeuroCritical Care". Its user interface structure is similar to Facebook (Facebook Inc, Menlo Park CA). Users can post answers or comments, as well as "like" and "follow" the discussion. Each month, two moderators post a clinical vignette pertinent to neurocritical care with two lead questions. The information is posted on a Monday and the nursing staff has five days to answer the questions, ask additional questions of the moderators, and also share their personal experiences before the clinical discussion closes on Friday. At the conclusion of the case, an updated review article on the topic is posted as a secure download for offline reading.

**Results:** Participation in the initiative is voluntary. This forum is ongoing, and has been active for eight months. Eight sentinel diagnoses have been presented so far. Currently 34 of 72 nursing team members formally follow the page regularly. Some of the clinical vignettes discussed so far include Complications after subarachnoid hemorrhage, Burst suppression in the ICU, Myasthenic crisis, Posterior Reversible Encephalopathy Syndrome, Stunned Neurogenic myocardium, Polyuria in the ICU and cerebral venous sinus thrombosis. The mean number of discussions strings per case is 8.3 posts. The unique visitors to the page during active case discussions exceed 100 members. More members view the page than actively participate in discussions. Feedback to date has been extremely positive and the nursing staff are continuing to request future topics for discussion.

**Conclusion/Recommendations:** Our single center pilot project offered a secure online problem based learning discussion format and point of care learning opportunity to our Neuroscience ICU nurses based

on their expressed need. We seek to develop this platform further by incorporating topics hosted by clinical experts and enhance engagement of nurses by incorporating continuing education credits (CE) into the current platform in the upcoming academic year.

## CLIN PST 2 - Clinical Poster Session 2

### CodeH(elp): Patient and Family Experience with a Patient and Family Activated Response System

---

*Cindy A. Elliott, BScN, RN, Canada*  
*Agnes T. Black, BSN, MPH, RN, Canada*  
*Sara-Grey Charlton, BScN, RN, Canada*  
*Candy Garossino, MSN, BSN, RN, Canada*

#### Purpose

The purpose of this presentation is to present evaluation findings of CodeH(elp); a patient and family activated response system. CodeH provides patients and families the opportunity to call a Clinical Resource Nurse in the event they have concerns they feel are not being addressed by their care team.

#### Target Audience

The target audience of this presentation is healthcare providers, healthcare leaders and consumers. Participants will gain an understanding of the experience of patients and families having access to a patient/family activated response system, and results of an evaluation of the CodeH program, including the benefits this system.

#### Abstract

Introduction: Under the Strategic Direction the Care Experience Providence Health Care (PHC) has committed that “We will have person and family centred care as our approach to the planning, delivery, and evaluation of health care that is grounded in mutually beneficial partnerships among healthcare providers, the people we serve and their families.” (Providence Health Care, 2015). One initiative PHC piloted and implemented under that Care Experience is a patient and family activated response system called CodeH(elp). Piloted in March 2013 on two medical units and later spread and implemented to a total of five medical units in an acute care tertiary hospital CodeH is currently expanding to four surgical units.

CodeH provides patients and families 24/7 access to a Clinical Resource Nurse should they have concerns which they feel they have been unable to address with their care team. The Clinical Resource Nurse attends the bedside, works with the patient or family who placed the call and then engages with members of the healthcare team to resolve the patient’s concerns. The Clinical Resource Nurses report through the Professional Practice Office, and are therefore not part of the local team caring for the patient and family, which allows them to be third party to the presented concerns. They are experienced nurses with Critical Care or Emergency background and skilled communicators.

Code Help was implemented to provide an additional source of support and safety for patients and families. Code Help enables patients and families to act as partners with the healthcare team for quality and safety and supports person and family centred care.

The steering committee included two patient partners who collaborated on the planning, design, implementation, spread, and sustainment of CodeH. Implementation included tent cards at each bedside with CodeH information as well as posters in each patient room. When CodeH transitioned from pilot to permanent resource on medicine, information was added to the “Welcome to Medicine” pamphlet. During admission to the unit, the admitting nurse includes information regarding CodeH as part of the patients welcoming and orientation to the unit.

In the first 22 months there have been 76 CodeH calls.

Methods: Evaluation of CodeH consists of three components:

- survey of patients, families and staff on units where CodeH is implemented

- analysis of the data collected by the CRNs when a CodeH call is placed
- structured interviews with patients and families who access CodeH

Using a simple survey tool created by the CodeH steering committee patients, families and staff on the units where CodeH is offered were surveyed to gain an understanding of their perceptions of the service.

Patients and families surveyed were asked if they were aware of the service, reasons why they might call CodeH and whether they feel safer having CodeH available. There was also space for additional comments.

Staff were surveyed and asked if they were, aware of the service and whether they felt CodeH benefits staff as well as patients and families. Staff were also provided free text space for additional comments.

Additional data was collected by reviewing the call logs of the Clinical Resource Nurses who respond to CodeH. The CodeH calls are tracked by the CRNs. The data tracking include the reason for call, other team members involved, response time, follow up visit with patient/family, and time spent. The data collected by the Clinical Resource Nurses is being reviewed and organized into themes.

Currently underway is the evaluation of patients and families who utilized the CodeH system. These individuals are being invited to participate in semi-structured interviews conducted by a trained research assistant. Interview questions will focus on the patients' or families' experience of calling CodeH and the impact of doing so. The interviews will be transcribed and coded and thematically analyzed.

Results: Results of surveys with patients and families indicate that CodeH provides a valuable source of support. 81% of respondents answered 'very true' or 'somewhat true' to the statement 'I feel safer with CodeH'

Additional patient and family member written feedback included:

"I think this is a very worthwhile project that provides assistance when there doesn't seem to be another alternative for information."

"Good idea - I am comfortable asking questions but many people need another avenue."

"Thank you for having this kind of service and for making sure that patients are aware of it. St. Paul's has been our hospital of choice for many years, and this just adds to the 'why' we go there when we need medical help."

Staff survey results indicated support to CodeH. 86% of staff surveyed were aware of CodeH; 66% of staff respondents reported viewing CodeH as beneficial to patients and families as well as to themselves as staff members.

Additional staff member written feedback included:

"Patient has more ways to find out the answer to their questions. Reduced anxiety."

" Any additional resources are great for nurses and patients"

"The team **ALWAYS** works hard on resolutions for complex d/c and other cases. We exhaust all and any possible avenues. Code H almost seems like making us duplicate our work or worse...checking on our work. I think it affects staff morale negatively"

Preliminary results for the analysis of the CRN call logs indicate that primary reasons patients and families call CodeH include lack of clarity about the plan of care, pain management and communication. Further findings will be included in the poster presentation.

Semi-structured interviews with patients and families who placed a CodeH during their admission are being conducted. Results of these interviews will be analyzed and presented in the poster.

Discussion: CodeH helps to support the philosophical push toward patient and family centred care at Providence Health Care. This evaluation demonstrates that patients and families find the program an important and valued resource. Staff survey results demonstrated that while some staff had reservation regarding the program over half of the respondents found it to be mutually beneficial for staff and patients.

Analysis of the data collected through the CRN call log identified potential areas for improvement for the care team.

Evaluating the experience of those patients and families who utilized CodeH will add important qualitative data to our evaluation.

Limitations of this evaluation include a small survey sample size.

CodeH is a well received patient and family centred care initiative that has the potential to improve care at health care organizations.

### Advance Nurse Practitioner Hypertension Management

---

Mary Jane Venzon, BSN, RN, CWCN, USA

#### Purpose

The purpose of this presentation is to evaluate the effectiveness of nurse practitioner hypertension management compared to physician management in achieving BP control among hypertensive adult in the primary care setting.

#### Target Audience

The target audience of this presentation is nurses.

#### Abstract

In recent years, the US health care delivery system has evolved from primary care treatment of acute medical illness to management of chronic conditions. Parallel to this change, nurse practitioners (NPs) presence in primary care setting is increasing especially in the chronic disease management (Watts et al., 2009). Considering that NPs are in the forefront of disease prevention and management among adults, they must demonstrate excellent clinical performance and improve patient outcomes. Studies have shown that NPs provide safe, efficient, cost-effective, and high-quality health care. Despite of this, some medical organizations, lawmakers, and health consumers are still wary of the NPs effective practice (Bauer, 2010). This resulted to limitations posed on NPs' scope of practice throughout the country.

Hypertension is one of the prevalent conditions encountered in primary care settings. A review of studies that examined practices of NPs specific to hypertension management showed that NPs effectively managed this condition with or without physician collaboration. This review provided support to advance full authority and scope of practice for all NPs in the country.

Keywords: Hypertension management, nurse practitioner, advance practice nurse, nurse-led hypertension management, primary care

## CLIN PST 2 - Clinical Poster Session 2

### The Severity of Medication Administration Errors Detected Using Three Different Research Methods

---

*Marja S. Härkänen, PhD, RN, Finland*

*Hannele Turunen, PhD, RN, Finland*

*Katri Vehviläinen-Julkunen, PhD, RN, RM, Finland*

#### Purpose

The purpose of this presentation is to discuss of the importance of the medication administration process to improving the quality of nursing care and preventing patient harm.

#### Target Audience

The target audience of this presentation is all registered nurses working in clinical practice with medication administration duties, nurse leaders, and researchers interested in nursing quality of care and patient safety.

#### Abstract

Nursing-sensitive indicators reflect the structure, process and outcomes of nursing care. Patient outcomes that are determined to be nursing-sensitive improve with greater quantity or quality of nursing care. (ANA 2015.) Medication administration is an important daily nursing task that involves great potential for errors and patient harm.

The aim of this presentation is to describe the severity of medication administration errors detected using three different research methods. The study was conducted in a university hospital in Finland. Three types of data-sets were analyzed: 1) medication-related incident reports (n=671) 2) randomly selected patients' medical records (n=463) using the Global Trigger Tool (GTT) method and 3) observations (n=1058) of medication administration by nurses' which were followed by a review of medical record (n=122). In the secondary analysis, only medication administration errors (MAEs) detected by the three aforementioned methods are analyzed and described.

Of the 671 medication-related incident reports, 39.8% (n=267) were MAEs. The GTT method revealed 153 medication errors, 26.8% (n=41) of which were MAEs. Observation of 1058 medication administration events revealed 235 medication errors, 61% (n=143) of which were MAEs. The severity of MAEs (n=451) was classified using the taxonomy from The National Coordinating Council for Medication Error Reporting and Prevention (NCCMERP 1998). The taxonomy's classification of the severity of medication errors (patient outcome) ranges from Category A (no error, no harm) to Category I (error, death).

Most of the MAEs detected (n=443, 98.2%) reached the patient. Still, 62.1% of MAEs did not cause harm to patients (Categories B and C), although 24.2% of MAEs required patient monitoring to confirm the lack of harm (Category D). MAEs that were more likely to cause harm to patients (Categories E, F, H) occurred in 13.7% of cases. When the severity of MAEs were compared using the different detection methods, the observational method revealed fewer MAEs that were more likely to cause harm (3.5%), whereas the GTT method revealed the most MAEs that were more likely to cause harm (22%) followed by incident reports (18%). Pearson's Chi-Square test demonstrated a statistically significant difference in the total number of MAEs detected by the different methods and as well as in the number of MAEs that were likely to cause harm ( $p < .001$ ).

MAEs are the type of errors that are the least likely to be prevented before reaching the patient. In this study, the documented severity of MAEs depended on the method used. These findings were expected as the GTT method is specifically designed to identify situations that cause harm to patients, whereas the observation method rarely identifies these situations because of the limited time of observations. More information is required to increase the safety of the medication administration process and to prevent harm to patients.

### Networking Improves Care for Women and Infants

---

*Rita Allen Brennan, DNP, RNC-NIC, APN/CNS, USA*

*Dawn E. Reimann, DNP, MS, RNC-NIC, APN/CNS, USA*

*Patricia M. Prentice, BSN, MBA, RN, USA*

*Angela C. Rodriguez, BSN, RNC, CCRC, USA*

#### Purpose

Demonstrate how collaboration within a perinatal network improves care for women and infants.

#### Target Audience

Nurses who care for women and children. Nurses interested in quality improvement.

#### Abstract

**Background:** Illinois has a regionalized perinatal system with ten networks. The Statewide Quality Council establishes quality initiatives that are to be instituted within each birthing hospital. Each perinatal network coordinates these initiatives for member hospitals through the Regional Quality Council (RQC). Two recent evidence-based initiatives are reduction of early elective deliveries (between 37-38 6/7 weeks gestation) and the evidence-based breastfeeding initiative. The Co-Perinatal Center is unique among the ten networks as the Chair of the Committee is a Nursing Leader from a community Level III hospital with expert qualifications including a Doctorate in Nursing Practice.

**Problem:** Baseline data collected by our Network RQC for these two key perinatal measures (early elective deliveries and breastfeeding) demonstrated that improvement was needed.

#### **Specific aims:**

- Improve outcomes for women & infants cared for in Perinatal network hospitals
- Collaborate with network hospitals on improvement strategies
- Meet state quality improvement requirements

**Method:** The Institute of Healthcare Improvement methodology of plan-do-study-act was the framework for change. Initial steps included process measures for each initiative, such as policy development. Hospitals were required to demonstrate that these policies were established within the organization. Quantitative data collection tools were developed by the RQC chair and the Perinatal Center for use by each hospital within the Network. Data was submitted to the network administrator and the RQC chair. Aggregate data is shared with all hospitals.

**Implementation strategies:** Engagement of hospital administration was the first step for each hospital's improvement project. The hospitals then developed teams to implement both of these initiatives. The perinatal network assisted and monitored progress for each hospital. Barriers and challenges, as well as successes, were presented to and shared amongst the network hospitals. Project data was submitted to the Perinatal Center, summarized and analyzed by the chair of the network quality council. Aggregated data is shared with all hospitals.

**Results:** The network has met or exceeded state established goals for each project. All hospitals have < 5% early elective delivery rate. Hospitals also have implanted the evidence-based breastfeeding initiative. The network breastfeeding initiation rate exceeds the state average. Several hospitals are now on the Baby-Friendly pathway.

**Conclusion/ Implications for nursing practice:** Implementation of quality or evidence-based projects can successfully be implemented with the perinatal network structure. By networking with other hospitals, improvements can be made. Learning can be implemented and barriers can be overcome. Establishing

these as statewide quality projects adds credence to the importance of the work, and compliance with such initiatives.

### Nursing Teamwork in Health System Hospitals: A Multisite Longitudinal Study

---

*Karen J. Vander Laan, PhD, MSN, BSN, RN, USA*

*Judith B. Westers, MSN, BS, RN, USA*

*Matthew A. Culver, USA*

*Katelynn M. Wohlfert, USA*

#### Purpose

Share baseline results from a 3-year longitudinal, repeated measure study of nursing teamwork and its five subscales – trust, team orientation, backup, shared mental model, and leadership – from the perspectives of nursing staff members who work in acute care inpatient units at diverse hospitals in a regional health system.

#### Target Audience

Nurses and leaders who see teamwork as an essential element of workplace culture to promote collaboration; enhance patient, family, and interprofessional outcomes; and open new avenues to professional growth and practice excellence.

#### Abstract

Teamwork among nursing staff members—licensed and unlicensed—is essential to create a strong and dependable workplace. Relationship-Based Care (RBC), a care delivery model rooted in Jean Watson's Model of Human Caring, was begun in 2006 in a Midwestern United States health care system's hospitals as part of our nursing professional practice model. RBC focuses on the relationships of caregivers with themselves, patients and family members, team members, and the community. Team members can be defined as two or more interdependent individuals who share skills and resources, working together to make decisions that achieve a common goal. It is hypothesized that as relationships between team members grow, teamwork increases. Teamwork, in turn, has been found to lead to productivity, job satisfaction, and promotion of optimal quality of care. Over the past decade, teamwork has been described, measured, and studied by Kalisch and colleagues in surveys of nurses from multiple units in a variety of hospitals. The significance of the longitudinal repeated measures study we are conducting is its aim to understand overall nursing teamwork and its facets over time, as perceived by nursing staff members who work in acute care inpatient units at diverse hospitals in a regional health system.

A pilot study with nursing staff from two acute care units and 10 nurses who worked in the medical center's resource pool was conducted in October 2014 to test the process for conducting and reporting the Nursing Teamwork Survey. Based on the success of the pilot study, this multisite study is being launched to create a longitudinal description of nursing teamwork in a health system's hospitals of various sizes and locations. The purpose of this poster will be to share baseline results of nursing teamwork to describe the current workplace environment, document variations in perceived teamwork, and identify potential improvement strategies for units/areas, hospitals, and the health care system.

Following IRB review, this descriptive, comparative, longitudinal study will collect data with an electronic survey that will be deployed every six months for three years. Potential participants include approximately 4200 nursing employees from acute care inpatient units within our health system's eleven hospital entities, some being Magnet®-designated. The Nursing Teamwork Survey (NTS), developed by Kalisch and colleagues, contains 22 items that explore demographics, hours worked, nurse to patient ratio and churn in a recent shift, and satisfaction with teamwork, staffing, role, and position. Another 33 items, scored as the percentage of time each occurs, comprise the overall teamwork measure and its five subscales: trust, team orientation, backup, shared mental model, and team leadership. A management leader and staff leader from each unit/area will collaborate to recruit nursing staff to participate in the semi-annual surveys. Data will be managed and analyzed by the research team to create descriptive reports for each participating unit/area, hospital, and the health system. Comparison statistics of survey responses by unit/area and hospital and hospital results by demographic characteristics will be

generated. The potential risk of survey participants being identified will be mitigated by not reporting demographic data at the unit level. Identifying opportunities to foster improved teamwork is an anticipated benefit. We will also share our experiences in designing, implementing, and reporting results of a multisite longitudinal study within a regional health system.

### Nurses Narrative Examples of Moral and Ethical Drift in Response to Health Information Technology Protocols

---

Jennifer A. Browne, MSN, RN -BC, CCRN, USA

#### Purpose

To present nurses' narrative descriptions of moral and ethical drift when utilizing health information technology (HIT) protocols in intensive care. Raising awareness of dilemmas faced by nurses utilizing HIT can help to inform future studies. These ad hoc findings were part of a dissertation which examined nursing workaround behaviors.

#### Target Audience

nurses utilizing bedside technology, administrators, nursing informatics experts and others interested in understanding and improving clinical information systems

#### Abstract

As technology applications in intensive care multiply, change and influence nursing practice the ethical implications of utilizing new technologies are difficult to anticipate. Because technologies do differ, the issues that nurses face change from organization to organization resulting in under-identification of ethical concerns. Additionally, when an information system is meeting clinical and organizational goals there is a reluctance to bring forward these "hidden" dilemmas.

There are situations in acute care where professional and ethical values can conflict with management and administrative goals.<sup>1</sup> Kleinman<sup>2</sup> describes ethical drift as "an almost indiscernible move toward cutting corners when making the best of a bad situation". Moral drift is a behavior whereby the choice between "the lesser of two evils somehow makes it right".<sup>2, p.73</sup> Conflicts of interest can occur when personal or private interests interfere with a nurses professional responsibilities. All three scenarios can contribute to moral distress, defined as "when one knows the right thing to do but institutional constraint make it nearly impossible to pursue the right course".<sup>3, p. 6</sup>

This dissertation study was a mixed methods survey conducted in collaboration with American Association of Critical Care Nurses and approved by The University of Texas Health Science Center IRB. A sample of 297 AACN Registered Nurse Members voluntarily responded to an email survey and described the problems and workarounds they encountered using health information technology (HIT) at the bedside. The Ad Hoc findings reported here were not part of the dissertation research questions but emerged from the qualitative data. The data was re-analyzed using MAXQDA software and nurse narratives characterizing moral and ethical drift were simply categorized as such.

Eighty seven percent of respondents were female, 13 percent male (n=279). The age of respondents (n=295) was most heavily represented in the 45-54 age group (35%) and in the over 55 age group (23%). The smallest age group was 18-24 (3.4%) followed by 25-34 (16.9%) and 35-44 (21.4%). Similarly, nurses with 21 or more years of experience (29.7%) and 11-20 years of experience (28%) represented over 50% of respondents (n=292). Nurses with less than 2 years of experience represented 10.6%, 3 to 5 years of experience 12% and 6 to 10 years of experience 18.8%.

Almost 50% of the nurses had a bachelor's degree in nursing (48.3%), 20.6% an associate degree and 19.9% had a masters degree (n=291). The mean level of self-reported ICU nursing experience was 4.48 (SD= +/- .95) which on a 1 to 5 scale with 5 being expert equates to midway between a proficient and expert level. The average size of the units the nurses worked on was reported in number of beds with the mean number of beds being 19.5 (SD= +/- 10.1). Seventy five percent of nurses reported a 1:2 assignment (1 nurse for every 2 patients), while 14.7% reported a 1:1 assignment and 14.5% reported a 1:3 assignment (n=296).

Forty two percent of the nurses worked in mixed intensive care units, 11 % in surgical intensive care units, 10.5% in coronary care and 9.5% in medical ICU units. The acuity of the patients the nurses were caring for were reported as: 61.8% critical, 28.7% guarded and 9.2% stable. The workload of the nurse was reported as heavy (40%), moderate (58%) and light workload (2%) (n=296). The software vendors that were represented in this study included: KBMA (Allscripts), Carefusion, Cerner, Epic, Meditech, McKesson (Horizon and Paragon), Soarian, eICU, Endotool and Glucostabilizer.

In fifteen percent (n=45) there was an ethical or moral dilemma identified. The narratives are presented in the broad classifications of ethical or moral drift. A third classification lists narratives which contain inferences to conflict of interest as there was evidence that on occasion what and how the nurse documents can be influenced more by a nurses' own year-end performance evaluations than by what was true or by what actually occurred.

**Ethical Drift: Incremental deviation from ethical practice that goes unnoticed and is justified as acceptable. (Kleinman, 2006, 73). Ethical drift occurs over time and the actions rationalized as reasonable given the set of circumstances or challenges in the workplace. (Duffy, 2009)**

1. "When bar code of an insulin bottle will not scan, I take barcodes off the multi-use vial and tape them to my badge"
2. "Frequently the computer is unresponsive for up to 10 minutes. I administer meds without scanning and then scan empty drug wrappers when system comes back up"
3. "I don't list all my IV medication titration changes that just to keep from having to beg someone to put in their password several times for each change"
4. "Scan barcodes and all meds outside of room, especially if patient is on contact precautions"
5. "Changes to IV pump settings for "drips" requires finding a 2<sup>nd</sup> RN who must also enter their info two to three different times for each witnessed event. It was discovered that changes can be entered all day without a witness and then at the end of day the witnessing RN only has to sign once and all fields fill in automatically"

**Moral Drift: A behavior whereby the choice between the lesser of two evils somehow makes it right (Kleinman, 2006).**

1. "Doctors unable to enter orders correctly; particularly medication orders. I put the order in myself"
2. "When initially signing into computer a "required" screen comes up and the RN has to enter a height and weight. To get past that you have to enter any number no matter what, then change it later"
3. "Titrating drips to fit the order, even if actual titration different"
4. "Many places on assessment have only certain choices and no place to free text what is not on the list. You must either leave it blank (and get in trouble) and put what is closest to the patient condition and this is not right either"
5. "Nurses check badges instead of medications when obtaining a double verification. The computer and admin are happy but the medication does not get double checked."
6. "I frequently need to complete documentation that is "required" by institution policy but is not available from the patient or truly assessed."
7. "Change the real administration time. Otherwise the system wants an explanation why medication wasn't given on time. Set yourself up for an investigation"

**Conflict of Interest: A conflict between the private interests and the official responsibilities of a person in a position of trust <sup>4</sup>**

1. "If barcode not readable give med without scanning and chart reason as "other patients care" whether it is true or not. I/ we could chart as "barcode not readable" but this means counseling from management for each non-scan"
2. "Our scan rate percentages on our end of year evaluations must be greater than 95% so if we "full document" by saying med was given but not scanned we are tagged."

3. I could not scan one medication. If you do not scan your medications it will reflect in your personal scan rates.
4. A barcode mismatch option is to trick out the computer by choosing “not given” with a reason code like “schedule adjust”, then proceeding to next screen where you are supposed to scan the patient. At this point you can change it back to “given” and proceed with the patient scan. Apparently this does not count against your scan rates”
5. “Organization is using computer charting as audit and disciplinary tool”

These narratives describing nurses' problems and workarounds when using technology are indicative of a larger problem that threaten the moral integrity of the nurse.<sup>3</sup> As is found frequently in the literature, ethical dilemmas and moral distress can negatively impact a nurse's well-being.<sup>3</sup> As we progress in the utilization of technology in intensive care, vendors, administrators and informatics nurses have a responsibility to look for and evaluate ethical mismatches in workflow analysis and to safeguard the nurse from moral distress precipitated by technology.

## CLIN PST 2 - Clinical Poster Session 2

### Development of a Learning Needs Assessment Tool for Nurse Managers to Offer Continuing Education Programs Which Reflect Their Learning Needs

---

*Toshiko Nakayama, PhD, RN, DNSc, Japan*  
*Naomi Funashima, DNSc, RN, Japan*  
*Tomomi Kameoka, RN, DNSc, Japan*  
*Yuriko Nomoto, RN, DNSc, Japan*  
*Kyoko Yokoyama, RN, DNSc, Japan*  
*Mitsuko Nagano, DNSc, RN, Japan*

#### Purpose

The purpose of this presentation is to introduce the results of the research, "Development of a Learning Needs Assessment Tool for Nurse Managers", and to discuss about the learning needs of nurse managers in many countries with the participants of the convention.

#### Target Audience

The target audience of this presentation is nurse managers working at hospitals are interested in the learning needs.

#### Abstract

**Background:** Nurse managers are the nurses with management responsibilities in a nursing unit. They have primary responsibilities for staffing and scheduling, managing current staff, and day-to-day operations of the unit. Recently, the role of nurse manager continues to expand within the health care system. To be able to adapt to this expansion of the role and to be able to undertake the role of nurse manager independently as a professional, it is necessary for nurse managers to learn independently and to have opportunities for continuing education. A learning needs assessment tool for nurse managers in Japan could measure the learning needs of nurse managers to promote evidence-based professional development.

**Objectives:** To develop a learning needs assessment tool for nurse managers, which has well-established reliability and validity.

**Methods:** There were three stages in developing the scale: (a) Making items for the scale based on qualitative and inductive research findings (Nakayama & Funashima, ongoing submission to a nursing conference in Japan). (b) Examining the content validity with a panel of experts and a pilot study. (c) Conducting two surveys and testing the reliability and validity of the scale.

**Results:** A Learning Needs Assessment Tool for Nurse Managers (LNAT-NM), consisting of 25 items with a 6-point Likert scale, was constructed using the afore-mentioned three stages.

In the 1<sup>st</sup> survey, the instrument packets, including the LNAT-NM and a demographic questionnaire, were distributed to 1,191 nurse managers working at 435 hospitals all over Japan. Six hundred and eleven nurse managers (52.3%) responded, and 512 valid data were analyzed. Cronbach's alpha, a reliability coefficient of the LNAT-NM, was 0.940. The result signifies that the LNAT-NM has high internal consistency. Nurse managers with under 2 years' experience at their nursing unit had learning needs higher than nurse managers with above 5 years' experience at their nursing unit ( $t=2.837$ ,  $p=0.005$ ). Nurse managers who perceived their management competency to be low had learning needs higher than nurse managers who perceived them to be high ( $t=2.675$ ,  $p=0,008$ ). The results indicate that the LNAT-NM has construct validity by the known-group method.

In the 2<sup>nd</sup> survey, the instrument packets, including the LNAT-NM and a demographic questionnaire, were distributed to 156 nurse managers working at 21 hospitals selected for convenience to examine stability.

Forty-four valid data were analyzed. Test-retest reliability was 0.746 ( $p < 0.001$ ). The result shows that the LNAT-NM has stability.

The LNAT-NM consists of 25 questions, including items such as “basic skills and knowledge of nursing management for effective and efficient provision of nursing services”, “knowledge and skills necessary for patient safety”, “organization and management according to the specialty and characteristics of a nursing unit”, “educational support and career development necessary for human resource development”, “improvement of a working environment and reduction of turnover for retention of human resources” and “management and business knowledge needed to participate in management planning in a hospital”.

**Conclusions:** The reliability and validity of the LNAT-NM was ascertained, and it has been found that hospital clinical nurse educators can measure the learning needs of nurse managers using the LNAT-NM, and use the results to offer continuing education programs for nurse managers designed to meet their learning needs.

## CLIN PST 2 - Clinical Poster Session 2

### Let's Move: Promotion of Physical Activity in the Treatment of Depression

---

*Josephine A. Igwacho, BSN, RN-BC, BSN, USA*

#### Purpose

The purpose of this presentation is to promote physical activity and physical activity counseling in the treatment of depression, so as to enhance self-care and improve overall wellbeing. Emphasis in the management of chronic diseases is currently moving in the direction of self-care management.

#### Target Audience

The target audience of this presentation is not only limited to mental health providers or prescribers, but the overall audience, because health promotion through increasing physical activity is something that anyone can benefit from. The benefits of physical activity in transforming the health for all age groups are widely known.

#### Abstract

Over the years, the prevalence of chronic diseases (resulting from poor lifestyle behaviors) and especially mental health disorders, such as depression, substance misuse disorders, suicide, and violence are continually on the rise, with depression projected to be the leading cause of disability in the U.S. by 2020 (CDC, 2012). A significant amount of the U.S. health care expenditure is being spent on depression and other mental health disorders. Yet, the efficacy of antidepressants continues to be modest, at best, with poor treatment response and remission rates. According to Gaynes, Lux, and Gartlehner (2012), approximately 70% of patients do not respond to their initial antidepressants while 50% remain resistant to multiple medications. Multiple studies have shown that treatment outcomes are much improved when antidepressants are augmented with other alternative treatment modalities and better self-care management, such as physical activity (Donaghy & Taylor, 2010; Mota-Pereira et al., 2011). Physical activity is one of the most modifiable risk factor against multiple chronic diseases. However, many Americans do not meet the recommended guidelines for physical activity (McPhail & Schippers, 2012).

In order to curb the increasing prevalence of multiple chronic conditions, which result from physical inactivity and other poor lifestyle behaviors, and transform health globally, the status quo must be improved. The management of chronic diseases must continue to move beyond the heavy focus on medical treatments where patients are passive recipients to models that incorporate integrative and self-care management. Recently, more focus has been on interprofessional collaboration as well as health promotion and preventive services. In this modern era of information technology, patients are increasingly empowered to take the lead in their health care. My scholarly project is centered on the promotion of physical activity as an adjunct treatment in the management of depression and, therefore, in line with this paradigm shift in health care.

The purpose of my project is to encourage physical activity counseling and prescription in the treatment of depression. The specific objectives are to encourage physical activity counseling and the incorporation of physical activity in treatment plans. This system change project is currently being implemented at a community health center in North East Tennessee, using a descriptive pretest posttest design. A presentation for the healthcare providers to encourage physical activity counseling and prescription, coupled with a PowerPoint streaming video for patients in the waiting room, physical activity pyramid poster in patient examination rooms and print brochures for patients have all been implemented. These interventions will provide visual cues and reminders to promote physical activity counseling. Data will be collected two months before and after the interventions using a questionnaire as well as a review of the electronic health record, assessing providers' perceptions and practices about physical activity counseling and prescription. Data will be analyzed using descriptive statistics and independent t-test. The primary outcome of this project will be an increase in physical activity counseling. It is hoped that providers will not only increase physical activity counseling, but also incorporate it into patients' plans of care. Further recommendations will be made based on the project outcomes.

#### Purpose

The purpose of this presentation is for the learner to assess the effectiveness of utilizing nurse practitioner-led teams to improve glycemic control for post cardiac surgery patients through the use of evidence based practice.

#### Target Audience

The target audience for this presentation is all registered nurses in any field seeking to expand their knowledge of evidence based practice and nursing leadership, as well as development of the advanced practice nurse role in the hospital setting.

#### Abstract

**Background and Significance:** Inpatient diabetes care consumes half of the \$174 billion total expenditures for diabetes in the United States. According to studies, patients with diabetes are more likely to be hospitalized and experience longer lengths of stay than those without diabetes. In addition, 30 – 40 % of all hospitalized patients develop hyperglycemia, with average hospital stays that are up to three days longer than for patients without hyperglycemia.

The evidence for inpatient glycemic control is substantial. Hyperglycemia in hospitalized patients is strongly linked to poor outcomes regardless of whether or not the patient has a diagnosis of diabetes. Patients with both new hyperglycemia and known diabetes are more likely to require admission to the intensive care unit (ICU) when compared to patients with well controlled blood glucose. For cardiac surgery patients, hyperglycemia is an independent predictor of mortality. Diabetes experts and interprofessional teams are essential components needed to translate evidence based practice for glycemic management into the inpatient setting. The purpose of this evidence based project is to evaluate the effectiveness of a nurse practitioner (NP) led team on achieving glycemic goals for post-cardiac surgery patients.

The project uses the Centers for Medicare and Medicaid Services (CMS) surgical care improvement project (SCIP) glycemic measure to benchmark glycemic goals. Prior to 2014, our institution evaluated glycemic data on postoperative days one and two. The goal was to achieve 6 A.M. blood glucose values of less than 200 mg/dL. Glycemic goals were consistently met at a rate of 96 % or higher. On January 1<sup>st</sup>, 2014 an additional glycemic measure was added on postoperative day one. The new criteria stipulated that blood glucose must be 180 mg/dL or less, hours 18 through 24 post-anesthesia end-time. The new glycemic goals were met for only 84 percent of patients, revealing a significant need for improvement of glycemic management processes.

**Project Objectives:** The first project objective is to determine the effectiveness of an NP led team on glycemic management of postoperative cardiac surgery patients. The 2014 SCIP measure defined euglycemia as maintenance of blood glucose of 180 mg/dL or less for hours 18 through 24 post anesthesia end-time. The project goal is to meet this requirement at a threshold of 95.8 percent.

The second project objective is to determine if individualized insulin and nutrition therapy interventions by the NP team will increase the incidence of hypoglycemia in postoperative cardiac surgery patients. Blood glucose results will be monitored for 48 hours following anesthesia end-time and/or discharge, whichever

comes first. The project goal is to maintain a zero percent incidence of hypoglycemia. The measured blood glucose ranges are 0 – 39 mg/dL and 40 to 69 mg/dL.

The third project objective is to evaluate nursing satisfaction with implementation of the performance improvement project. Cardiac surgery nurses may not feel that they were engaged in development and implementation of the performance improvement project. Nursing satisfaction will be rated with a five question anonymous survey, utilizing a five point Likert scale of measure. Achievement will be measured as 80 percent or more nurses rating overall satisfaction with implementing the performance improvement project at a 4 (agree) or 5 (strongly agree) on the Likert scale for a minimum of four questions.

**Methods:** This is a single-center descriptive, prospective, comparative analysis of an NP led quality improvement project. The analysis is designed to assess the effectiveness of NP management of hyperglycemia in post cardiac surgery patients. The measure of success is based on compliance with the 2014 SCIP glycemic requirements for this population. The prospective analysis will not be masked to the investigators or staff. The project is a chart review of postoperative cardiac surgery patients. No subject recruitment or consent is indicated. The analysis will evaluate compliance with the 2014 SCIP glycemic control requirements of blood glucose 180 mg/dL or less between hours 18 and 24 post anesthesia end time. The analysis will evaluate for incidences of hypoglycemia, defined as blood glucose less than 70 mg/dL and for critically low values defined as blood glucose results of less than 40 mg/dL., for the period of 48 hours post anesthesia end time. The analysis will also assess nursing satisfaction with evidence based process changes.

**Data Analysis:** Data analysis will be carried out using the Statistical Package for Social Sciences (SPSS Inc., Chicago, IL and USA), version 22. Descriptive statistics such as frequency distribution (percentages), measures of central tendency (mean, median), and measures of dispersion (range, standard deviation) will be used to describe the sample population and overall utilization rate. A paired t-test will be used to show the difference between the changes in glycemic management processes and patient outcomes. In this project, statistical significance will be considered when the probability is equal to or less than 0.05. The final analyses will use descriptive statistics and chi-square tests. Secondary aims will be analyzed, using Pearson's correlation. Analysis is under way and data is pending for this project.

## CLIN PST 2 - Clinical Poster Session 2

### The Postoperative Pain of the Elderly Patients

---

*Shu-Hui Wang, MSN, NP, RN, Hemodialysis RN, Taiwan*

*Tsy-Huei Chang, PhD, RN, Taiwan*

*Jing-Yi Wu, MSN, RN, Taiwan*

#### Purpose

The purpose of this study was to investigate the postoperative pain and related factors of elderly patients who received abdominal surgery.

#### Target Audience

The target audiences of this presentation are clinical nurse and health care provider who involve in clinical postoperative care and whose interest is to investigate the outcome of clinical care for elderly.

#### Abstract

**Purpose:** This study was to investigate the postoperative pain of the elderly patients who received abdominal surgery and the associated factors of postoperative pain.

**Methods:** A descriptive, cross-sectional study was conducted in a medical center in northern Taiwan. Patients aged over 65 years and hospitalized in the surgical wards were eligible for inclusion. Convenience sampling method was adopted and 164 patients were enrolled. The data collection included patient basic information, clinical characteristics, treatments, the Brief Pain Inventory (Taiwan version), Pain Opioid Analgesics Belief Scale, Short Portable Mental Status Questionnaire (SPMSQ), and the dosage of analgesics. Data were assessed through descriptive analyses, independent-sample t-tests, one-way ANOVA, and Pearson correlations.

**Results:** There was about the same number of males and females included in our study with the mean age 73.08 years old. The patients had average three chronic illnesses. Most of patients were with primary level of education. The self-recognized disease severity was most frequently assessed to be moderate. The most common modality used for postoperative pain control was morphine PCA (86%). The severity of postoperative pain was reported to be mild to moderate during the postoperative 1-3 day, and declined gradually thereafter. The average pain opioid analgesics belief scale score was 21.31, which revealed a belief about the negative effect of analgesics. Self-recognized disease severity and the surgical site were the major predictive factors of postoperative pain. More severe postoperative pain was reported in the patients who were aware of higher severity ( $\beta = .23, p < .01$ ), whereas less pain was noted in the patients receiving lower gastro-intestinal surgery ( $\beta = -.25, p < .01$ ). Besides, males received higher dosage of analgesics than females during 8 to 16 hours after surgery, was also a crucial associated factor of postoperative pain ( $\beta = .29, p < .01$ ).

**Conclusion:** This study suggests that in order to optimize the management of postoperative pain for the elderly patients who receive abdominal surgery, the following factors such as the self-recognized disease severity of postoperative disease severity, surgery site, gender etc. should be assessed comprehensively. An appropriate pain control plan can be done accordingly. A pain-free postoperative care is not only for the right of human being, but also beneficial for the quality of care and patient recovery.

### Implementing Health Coaching on a Rural College Campus

---

*Cheryl Crisp, PhD, MSN, BSN, ASN, RN, PCNS-BC, CHPPN, CRRN, USA*

#### Purpose

Identify how health coaching can be integrated into the culture of a rural college campus

#### Target Audience

Nurses and educators interested in implementing health coaching in rural areas.

#### Abstract

Purpose: The purpose of this paper is to describe how health coaching can become a part of the culture of a rural college campus.

Specific Aims: Describe ways in which students who are learning to become health coaches can assist faculty, staff, and students to make desired health behavior changes.

Method: Students enrolled in the Health Coaching didactic/practicum course invited interested members of the faculty, staff, and student body to join with them in this learning experience. Students learn health coaching skills and participating members of the faculty, staff, and student body learn ways to effect positive behavior changes.

Results: Approximately 40 students and 80 members of the faculty, staff, and student body have participated in the health coaching sessions. Current information suggests that this has been a positive experience for all involved, although recruitment can be somewhat of a challenge.

Implications for practice: Using student nurses as beginning health coaches on a rural college campus provides excellent learning experience for the students, and environment for desired behavior change for faculty, staff, and students, and can be used to influence a positive culture change for all involved.

### The Alarming Prevalence of HIV/AIDS in African-Americans and Recommendations for Prevention and Treatment Based on Epidemiological Concepts

---

*Rebecca M. Gaines, BSN, MSN, RN, FNP-BC, USA*

*Yeow Chye Ng, PhD, MSN, BSN, BSE, RN, FNP-BC, NP-C, NRCME, AAHIVE, USA*

#### Purpose

The purpose of this presentation is to educate providers about the multifactorial causes of HIV/AIDS in the African American population and how the researcher may implement interventions based on epidemiological concepts to decrease this prevalence.

#### Target Audience

Nurses, health care providers, and other health care workers responsible for the daily clinical aspects of prevention and treatment modalities for this vulnerable population.

#### Abstract

African Americans make up only 12% of the United States population, but they have the highest HIV rates of all races and ethnicities, accounting for over 46% of all HIV diagnoses (CDC, 2013). HIV is the fifth leading cause of death in African American men and seventh among African American women (Kaiser Family Foundation, 2014). There are a variety of factors that result in higher rates of HIV transmissions among African Americans, including social, cultural, economic, environmental, and political causes. Traditionally, health promotion and disease prevention interventions were focused on individual patients and were not necessarily based on the broader social and cultural contexts of scientific research principles.

Identifying and targeting interventions that coincide with the needs of multiple populations such as men who have sex with men, intravenous drug users, and young people who are marginalized and discriminated against, is difficult. Stigmatized populations are often hidden and difficult to reach (UNAIDS, 2013). Therefore, approaches to reducing HIV and AIDS prevalence must be multi-faceted and multi-leveled. Current literature suggests that successful health promotion, disease prevention, and treatment efforts, including medication regimens, should be based on demographic data and epidemiological concepts such as population-level assessments of disease burden, risks, and outcomes (Dorrucchi, 2010). In order to achieve more favorable outcomes, protocols and clinical practice guidelines should be based on random control studies (RCTs) that examine patterns and the distribution of the principles of HIV/AIDS in high-risk populations and certain geographical regions locally, nationally, and globally. Furthermore, interventions should include biomedical, behavioral, and social services with a focus on quality of life.

A number of studies have examined contributing factors to the high prevalence of HIV/AIDS in African Americans, such as discrimination and stigma, homophobia, poverty and sexual relationships, unemployment, lack of access to healthcare, and the high cost of HIV/AIDS treatment. Fear of stigma and discrimination and widespread perceptions about the escalating rates of HIV/AIDS in African Americans and the misconceptions about routes of transmission are barriers that impede dialogue, create barriers to accessing key populations, and derail early preventive measures and treatment (CDC, 2013).

Incarceration can also play an integral role in discrimination and stigma. In mid-2013, African Americans accounted for more than 36% of prison inmates and 65% of prison deaths (in 2007) from AIDS-related illnesses, which provide another avenue for HIV transmission (CDC, 2012). Homosexuality is highly stigmatized in the African American community with the majority of African American churches preaching that homosexuality is a sin (McCree, Jones, & O'Leary, 2010). As a result, African American men may prefer to keep their sexuality a secret.

A cause and effect relationship oftentimes exists between poverty and sexual relationships. According to a recent article, twenty eight percent of African American families live in poverty (Avert, 2014). African Americans often live in heavily populated residential areas where high-risk sexual behavior and drug abuse is prevalent. This is known as 'residential segregation' and accounts for the high rates of HIV infections in these communities (Avert, 2014).

Unemployment is another issue that many African Americans and other minorities may encounter. In the workplace, people living with HIV/AIDS may suffer stigma in the form of social isolation or ridicule from their employers and/or co-workers or may fear discriminatory practices such as termination (CDC, 2013). Without a job or underemployment, the high costs of treatment increases the likelihood that African Americans may delay treatment until they are seriously ill. Unfortunately, unaware of their status, many have engaged in unprotected sexual acts with multiple partners by this time. Health care providers must address these missed opportunities to decrease racial disparities (CDC MMWR, 2010).

Lastly, another contributing factor to the rising prevalence of HIV/AIDS in African Americans is lack of access to healthcare. After an AIDS diagnosis, survival and death rates are higher among African Americans than other racial and ethnic groups due to poor access to health care (CDC, 2013). People who live in poverty often have state-funded insurances such as Medicaid or Medicare while others are uninsured altogether. In July 2010, the National HIV/AIDS Strategy underscored these facts in HIV treatment in the Affordable Care Act. In 2014, these changes expanded Medicaid eligibility and provided protection to people with pre-existing and chronic illnesses such as HIV/AIDS (U. S. Department of Health & Human Services, 2014).

In order to make a significant difference in the escalating rates of HIV and AIDS in African Americans, the DNP educated nurse practitioner may serve in various roles, including clinician, educator, consultant, collaborator, researcher, and legislator. In these multiple roles, the nurse practitioner can advocate for change at the local, state, national, and even global levels; appeal to community leaders, faith-based organizations, and key institutions that help mold and reinforce societal norms and values; work collaboratively with other disciplines to address the multiple factors such as stigma and discrimination, poverty, unemployment, and housing; and advocate legislatively with policymakers to pass laws that increase awareness of HIV/AIDS and pinpoint contributing factors that play an integral part in this epidemic.

### **Epidemiological Basis for Preventive Strategies**

**Primary prevention – Clinician and Educator.** The nurse practitioner should conduct individual and group screenings and prevention programs in churches and other common meeting places for African Americans.

**Secondary prevention – Consultant and Collaborator.** Health care practitioners should provide routine screenings on high-risk persons and institute the early initiation of antiretroviral therapy based on current research, including random controlled trials; conduct widespread social marketing and advertising campaigns that target churches and other heavily populated African American organizations; serve as consultants for patients and other disciplines, and conduct educational programs for peers and other community providers (Grant et al., 2010; Thigpen et al., 2011).

**Tertiary prevention – Researcher and Legislator.** Providers should remain in constant contact with health care facilities and community organizations and implement changes based on evaluations and current epidemiological research which include, but is not limited to, qualitative and quantitative population-based studies; actively participate in legislative policies, serving as an advocate, so that changes can be made locally, nationally, and globally (CDC, 2013)

## CLIN PST 2 - Clinical Poster Session 2

### Measuring and Influencing Noise on an Intensive Care Unit Using a Visual Warning System

---

Marie-Louise Luiking, RGN, MA, Netherlands

#### Purpose

The purpose of this presentation is to present the effects of a visual noise warning system on noise reduction in an intensive care unit and the contribution of unnecessary noise generated by persons to the disturbance created by noise.

#### Target Audience

The target audience of this presentation are nurse leaders and nursing managers who want to improve the hospital environment to better the patients' recuperation.

#### Abstract

**Introduction/ aim:** The experience of background noise can hamper the recovery of a patient. It can cause sleep deprivation, agitation and delirium. (Darbyshire\_ & Young 2013, Bartick et al 2010) For this reason the World Health Organisation advises to keep the mean noise level below 35 to 40 decibel. The noise level in a hospital setting is generally high and on an intensive care unit it is generally very high . On an intensive care unit, an unavoidable part of the noise is generated by the equipment, but a substantial part of the noise is produced by the people present (staff, patients and visitors). How much noise is produced by the people present depends on their awareness that they generate unnecessary noise and their willingness to change their noise generating behaviour. In this study the noise reduction was researched that could be reached when the persons present in the room were notified of the (too high) sound level. Additionally it was investigated what the nurses considered unnecessary noise.

**Method:** In a prospective study, the sound levels were measured for 3 weeks in a 4 person intensive care room of a class 3 intensive care. Subsequently a visual noise warning system was fixed to the wall on a highly visible place. Thereafter the sound levels were again measured for 4 weeks. The sound level measurements were done using a BG-5 class 2 sound level meter, which recorded the sound level every minute. This meter was fixed to the roof in the middle of the room. The visual noise warning system looked like a traffic light and displayed an amber light at 45 to 55 dB and a red light above 55 dB.

The perception of the nurses of unnecessary noise factors was investigated using the Topf's Disturbance of Hospital noise scale. (Topf, 2000) It exists of a list of 29 items each describing a particular sound. The respondent has to indicate using a 5 point Likert scale to what degree a particular sound disturbed him or her during work. The questionnaire was translated to Dutch.

**Results:** The mean sound level before the introduction of the traffic light was 54.6 dB, after the introduction it was reduced to 53.9 dB (ttest,  $p < 0.001$ ). The Topf's Disturbance of Hospital noise scale had an internal consistency (Cronbach's alpha) of 0.883. All 120 intensive care nurses were approached to complete the questionnaire, 83% of the questionnaires were returned. The 4 most disturbing noises beside alarm signals were all noises which are dependent upon the behaviour of the persons present: loud conversations in the corridors at night, mobile phone usage, conversations among nurses in the rooms and slamming of doors. The 5 least disturbing noises were all noises which are not dependent upon the behaviour of persons present: traffic noise, flushing of toilets, washing of hands, sounds created by cutlery or serving trays, airconditioning or heating.

**Conclusion:** In this study, the influence of a visual noise warning system was limited. Noise which was generated unnecessarily disturbed the nurses most. Therefore a visual noise warning system seems to contribute to noise reduction but additional interventions are necessary to effectuate a change in behaviour towards noise. The nurses are well aware of which behaviours need to change.

## CLIN PST 2 - Clinical Poster Session 2

### Fathers' Experience with Autism Spectrum Disorder (ASD)

---

Linda S. Frye, PhD, RN, CPNP, USA

#### Purpose

The purpose of this presentation is to describe the experience of fathers of children with ASD, the depression and anxiety they may experience, and their resources needed to help them actively engage in their roles as fathers of children with ASD to improve the outcome for the children and families.

#### Target Audience

The target audience of this presentation is anyone in clinical practice working with pediatric patients with developmental delays and ASD and their families, particularly fathers.

#### Abstract

**Purpose:** The purpose of this study was to describe the experience of fathers of children with autism spectrum disorder (ASD), the depression and anxiety they may experience, and their resources needed to help them actively engage in their roles as fathers of children with ASD.

**Background and Significance:** ASD is a lifelong neurological disorder that causes impairments in communication skills and social interactions, and unusual behaviors that interfere with the children's ability to function independently and interact appropriately with other people. In 2010, the prevalence was 1:68 children, a significant increase from 1:88 children in 2008. As the prevalence rate increases, the cost and negative consequences for the children and their families will also increase. Actively engaged fathers were a strong predictor of outcomes for children with developmental delays, an early sign of ASD. Actively engaged fathers also improved family cohesion, family stability, and well-being of the family. The experience of fathers of children with ASD must be understood and addressed to encourage the fathers to become actively engaged to improve the outcomes for the children and their families.

**Design:** A phenomenological case study was conducted to expand knowledge, understanding, and gain insight to improve clinical practice and outcomes for children with ASD and their families. Data collection included open ended questions about the children with ASD, the effect of ASD on the fathers', challenges they faced, reaction to the diagnosis and other people to their children, advice for other fathers of children with ASD, and their needs to meet the challenges of ASD. Data collection and analysis occurred simultaneously to identify common themes in the data. Data analysis by the primary investigator was conducted using line by line coding of each transcript using emotion and in vivo coding. Atlas.ti.7.5 software was used to organize the transcripts, quantify the codes, organize the codes into themes, maintain a codebook, and provide an audit trail. Rigor was maintained by evaluating credibility, applicability, dependability, and neutrality. Methodological and investigator triangulation was used to improve rigor.

**Findings:** All of the fathers stated this was the first time they were asked about their experience with ASD. The three major themes were family life: making adjustments, a father's needs, and grief and loss. ASD became the center of family life requiring the family to adjust and adapt to the challenges of ASD. Fathers' needs were money, teamwork, honesty/information, getting involved/taking action, and time. Fathers experienced the loss of their ideal children and dreams for the children's future. The stages of grief and loss for the fathers include denial and isolation, anger, bargaining, depression, and acceptance, similar to the classic stages of grief and loss when experiencing a death.

**Clinical Implications:** Nurses are in a unique position to serve locally to improve the lives of families and children with ASD. Nurses can proactively listening to fathers, advocating for fathers and their children, addressing their needs, providing information about beneficial interventions, including fathers in meetings and conversations about their children with ASD, and identifying ASD services and the increasing need for services for these children. Serving the children with ASD and their families on the local level can have

the same transformation regionally by increasing awareness and number of services available improving the outcomes for the children and their families. Serving locally and transforming regionally can help nurses become leaders globally to improve the quality of lives and outcomes for the families and children with ASD.

### Failure to Communicate

---

*Kelly S. Johnson, DNP, RN, USA*  
*Holly Carter, MSN, RN, FNP-BC, USA*

#### Purpose

The purpose of this presentation is to present literature that supports the use of interpreters for non-English speaking patients in health care and identify barriers and facilitators in interpreter usage.

#### Target Audience

The target audience of this presentation is health care providers in clinical settings.

#### Abstract

The use of interpreters in health care is a growing concern among providers and organizations with the increase of non-English speaking populations. A 2005-2009 American Community Survey reported that 20% of the population does not speak English as their primary language (Grover, Deakyne, Bajaj, & Roosevelt, 2012). Twelve percent of those surveyed are Spanish speaking (Grover, et al., 2012). Language barriers in health care can prevent patients from receiving care, obtaining proper follow up, and making informed decisions about their care (Grover, et al., 2012). Health care organizations have identified interpreters in health care as professionals at a facility who are fluent in another language, family members, friends, other patients, and nonprofessional staff at the facility (Schenker, Perez-Stable, Nickleach, & Karliner, 2011).

In several studies, the use of interpreters have improved patient outcomes and even decreased hospitalizations and emergency room visits (Hacker et al., 2012; Grover et al., 2011). Non-English speaking patients have a higher rate of 30-day readmissions when compared to English speaking patients (Lindholm, Hargraves, Ferguson, & Reed, 2012). In one study the time from seeing a physician to disposition was increased with use of a telephone interpreter compared to in-person interpreter usage (Grover et al., 2012).

Health care facilities have identified the cost of a full-time professional in-person interpreter as a barrier to providing interpretation to non-English speaking patients. Many facilities may even use part-time interpreters who can be called in when needed. Inconsistency among part-time interpreters can lead to errors in communication. They may omit issues pertinent to non-English speaking cultures. Likewise patients may not disclose all health care concerns needed to provide appropriate care (Lindholm et al., 2012).

With over 300 different languages spoken in the United States and over 24 million who speak little English, health care providers are faced with providing competent care to patients that includes understanding of their treatments, diagnosis, and preventive services (Lindholm et al., 2012). The patient has a right to information and it is the responsibility of health care providers to ensure every patient receives the best quality care.

### Behind Closed Curtains on Eighteen Wheels: The Risk Factors and Consequences of Intimate Partner Violence in Female Long-Haul Truck Drivers

---

Kimberly M. Bourne, MSN, BSN, RN, SANE, CEN, EMT-B, USA

#### Purpose

The purpose of this presentation is to present what is currently known about intimate partner violence as it applies to long-haul trucking and to outline the physical and psychological health outcomes of intimate partner violence in female long-haul truck drivers.

#### Target Audience

The target audience of this presentation is researchers and professional nurses who may come in contact with female long-haul truck drivers.

#### Abstract

**Background.** Intimate partner violence affects more than 1.3 million women in the United States (US) each year and 50% of all female homicides are committed by current or former intimate partners. Intimate partners are defined as a spouse or sex partner who cohabitate together. There are nearly 122,000 female long-haul truck drivers in the US who drive as part of a team with their intimate partners. Their jobs require them to be in close proximity with their intimate partners 24-hours a day for days to weeks at a time increasing the potential for intimate partner violence. Little has been published in the nursing literature about intimate partner violence in female long-haul truck drivers, the risk factors of intimate partner violence associated with female long-haul truck drivers, or the health outcomes related to intimate partner violence in female long-haul truck drivers. It is important for nurses, who are often the first to see evidence of intimate partner violence, to understand the risks and consequences of intimate partner violence within the trucking industry. **Purpose.** The purpose of this poster presentation is to present what is currently known about intimate partner violence as it applies to long-haul trucking and to outline the physical and psychological health outcomes of intimate partner violence in female long-haul truck drivers. **Method.** A literature search was conducted utilizing the key words intimate partner violence, women, and workplace in four databases: PubMed, CINAHL, PsycInfo, and MedLine. Peer-reviewed articles in English published between 1993 and 2014, with adult females were inclusion criteria. Those articles which focused on only males or medical personnel were excluded from the review. Prevalence rates, factors associated with intimate partner violence, experiences with intimate partner violence, and physical and psychological health consequences relating to intimate partner violence were abstracted for this review. **Results.** Victims who were young to middle age, had a lower socioeconomic status, had less education, and had a prior history with abuse have been identified at a higher risk for experiencing intimate partner violence. The health outcomes associated with intimate partner violence are both physical and psychological including headaches, generalized chronic pain, depression, anxiety, and post-traumatic stress disorder. **Recommendations for future research** include examining the relationship between length of time on the road and the increased risk for intimate partner violence and evaluating the relationship status between team drivers and the incident rate of intimate partner violence. In addition, comparing the similarities and differences in risk factors for female long-haul truck drivers and women in non-male dominated professions in order to develop interventions to reduce the risk of intimate partner violence in female long-haul truck drivers needs to be examined. The target audience for this presentation includes researchers and professional nurses who may come in contact with female long-haul truck drivers.

## CLIN PST 2 - Clinical Poster Session 2

### Nurses Leading the Fight Against Chronic Diseases: Are You Ready?

---

*Letha M. Joseph, MSN, RN, AGPCNP-BC, USA*

#### Purpose

The purpose of this presentation is to highlight the high prevalence and impact of non-communicable chronic diseases (NCDs) on global health and economy and nurses role in primary, secondary and tertiary levels of prevention of these diseases.

#### Target Audience

The target audience is nurses practicing in any setting, with any level of education and in any capabilities. Nurses in any role has potential to influence the global fight against chronic diseases.

#### Abstract

Chronic diseases are “diseases of long duration and slow progression” and World Health Organization (WHO) defines non communicable Chronic Diseases (NCD) as diseases, not typically caused by an infectious agent but from genetic susceptibility, lifestyle or environmental exposure. According to WHO, NCDs contribute to 60% of global deaths & 43% of disease burden and by 2020, 73% of global deaths & 60 % of global disease burden will be due to NCDs. Cardiovascular diseases, cancer, chronic obstructive pulmonary disease, and diabetes are common NCDs . There are four modifiable health risk behaviors which cause these NCDs. They are lack of physical activity, unhealthy eating, tobacco use, and excessive alcohol consumption.

Nurses have an important role in primary, secondary and tertiary levels of prevention of NCDs. Primary prevention includes addressing the risk factors, increasing awareness and motivating for life style modification by encouraging realistic & affordable healthy choices. Nurses can be change agents and work towards policy revision at government level to make healthy choices easy choices. Secondary prevention focuses on early identification of the disease. Tertiary prevention focuses on appropriate disease management. Successful management of chronic diseases occurs only when prepared, informed, and motivated patients and families, health care teams and the community work together for a common goal. Nurses have a great role in this. As the most trusted profession, patients and families accept them and discuss their concerns. Patients live with these conditions and they need to modify their lifestyle to improve the management outcome. Nurses can very well work with patients to identify a working strategy for them. In a complex health care system, patients often get overwhelmed. Care coordination is another area where nurses have an important role.

As NCDs continue to be a global concern, nurses are ready to be in forefront to make waves and lead the fight against this tsunami.

## CLIN PST 2 - Clinical Poster Session 2

### Low Parental Health Literacy: A Pediatric Nursing Concern

---

*Eileen K. Fry-Bowers, PhD, JD, RN, CPNP, USA*

#### Purpose

To provide nurses with information regarding low parental health literacy (HL) and its impact on pediatric health outcomes. Adoption of a “universal precautions” approach to health care communication will be discussed and evidence-based interventions for clear communication will be presented.

#### Target Audience

all nursing professionals who provide care to children and their families.

#### Abstract

**Purpose:** The purpose of this presentation is to provide the pediatric nurse with information regarding low parental health literacy (HL) and its impact on pediatric health outcomes. Clinical assessment of HL versus adoption of a “universal precautions” approach to health care communication will be discussed. Evidence-based interventions for clear communication to parents at risk for low HL will be presented.

**Background:** Health literacy (HL), which comprises numerous skills beyond those of reading and writing, including speaking, listening, and numeracy, allows individuals to obtain, process, and understand basic health information and services needed for making appropriate health decisions. Nearly half of all adult Americans possess low levels of HL. Limited HL appears to profoundly affect a myriad of health indicators.

Given the reciprocal nature of health communication, patient-nurse interactions play an important role in care, particularly among patients with low literacy. Nursing knowledge regarding the prevalence of and patient characteristics associated with low HL may influence these interactions. Lack of knowledge among nurses regarding issues related to parental HL can alter communication and hinder benefits expected from medical care.

Despite expanding research on HL and health outcomes in adult populations, few studies have assessed the relationship between parental, caregiver or child literacy and pediatric health outcomes, or the association between patient/parent-provider communication and health outcomes, among patients/parents with limited HL. Given nursing's role in direct patient care and its responsibility in the delivery and management of health services, nurses must gain an improved understanding of this phenomenon and those interventions which mitigate the negative impact of low HL, particularly among parents and caregivers.

All patients/parents, not only those with limited HL, will benefit from interventions which improve health care communication, offer clear and unambiguous instructions, and simplify use of services—all of which play a substantial role in improving the safety and quality of health care.

**Practice Implications:** Nurses caring for pediatric patients and their families must enhance those skill sets that are most useful for communicating appropriately with parents of low education or socio-economic status, those at risk for low HL, and those for whom English is not their first language. Evidence-based techniques that improve interactive communication skills include using plain language, sitting down to achieve eye-level with a parent, breaking information into sentences, using visual models and pictures when possible, and promoting a safe environment where parents can ask questions are simple steps that will foster self-efficacy, improve communication, and support cultural expectations. In addition, a Health Literacy Universal Precautions Toolkit (United States Department for Health and Human Services, Agency for Healthcare Research and Quality, 2013) can be used by

pediatric primary care practices and health systems to design and implement strategies to minimize the impacts of low HL and support the delivery of culturally and linguistically sensitive pediatric health care.

### Autonomic Dysreflexia: An Update, How Serious Is It?

---

*Julius H. Penning, MSN/ED, RN, CRRN, USA*

*Lavonya L. McAlister, BSN, RN, USA*

*Sandra Iwunze, BSN, RN, USA*

#### Purpose

to increase knowledge for medical staff to identify and treat autonomic dysreflexia (AD) to maintain the health and well-being of spinal cord injury (SCI) individuals susceptible to life threatening even.

#### Target Audience

Medical professionals who will provide care for SCI individuals who are at risk for AD.

#### Abstract

Autonomic Dysreflexia (AD) is a medical emergency for individuals who have sustained a spinal cord injury (SCI) at or above the thoracic sixth vertebrae (T-6), which can cause complications with seizures, stroke, cardiac complications or death if not treated. The general public, family physicians, non-rehabilitation hospitals, Emergency Departments and rehabilitation hospitals for spinal cord injury play a crucial role in maintaining the health care and well-being for SCI individuals. Male-to-female ratio for SCI is 4:1; however AD is not sexually predetermined. SCI complete injuries (no motor or sensation) have a higher risk for experiencing AD, 91% vs 27% for incomplete SCI. Although motor vehicle crashes are still the most common cause of SCI, an alarming rate of falls in the elderly (individuals over the age of 60) over the past three decades by far are the fastest growing age group of individuals sustaining spinal cord injuries. Cervical injuries are greater than 56.5%. Individuals are presenting with cervical stenosis and often require rehabilitation for a SCI due to injury to the spinal cord. Increasing knowledge for individuals at risk with a SCI at or above T-6, medical staff, family members, care providers and the general public is critical to maintaining the health and well-being of individuals who are at risk for AD.

## CLIN PST 2 - Clinical Poster Session 2

### Near Misses in Health Care: Nurses Perceptions and Experiences Associated with Omissions, Commissions, Scheduling Misperceptions and Complications with Adherence through the Investigation of Power Distance and Recovery

---

Luanne Ruth Linnard-Palmer, BSN, MSN, EdD, USA

#### Purpose

The purpose of the study was to understand nurse's perception of errors, recovery processes, the concept of power distance and poor communication that have led to the near-miss incidents.

#### Target Audience

Practicing nurses, from novice to expert, who are concerned with the on-going dilemma of medical and medication errors; actual or near misses.

#### Abstract

Medication errors continue to be a major problem (IOM, 1996). Research investigating what factors contribute to medication errors continues in an attempt to reduce the incidence and save lives. A near miss is an incident that could potentially cause harm, but didn't. Little is known about near misses and research is needed. Nurses' perceptions, what led up to the incident, and how they went about correcting these incidents (recovery) provide great insights to understanding what near misses are. In nursing, one variable that relates to errors and near misses is the concept of power distance (Hofstede, 1980) and how it affects communication between nurses, colleagues and families. Power distance is based on the premise that inequality exist between individuals and this perception of power may contribute to errors, near misses, poor adherence and poor compliance with medications. Poor communication is directly linked to medication errors and near misses (Henneman, 2010).

**Objectives:** The aim of the study was to understand nurse's perception of errors, recovery processes, the concept of power distance and poor communication that have led to the near-miss incidents.

**Methods:** A survey was either taken online, or filled out by a total of 87 registered nurses and students.

**Results:** Analysis of the descriptive data is in progress and the results will be shared at the conference via the presentation.

**Conclusion** Nurses' experiences with near misses, recovery and power distance contribute to defining what a near miss is, recovery, prevention and ultimately improve communication and patient's safety.

### Critical Care Nurses' Pain Assessment and Management: A Survey in Taipei

---

*Ying-Shan Chen, MS, RN, Taiwan*  
*Tzu-Ying Wu, MPH, MS, BS, RN, Taiwan*  
*Hui-Tzu Yeh, MSN, RN, Taiwan*  
*Li-Chuan Kao, BSN, RN, Taiwan*  
*Yuan-Mei Liao, PhD, RN, Taiwan*

#### Purpose

The aims of this study were to (1) investigate critical care nurses' pain assessment/management practices for critically ill patients, and (2) understand enablers and barriers related to critical care nurses' pain assessment/ management practices.

#### Target Audience

The target audience of this presentation is healthcare providers, clinical professionals from varied areas who are interested in the healthcare for critically ill patients.

#### Abstract

**Purpose:** Pain is a common problem among critically ill patients in intensive care units. Critical care nurses employed at intensive care units play an important role on pain assessment/management for critically ill patients. The aims of this study were to (1) investigate critical care nurses' pain assessment/management practices for critically ill patients, (2) understand enablers and barriers related to critical care nurses' pain assessment/ management practices, and (3) explore associated factors of critical care nurses' frequent utilization of pain assessment tools among non-communicative critically ill patients.

**Methods:** This study was a cross-sectional, descriptive, correlational study. In total, 381 critical care nurses who were full-time employed at intensive care units in Taipei area were recruited. A structured questionnaire was used to collect related information. The Chinese scale developed to assess pain assessment/management practice comprises 29 items. SPSS 19.0 software was used to analyze collected information. Statistical significance was established at  $p < .05$ . Descriptive statistics was used to demonstrate critical care nurses' individual characteristics, pain assessment/management practice for critically ill patients, and enablers/barriers related to critical care nurses' practices of pain assessment/management. Logistic regression was used to examine associated factors of frequent utilization of pain assessment tools for non-communicative critically ill patients. For the final model of logistic regression, estimated odds ratios and associated 95% confidence intervals of frequent utilization of pain assessment tools for each independent variable were obtained.

**Results:** Of the 381 critical care nurses, the majority were female ( $n = 366, 96.1\%$ ), had bachelor degrees ( $n = 276, 72.4\%$ ), and had received intensive care training ( $n = 310, 81.4\%$ ). For communicative critically ill patients, the majority of critical care nurses ( $n = 370, 97.1\%$ ) reported that they would use pain assessment tools, and considered patients themselves could provide the most accurate pain assessment ( $n = 297, 78.0\%$ ). The majority of critical care nurses ( $n = 328, 86.1\%$ ) reported that they would use pain assessment tools for non-communicative critically ill patients, and considered nurses as the persons who could provide the most accurate pain assessment ( $n = 252, 66.1\%$ ). A small portion of the critical care nurses did not use pain assessment tools for non-communicative critically ill patients ( $n = 50, 13.1\%$ ), and indicated that frequent assessing/recording pain was slightly important or not important at all ( $n = 40, 10.5\%$ ). The critical care nurses reported that availability of standardized pain assessment tools ( $n = 262, 68.7\%$ ) and pain management guidelines ( $n = 251, 65.8\%$ ) at working settings, and physicians' prescriptions of sufficient analgesic dosage ( $n = 252, 66.1\%$ ) were the enablers of their pain assessment/management practices. The barriers of their pain assessment/management practices were taking care of non-communicable patients ( $n = 203, 53.2\%$ ), taking care of patients with unstable conditions ( $n = 196, 51.4\%$ ) (e.g., hemodynamic instability), and working load ( $n = 195, 51.1\%$ ). Factors

associated with critical care nurses' frequent utilization of pain assessment tools among non-communicative critically ill patients were hospital type, working unit, and availability of pain assessment tools. Critical care nurses employed at the Joint Commission International (JCI) accredited hospitals (OR=5.51, 95% CI 2.93-10.34,  $p < .001$ ), the units with patients receiving surgical treatments (OR=2.49, 95% CI 1.52-4.06,  $p < .001$ ), or the institutions implementing pain assessment tools for non-communicative patients (OR=3.35, 95% CI 1.55-7.24,  $p < .01$ ) were more likely to frequently utilize pain assessment tools than those employed at the hospitals without JCI accreditation approvals, the units without patients receiving surgical treatments, or the institutions without implementing pain assessment tools for non-communicative patients.

**Conclusion:** Pain is a major stressor for critically ill patients. Our study findings could be applied to the following areas: clinical practice, education, and research. Implementing standardized pain assessment tools and pain management guidelines at healthcare institutions is suggested to improve healthcare providers' pain assessment/management practices for critically ill patients. Delivering education or training related to pain assessment/management for critically ill patients at healthcare institutions or medical education institutions is recommended to improve healthcare providers' capabilities of performing pain assessment/ management for this specific population. The Chinese scale developed to assess healthcare providers' pain assessment/management practices for critically ill patients could be used in education settings or future research to examine healthcare providers' pain assessment/management practices and effects of related education interventions.

## CLIN PST 2 - Clinical Poster Session 2

### The Perceptions of Learners on the School Nutrition Programme in Msukaliwa Sub District Mpumalanga

---

*Mmapheko Doriccah Peu, PhD, MCur, BCur (Hons), BCur, RN, RM, RNM, RNE, FANSA, South Africa*

#### Purpose

The purpose of this presentation is to explore and describe the perceptions of learners on the School Nutrition Programme in Msukaliwa, Mpumalanga.

#### Target Audience

The target audience of this presentation is academics, clinical practitioners, educators and administrators

#### Abstract

**OBJECTIVE:** The objective of the study was to explore and describe the perceptions of learners on the School Nutrition Programme in Msukaliwa, Mpumalanga.

**METHOD:** The qualitative approach was used to conduct the study. The data was collected by means of focus group interviews and field notes. The data was tape-recorded and transcribed verbatim. The learners on the School Nutrition Programme were purposely selected based on the knowledge regarding school nutrition.

**SETTING:** The interviews were conducted at the school, which was the familiar environment.

**FINDINGS:** The data was analysed according to the Tesch method whereby a series of steps were followed. The categories, subcategories and themes were identified. The categories that form the basis of the discussion were: the effects of nutrition on learners, quality of food, preparation and taste, lack of resources, problems experienced and learners' preferences.

The effect of nutrition on learners was identified as the first category. The learners had difficulty in concentrating and learning due to hunger. They needed breakfast because some learners come to school hungry and it became difficult for them to concentrate and learn on an empty stomach. After food consumption they became productive, alert and not tired in class. An intake of starchy food and glucose kept them active and they were able to cope with their studies.

Learners had their preferences, preferring to eat meat rather than soya mince and vegetables to be added. Depending on the weather the juice or tea was added.

**Recommendation:** It was recommended that learners be involved when planning the menu for the School Nutrition Programme, to know learners' food preferences and to avoid food wastage.

**Conclusion:** The School Nutrition Programme is important in alleviating hunger and motivating learners to come to school in order to learn.

## CLIN PST 2 - Clinical Poster Session 2

### Integrated Nursing Program Improves Symptom Distress, Depression, and Heart Rate Variability in Patients with Heart Failure

---

Hui Ling Hsieh, MSN, RN, Taiwan  
Chi-Wen Kao, PhD, RN, Taiwan

#### Purpose

The purpose of this presentation is to report the findings of the effects of an integrated nursing program on improving symptom distress, depression, and heart rate variability in patients with heart failure.

#### Target Audience

The target audience of this presentation is clinical nurses, nursing educators, and nursing administrators.

#### Abstract

**Background:** Physical symptoms of heart failure impair patients' functional capacity and affect their psychosocial well-being. A common comorbidity in heart failure patients is depression. Depression may contribute to a poor prognosis for patients with heart failure. In fact, depression is related to increased morbidity and mortality in patients with heart failure.

**Purpose:** The aim of this study was to examine the effect of a "Integrated Nursing Program" on symptom distress, depression and heart rate variability (HRV) in patients with heart failure.

**Methods:** Total of 78 heart failure patients participated in this longitudinal experimental study. The subjects in experimental group (n= 36) received the "Integrated Nursing Program", and subjects in control group (n= 42) received routine care. Data were collected at four times: baseline, and one time per month for three months. The Beck Depression Inventory-II was used to measure the depressive symptoms. The Generalized Estimating Equation (GEE) was used to analyze the effect of the "Integrated Nursing Program" on symptom distress, depression, and heart rate variability.

**Results:** The majority of subjects were male (58.5%), with New York Heart Association class II (75.6%), a mean age  $71.04 \pm 11.01$  years, and left ventricular ejection fraction  $51.80 \pm 11.13\%$ . The patients receiving the "Integrated Nursing Program" have a significant decrease in the symptom distress ( $\chi^2= 4.792$ ,  $p= .029$ ), and depressive symptom ( $\chi^2= 3.668$ ,  $p= .05$ ), compared to the patients without obtaining this program. Even though the heart rate variability was not significantly increased in experimental group patients when compared with the control group patients, there was an improvement trend in heart rate variability.

**Conclude:** The "Integrated Nursing Program" is able to decrease the symptom distress and depression, and improve the heart rate variability in patients with heart failure. The clinicians may use this program to instruct heart failure patients how to deal with their symptoms and self-care.

## CLIN PST 2 - Clinical Poster Session 2

### A Staffing Matrix for Support of Alternate Care Sites

---

*Jean M. Roberts, MSN, RN, PHN, CNL, USA*

#### Purpose

The purpose of this presentation is to demonstrate a staffing matrix based on Hospital Incident Command System (HICS) job positions selected to support medical staffing of an alternate care site. This matrix was developed to address a gap identified in disaster response.

#### Target Audience

The target audience for this presentation is healthcare professionals involved in disaster response in hospital and public health settings

#### Abstract

One approach proposed to fulfill the need for additional hospital beds during emergency and disaster situations has been establishment of alternate care sites. An alternate care site (ACS) is defined by the State of California as a location typically not intended for provision of medical services that can be quickly converted to enable provision of care after a declared emergency. CDPH specifies that the need for and authorization to open an ACS are designated by local government, usually as a function of emergency management or public health departments, and that an ACS is not an extension of an existing healthcare facility. An ACS might include mobile field hospitals, schools, hospitals that were closed previously ("shuttered"), an arena, or any other building capable of housing multiple individuals and meeting basic requirements for health and safety.

Kern County, California, with a population of about 856,000 and approximately 1,500 hospital beds, is at significant risk for inability to care for the medical needs of its residents in the face of a disaster or an emergency. Recognizing the need for alternatives to manage hospital surge, the local public health department, the state, and federal officials collaborated with community partners to identify and contract with sites where emergency medical facilities can be established to help deliver medical care in a catastrophe.

This project was developed to address this gap in disaster response involving staffing of alternate care sites. A tool was developed based on Hospital Incident Command System (HICS) job positions selected to support medical staffing at an alternate care site. These job descriptions were coupled with mandatory and recommended training to create a matrix intended to support staffing efforts should establishment of an alternate care site become necessary. Most of the training is available online, with additional courses that may be offered by states, locally, or the federal government. The matrix also can serve as guidance for training efforts directed toward staff or volunteers. The matrix is completed with a sheet for recording of individual contact information and training completed. This combination allows emergency planners to identify individuals with the training and experience required to fill critical positions in support of alternate care sites. The matrix supports the training of healthcare providers, governmental entities, volunteer groups, and others who would be expected to participate in emergency activation.

The project in establishing an ACS program follows a quality improvement approach modeled on the National Response Framework, the Homeland Security Exercise and Evaluation Program (HSEEP), and Plan-Do-Study-Act (PDSA) and is grounded in complexity theory. Sustainability and maintenance of the developed program is based on ongoing feedback from additional and current ACS partners. Details of the program components are included as part of an annex emergency plan document explaining the full life cycle of an ACS, updated regularly based on receipt of evidence-based innovations that have proven successful and are evaluated periodically for compatibility with other emergency plans.

### Culture and Marriage: The Dual Barriers to Condom Use among Health Care Providers in Tshwane, South Africa

---

*Sanah Mataboge, BCur, MCur, DCur, RN, South Africa*

#### Purpose

to communicate similar barriers the health care providers experience regarding condom use as being in the forefront for HIV and AIDS prevention and condom promotion

#### Target Audience

reproductive health promoters, HIV and AIDS health care providers

#### Abstract

The use of condom will provide men and women 100% protection against HIV and AIDS infection. However, the acceptability of condom use in sexual relations including marriage is confronted with culturally entrenched barriers. Health care providers as being socialised within the communities with specific cultures also experience barriers regarding condom use.

The purpose of the study was to explore and describe culture and marriage as barriers regarding condom use among health care providers in Tshwane.

A qualitative, focused ethnography design was used. Data collection was through semi-structured interviews using three research questions. The population included health care providers who were responsible for provision of HIV and AIDS programmes in selected health care settings in Tshwane. Purposive sampling was used and ethical principles were upheld. Trustworthiness was ensured.

Results indicated that irrespective of health care providers being knowledgeable on condom use, when faced with condom use in their sexual relationships they are confronted by culturally entrenched barriers. Marriage becomes a barrier for condom use as it is culturally embedded. Norms and values determining men and women's behaviour in a relationship stipulate that men are decision makers. As such, health care providers' sexual partners refuse to use condoms.

It is recommended that culturally sensitive programmes be developed and health care providers receive appropriate training to address culture and marriage as barriers regarding condom use in their sexual relationships.

Key words: health care providers, condom use, barriers, culture and marriage.

## CLIN PST 2 - Clinical Poster Session 2

### Progressive Clinical Performance Evaluation Tools Incorporating the QSEN Competencies

---

*Amanda Eymard, DNS, PMHNP, MSN, BSN, RN, CNE, USA*

#### Purpose

The purpose of this presentation is discuss suggestions regarding implementing clinical evaluation tools, faculty and administration experiences with implementing the tools, and many benefits of implementing the tools. Nursing programs can enhance evaluation of students' clinical performance by incorporating the newly developed clinical performance evaluation tools.

#### Target Audience

The target audience of this presentation is undergraduate nursing faculty as well as possibly graduate faculty who are interested in improving evaluation strategies in the clinical setting while also incorporating the QSEN competencies.

#### Abstract

Members of the baccalaureate research and evaluation committee developed a set of Clinical Performance Evaluation Tools incorporating the knowledge, skills, and attitudes for each of the Quality and Safety Education in Nursing (QSEN) competencies. Eight course/level specific tools were developed demonstrating progression throughout the program. Remediation strategies for each course were addressed with a separate tool, the Clinical Performance Remediation (CPR) Tool. Walsh (2010) and University of Portland (2011) shared clinical evaluation information and contributed to the development of the tools. Input from faculty representing all levels within the program was also welcomed and considered. In addition to incorporating the QSEN competencies, the faculty felt strongly about including a professionalism section within the tools. This presentation describes the process and outcome for creating an evaluation tool that blended an effective combination of QSEN's core competencies, the BSN Essentials, and the baccalaureate program's conceptual model.

The tools were piloted spring of 2012 and have been in use since this time. This presentation will discuss suggestions regarding implementing the tools, faculty and administration experiences with implementing the tools, and many benefits of implementing the tools. Nursing programs can enhance evaluation of students' clinical performance by incorporating the newly developed clinical performance evaluation tools. The tools are available on the QSEN web site for use by other nursing faculty interested in incorporating the QSEN competencies into their clinical evaluation process.

## CLIN PST 2 - Clinical Poster Session 2

### Care Needs and its Related Factors of Primary Caregivers for Patients Waiting for Brain Tumor Surgery

---

*Yu-Shin Cheng, MSN, RN, Taiwan*  
*Hsing-Mei Chen, PhD, RN, Taiwan*  
*Ann-Shung Lieu, PhD, MD, Taiwan*

#### Purpose

The purpose of this presentation is to discuss the caring needs of the primary caregivers and the respective factors .

#### Target Audience

The target audience of this presentation is to provide references to future researches regarding clinical care and nursing education.

#### Abstract

Brain tumors may result in patients with different clinical manifestations, including headaches, mental and memory loss, personality changes, blurred vision, unsteady gait, and limb paralysis. Even after receiving treatments, the patient may remain some sequelae such as, paralysis, incontinence, language barriers, and cognitive function, affecting their daily living skills and may require help from caregivers 24 hours a day. The primary caregivers play a very important role on reduced readmissions, medical expenses, and infection prevention and monitor of the patients. They often need to learn how to take care of the patient, generating a lot of care needs, but their care needs are often ignored or may not be met. Therefore, the purpose of this study was to explore the care needs and its related factors of the primary caregivers for patients with brain tumor.

A correlational descriptive research design was used and 80 caregivers completed the questionnaires in a neurological unit of a medical center located in Southern Taiwan. Instruments included the Karnofsky Performance Scale, Hospital Anxiety and Depression Scales, and Supportive Care Needs Survey-Partners & Caregivers 45 (SCNS-P&C 45). Data were collected from March 2013 to May 2014.

The results showed that two subscales of the SCNS-P&C 45, Information Needs and Health Care Service Needs, received the highest scores among the SCNS-P & C 45. Pearson correlation analyses showed that higher anxiety ( $r = .37, p < .01$ ) and higher depression ( $r = .31, p < .05$ ) were correlated with greater level of care needs. The multiple linear regression analysis revealed that anxiety was the only significant predictor of care needs in primary caregivers of patients with brain tumor ( $R^2 = 12.8\%$ ).

This study findings support that the primary caregivers of patients with brain tumor experience great level of care needs, especially for the information needs and healthcare service needs. Therefore, healthcare providers should always evaluate the caregivers' care needs and emotional states, so that appropriate and adequate medical information and services could be provided on time, and in turn avoid any events that will cause or exacerbate their anxiety and depression states. This study can provide references for healthcare providers to future researches, clinical care, and nursing education regarding this important issue.

## CLIN PST 2 - Clinical Poster Session 2

### The Use of the TyMed™ Wheel in Postoperative Pediatric Pain Management at Home

---

*Celeste Rene Knoff, MAN, MBA, BS, RN, CRRN, USA*

#### Purpose

The purpose of this presentation is to describe the TyMed™ Wheel and its creation, development, study, and use in managing pain, minimizing side effects, and tapering opioid and benzodiazepine medications in postoperative pediatric patients at home.

#### Target Audience

The target audience of this presentation is clinicians who work with patients and families managing pharmacological pain management at home. This would apply to almost any inpatient or outpatient surgical setting as well as other facilities that treat acute pain.

#### Abstract

The treatment of postoperative pediatric pain has historically been suboptimal (Avansino, Peters, Stockfish, & Walco, 2013; MacLaren Chorney, Twycross, Mifflin, & Archibald, 2014; Rony, Fortier, Chorney, Perret, & Kain, 2010; Sutters et al., 2012; Vadivelu, Mitra, & Narayan, 2010). Reasons for this deficiency are many and include personal biases of clinicians and parents, inconsistencies and difficulties in pain assessments, obstacles to educating caregivers on pain management, and a lack of research on best practices for pediatric pain management. Reduced hospital stays and increased outpatient procedures are shifting the onus of pain management for children to their primary caregiver, usually a parent.

Teaching parents how to provide safe and effective pain management is a priority in the care of postoperative children at home (MacLaren Chorney, 2014), especially after complex orthopedic surgeries. The protocol for pain management after these surgeries includes opioids and benzodiazepines and the potential for underuse, misuse, and adverse drug events presents a particular challenge for parents and potential safety issues for children. Educating parents in the safe, effective use of pain medications, the reduction of medication side effects, and the appropriate tapering of the medications is paramount. This education is complex and multifaceted. Best practices for patient education have yet to be refined and the needs of this group of learners are extensive (MacLaren Chorney, 2014).

It is not enough to teach on just the cognitive level. Psychosocial, cultural, and environmental factors impact both the learning and the perceived need for managing children's postoperative pain management at home. Educating caregivers on this important task requires a learning device that addresses these barriers and provides a simple guide for medication management. Such a learning device was created and designed for the purpose of assisting parents in the timing, the dosing, and, ultimately, the elimination of opioid and antispasmodic medications for their children at home. This tool is called the TyMed™ Wheel.

The TyMed™ Wheel is a simple device that looks like the face of a 24-hour clock. There are four, moveable, colored arrows on the device that represent 4, 5, 6 and 8 hour increments. Using the TyMed™ Wheel, parents time the next dose of their child's pain medication. As they continue around the wheel, they can also plan subsequent doses of the medications for 24 hours. Using the accompanying medication worksheet, parents record the times of medication administrations, pain assessments, and any significant side effects. This record assists parents in creating a tangible, visible plan for daily management of the child's pain. It also helps minimize potential problems such as overmedication, duplicate dosing, missed doses, and overlooked side effects.

The TyMed™ Wheel was developed and evaluated over a three-year period during two pilot studies. Both studies were reviewed by an Institutional Review Board and deemed exempt. The first

study focused on tool design and usability, using input from 13 nurses and 18 parents. All nurses and parents completed an interview after a demonstration of the TyMed™ Wheel. All participants expressed an understanding of the wheel and over 90% of the parents indicated an expectation of its use at home. Both groups provided insight that added clarity to the design and use of the wheel and the medication worksheet.

The second study evaluated parental understanding and subsequent home use of the TyMed™ Wheel. The target population was children who had undergone a complicated orthopedic surgical procedure and were discharged on a complex pain management protocol that consisted of four oral medications: oxycodone (every 4 hours), valium (every 4 to 6 hours), Tylenol (every 4 hours but not more than 5 doses in 24 hours), and vistaril (every 6 hours). All inpatient orthopedic nurses were instructed on the use of the wheel by demonstration and received a written guide. These inpatient nurses taught 25 families how to use of the TyMed™ Wheel prior to discharge. Families were given the wheel and ten medication worksheets for home management of their child's prescribed pain medications. Parental understanding of the TyMed™ Wheel was evaluated using a ten question written survey completed by parents after the discharge teaching by the inpatient nurse. Parental use of the wheel at home was evaluated using a structured follow-up call to each family 14-21 days post-discharge.

Most families (n=23) completed the ten question parental understanding survey. These families indicated a quick understanding of the purpose and use of the wheel. Most expected to use the wheel at home and anticipated it would be useful. Eighteen families completed the post-discharge follow-up call. These families showed some mixed responses. While some families used the wheel in conjunction with the medication worksheet, many preferred to use only the wheel or the worksheet. Regardless of the tool used, the majority of families indicated that by using one or both of the tools, their child had good pain management and none identified any significant side effects. The majority of respondents planned to keep their wheels and use them for other types of pharmacological administration.

Inadequate treatment of pain contributes to higher rates of complications, lower quality of life, and has significant financial consequences for individuals and society (Zhang et al., 2008). A study conducted by Rony et al. (2010) reported that parents gave subtherapeutic analgesic doses 70% of the time at home and 58.8% of the children received less than the recommended daily dose of pain medication. Because this problem is so pervasive, it must be addressed. Pain can lead to multiple physical and psychological complications. The TyMed™ Wheel was created to provide parents with a tool to maximize the safe administration of complex pain protocols while minimizing pain medication side effects and complications. This tool can be particularly useful when there are multiple caregivers such as two parents or grandparents. Once a plan is established for the day, all caregivers can easily follow it. The TyMed™ Wheel can also be useful when increasing the times between doses as patients begin to taper off their medications. By using a different colored arrow for the next dose timing, parents are reminded to decrease their child's medication once their child's symptoms warrant it.

Our findings suggest that the TyMed™ Wheel effectively assists parents in providing optimal, safe pain medication management at home. Full implementation of the TyMed™ Wheel in the inpatient and same day surgery departments is planned for 2015.

## CLIN PST 2 - Clinical Poster Session 2

### The Effect of Multimedia Symptom Management Program on Coping Strategies and Quality of Life in Patients with Heart Failure

---

*Chi-Wen Kao, PhD, RN, Taiwan*

#### Purpose

The purpose of this presentation is to report the findings of the experimental study on the effect of multimedia symptom management program on coping strategies and quality of life in patients with heart failure.

#### Target Audience

The target audience of this presentation is clinical nurses, nursing educators, and nursing administrators.

#### Abstract

**Background:** The incidence of heart failure is increasing in recent twenty years. Most of patients with clinical symptoms delay the best timing for treatment due to lack of coping capability. Despite many domestic researches focus on the clinical issues of heart failure patients, there was no study to investigate the effect of multimedia symptom management program on improvement of coping strategies in patients with heart failure, and increasing quality of life in patients with heart failure.

**Purpose:** This study aims to examine the effect of multimedia symptom management program on improving coping strategies and quality of life in patients with heart failure.

**Methods:** Total 78 subjects were enrolled from a cardiovascular out-patient department in a medical center. The 36 subjects were randomly assigned to the experimental group (EG) and 42 subjects to the control group(CG). The subjects in the experimental group received multimedia symptom management program in symptom management, while the subject in the control group received traditional nursing instruction. The subjects were evaluated once a month for four times. The instruments included Brief-COPE and Minnesota Living with Heart Failure Questionnaire (MLHFQ). The Generalized estimating Equation (GEE) was used to analyze the effect of this multimedia symptom management program.

**Results:** Total of 78 heart failure patients participated in this longitudinal experimental study. There were statistically significant more problem oriented coping strategies ( $p < .001$ ) and less emotional oriented coping strategies ( $p < .001$ ) performed in the experimental group, compared with the patients in control group.(2) There was statistically significant greater improvement on quality of life in the experimental group compared with control group ( $p < .001$ ).

**Conclusions:** The multimedia symptom management program may help heart failure patient more frequently use the problem oriented coping strategies to deal with their symptoms, and then improve their life quality. Clinical professionals can provide this program to heart failure patients to improve patient's outcomes and the clinical care quality.

### Nursing Grand Rounds for Patient Teaching: An Innovative Clinical Education Strategy

---

Margie A. Hull, MEd, MSN, ACNS-BC, CDE, RN, USA  
Jennifer L. Kitchens, MSN, BSN, RN, ACNS-BC, CVRN, USA

#### Purpose

The purpose is to implement and evaluate nursing grand rounds as an innovative clinical education strategy to strengthen nurses' ability to teach patients who have been diagnosed with Diabetes/Heart Failure.

#### Target Audience

The target audience is bedside nurses or other nurses responsible for patient teaching about Diabetes/Heart Failure.

#### Abstract

**Purpose:** To implement and evaluate nursing grand rounds as an innovative clinical education strategy to strengthen nurses' ability to teach patients with Diabetes/Heart Failure.

**Background:** In the nursing literature, the effectiveness, processes and outcomes of nursing grand rounds has received minimal attention. Grand rounds is one strategy to address clinical education needs.

**Description:** The nursing grand rounds for patient teaching was implemented by: prioritizing and integrating topics; developing an evidence-based presentation; coordinating the nursing contact hour process; designing handouts; advertising; acquiring media technology; cultivating a learning environment; engaging participation; analyzing evaluation data; and disseminating findings. Objectives were: describe the key principles of adult learning; list key patient teaching points for patients with diabetes and/or heart failure; assess teaching effectiveness by the Teach Back method and patients' abilities to repeat at least two main teaching points. The effectiveness of the nursing grand rounds as an effective clinical education strategy was evaluated for: meeting program objectives; method effectiveness; and presenter effectiveness. A 4-point Likert scale was used with 1= strongly disagree; 4= strongly agree (higher scores equaling a more positive evaluation).

**Outcome:** There were 3 duplicate nursing grand rounds sessions offered at various times/locations (0.5 nursing contact hour each). Attendance was 46 nurses. The mean evaluation scores were positive: meeting program objectives 3.63; methods effectiveness 3.63; presenter effectiveness 3.69.

**Interpretation:** Results indicate that nursing grand rounds for patient teaching was an effective clinical education strategy to address learning needs of nurses about patient teaching. Additional grand rounds programs should be held in the future using a similar approach.

**Implications:** Future evaluation of nursing grand rounds programs should include items to assess: application of knowledge into clinical practice; contribution to collegiality; and impact on professional growth and preference for grand rounds versus online offerings.

### Nurse Residency and Interprofessional Collaboration: Inspiring Novice Nurses in Professional Development

---

*Kimberley Ann Bertha, MSN, RN, RNC-NIC, RN-BC, USA*

*Lya Michele Stroupe, DNP, MSN, BSN, RN, CPNP, USA*

#### Purpose

The purpose of this presentation is to increase awareness among attendees how a program of shadowing interprofessional disciplines impacts new graduate nurses' perceptions of how all disciplines and departments work together to improve patient care.

#### Target Audience

The target of this presentation are educators in schools of nursing and acute care settings that are interested in exploring new avenues to enhance professional development of nursing students and new graduate nurses.

#### Abstract

Nurse Residency Programs promote nursing professional development through interprofessional collaboration shadowing experiences. Interprofessional collaboration requires a deliberate commitment by each profession to create an experience that focuses on improving patient care and quality outcomes. Utilizing current evidence based research related to interprofessional collaboration and its effect on the quality of nursing care, the Nurse Residency Program at this 531 bed tertiary care Magnet facility partners with nine departments to provide 88 nurse residents with eight hours of collaboration/shadowing experiences. Our partners in practice include Pain Management Practitioners, Respiratory Services, Rehabilitation Services, Diabetes Education Center, Adult and Pediatric Palliative Care, Tray Line and Room Service, House Supervisors, Pharmacy, and Wound Care. A total of 519 collaboration experiences are provided with each individual experience evaluated by the nurse resident. Each experience is evaluated on overall experience and relevance to future nursing practice. The collaboration/shadowing experiences provide an opportunity for the nurse resident to observe how departments work together to impact quality patient care and increase patient satisfaction. The overall goal of the experience is to create an increased awareness among new nurses regarding how all disciplines and departments work together to improve patient care. Residents take valuable knowledge with them from each experience so that they can also grow in their own professional development.

### Patients' Coping Process of Having Acute Myocardial Infraction Attack and Receiving Urgent Percutaneous Coronary Interventions (PCIs): A Grounded Theory Study

---

*Shu-Fen Su, PhD, MSc, RN, Taiwan*  
*Ya-Wen Lin, MSc, RN, Taiwan*  
*Chiung-Fen Shih, MSc, RN, Taiwan*

#### Purpose

The purpose of this presentation is to explore coping process of AMI patients underwent emergent percutaneous coronary interventions(PCIs)

#### Target Audience

The target audience of this presentation is for clinical nurses and nursing academic.

#### Abstract

**Background:** Cardiovascular diseases represent the second cause of death in Taiwan, resulting in annually 4,000 to 5,000 people die by AMI. However, limited studies focus on investigating AMI patients' coping process of PCIs.

**Objective:** This study explored coping process of AMI patients underwent emergent PCIs.

**Methods:** A total of 29 AMI patients receiving emergent PCIs were recruited from 2 hospitals in Taiwan and participated in the semi-structured interviews. Data were analysed through a multi-step synthesized grounded theory analysis developed by the researchers. Methods of asking questions, reviewing references, constant comparison, and theoretical sampling were utilised throughout the data collection process for achieving theoretical saturation and research integrity.

**Results:** Hypertension, diabetes mellitus, hyperlipidemia, hardworking, huge stress, no exercise, poor life style, were the high risks to induce AMI. When AMI attacks, it causes physical, psychological, social, and economic problems for patients and their families. Blank mind, dying, powerless, regretful, goodbye, and helpless were patients' experiences of AMI attack. Pain, nervous, unconscious, difficult times, or no idea, were their perceptions of receiving emergent PCIs. AMI patients regretted to live inappropriately and tried to have good life styles in getting healthy back. They used positive coping strategies, such as life style change, medication compliance, and exercise, to face AMI.

**Conclusions:** Patients only perceived disease seriousness as they had AMI attack. We suggest that early prevention and enough education of AMI diseases are necessary in clinical practice and community care. However, due to small number of participants, we suggest further study is needed.

## CLIN PST 2 - Clinical Poster Session 2

### Resilience and Connectedness in Graduate Psychiatric Nursing Students: Influence of a Virtual Community of Practice (VCoP)

---

*Lori I. Kidd, PhD, RN, CNS, USA*

*Kathleen Tusaie, PhD, APRN, BC, USA*

#### Purpose

The purpose of this presentation is to describe a pilot study conducted to determine feasibility of including a virtual community of practice (VCoP) in a graduate psychiatric nursing curriculum and effects of that participation upon the students' resilience and sense of connectedness to the psychiatric nursing profession

#### Target Audience

The target audience of this presentation is advanced practice nurse educators, advanced practice nursing students, advanced practice nurses.

#### Abstract

**Purpose:** A pilot study was conducted to determine the feasibility of including a Virtual Community of Practice (VCoP) in a graduate psychiatric nursing curriculum and to determine the effects of participation in VCoP upon students' resilience and sense of connectedness to the psychiatric nursing profession. Analysis related to feasibility were previously published (Jevack, Tusaie, Jones, Purcell, & Huff, 2014) and this paper will focus upon resilience and connectedness.

**Problem:** Approximately one-third of Nurse Practitioners change their employment within the first year after graduation. Reported reasons include conflicts with acceptance of their role, changes and losses in relationships, feelings of isolation, uncertainty and guilt for not knowing information they believed they should know, and inability to function in a holistic manner. During this evolving role and multiple transitions in health care delivery, would the structured participation in a VCoP for Psychiatric Nurses increase new graduates' sense of connectedness and level of resilience?

**Methodology:** A mixed methods pilot study was conducted with a convenience sample. Graduate students (n=6) enrolled in their final year of the psychiatric nurse practitioner track at a large Midwestern university were assigned to become members of the American Psychiatric Nurses Association and to participate in the VCoP available on their website. The Connor-Davidson Resilience Scale (Connor & Davidson, 2003) was used to assess levels of resilience before and after participation and graduation in the VCoP. The Sense of Community Index 2 (Chavis, Lee, & Acosta, 2008) was used to assess changes in development of a sense of connectedness/community with colleagues.

**Analysis:** Thematic analysis, peer debriefing and verification were used to ensure credibility of peer group analysis. Paired sample t-tests were used to determine differences in resilience and sense of community pre and post active participation in a VCoP.

**Findings:** Total mean scores for resilience and sense of connectedness increased posttest. Students reported using the VCoP more after graduation than when it was required as a class assignment. Only one graduate (16%) changed employment in the first year after graduation.

**Implications for Nursing:** Although sample size is a limitation, data trends demonstrate increased levels of resilience and sense of community as well as increased use of the VCoP after graduation. While health care environments struggle to shift to new models, perhaps graduate education can utilize social networking to build connectedness and resilience within new graduates. Future plans include repeating the study with a larger sample and additional variables.

## CLIN PST 2 - Clinical Poster Session 2

### Designing the Nation's First Critical Care Transport Helicopter Simulator

---

*Celeste M. Alfes, DNP, MSN, BSN, RN, USA*

#### Purpose

The purpose of this presentation is to describe an innovative inter-professional academic center featuring the Nation's first high-fidelity Sikorsky helicopter simulator which provides training in crew resource management, collaboratory practice, pre-deployment training, and practice edification for civilian air medical crews to promote quality and safety across the life span.

#### Target Audience

The target audience for this presentation are nurse faculty, nurse practitioners, and nurse leaders interested in developing innovative teaching strategies using high fidelity simulation to prepare interdisciplinary teams for collaborative practice, research, and leadership.

#### Abstract

Air medical transport requires the practitioner to develop clinical and diagnostic reasoning abilities and manage the dynamic needs of the patient in unstructured, uncertain, and often unforgiving environments. High-fidelity simulation can be instrumental in training interprofessional flight teams to improve competency through quality and safe patient care during medical transport that may otherwise take years to learn because of the inconsistency in real-life experience. Because of the particularly unfavorable conditions in critical care air transport, a helicopter simulator designed to replicate the phases of flight and train teams in critical care transport scenarios has been developed for an academic center for flight nursing. The center's goal is to provide quality nursing and medical instruction in a simulated flight center while also presenting relevant clinical experiences to prepare interdisciplinary teams of students for collaborative practice, research, and leadership.

Since 2013, the school's Learning Resource Center (LRC) director has been engaged as the simulation information expert for the academic center for flight nursing to acquire, adapt, and implement a fully articulating helicopter simulator to train advanced practice acute care nurse practitioners in critical care transport. Taking a collaborative approach to the project, the LRC director and the school's Flight Program director have networked with industry leaders and faculty from medicine and biomedical engineering. Taking center stage in the flight center is a Sikorsky S-76® helicopter fuselage adapted for interprofessional education, team training, and collaborative research to promote quality and safety in critical care transport across the lifespan. This innovative interprofessional academic center and team training facility will be the first in the United States, with only one similar center at St. John's Rescue Academy in Hanover, Germany. Working with industry leaders in flight simulation, substantial engineering and manufacturing resources were dedicated to adapting simulation technology to the scale and weight of an S-76 fuselage and to integrate motion, visual and sound effects into prescribed training scenarios with a high level of realism. The flight simulator is outfitted with a Federal Aviation Administration approved medical interior for the most realistic training of nurses, physicians, emergency medical service, and ambulance personnel. A sound system and lighting controls allow faculty to manage the audio and video image capabilities inside the fuselage, replicating the noisy and sometimes poorly lit conditions of flying. The fuselage windows have been replaced with a double pane Lexan™ screen utilizing a rear projection system to simultaneously display real-world views of particular mission scenarios that include takeoff, landing, hover, and transition of the various phases of flight. Video-recording capabilities give faculty the ability to record and store data for post training debriefings, research analysis, scholarly publications, and presentations. Training activities include crew resource management, pre-deployment training and practice edification for civilian air medical crews, as well as providing a resource for faculty research topics related to team-building and collaboratory practice. The critical care transport simulation scenarios are shared locally with community providers, nationally with government flight teams, and internationally with our academic exchange partners at Aichi Medical University in Nagoya, Japan. The flight simulator was delivered on 12/15/14 and the grand opening of this facility is scheduled for May 2015.

### Mnemonics in Health Care: Do They Really Work and Can They Save a Person's Life?

---

*Luanne Linnard-Palmer, RN, CPN, EdD, USA*

#### Purpose

This presentation will review two studies conducted that investigated the effectiveness of mnemonics for the rapid recall of information; skills performance or knowledge. Mental mnemonics, used for decades, have shown help in recall of complex material, especially in emergent situations. This interactive presentation will engage participants in using and developing mnemonics.

#### Target Audience

Practicing nurses in any clinical setting and in any practice specialty. This presentation will benefit novice nurses and expert nurses. Nurse managers and nurse administrators may find that the use of medical mnemonics can assist with error reduction and improved confidence.

#### Abstract

Mnemonics in Health Care: Do they really work and can they save a person's life?

Mental mnemonics have been used in health care for decades. A series of letters, words or phrases that help with recall of complex material, mnemonics are widely used in all settings and across various professional disciplines. Validating their effectiveness has been overlooked and under-represented in the literature.

The goal of this presentation is to share where we are in the use of mnemonics and to disclose the results of two research projects whose aim was to demonstrate the validity of a mnemonic. This author conducted two pilot quantitative quasi experimental single group research projects investigating the use of a mental picture, a mnemonic, for a means to organize one's thinking in a logical order. One study that will be shared is on a rapid code blue response for novices. The other was a mnemonic developed, validated and tested for the complexities of administering chemotherapy to children. Findings of these two studies will be briefly shared and implications for practice guided by the use of mnemonics will be discussed. A group activity will follow that will illuminate the wide spread use of, but infrequently validated, use of mnemonics in health care.

Objectives: At the completion of this oral presentation, the participants will be able to:

- Describe the various settings and clinical situations where mental mnemonics are used in health care.
- Analyze the effectiveness of two examples of mnemonics used in emergency responses and oncology nursing.
- Evaluate the need for mnemonic testing in various stressful situations

## CLIN PST 2 - Clinical Poster Session 2

### Correlates of Barriers to Medication Adherence in Patients with Coronary Artery Disease

---

*Jen Ying Huang, MSN, RN, Taiwan*  
*Hsing Mei Chen, PhD, RN, Taiwan*

#### Purpose

The purpose of this presentation is to explore the predictors of barrier to medication in patients with coronary artery disease. Findings from this study can provide nurses as references to early detect and prevent poor medication adherence of the patients.

#### Target Audience

The target audience of this presentation is patients with coronary artery disease.

#### Abstract

Adherence to medications can effectively reduce the recurrence of mortality, myocardial infarction or cardiovascular events in patients with coronary artery disease. However, around 50% of the patients do not adhere to medication. The purpose of this study was to explore the predictors of barriers to medication. A cross-sectional, descriptive correlational research design was used, and a non-probability sample of 250 participants was recruited from the cardiology outpatient department and ward of a medical center located in southern Taiwan. Inclusion criteria were as follows: (1) being 20 years or older, (2) having a diagnosis of CAD (ICD-9-CM Diagnosis Code 410-414) as determined by cardiologists, (3) having received CAD medications for at least three months, (4) being able to communicate either by Mandarin or Taiwanese, and (5) willing to participate in this study. The instruments included demographic data, medication-related variables, Cardiac Symptom Survey, Charlson Comorbidity Index, and Medication Adherence Scale (knowledge, attitude, and barriers). Data were analyzed using SPSS version 20.0 for Windows and SAS version 9.3. A tobit regression was conducted to identify significant predictors of barriers to medication adherence.

The results showed that the majority of the participants had high medication adherence with a mean knowledge dimension score of 1.92 (range, 0-3), a mean attitude dimension score of 26.71 (range, 11-30), and a mean barriers dimension score of 5.90 (range, 0-68). The significant predictors of barriers to medication adherence included poor attitude ( $p < .0001$ ), younger age ( $p = .012$ ), employment ( $p = .016$ ), irregular follow-up ( $p = .041$ ), and cardiac symptoms ( $p = .037$ ). Findings from this study can provide nurses as references to early detect and prevent barriers to medication adherence of the patients. It can be done by strategies such as, reviewing the patient's prescribed medications by a physician in order to simplify the medication use and monitoring the side effects of medications by nurse specialists. Likewise, merely 21.2% of the participants had been received a comprehensive medication counseling. Implementing comprehensive medication counseling services is particularly needed to help improve medication adherence of the patients.

## CLIN PST 2 - Clinical Poster Session 2

### What Would the Patient Say? Satisfaction with Nursing Care during a Simulation Experience

---

*Deborah A. Raines, PhD, EdS, MSN, BSN, RN, ANEF, USA*  
*Jennifer Guay, DNP, RN,, USA*

#### Purpose

The purpose of this presentation is to explore the patient's perception of nursing care during a simulated experience.

#### Target Audience

The target audience of this presentation is nurse educators and simulation specialists.

#### Abstract

Clinical practice hours in a simulation environment with manikins that replicate physiologic responses are becoming an integral part of nursing education. Simulation experiences are popular because they provide a safe learning environment for students. In the process of learning how to deliver nursing care students can perform a variety of technical, communication and inter-professional skills. The simulation ends when the students and faculty leave the simulation room and the manikin is reset and readied for the next group of student. However in the real world of nursing practice, patient are not reset and their perception of and satisfaction with the care received is part of important benchmarks used by the organization and external agencies to assess the quality of care.

As part of the clinical experience in a maternal-newborn clinical practice course nursing students engage in a simulation of a woman in labor with a prolonged deceleration of the fetal heart rate and a birth followed by a post-partum hemorrhage. To provide variety to the experience the use of the Mama Natalie obstetrical simulator and the Noelle obstetrical simulator are alternated. Mama Natalie is a portable obstetrical simulator that is worn by an actor who controls the birth of the infant and the release of blood for the post-partum hemorrhage. Noelle is full-body manikin and the birthing event and bleeding is controlled by a computer program. An actor is used to supply Noelle's voice.

As part of the evaluation of the simulation experience and the quality of nursing care, the actor was asked to document their perception of three aspects of nursing care during the simulation. Three items related to nursing care were adapted from the HCAHPS Survey:

- During this hospital stay, how often did nurses treat you with courtesy and respect?
- During this hospital stay, how often did nurses listen carefully to you?
- During this hospital stay, how often did nurses explain things in a way you could understand?

These item was rated on a 4-point scale (1=never, 4=always) similar to the HCAHPS survey tool. In addition the actor was asked to provide a statement describing or providing an example to support their rating of these items and was asked if as the patient they felt safe with the care being provided.

A total of 16 simulation sessions were conducted: 8 with the actor wearing the Mama Natalie simulator and 8 with the actor as the voice of the Noelle simulator. The lowest rated item was did the nurses explain things in a way you could understand. The actors indicated that the nurses did not explain to the "patient" what was happening until the patient asked. The actor (who knew the scenario included a complication) indicated that the nurses often provided false reassurance "everything will be alright" or "the heart rate is a little low but it is OK". These scores were lower in the scenarios with the Noelle simulator than with the Mam Natalie simulator. Similarly the scores for feeling respected and treated with courtesy were lower with the Noelle simulator. The actors identified that in most of the scenario the nurses initially addressed the patient by name and introduced themselves, but the use of names and actions indicating

respect for the patient, such as keeping the perineum exposed even if nothing was being done or watching the monitor or computer screen while the patient was making a request became more frequent as the scenario proceeded. The actors also scored the item related to the nurse listening carefully to the patient lower when the Noelle manikin was used as the patient. The responses to feeling safe demonstrated wide variation but the scores were lower when the actor was wearing the Mama Natalie Simulator than with the Noelle simulator. In part this may be explained that the actor is in the room and the blood pressure and other non-invasive assessments are actually performed on the actor's body with the Mama Natalie Simulator, whereas with the Noelle simulator the actor is in the control room and assessments are performed on the manikin with the data provided from an external source. As one actor shared, when the nurse couldn't get the oxygen to work I became anxious –even though I could breathe just fine!

Nursing is more than the performance of technical skills. In the nursing practice environment attention to addressing patient centered care and promoting patient satisfaction is important. In the simulation environment we need to consider how to develop these skills concurrent with leaning the technical aspects of nursing care. This presentation will share the qualitative comments from the actors as well as observations of the simulation coordinator and strategies for the future.

## CLIN PST 2 - Clinical Poster Session 2

### Vitamin D and Immunity: Walking on Sunshine, Does it Make Us Feel Good?

---

*Susan Lynne Bushinski, DNP, MSN, BS, ADN, LPN, RN, FNP, ACNP-BC, FNP-BC, USA*  
*Caroline M. Peltz, PhD, MSN, MSHSA, BSN, RN, CNE, USA*

#### Purpose

**Purpose:** To identify evidenced-based data to support the hypothesis that vitamin D is essential to maintaining a healthy immune system, and maintaining serum blood levels within a “normal” reference range which may be one way advance practice nurses can prevent the onset of multisystem disease.

#### Target Audience

Nurse Practitioners who need a comprehensive review of evidenced based literature concerning Vitamin D levels and benefits to immunity. This could prevent diseases that have been shown to have connections to the maintenance of "normal" clinical serum Vitamin D levels.

#### Abstract

**Background:** Vitamin D has long been known to have an active role in innate and adaptive immunity in humans. Historically vitamin D has been found to play a major role in the regulation of the immune system in by Cantorna, M., Zhu, Y., Froicu, M., & Wittke, A. (2004) due to the location of vitamin D receptors on peripheral blood mononuclear cells. Low vitamin D levels have been linked to many diseases such as cardiovascular disease, lung and respiratory disease, bone disease and certain cancers according to Scacchetti, A., Cariani, E., Manieri, G., Vecchi, C., & Trenti, T. (2014). Ginde, A., Mansbach, J., & Camargo, C. (2009), have found low vitamin D levels to be associated with the presence of serum IgE manifesting in increased allergy symptoms in individuals. Martineau, A., Wilkinson, R., Wilkinson, K., & Newton, S. (2007) established that a single dose of vitamin D can enhance immunity to mycobacteria, which may have benefits in the prevention of Tuberculosis. While vitamin D and the benefits to bone health have been known for years, it is the new evidence in the literature that supports the belief that suboptimal circulating serum vitamin D levels has a significant abrogating effect on healthy autoimmune function, cardiovascular health and protection against certain cancers according to Hewison (2012). These preventative effects seem to rely on the localized activation of vitamin D, Hewison (2012). Vitamin D levels and the immune protection it offers is not solely reliable on supplementation, the American Diabetes Association (2012) found a profound effect on the body's Immune cells and their ability to function if there was insufficient circulating vitamin D. Part of the recommendations, according to researchers, is that sunshine is just as effective and important in treating those with Tuberculosis, due to it's ability to alter body vitamin D levels in a positive manner.

**Purpose:** To identify evidenced-based data to support the hypothesis that vitamin D is essential to maintaining a healthy immune system, and maintaining circulating serum blood levels within a “normal” reference range which may be one way advance practice nurses can prevent the onset of multisystem disease. To prepare a comprehensive review of the literature on the subject of vitamin D and the relationship to immunity. This state -of-the -art literature review would serve as a foundation upon which researchers could focus future research in order to establish practice guidelines on vitamin D supplementation in an effort to prevent disease.

**Methods:** Fifty-six articles were selected from a review of literature using key words (vitamin D, immunity, cardiovascular disease, respiratory disease, cancer, allergies, bone disease and serum vitamin D levels in humans). CINAHL and PUBMED data bases were explored with a five year date restriction except when establishing significant historical scientific data to capture the range of disease that has been found to have associations with serum vitamin D levels. Articles were selected based on establishing the best-evidence based guidelines, standards of care, and relevance to advanced practice nursing in providing disease prevention.

**Results:** A review of the literature on vitamin D and immunity supplied evidence that a relationship exists between vitamin D and innate and adaptive immunity. The literature also supported the hypothesis that low serum vitamin D levels may be related to the existence of multiple disease states in human beings. Supplementation of vitamin D was shown to enhance immunity to bacteria such as mycobacteria in Tuberculosis and potentially inhibiting the reactivation of latent Tuberculosis in individuals.

**Conclusions:** Clinically efforts should be aimed to supplement vitamin D levels to boost both innate and adaptive immunity to prevent and alleviate diseases linked to low circulating vitamin D levels.

**Implications:** Further research needs to be done to specifically determine the link between the supplementation of vitamin D with the goal to keep serum vitamin D levels within a normal to high of the normal reference range likely augmenting innate and adaptive immune responses in humans to prevent or alleviate multiple disease states.

### Assessment of the Provision of Education Materials on HIV/AIDS Prevention among Boys Who Undergo Male Circumcision at Hospitals in the Vhembe District, Limpopo Province, South Africa

---

Lufuno Charity Malala, MCur, BCur, BA, RN, South Africa  
Fhumulani Mavis Mulaudzi, DLitttPhil, RN, RM. FANSA, South Africa

#### Purpose

The purpose of this presentation is to assess if there are educational materials on HIV/AIDS prevention provided to boys who undergo male circumcision at a hospital setting.

#### Target Audience

The target audience for this presentation includes, Health professionals and policy makers

#### Abstract

**Background:** Literature shows the importance of health education coupled with educational materials as important tools towards HIV/AIDS prevention. HIV/AIDS remains a major obstacle against the achievement of the millennium development goals (MDGs). Male circumcision as one of the HIV prevention strategies endorsed by the World Health Organization (WHO) can be of great assistance in the reduction of the high HIV statistics as well as aiding in the achievement of the MDGs. Although male circumcision has been practised traditionally, boys are found to prefer medical than traditional due to safety concerns associated with the latter.

**Objective:** The educational role played by traditional male circumcision seems missing in the medical male circumcision. This article aims to assess if there are educational materials provided to boys who undergo male circumcision at a hospital setting.

**Method:** Quantitative descriptive survey was used to conduct the study. Data was collected amongst males aged between 12 and 21 years through a self-designed standardised questionnaire, administered through face-to-face interviews. Convenience sampling was applied to select the participants and to identify hospitals where data was collected. STATISTICA and Microsoft Excel were used as software to analyse the data.

**Results:** The results of the article revealed that there is limited provision of educational materials regarding HIV/AIDS prevention among boys who undergo male circumcision at a hospital setting.

**Conclusion:** The development of an educational package for HIV/AIDS prevention for boys, who undergo medical male circumcision which is culture sensitive, was recommended.

### Dress for Success: Increasing Self-Efficacy Baccalaureate Nursing Students

---

Mary Elizabeth Fortier, EdD, MA, BSN, RN, CNL, USA

#### Purpose

The purpose of this presentation is to inform the attendees of the significance that self-efficacy plays in the success of novice baccalaureate nursing students in their first clinical course.

#### Target Audience

The target audience of this presentation is nurse researchers, educators, clinicians, and nursing students.

#### Abstract

My research focused on the impact, if any, on novice nursing students' perception of their self-efficacy when the intervention of requiring professional attire is utilized in their first clinical course? Novice nursing students' are faced with many challenges when beginning a baccalaureate program. The challenges include time management, academically thought-provoking coursework, and learning a new skill-set for patient assessment. The purpose of this exploratory interventional study was to measure novice baccalaureate nursing students' self-efficacy perceptions in their first clinical experience. "Does self-efficacy increase if given professional attire therefore increasing the students' perception of their roles as nursing students and in turn their self-efficacy?" A sample size of 8 for the experimental group and n=8 for the control group is realistic for this proposed intervention; consequently a pilot study format was utilized. A quasi-experimental research design is anticipated. Demographics were obtained at the beginning of the study. The General Self-Efficacy Scale was administered to both the control group and the experimental group at the beginning and the conclusion of the pilot study. Data was evaluated using the SPSS statistical package.

Self-Efficacy is defined as: a personal judgment or belief concerning one's ability to successfully perform a particular task or behavior (Bandura, 1986). It has been theorized that self-efficacy may influence the likelihood of success. The significance of this interventional research study that evaluated the advantage of requiring novice nursing students to dress in professional attire and the effect this intervention had on their self-efficacy perception. The investigator anticipated and found that when given professional attire, a lab coat, the novice nursing student demonstrated a significant improvement in their self-efficacy perception.

## CLIN PST 2 - Clinical Poster Session 2

### Examining the Health Behaviors of Frontline Nurses

---

*Lauren Marie Murphy, MSN, BSN, RN, ACNS-BC, USA*  
*Adele M. Spelman, PhD, RN, USA*

#### Purpose

The purpose of this presentation is to examine the health behaviors of frontline nurses, their self-care practices and the strategies that contribute to sustained healthy behaviors.

#### Target Audience

The target audience of this presentation is nurses and health care professionals with interest in self-care practices related to health and wellbeing.

#### Abstract

**Background.** Professional nursing views health promoting behaviors to be foundational for holistic wellbeing. Through advocacy and education, nurses encourage patients and families to practice healthy behaviors. It is logical to assume that nurses are knowledgeable regarding the value of health promotion and healthy behaviors. Yet, as a group, nurses are recognized to have less-than-optimal health practices. Recent studies have found that large numbers of nurses reported personal fatigue, inadequate exercise and irregular diets. Motivated by rising health care costs, employers offer incentives to healthcare workers who meet selected criteria goals, such as blood pressure, blood glucose and cholesterol levels as well as body mass index parameters. Few studies have reported the effectiveness of such strategies for direct care nurses.

The purpose of this study was to examine frontline nurses' reports of their personal health behaviors and frequency with which health behaviors are practiced. The study's framework draws on the Artinian Intersystem Model for adapting research-based evidence. The model emphasizes that effective strategies must be meaningful and manageable. Prior to identifying interventions and areas for advocacy, planning is approached as an interactive process with target participants.

**Methods.** The study used a descriptive design and convenience sample of RNs and LPNs who provide care directly to patients and families at hospital bedsides or ambulatory clinics. Data were collected at a mid-sized medical center with an active wellness program in a northeast Pennsylvania. Following IRB approval, nurses were emailed an invitation to participate and link to the electronic survey. Informed consent was implied when the survey was completed and submitted.

Self-care behaviors were examined using the Health-Promoting Lifestyle Profile II (Walker, Sechrist, Pender, 1995). The tool consists of 52 statements about self-initiated health behaviors that are rated according to frequency (1 = never to 4 = routinely). It is organized into 6 subscales: health responsibility, nutrition, physical activity, stress management, interpersonal relations and spiritual growth. An additional 6 items collected demographics and qualitative comments about professional practice. Validity is established and acceptable reliability is reported. It required 10-15 minutes to complete.

**Results.** Surveys were received from 160 nurses, representing a 21% response rate. Participants' ages ranging from under 30 years (15%) to over 50 years (43%). Most identified themselves as RNs (84%) who work over 36 hours/week. When Lifestyle Profile scores were examined according to age groups (<35 yrs., 35-50 yrs., >50 yrs.), the oldest group nurses reported the highest total and subscale scores. Significant, albeit small, differences found for Health Responsibility ( $F(2,157) = 4.28$ ;  $p = .016$ ,  $\eta^2 = .23$ ), Nutrition ( $F(2,157) = 3.45$ ;  $p = 0.34$ ,  $\eta^2 = .24$ ), and Stress Management ( $F(2,157) = 2.13$ ;  $p = 0.34$ ,  $\eta^2 = .21$ ). Qualitative comments pertained to the difficulties of balancing work, family, and self-care among younger nurses and those over 50 years of age.

**Conclusions.** Participants reported moderate levels of healthy behaviors. Contrary to expectations, the highest frequencies of healthy behaviors were reported by older nurses. This may reflect fewer competing priorities, stronger adaptive strategies or an increased awareness of the impact of lifestyle choices. Additional study is needed to identify potential strategies to motivate and sustain healthy behaviors among frontline nurses.

### Factor Analysis of Professional Nurses' Lifelong Learning, a Private Hospital, Thailand

---

*Boonsom Kuanchom, MSN, RN, NNP, MSN, Thailand*  
*Areewan Oumtanee, PhD, MS, RN, Thailand*

#### Purpose

The purpose of this present was to study the components of lifelong learning of professional nurses working in Private hospital, Bangkok, Thailand

#### Target Audience

Professional nurses, Nurse manager, Nurse Educator and Nurse who may concern about professional development.

#### Abstract

The purpose of this study was to study the components of lifelong learning of professional nurses working in Private hospital, Bangkok, Thailand. Study sample selected by using simple sampling were 250 professional nurses. The research instrument was the professional nurses' lifelong learning questionnaire which was examination for content validity and test for reliability. The Cronbach's Alpha Coefficient of professional nurses' lifelong learning questionnaire was .94. The data were analyzed by using Principal Components axis analysis and orthogonal rotation with varimax method.

The findings were as follow: The lifelong learning of professional nurses in tertiary hospital of consists 6 components. The accounted for 72.99% of variance:

1. Systemic thinking described by 17 items accounted for 19.38 such as having a good communication including listening, speaking, writing and reading, problem solving skills, creating, remembering and making judgment base on evidence
2. Learning resource adaptation described by 6 items accounted for 15.97 such as applying knowledge to work, applying knowledge to improve work, develop in working system, sharing knowledge to other, getting a new idea and building learning network .
3. Interpersonal skills described by 6 items accounted for 11.36 such as be able work with team, responsible in job and assign job and making friend easily.
4. Goal setting and achievement described by 4 items accounted for 8.52 such as having clearing goal, application of knowledge and skills and having learning plan.
5. Being self directed learner by 3 items accounted for 5.56 such as having ability to learn, having own opinion and having world view.
6. Looking learning opportunities described by 4 items accounted for 5.32 such as improve self development , participating scholarly activities and access knowledge source.

## CLIN PST 2 - Clinical Poster Session 2

### Community-Based Collaborative Action Research Supports Academic-Community Partnerships in a Service-Learning Project

---

*Norma Krumwiede, EdD, RN, USA*

*Kelly Krumwiede, PhD, RN, USA*

*Stacey Ann Van Gelderen, DNP, RN, USA*

#### Purpose

To disseminate how the Community-Based Collaborative Action Research (CBCAR) framework can be used by nursing faculty to design and guide service-learning opportunities for baccalaureate nursing students that enhance their knowledge of public health nursing.

#### Target Audience

Nursing faculty, public health nurses, and nurse researchers interested in improving the health of the community.

#### Abstract

**Purpose:** The purpose of this service learning project was to assess the effectiveness of the Community-Based Collaborative Action Research framework in providing real-world learning opportunities for enhancing baccalaureate nursing students' public health knowledge.

**Background/Significance:** Service-learning teaches the value of leadership skills, promotes students' personal growth, academic achievement, and opportunity for strengthening interpersonal skills, self-efficacy, and social responsibility. Academic-community partnerships provide opportunities for students to apply newly learned skills in real-world settings. These opportunities meet a community's need and facilitate greater understanding of the nursing profession and meaning of being a professional.

**Theoretical/Conceptual Framework:** This case study analysis used the six phase framework of the Community-Based Collaborative Action Research (CBCAR) to guide a community health needs assessment of a rural community within a service-learning project while students applied public health nursing core competencies. The six phases of the CBCAR framework are: 1) Partnership: Collaboration; 2) Dialogue: Research question and direction determined; 3) Pattern recognition: Data collection and analysis; 4) Dialogue on meaning of pattern: Representation of research findings; 5) Insight into action: Community dialogue about meaning of research findings-Action planning; 6) Reflecting on evolving pattern: Evaluating actions and considering new questions.

**Methods:** The CBCAR framework linked service learning and community health needs assessment with public health nursing core competencies. Fifteen nursing students partnered with collaborative members. Student observational field notes and narrative reflections were analyzed qualitatively for fidelity to the CBCAR framework and to evaluate student public health knowledge. Community data and student stories were extracted from this comprehensive real-world, service-learning experience of students to provide meaningful data.

**Results:** Nursing students successfully utilized the CBCAR framework in collaboration with the critical access hospital and community members to design and conduct the community health needs assessment. Service learning themes were real-world solutions, professional development, community collaboration, and making a difference. Students developed skills in six of the eight domains of the Quad Council's core competencies for public health nurses.

**Conclusions:** Community-Based Collaborative Action Research facilitates collaborative partnerships and relationships throughout the service learning process. Students benefited by applying what they have learned from their education to a real community who lacks resources. The CBCAR framework provided a safe environment where open, non-judgmental dialogue encouraged and strengthened community voices

which had not always been heard by health care professionals. CBCAR created space where meaningful work by community members, nursing students and nurse researchers could collaborate to enhance the health and wellness of the rural community. CBCAR provided gratifying work for nursing students and nurse researchers which benefited community growth through dialogue, and promoted meaningful long-term relationships with those involved in the process. Outcomes for the students, university, and community suggest continued use of the CBCAR framework with service-learning projects. When educators provide service-learning opportunities, students learn to recognize barriers and social determinants of health within the community, prioritize primary prevention, and use available resources to help improve societal health. Use of the CBCAR framework is recommended to facilitate academic-community partnerships and relationships when designing and implementing service learning opportunities.

## CLIN PST 2 - Clinical Poster Session 2

### An Interdisciplinary Study to Examine Obesity and Inactivity as Early Predictors of Gestational Diabetes

---

Janeen S. Amason, PhD, RN, USA  
Rebecca L. Shabo, PhD, RN, USA  
Katherine H. Ingram, PhD, MS, USA

#### Purpose

to discuss an ongoing interdisciplinary research study that explores early identification measures (body composition, inactivity) as early indicators of gestational diabetes in primigravida women.

#### Target Audience

Clinical nurses and other healthcare professionals in the area of Women's Health.

#### Abstract

Gestational Diabetes (GD) is a serious condition that affects approximately 9% of pregnancies and is characterized by an insufficient response of blood glucose to the actions of insulin. In early pregnancy, GD can result in birth defects, over-nutrition, and large babies that increase risks of childbirth. The offspring are more likely to develop obesity and diabetes within their lifetimes. The risks of these disorders perpetuate a transgenerational cycle of obesity and diabetes, underscoring the need for effective interventions that reduce maternal obesity and GD. The current standard of care involves testing for GD during month six of pregnancy, however earlier prediction of GD could lead to earlier lifestyle intervention and a better outcome for both mother and baby.

Obesity and inactivity are major modifiable risk factors for GD. It is unknown which of these risk factors is most predictive of insulin resistance during pregnancy. This interdisciplinary study involving nursing and exercise science examines which early measures of obesity and inactivity can serve as early clinical predictors of gestational insulin resistance or GD.

First time pregnant women, aged 18 to 34, are recruited during their first prenatal visit. Participants receive body composition measurements in the exercise science laboratory and complete a physical activity questionnaire. Participants also wear an accelerometer to collect motion data. At 24-28 weeks, fasting plasma glucose and insulin levels are collected to compute the homeostasis model assessment of insulin resistance (HOMA-IR).

Preliminary data on the impact of early measures of obesity and inactivity on gestational insulin resistance and GD in primigravida women will be presented. Predicting GD early in pregnancy will provide healthcare workers an opportunity to intervene in order to prevent or delay the onset of this disease. The goal of this collaborative project is to create a predictive model for early identification and prevention of GD.

## CLIN PST 2 - Clinical Poster Session 2

### Curriculum Development and Service Learning to Bring Theory into Practice

---

*Margarett Alexandre, MSN, CNA, RN, USA*

#### Purpose

To describe a course which incorporates Student Learning Outcomes; with a two week service learning in Haiti. Nursing students had the opportunity to immerse and provide services to an underserved population. They worked along other health professionals in the community; at Mission of Grace Clinic, Orphanage, School and Senior Home.

#### Target Audience

The target audience for this presentation is faculty both in clinical and lecture settings; who are interested in innovative curriculum development with a global service learning partnership component.

#### Abstract

An elective course was developed incorporating the Student Learning Outcomes; which included the need to advocate for health policies that address local and global health issues, effectively communicate with diverse client populations and disciplines using a variety of strategies and respecting client's cultural beliefs and practices, as well as the essential curriculum concepts: Communication/Collaboration, Safety/Technology, Critical Thinking/Nursing Process, Leadership/Management, Professional Accountability/ Advocacy, Legal, Moral, Ethics and Research. A two week service learning component in Haiti, gave the nursing students the opportunity to immerse and provide needed services to an underserved population. Senior and junior level nursing students were selected. Nursing students and faculty worked along other health professionals in the Carries community; at the Mission of Grace Medical Clinic, Orphanage, Elementary School, and Senior Home. Course preparation involved: development and review of syllabus, completion of assigned readings and research on Haiti's history, culture, healthcare, social and economic issues as well as immersion in the Kreyol language. Students also attended seminars and an eight hour orientation before travel. Emphasis was placed on communication, critical thinking, client education, cultural considerations and evidence-based clinical guidelines in nursing practice. Conferences and lectures were held to assist the students to reflect, synthesize. Overall the course provided a service learning experience where students could contribute; to delivery of health care; to underserved population on a global level; as well as to provide engaged learning that integrates theory into practice. Comparison and contrast could be made within and among the communities. While a fair comparison could not be made, inequality and inequity among the local people was undeniable. Another is the need for infrastructure (health care, education, sanitation, water, and housing). We left being more appreciative of the things we take for granted living the United States, such as clean water, shelter, and access to health care.

### Debriefing In Laboratory Experiences in Undergraduate Nursing Education: Consolidating Learning and Creating Meaning

---

*Gerri C. Lasiuk, PhD, CPMHN(C), RN, RPN, Canada*  
*Penny L. MacDonald, MN, BScN, RN, Canada*  
*Jill E. Vihos, BScN, MN, RN, Canada*  
*Denaine Lozza, BScN, RN, Canada*  
*Dorothy J. Spies, BScN, RN, Canada*  
*Loreen Carol Pollard, MN, BScN, RN, Canada*  
*Beth Malishewski, BScN, RN, Canada*  
*Moira Bazin, MN, RN, Canada*  
*Nadine M. Moniz, MN, BScN, RN, Canada*

#### Purpose

The purpose of this poster presentation is to report the findings of a pilot project conducted to explore the cognitive, affective and social learning outcomes of debriefing of laboratory experiences. This project was conducted in the Faculty of Nursing at the University of Alberta by instructional faculty.

#### Target Audience

The target audience includes; registered nurses, nursing educators, and nursing students.

#### Abstract

Debriefing is a pedagogical strategy used in nursing education to allow students to create personal meaning of learning experiences, which is fundamental to understanding who one is as an individual in both learning and practice. For nursing students, recognizing one's spirit and what it personally means to be a nurse is foundational to their moral growth. When nurses acknowledge their personal identity, they are able to set themselves aside to understand the lived experience of the patients that they care for. Encouraging learners to talk about their practice can contribute to their personal transformation, professional growth and lead to accumulation of nursing knowledge. When nursing students can articulate who they are as professionals, they can meet their spiritual needs, as well as meet the spiritual health needs of their patients. Debriefing also socializes nursing students into practice through recognizing the importance of establishing safe spaces to engage in collaboration, caring communication, role clarification and reflection about learning experiences within a peer group. Debriefing strategies with nursing students can include; group reflection at the end of classes, tutors providing immediate feedback to students after performing learning activities, and dialogue after interactions with patients and their families. In nursing education, learning outcomes from debriefing can be reflected in cognitive, affective and social growth over the duration of their nursing program. Debriefing about learning experiences helps learners to engage with the lived experience of others, and facilitates appreciating the humanity of others which is necessary for providing safe, competent care in nursing practice. The practice of debriefing is an essential component of the nursing students' learning process towards their spiritual and professional transformation into becoming a nurse. The results of a pilot project, "Debriefing in Laboratory Experiences", that was conducted at the Faculty of Nursing, University of Alberta are presented.

## CLIN PST 2 - Clinical Poster Session 2

### Related Factors to the Use of Psychotropic Medicines in Primary Health Care Units

---

*Adriana Inocenti Miasso, PhD, Brazil*

*Tatiana Longo Borges Miguel, PhD, MSc, RN, Brazil*

*Kathleen Mary Hegadoren, PhD, Canada*

#### Purpose

The purpose of this presentation is to identify psychotropic medicines use in patient visiting the units; and, its association with: the presence of Mental Common Disorders (CMD), socio-demographic profile, use of other pharmacotherapy and presence of clinical comorbidities.

#### Target Audience

The target audience of this presentation is health professionals and academics.

#### Abstract

**Purpose:** Not always psychotropic drugs are used for specific mental disorders. Sometimes the doctor who prescribed the psychotropic can not point accurately the reason for its utilization. There is a gap in the literature to investigate in primary health care the factors related to the psychotropic drugs consumption; and, if people using psychotropic medicines without a defined psychiatric diagnosis are positive to Mental Common Disorders. This study aims to identify psychotropic medicines use in patient visiting the units; and, its association with: the presence of Mental Common Disorders, socio-demographic profile, use of other pharmacotherapy and presence of clinical comorbidities.

**Methods:** This study was performed with a quantitative approach, cross-sectional and descriptive correlational character. A stratified sample of 430 patients was interviewed in five primary health care units at Ribeirao Preto city, Brazil. Data collection included questionnaires with socio-demographic information, medication history and the SRQ-20 (Self-Reporting Questionnaire - to assess Mental Common Disorders). The health records were also examined. To assess those associations was used chi-square test, with accepted association when p is less than or equal to 0.05; and, logistic regression models.

**Results:** The prevalence of psychotropics use was 25,8% (N=111). The most prevalent prescribed psychotropic were antidepressants (73% - N=81). Chi-square test indicated association between psychotropics use and SRQ-20 result (the prevalence of CMD:41,4% - N=178), other medicines use, number of prescribed medicines, number of pills prescribed per day, clinical comorbidities, age and education. However, according to multivariate analysis the predictor factors were: Mental Common Disorders (OR=3,9; IC95% 2,36-6,55), clinical comorbidities (OR=5,4, IC95% 2,84-10,2) and lower level of education (OR=1,7; IC95% 1,02-2,92). This study is the first in Brazil to have contemplated the question of the presence of CMD and use of psychotropic medication at Basic Health Units.

**Conclusion:** Considering the association between use of psychotropic medicines and socio-demographic factors, the results highlight the need for an assessment focused on psychosocial aspects so that patients would have their symptoms seen by health professionals and be attended in their needs.

## CLIN PST 2 - Clinical Poster Session 2

### Increasing Student Competence and Clinical Confidence Using a Multimodal Approach Poster

---

*Cynthia Denise Bain, MSN, RN, CNE, USA*

*Nancy McMenamy, MS, RN, CNE, USA*

*Deborah A. Tapler, PhD, RN, CNE, USA*

*Nola Schrum, MS, RN, CCRN, USA*

#### Purpose

To improve first level student success in learning introductory clinical skills using a multimodal approach. Our focus was on reducing student anxiety, improving competence, confidence, and continuity in performance. Modes utilized included faculty demonstration videos, standardized skills checklists, simulated experiences and supervised open lab practice. Post-survey results were overwhelmingly positive.

#### Target Audience

The target audience is clinical nursing educators in high schools (HOSA), colleges, universities and hospitals.

#### Abstract

First level nursing students are often overwhelmed with the demands of nursing school. They are taught introductory clinical skills that are basic to a solid foundation for clinical practice. To increase competency, confidence and continuity between all nursing instructors, including adjuncts, as well as decrease student anxiety; the course team developed a multimodal approach to ensure student success. The purpose of our approach was to improve first level student competence, confidence, and continuity and decreased anxiety through using a multimodal approach to teaching skills. 4 modes were utilized to achieve this. The first mode was use of a Faculty Skill Demonstration Video which was available on blackboard for student viewing. Each lab practicum skill was demonstrated and videotaped by a seasoned faculty member. These videos provided a resource that the student could access at any time with an internet connection. The videos reinforced the skills learned in lab. Promotion of continuity between instructors and students was enhanced by a single, correct skills procedure for validation in check-offs. The second mode was utilizing consistent Standardized Practicum Skills Check off Sheets for students that matched the faculty video. Each lab practicum skill was incorporated into a standardized check-off form with specific evaluation criteria including critical behaviors. The check-off forms stipulated the steps of the skill and the grading criteria. Both the students and faculty now had matching expectations for a passing score. Another method used was practicing of the skills using Simulated Experiences. Simulated case studies with the skills integrated were developed to improve the students' psychomotor aptitudes. The experiences provided opportunities for critical thinking with faculty guidance. Important safety procedures were demonstrated by the students when giving medications including the "5 Rights." Lastly, we utilized Supervised Open Lab Practice Times for students to practice in a nonthreatening environment. This extra time afforded opportunities to acquire reinforcement of correct technique or remediation for incorrect techniques. At the conclusion of the experience, students were surveyed about their experiences utilizing the various modalities. They were asked if they accessed the skills videos produced by the faculty and if they thought the videos contributed in their success. Ninety-four percent of the responding students accessed the online videos and attended the simulation. Student comments regarding the faculty skills demonstration videos were collected and were overwhelmingly positive. Eighty-six percent of students stated that the demonstration videos reduced their level of anxiety about check-offs. Eighty-two percent of students attended an open lab session for practice of skills outside of scheduled course lab time. The future recommendations of the project were that the skills demonstration videos should consistently follow the check-off procedures exactly. The fundamental scientific principles should be consistent between lab sessions and between the nursing faculty. Students now knew what the skills performance expectations were so they felt less stressed and therefore more confident during check-offs. The faculty were

encouraged to stress the importance of the fundamental principles of safety and sterility in response to dynamic clinical situations.

## CLIN PST 2 - Clinical Poster Session 2

### Prevention Decline in Older Cardiac Surgery Patients (PREDOCS) Programme

---

*Tjitze S. Hoekstra, MSc, RN, Netherlands*

#### Purpose

The purpose of this presentation is to learn more about a preadmission multicomponent intervention for frail older patients in cardiac surgery.

#### Target Audience

The target audience of this presentation are nurses working in the clinical setting.

#### Abstract

**Background:** Complications after cardiac surgery are common in older patients and are associated with prolonged hospital stay, a reduced quality of life (QoL), and increased costs of healthcare. High prevalent complications after cardiac surgery in older patients are delirium (11.9% - 43.1% ), depression (15% - 18% ), pressure ulcer (13% - 18% ), and infection (1.3% - 2.4%). The risk of developing postoperative complications is not the same for every older cardiac surgery patient. Frail older patients are more likely to experience postoperative complications than non-frail older patients.

Because postoperative complications occur more frequently in frail-older patients, nurses will increasingly be charged with the care for these patients. Simultaneously, sources claim that the nursing care for these patients is insufficient. Research has shown that if they optimize the preparation of older cardiac surgery patient prior to the hospital admission period, postoperative complications can be prevented.

We therefore developed a multi-component preadmission nursing intervention called 'PREvention Decline in Older Cardiac Surgery patients' (PREDOCS) to prepare older patients better for elective cardiac surgery and to prevent postoperative complications. The PREDOCS programme includes a comprehensive geriatric nursing approach aimed to prevent four frequently occurring postoperative complications in cardiac surgery: delirium, depression, pressure ulcers and infections. The programme can be offered to patients 65 years and older who are scheduled for cardiac surgery. It consists of one nursing consult, two to four weeks prior to surgery.

**Method:** A multicomponent preadmission intervention was developed using several previously performed studies, these are; a systematic review for effective preventive interventions; an etiological study on links between preadmission patients characteristics and the occurrence of postoperative complications; a prognostic study resulting in instruments for predicting the risk of occurrence of the four postoperative complications; interviews among cardiac surgery patients about their needs before and during hospitalization; and a survey among nurses to their views on prevention, diagnosis and treatment of the four postoperative complications. These studies resulted in five international publications. In addition, the intervention was reviewed by four experts in the areas of delirium, depression, pressure ulcer, infection, and anaesthesiology. It was also reviewed by six employees (doctors and nurses) in the hospitals participating in this multicenter study.

Before the clinical effects of such a complex multicomponent intervention can be evaluated, the feasibility was determined to detect possible problems with the acceptability, compliance and delivery. Two large cardiac surgery centres and one university hospital in the Netherlands participated in the assessment of feasibility. The cardiac surgery centres were St. Antonius Hospital in Nieuwegein and the Isala Clinics in Zwolle, where respectively over 1900 and 1400 cardiac surgeries are performed each year. At the University Medical Centre of Utrecht, over 800 cardiac surgeries are performed each year. This resulted in a sixth international publication.

**Results:** To improve the patients' physical, social, and psychological condition in the preadmission period and thereby reduce the occurrence of delirium, depression, pressure ulcer, and infection after cardiac surgery, at preadmission the PREDOCS programme is introduced.

In February 2014 nurses at the cardiac thoracic ward at the St. Antonius Hospital started to use this program for patients 70 years and older, four weeks before admission at the preadmission.

The intervention included three parts:

1. The intervention is administered during a consultation by the nurse two to four weeks before the surgery procedure. The consultation includes three parts: a general part for all patients of 70 years and older, patients received general advice regarding nutrition, social support, pain management, and the upcoming surgery
2. A second part, in which patients with an increased risk are identified. The patients' risk to develop postoperative delirium, depression, pressure ulcer, and infection was calculated using scorecards.
3. A third part in which selected patients are informed about how to prepare themselves for the hospital admission to reduce their risk.

**Conclusions:** The average time the nurses spent on the intervention is 20 minutes. This includes a social-talk and recruitment. For the nurses, the preadmission intervention is complete and concrete. There are tools for the preparation of the coming surgery for the patients. Moreover, patients and relatives appreciated the given advices. The preadmission intervention is complementary to usual care.

## CLIN PST 2 - Clinical Poster Session 2

### Innovative Teaching Strategies for the Community Clinical Student: Engaging Students Where They Live

---

*Bilinda L. Norman, MSN, BSN, APRN, CNS, CDE, USA*

#### Purpose

The purpose of this presentation is to demonstrate ways the community clinical experience engages nursing students in the community where they live. With shorter length of stays in the acute care setting, the community health care nurse has assumed the responsibility of caring for more patients on an outpatient basis.

#### Target Audience

The target audience will be educators (RNs, faculty) who wish to learn more about unique clinical experiences for traditional and non-traditional nursing students.

#### Abstract

The purpose of this presentation is to demonstrate ways the community clinical experience engages nursing students in the community where they live. With shorter length of stays in the acute care setting, the community health care nurse has assumed the responsibility of caring for more patients on an outpatient basis. To meet the challenging needs of health care, a mid-southern university used a wide array of community resources to immerse their students into various types of nursing opportunities in the community setting rather than the typical acute care setting. The students were introduced to community nursing in settings such as diabetes management, dialysis, wound care, school nursing, cancer centers, and a variety of other outpatient venues.

Community health nursing provides care not only to the individual patients, but to the families and the communities in which they live. The BSN nursing students are immersed into the community experience, allowing an opportunity to become well-rounded and explore a variety of nursing challenges. With the changing health care system, and the advancing age of the population, nurses are needed more in the home and in the community setting.

Nurses in the community setting serve as educators, advocates for the patients, counselors, and patient liaisons/case managers, as well as providers of direct patient care. Students have observed that these clinical opportunities have opened their eyes to new avenues which nursing has to offer that were nonexistent prior to this clinical experience and have realized that community nursing plays a vital role in caring for the chronically ill and the aging population as well as the under privileged and under-served populations.

This presentation will give specific examples of community health nursing facilities utilized to provide an opportunity for senior students to be exposed to a variety of nursing opportunities within the community. The students were able to utilize critical thinking skills, advocate for individual patients and families, and provide direct patient care.

### Action Research on Health Providers and Consumers' Collaborative Initiatives for Provision of Community-Based Health Promotion Services in a Sub-Urban Community of South-East Nigeria

---

*Idongesit I. Akpabio, PhD, MSc, MPA, BSc, RN/RM, FWACN, Nigeria*

*Ekpoanwan E. Esienumoh, PhD, MPH, BSc, RN/RM, FWACN, Nigeria*

*Felicia S. Akpabio, MPH, BNSc, RN, RM, FWACN, Nigeria*

*Regina E. Ella, PhD, MEd, BSc, RN, RM, FWACN, Nigeria*

#### Purpose

The purpose of this presentation is to empower the target audience with knowledge of steps and strategies needed for sustained, inter-professional, collaborative community-based health promotion services with focus on empowering clients to take control over their health and its determinants, which invariably is expected to improve their health.

#### Target Audience

The target audience of this presentation is conference attendees who are currently or potential providers of community health services, nursing students and all cadres of current or potential nurse educators who should be in positions to teach others.

#### Abstract

**Introduction:** Globally, for over three decades, many member nations of the World Health Organization, including Nigeria had adopted primary health care as the focus of their health policy with emphasis on community-based health promotion and disease prevention. However, many studies have confirmed that emphasis of healthcare in many parts of the world has been on curative, short-term, institution-based and individually focused prevention interventions. Several health promotion research literature also show that community health nurses have not yet demonstrated a clear practical role in implementing community-based health promotion activities in collaboration with other healthcare providers and consumers. These deviations in health practices have resulted in low health indices of citizens in several countries of the world as indicated in the 2014 Legatum Institute reports. To bring about a transformative community health nursing practice, this action research was proposed to empower members of the community to collaborate with healthcare providers for the provision of community-based health promotion services. The objectives were to: carry out a participatory fact-finding assessment of community-based health promotion needs and service provision structures; collaboratively plan and implement actions for the provision of community-based health promotion services and evaluate outcomes of the actions with in-built measures for sustainability of the services.

**Methods:** Mobilization of members of the research team and the participatory fact-finding assessment took place in the third week of November 2014. For the research team members, inclusion criteria were community health nurses, community health extension workers, policy makers, community leaders, church representatives, environmental health officers and social services providers. Following ethical approval from the Municipal Council and informed consent from the participants, data were collected using twenty-seven interviews and two focus group discussions (FGDs). Each of the FGDs involved nine participants with the pre-determined criteria, recruited through purposive and snowball sampling techniques. Altogether, two FGDs and four research team meetings were carried out, and twenty-seven members of the community who were not members of the FGDs were interviewed.

**Results:** Data were analyzed thematically following verbatim transcription of the interviews and the FGDs. The following themes emerged: Poor public drainage system in the community, improper waste disposal; inadequate supply of potable water; need for health promotion information; youth involvement in alcoholism and cannabis smoking; poor formal educational status of the children and youth; poor

infrastructure (including lack of power supply that has lasted several months; lack of Health Centre) and lack of knowledge of existing health policies for the benefit of the community.

These findings were critically reflected upon by the action research group and interventions were jointly prioritized, planned and implemented with the hope to bring about solutions.

**The actions included:** 1) Creating supportive environment for health promotion. This covered three perspectives: a) Establishment of health committees in the community and the two churches within the community to strengthen leaderships for health promotion; b) Advocacy meeting with the Chairman of the Municipal Council for improved health infrastructure, advocacy for the provision of a Health Centre and primary school and resource allocation and utilization for health promotion; c) For Inter-professional collaboration and multi-sectoral approach to service delivery, advocacy meetings were held with the General Manager of the electricity organization and the Manager of the Water Board for restoration of power supply to affected parts of the community and provision of potable water supply respectively. Similarly, the Sanitation Board was contacted to provide commercial waste receptacles at strategic locations in close proximity within the community to encourage safe and sanitary waste disposal. The services of a town-planner was engaged by the community to advise and assist house owners on appropriate ways of channeling rain water from their homes for proper drainage to avoid the menace of flooding and collection of stagnant water along the roads with the consequences of producing unhealthy environment. 2) Strengthening community action through community mobilization and education. 3) Capacity building through education of the action research group members and members of the health committees on health promotion and health education strategies as well as strategies for health surveillance. This action was aimed at developing their skills for health education of their people on identified areas of health promotion needs. Youth volunteers in the community were identified and trained as peer educators for prevention of alcoholism and smoking. 4) Promotion of public policies. This included new regulations agreed upon by the community leaders to control unhealthy waste disposal.

**Evaluation:** The first participatory evaluation of the actions was undertaken by the members of the action research group in the third week of January, 2015. The findings included the following: political will to build a Health centre and Primary school for the community and to achieve this goal, the community was requested to provide an empty land for the projects. Also, the health committee members and the co-researchers took a decision to disseminate health information monthly at the market place, the community hall and in each of the two churches within the community. This action had commenced in December 2014 and is ongoing with one health education programme monthly in each of the designated places. The health education topic is usually based on areas identified by members of the community and research team as the area of need. Furthermore, through this community-based health promotion action research effort, it was possible for the health committee to utilize the efforts of the youths in the community and the sanitation board to evacuate refuse and improve their drainage system. Additionally, every last Saturday of the month was fixed for compulsory sanitation within the community and this has been found to be very effective in promoting the sanitary condition of the community. In addition to that, the community also decided on sanctions for wrong channeling of rain water from individual homes to cause flood along the roads and indiscriminate refuse disposal, but successfully promoted compulsory ownership of toilet facility in every home within the community. Very importantly, members of the community have continuously expressed their delight at the opportunity of having healthcare personnel available to facilitate their education on health promotion and empower them for actions, which according to them “have been very useful”

**Conclusion** The community is an important resource which if mobilized through the process of action research, would be empowered for health promotion activities. The process fostered inter-professional collaboration among healthcare and social services providers and similarly empowered healthcare consumers to take control over their health and its determinants, which invariably is expected to improve their health. The implication of the findings of this action research is that community-based health promotion practices should be recommended globally to enhance transformative community health nursing practice for the sustenance of health benefits to the society.

### Critical Communication in Escalation of Care

---

*Kate McConathy, BSN, RN, USA*

*Sheila Montgomery, MSN, RN, USA*

#### Purpose

To discuss a critical event, the barriers within escalation and what can be done within debriefing to improve outcomes. Debriefing can pinpoint areas of improvement for those involved in the events. These events need to be examined in a safe and effective way that improves patient safety and decreases cost.

#### Target Audience

The target audience is front-line nurses and nursing leadership.

#### Abstract

This presentation will discuss a critical event, the barriers within escalation and what can be done within debriefing to improve outcomes. Communication during critical events can be very stressful for the family, nurse, care team, and the patient. Critical events occur throughout hospital environments. Debriefing can pinpoint areas of improvement while providing emotional support for those involved in the events. Critical events occur when patients need escalation of care; such as the patient experiences a change in heart rate, blood pressure, levels of oxygen saturation, decreased level of consciousness. These events need to be examined in a safe and effective way that improves patient safety and decreases cost. Active involvement of the entire team involved (including floor nurses) encourages patient safety and improved management of patients during critical events. Debriefing identifies the knowledge gaps of the nursing staff. Debriefing allows the hospital to address inconsistencies in critical situations and educate to improve patient care. Debriefing reduces the costs by reducing errors and helps save lives.

## CLIN PST 2 - Clinical Poster Session 2

### Re-Examining Metoclopramides' Role in the Prevention of Postoperative Nausea and/or Vomiting: A Secondary Analysis

---

*Amy Masiongale, DNP, CRNA, USA*

*Jane Garvin, PhD, RN, USA*

*Marguerite J. Murphy, DNP, RN, USA*

*Stephen W. Looney, PhD, USA*

#### Purpose

While current practice guidelines recommend several antiemetics for postoperative nausea and/or vomiting (PONV) prophylaxis, metoclopramide was not recommended. These guidelines contain published research that has been discredited. Therefore, the purpose of this study was to re-examine metoclopramide's effectiveness, describing the incidence of subsequent PONV among adult ambulatory surgical patients.

#### Target Audience

All nurses that provide care for adult surgical patients to include preoperative, intraoperative, and postoperative care. Academic nurses that teach perianesthesia courses and administrative nurses involved in policy development for anesthesia and surgical services.

#### Abstract

Postoperative nausea and/or vomiting (PONV) continue to be two of the most undesirable and distressing complications following general anesthesia, affecting 20-30% of all surgical patients and up to 70% of patients with multiple known risk factors. Clinical guidelines recommended identifying PONV prophylactic interventions based on risk score. While the guidelines recommend several antiemetics, metoclopramide was not recommended. The guidelines were tainted by systematic reviews and meta-analyses that included the work of one widely published researcher that has been discredited. Therefore, the purpose of this study was to re-examine the use of metoclopramide and describe the incidence of subsequent PONV among adult ambulatory surgical patients. Secondary data from a 12-center, observational, cohort study of 2170 adult ambulatory surgical patients collected from 2007-2008 were analyzed. The parent study contained variables of interest that were recoded for this study including demographics, PONV risk factors, antiemetic use, and incidence of PONV. Descriptive statistics were used to characterize the sample in terms of PONV risk factors and incidence of PONV. Chi-square was used to determine differences between groups. Cohen's *d* was used to describe the effect size for reduction of PONV for each antiemetic group compared to the expected risk of PONV based on PONV risk score. Of the 2116 participants with sufficient data to calculate risk scores, participants were on average 49.7 (SD = 15.4) years of age and overweight (body mass index = 28.3, SD = 6.9), and primarily female (N = 1379, 65%). PONV risk scores ranged from 0-4 with a mean 2.6 (SD = 1.0). Metoclopramide 10 mg IV alone had a beneficial effect with risk scores of 1 and 2 (0% PONV vs. expected 21% and 39%) and 3 (50% PONV vs. expected 61%, *d* = 0.22). Metoclopramide 10 mg IV combined with ondansetron 4 mg IV had a large effect for PONV risk scores of 1 (0% PONV vs. 21%), 2, 3, and 4 (8% vs. 39%, 16% vs. 61%, 36% vs. 79%; *d* = .78, .97, .90; *p* = .046, < .001, .001, respectively). Metoclopramide 10 mg IV combined with dexamethasone 8 mg IV and ondansetron 4 mg IV had a beneficial effect for PONV risk scores of 1 and 2 (0% vs. 21%, 0% vs. 39%) and 3 and 4 (25% vs. 61%, 35% vs. 79%; *d* = 0.75, 0.92; *p* = .025, < .001, respectively). While this cohort study had limitations, future studies should investigate metoclopramide use based on risk score recommendations and guidelines should be re-evaluated.

## CLIN PST 2 - Clinical Poster Session 2

### Knowledge and Practice for Prevention of Hepatitis B among Practicing Midwives in University of Calabar Teaching Hospital, Calabar Nigeria

---

*Regina E. Ella, PhD, MEd, BSc, RN, RM, FWACN, Nigeria*

#### Purpose

The purpose of this presentation is to empower the midwives who come in frequent contact with clients blood/body fluids and other health workers with knowledge of hepatitis B virus universal precaution as a strategy to reducing Hepatitis B transmission and mortality in developing countries.

#### Target Audience

The target audience of this presentation includes the conference attendees, nurse clinicians, nurse educators, nurse administrators, student nurses and student midwives, health policy makers, who should be in position to educate, ensure practice and enabling environment to all preventive measures especially to Universal Precautions.

#### Abstract

**BACKGROUND:** Globally it is estimated that about 400 million individuals are chronic carriers of hepatitis B virus (HBV) and that more than a million people die annually from HBV related causes. Hepatitis B Virus (HBV) is the blood-borne communicable disease and the ninth leading cause of death worldwide. Though, a major public health issue world wide, the prevalence is higher in the developing countries than the developed. There is an average carrier rate of 10 - 20% in sub-Saharan African general population and 9 to 39% in Nigeria. The high carrier rate and hepatitis B being an endemic disease in Nigeria reveal the associated risk of infection among nurses and midwives who have frequent contact with infected blood through invasive procedures. The most frequent route of transmitting Hepatitis B Virus is through needle stick injury. HBV is a hospital acquired infection which could be transmitted from an infected health-care provider to patients or vice visa which calls for precautionary measures to be put in place to reduce the mortality associated with this disease. However, if the midwife is infected it becomes more precarious because the life of the mother and the baby that she come in contact with on a daily basis stands the risk in this one infection. This study, therefore, assesses midwives knowledge and practice towards the prevention and control of Hepatitis B infection in University of Calabar Teaching Hospital, Calabar Nigeria.

**METHOD:** A descriptive research design was utilized to obtain information on midwives' knowledge and practice for prevention of Hepatitis B. Purposive sampling technique guided the recruitment of 120 practicing midwives who work in labor, ante-natal, post-natal and gynecology wards of the University of Calabar Teaching Hospital from July to November 2013. A self-structured questionnaire with content validity index of 0.79 and a test-retest reliability coefficient of 0.81 was used to elicit information from respondents. Data was analyzed using simple proportion and parametric test-chi-square ( $X^2$ ) at  $p < 0.05$ .

**RESULTS:** The result showed that majority of the respondents 58 (48.4%) were between age 25 and 34 years; majority of these respondents 83 (69.2%) had worked between 10 and 20 years and were mostly diploma holders 96 (80%). The results also revealed that 78 (65%) respondents had good knowledge of hepatitis B virus, and 83 (69.2%) respondents practiced universal precautions while 37 (30.8%) did not. Majority of the respondents 117 (95.5%) had never contracted hepatitis B infection, while 3 (2.5%) had been infected with hepatitis through practice. Most of the respondents 96 (63.3%) had received hepatitis B vaccine while a high minority 44 (36.7%) had not. Further results highlighted a statistically significant relationship between knowledge regarding prevention of hepatitis B infection and practice of universal precaution to protect against hepatitis B among practicing midwives in UCTH (cal  $X^2 = 15.6$ ;  $p < 0.05$ )

This result finding is encouraging considering the fact that knowledge is usually the first step towards the modification of desirable behavior. However despite the respondents high knowledge of the infection and practice of universal precautions, about 22% had poor knowledge of infection while 37% did not practice

universal precaution. This gap calls for concern seeing that the only way to prevention of hepatitis B infection among practicing midwives is through effective vaccination and adherence to universal precautions which often times cannot be guaranteed.

**CONCLUSION:** The result of the study affirms a significant relationship between knowledge and practice of universal precaution. It was therefore concluded that deliberate programmes of continuing education and training be designed for the target population and other health care workers in general, and vaccines be continuously provided to enhance compliance to universal precautions and to prevent Hepatitis B in the clinical areas

## CLIN PST 2 - Clinical Poster Session 2

### Clinical Nursing Experiences in Rural Aboriginal Settings

---

*Steven M. Ross, MN, BSN, RN, Canada*

#### Purpose

The purpose of this presentation is to describe the implementation of a collaborative innovative nursing practice education hub at an Aboriginal Friendship Center in which the intent is to address the identified shortage of registered nurses and their high rate of turnover in First Nations communities.

#### Target Audience

The target audience of this presentation is individuals interested in developing practice opportunities with local Aboriginal peoples or minority groups with the intent of supporting future graduates that are prepared to provide culturally safe care and to recognize and address inequities experienced by Aboriginal peoples.

#### Abstract

**INTRODUCTION:** In 2011, a nursing education practice hub was established at the Conayt Friendship Centre in Merritt, BC to address the identified shortage of registered nurses and their high rate of turnover in First Nations communities. The intentions of this partnership were to:

- strengthen relationships between Conayt, Aboriginal peoples of the Nicola Valley, and faculty/students of the TRU School of Nursing (SON)
- develop students' competence to function in community health and relevant practice roles in Aboriginal rural communities
- promote students' ability to support Aboriginal peoples' health and well-being
- increase the number of new graduates planning to work within rural Aboriginal communities

**BACKGROUND:** Thompson Rivers University (TRU) is located in a region rich in both urban and rural Aboriginal communities that span a large geographical area which includes the traditional lands of five different Nations. TRU is committed to being the "University of Choice" for Aboriginal peoples and has one of the largest Aboriginal student populations in the BC post-secondary system.

The SON has worked in partnership with many Aboriginal individuals, organizations, and communities over the years to increase the number of Aboriginal nursing graduates, and to develop practice opportunities with local Aboriginal peoples so that all its graduates are prepared to provide culturally safe care and address inequities experienced by Aboriginal peoples.

The Conayt Friendship Center is located in Merritt, a small city in the Nicola Valley of the south-central interior of BC, Canada. "Conayt" comes from the Nlaka'pumux word for "helping others", and the Centre is devoted to improving holistically the quality of life and cultural distinctiveness of clients and families, and strengthening friendship and cooperation between the Aboriginal and Non-Aboriginal members in the territories. Conayt also offers numerous programs and services to address these aims.

**THE CONAYT PROJECT:** Drawing on the principles of community development, faculty worked with members of Conayt to develop opportunities for students that were responsive to both student learning and community health needs. Student and faculty engaged with Elders, members of interdisciplinary teams, and other community members to build trusting and reciprocal relationships as they worked in a variety of programs and services offered on and off reserve through Conayt and rural Aboriginal health centres and communities.

Students were involved in public health and home and community care when they worked with community nurses on reserve, they developed projects with community agencies addressing harm reduction, Youth programs in the community, pre and postnatal program for Aboriginal and families in

need, and developed initiatives within the supported housing programs at Conayt. Weekly seminars connected students' together and provided space and time to share their experiences, learnings and to address issues relating to race, power, privilege and cultural safety.

OUTCOMES: Elders valued opportunities to talk, share stories, explain and demonstrate elements of Aboriginal culture. This was seen as important in developing nurses that are holistic, understanding, connected, and respectful of the traditions of Aboriginal people. Elders embrace opportunities to pass along knowledge to youth and suggest it provides a sense of self-worth.

Faculty were valued as mentors, educators, and resources for some community health placements, particularly those with limited nursing supports.

Faculty identified the growth of both students and themselves in their cultural safety as a key outcome of the experience. They also noted the desire of the Aboriginal communities to work with students and share their knowledge and experience with both students and faculty. Embracing a community development approach, with emphasis on relationship building, was critical to the success of collaborating with Aboriginal people and communities

Students thought this practice placement provided many opportunities for them to:

- develop relationships based on trust and equity
- engage with and develop understanding of the lived experience of members of these Aboriginal communities
- understand the past and present impact of residential schools and colonization on the Aboriginal people of the region
- reflect on the impact that personal bias, misconceptions, and stigma could have towards culturally diverse populations
- recognize the prevalence, impact, and management of chronic health conditions in Aboriginal communities
- understand the value of alternative and traditional medicines
- consider career opportunities in Aboriginal communities

CHALLENGES:

- Some of the second year students expected that all their clinical placements were going to be in an acute care setting.
- Merritt, which is a 45-60 minute drive from the TRU campus, is a high mountain highway subject to significant weather changes in the winter months.
- Initially, faculty and students were used to more structured practice placements. They learned to be more flexible and open to learning opportunities as these unfolded.

REFLECTIONS :

- Cultural immersion experiences provide valuable learning for nursing students and are possible across a variety of geographic locations and cultures.
- Taking time to develop relationships and using a community development approach is critical to the success of collaborating with Aboriginal communities.

## CLIN PST 2 - Clinical Poster Session 2

### A Concept Analysis of Caring

---

*Odette A. Spencer, MS, RN, FNP-BC, USA*

#### Purpose

The purpose of this presentation is to closely examine the concept of caring to educated nurses unfamiliar with the depth and complexities of homelessness to improve nurse-patient relationship and increase nurses willingness to serve the homeless population.

#### Target Audience

This activity was developed for healthcare providers who are involved in treating patients experiencing homelessness.

#### Abstract

Caring represents a basic tenet of nursing that undoubtedly defines the profession. Yet, it remains a somewhat ambiguous term, with a plethora of different ways of conceptualizing it. Using the Walker and Avant methodology of a concept analysis, the internal structure and function of caring as a concept is explored within the context of healthcare for homeless. Research has shown that encounters between homeless population and nurses are not always positive. Faced with the inability to secure stable housing/employment and affected by chronic illnesses, limited access to healthcare, substance addiction and/or mental problems, most homeless persons are clearly disadvantaged. As a result, many homeless individuals feel unwelcomed when seeking healthcare. Homeless health care has to deal with many challenges as homeless individuals tend to experience feelings of disconnectedness and hopelessness. Therefore, it is important to revisit the concept of caring in order to demonstrate that the nurses have a clear potential to make an otherwise difficult situation of the homeless in U.S. today significantly more tolerable.

Key words: caring, homelessness, concept analysis

### Selected Factors Related to Quality of Life of Low Back Pain among Thai Patients in Orthopedics Clinic at Police General Hospital

---

*Bencharat Somgiat, RN, MS, Thailand*

#### Purpose

to study the quality of life of low back pain among patients in orthopedics clinic at Police General Hospital and to examine the relationships between variables such as personal factors and job characteristics and environment in working factors and quality of life (QOL).

#### Target Audience

to prepare a nursing guideline for patients in low back pain. Nurses should advise to properly enhance prevention in their work is a key component to decrease some factors related to quality of life.

#### Abstract

**Background** : Low back pain is a very prevalent pain condition that is often associated with increased disability, decreased relationship satisfaction and diminished quality of life.

**Objective** : The purposes of this research were to study the quality of life of low back pain among patients in orthopedics clinic at Police General Hospital and to examine the relationships between variables such as personal factors and job characteristics and environment in working factors and quality of life (QOL).

**Measurement** : The samples consisted of 142 low back pain among patients in orthopedics clinic at Police General Hospital. The quality of life questionnaire was tested content validity and reliability with the Alpha of .87. Statistical methods used to analyze the data were frequency, percent, mean, standard deviation, and Chi-square correlation.

**Results** : The results of the study revealed that;

1. The overall quality of life of low back pain among patients in orthopedics clinic at Police General Hospital was at the moderate level with mean score of 3.30 .
2. Personal factors were not related to quality of life.
3. Factors which were statistically significant related to quality of life. ( $p < 0.05$ ) included : bending and twisting while working and the weight of the load lifted, the surface of floor and vibrated feeling while working.

**Conclusion** : Increasing higher QOL of low back pain among patients, nurses should advise to properly enhance prevention in their work is a key component to decrease some factors related to QOL.

## CLIN PST 2 - Clinical Poster Session 2

### Are We Ready for Ebola?

---

*Leah B. Abecassis, MSN, BS, RN, CCRN, USA*

*Paula Conrad, BSN, RN, CCRN, CPN, USA*

*Joanne Kinlay, MMedSci, BSN, RN, CIC, USA*

#### Purpose

The purpose of this poster is to describe a training program designed to prepare healthcare providers to safely give direct care to patients with confirmed or suspected Ebola Virus Disease.

#### Target Audience

The target audience of this presentation is nursing and physician staff who will be taking direct care of the patient with potential or actual Ebola Virus Disease.

#### Abstract

Ebola virus disease (EVD) is one of many viral hemorrhagic fevers. It is a horrible, often deadly disease in humans. Bodily fluids from a patient with EVD are highly infectious, and therefore use of special contact and droplet precautions while caring for patients with potential Ebola Virus Disease (EVD) is vital to preventing spread of the virus (CDC, 2014). Our hospital started preparations for these distinct precautions with use of specialized protective personal equipment (PPE) that follows the Centers for Disease Control guidelines. In preparation for a suspected or real case of EVD, there have been PPE trainings done with the Intensive Care Unit staff in the location in the hospital where these patients would be cared for. This training included a one hour practice session with a trainer on donning and doffing, staff being sent home with kits to practice on their own, and then a sign off, done by a trainer, of competence in the skills to don and doff the PPE. The training process was done during work hours and there were rooms dedicated just for use in training purposes for four weeks.

The objective of this quality improvement project was to determine whether health care providers (HCPs) felt adequately prepared in PPE use, should a suspected or confirmed case of EVD present to our hospital for care.

An online survey of 49 HCPs (41 nurses and 7 physicians) working in the medical intensive care unit was conducted. The years of experience as a nurse or physician ranged, with 16 (49%) HCPs having 5-10 years of experience. The 10 question survey, using the Likert scale, assessed comfort level with PPE training and care of the EVD patient.

There were 29 (68%) nurses and 4 (57%) physicians who responded to the survey. That is a 67% response rate to the survey (n=33). Prior to receiving PPE training, 4 (12%) of HCPs indicated they were comfortable with caring for an EVD patient, while 17 (52%) stated they were uncomfortable. Following training, 9 (27%) HCPs were comfortable with caring for an EVD patient, while 8 (24%) were uncomfortable. 21 (65%) HCPs practiced donning and doffing PPE between 3-5 times. 6 (18%) had practiced 6 or more times. 18 (55%) staff members felt that they had adequate practice using the PPE.

Understanding the factors that contribute to the willingness of health care providers to provide care during an Ebola outbreak is critical to emergency preparedness. Some studies have shown that keeping staff informed of the emergency plans, stocking PPE, and having the PPE available to HCPs, improves their willingness to work during a pandemic (Devnani, 2012). Another important factor is comfort with the contents of their PPE and how to use it. In order for people to be more comfortable and prepared, there need to be frequent training sessions (Loke, Fung, and Liu, 2013). Feistritzer, Hill, Vanairsdale, and Gentry (2014), stated that the HCP team at Emory in their biocontainment unit has rapid cycle education with competency verification, including the donning and doffing of PPE, to ensure the safety of their staff.

In the next iteration of our survey, we should include more questions that lead us to understand the background behind the discomfort that staff have, and how to improve their comfort level. The information from this survey leads our group to conclude that a smaller volunteer team with more hours of practice may be in the best solution to who should care for these patients.

### Transforming Care for Individuals with Developmental Disabilities: Innovations in Education

---

*Catherine M. Mann, EdD, MSN, BSN, RN, CNE-C, USA*  
*Lisa Sherry Ball, PhD, MS, BSN, RN, FNP-BC, USA*

#### Purpose

The purpose of this presentation is to share innovative graduate, undergraduate, and community education strategies and resources to improve care for individuals with developmental disabilities. Regional strategies adapted for local programs developed to empower clinicians to act as global leaders and change agents for this underserved population will be discussed.

#### Target Audience

The target audience of this presentation is nurse educators, clinicians, students, and healthcare administrators.

#### Abstract

Nursing faculty recognize individuals with developmental disabilities as an underserved community with unmet needs. Disparities in health care may be attributed to lack of health provider knowledge and comfort in caring for the population (Centers for Disease Control and Prevention, 2014; Ward, Nichols, & Freedman, 2010).

In response to the New York State Developmental Disabilities Planning Council's (NYS DDPC) call for proposals related to piloting, evaluating, and infusing innovative programs to educate and empower health care professionals to act as leaders in providing quality health care to people with developmental disabilities (NYS DDPC, 2012), innovative graduate, undergraduate, and community education strategies and resources were developed, implemented, and evaluated.

"Partners in Health Education for People with Disabilities," initially implemented in January 2013, is an ongoing innovative program that was developed to educate and empower nurse practitioners and physician assistants to act as leaders in providing quality health care to people with developmental disabilities. The program focused on improving abilities to (a) synthesize concepts from pathophysiology and epidemiology with societal and legal issues affecting individuals with developmental disabilities across the lifespan, (b) demonstrate leadership and evidence-based practice competencies as members of the interdisciplinary team, and (c) employ competent patient-centered care to individuals with developmental disabilities.

"Educating Nurses to Care for Medically Fragile Individuals with Developmental Disabilities" is a program presenting opportunities to develop advocacy and leadership skills when caring for medically fragile individuals with developmental disabilities and their families. Initially implemented in September 2013 for registered nurses, the program was expanded in Fall 2014 to include all health care students and professionals.

The purpose of the current presentation is to share strategies and resources for use in graduate, undergraduate, and community education to improve health care for individuals with developmental disabilities and their families. Regional strategies and resources used in local programs to empower clinicians to act as leaders and change agents for this underserved population will be presented. Implications for broader implementation in education will further be discussed.

### Truly Flipped Practicum: From Patient Safety to Community Safety Story Quilt

---

*Pamela Allyn Di Vito-Thomas, ADN, BSN, MS, PhD, RN, CNE, USA*

#### Purpose

The purpose of this presentation is to imprint the development of tomorrow's nurses as community health and population health nursing students in innovative teaching/learning environments to facilitate the transitions from education to practice and reach toward the benchmark of the AACN Essentials VI.

#### Target Audience

The target audience of this presentation is for faculty exploring innovative and creative educational redesigns for population health and community clinical practicum with a goodness –of –fit for present-day nursing education.

#### Abstract

On Nov. 21, 2013 an EF-4 tornado raged through Washington, IL leaving a path of deadly destruction. And in the central Illinois region, the utility for nursing curriculum to develop and practice community emergency management is evident. In this student-learning centered poster presentation the "Truly Flipped Practicum: From Patient Safety to Community Safety Story Quilt" serves as a unique example of taking community health nursing students beyond traditional learning strategies to "being in the moment." This exceptional educational experience of walking beside community leaders was paramount in actively contributing to the city office (Office of Emergency Management), and for the community and population health curricula by revising the abridged "Call to Action" in-class program.

Oftentimes, as nursing students progress from acute care to community based clinical settings, the change of thinking, sensing, and seeing "community as client" may be obscure until the light fog begins to lift and broader ways of "thinking like a community and population health nurse" begin to emerge. As faculty, I joined the new journey of a senior nursing student group, and served to carry the light for these student's paths, to walk beside the students, and help them through the experiential learning process to catalyze the change in behavior that bears evidence of growth and personal satisfaction. In a short time, the fog began to dissipate, the vision became clear, and evidence flourished as the group moved through the assignments focusing on downtown Peoria, Illinois and the Office of Emergency Management. Included in the assignments were; a windshield survey, agency analysis, and a comprehensive community health assessment and analysis using the goals of Healthy People 2020. By working together the group developed a most creative and unique presentation; "From Patient Safety to Community Safety Story Quilt."

Notably, nursing faculty imprint the development of tomorrow's nurses as community health and population health nursing students are engaged in innovative teaching/learning environments to facilitate the transitions from education to practice and reach toward the benchmark of the AACN Essentials VI Inter-professional communication and collaboration for improving patient health outcomes; and VII Clinical prevention and population." While nursing students were "being in the moment" the distinct set of newly created pictorial storytelling blocks captured the underlying story, and yielded both formative and summative assessment data for the practicum. Up and coming practice challenges will surely be evidenced as nurses step out into the health care environment generating partnerships with practitioners and stakeholders to promote and support our national treasure-health. The "From Patient Safety to Community Safety Story Quilt" process and project is an educational redesign with a goodness –of –fit for present-day nursing education.

## CLIN PST 2 - Clinical Poster Session 2

### Integrative Review of the Transitions of Emerging Young Adults with Type 1 Diabetes

---

*Jennifer Saylor, PhD, RN, APRN-BC, USA*

#### Purpose

The purpose of this presentation is to conduct an integrative literature review of the transitional experience among young emerging adults with type 1 diabetes. This poster will illustrate the barriers and facilitators experienced among those transitioning to adult care and college with type 1 diabetes.

#### Target Audience

The target audience of this presentation is all members of Sigma Theta Tau International, including students, clinicians, nurses, faculty, and researchers. All members will benefit from understanding the barriers/facilitators of individuals with type 1 diabetes and their transition to adult care settings/college, which is similar to other chronic illness.

#### Abstract

**Background/Purpose:** Approximately three million Americans have type 1 diabetes, which is the most common childhood metabolic disease. Transitional events among emerging adults from late adolescence to late twenties may cause physiological and psychological difficulties, especially for those with type 1 diabetes. Although research is more prevalent in the early and mid-adolescent age groups, there is a dearth in the literature among the emerging adults age group. This vulnerable population undergoes a critical transitional time with an overwhelming sense of developing independence. This critical phase may impact the trajectory of type 1 diabetes management not only physiologically, but also psychologically throughout one's lifespan. This integrative literature review evaluates the current state of the science of emerging adults with type 1 diabetes during transitional events.

**Methods:** A comprehensive multi-step literature search (published 1994–2014) of transition, type 1 diabetes, and young adults, which indexed in the CINAHL, Pubmed, PsychINFO and Cochrane databases was performed. A sample of 36 research and non-research reports met the inclusion criteria. All 36 articles were included in the review. A systematic and iterative approach was used to extract and reduce the data to draw conclusions.

**Results:** This analysis revealed that the most crucial transitional events among emerging adults with type 1 diabetes are those that promote independence, including attending college, leaving parents' home, obtaining new employment, and transferring from a pediatric to adult care. Stress was a common theme among emerging adults, especially those in college with erratic eating, sleeping, and course schedules. Balancing college living and diabetes management is essential but non-existent in the literature.

**Conclusions & Implications:** Despite the small sample sizes and descriptive research methods, this review suggests some barriers and facilitators for transitioning emerging young adults with type 1 diabetes. Further research including interventional studies of educating emerging young adults is essential to aid in the transition to college, which may improve diabetes management and quality of life.

## CLIN PST 2 - Clinical Poster Session 2

### Knowledge, Risk Perception and Practice of Health Care Associated Infections (HAIs) Prevention and Control among Primary Health Care Workers in Cross River State, Nigeria

---

*Olaide Bamidele Edet, BSc, MPH, PhD, RN, RM, RNE, FWACN, Nigeria*

*Comfort E. Ekanem, PhD, MPH, RN, Nigeria*

*Margaret Akpan, BSc, MPH, RN, RM, FWACN, Nigeria*

*Iquo Okon, BSc, MPH, RN, RM, FWACN, Nigeria*

#### Purpose

The purpose of this presentation is to highlight gaps in the knowledge and practice of infection prevention and control measures among community health workers at the grass root level in a developing country like Nigeria; with a view of proffering solutions on how to fill the gaps

#### Target Audience

The target audience of this presentation is all health care workers particularly nurses working / interested in offering services, clinical, education or carry out research activities at the grass root /primary/first contact level of the health care system.

#### Abstract

**Background:** Infection control refers to all policies, procedures and activities which is aimed at preventing or minimizing the risk of transmission of infectious disease at health care facilities to workers and general community. The emerging of life threatening infectious diseases have underscored the need for efficient infection control programs in all health care setting and capacity building for healthcare workers to prevent/reduce the transmission of pathogens within health care setting. Primary Care workers are highly susceptible to Healthcare Associated Infections (HAIs) in health care and community settings. In the past 20 years, the overall incidence of health-care associated infection has increased by 36 percent. Health-care Associated Infection occurs worldwide and affects both developed and developing countries. About 5% -10% patients acquire one or more infections in health care setting worldwide. It is also estimated that more than 1.4 million people worldwide are suffering from infections acquired in hospitals. Developing countries were reported to have up to 20 times the risk of contracting a nosocomial infection compared with developed countries (Hopmans, Blok, Troelstra, Bonten, 2007); World Health Organization, 2008.) Very few studies have focused on risk perception, knowledge and practices of HAIs' prevention and control among primary care/ first contact level health care workers. Nurses provide leadership for most of the health facilities at this level care. This study determined risk perception, knowledge and reported practice of infection control measures among Primary Health Care workers as a basis for planning continuing education for health care workers at the primary level. Specifically the objectives of the study were to:

1. Explore Health Care Workers (HCW) perception about susceptibility to nosocomial infections in the work place
2. Determine HCW' s level of knowledge universal and standard precautions HCW at the primary for protecting self and patients from nosocomial infections
3. Assess preventive and control measures utilized by Examine
4. Identify facilitators and barriers to effective practice of IPC measures

**Methods:** A descriptive cross sectional design was used. The study population consisted of 104 primary care workers selected through a purposive sampling technique, from all the LGAs in Cross River State. Responses to a validated 52-item self- reporting, semi-structured questionnaire provided the source of data. The questionnaire was tested for face and content validity by experts on the field. Consent was obtained from the respondents to administer the questionnaire.

**Results:** The mean age of the participants and years of practice were 39.2 +/- 9.1, and 16.8 +/- 9.0. Risk perception for acquiring HIV/AIDS was perceived high by 79(76.0%); HBV by 76(73.1%) and Ebola by 88(84.6%). Findings show that 40(38.5%) had poor knowledge of standard precautions while 64(61.5%) had good knowledge, 62(59.6%) had poor knowledge of hand hygiene while 42(40.4%) had good knowledge; 9(8.7%) had poor knowledge of EBOLA while 95(91.3%) had good knowledge. The major barrier for infrequent use of IPC measures was non-availability of PPE and other resources on a regular basis.

**Conclusion:** Study has shown that risk perception is high; gaps exist in critical aspects of IPC knowledge and practice. PHC workers would benefit from continuing professional education on prevention and control of HAIs including Ebola. This should be organized by professional associations, while government provides the funding. There is urgent need for employers to make available to worker at the primary level regular supply of personal protective equipment. Creating an enabling environment which include provision of wash basins, good hand hygiene agents, masks and frequent monitoring and feedback in addition to knowledge updates should be emphasized to enable health care workers comply with infection control recommendations consistently (Kamulegeya, Kizito, Balidawa, 2013; Mukerji, A, Narciso, J, et al., 2013).

#### Purpose

The purpose of this presentation is to demonstrate the importance and process of proactive education and training for Ebola preparedness including the implementation of an interdisciplinary specialized medical team. Specific guidelines for SMT training and education are also discussed.

#### Target Audience

Any healthcare institution preparing to establish an education and training program for Ebola readiness. All healthcare workers should be able to respond to any contagious pathogen utilizing established protocols and specially trained response teams to decrease the chance of contamination.

#### Abstract

Once believed to be contained to a tropical area in Africa, medical care for a patient with the Ebola disease virus (EDV) remained isolated to the areas affected by this horrific disease. The recent spread of the virus to the western hemisphere has created an urgent need for training and preparation of healthcare workers. The Center for Disease Control (CDC) has recommended that all healthcare facilities establish procedures for the screening, isolation, and transfer of care for any patient suspected of having a highly contagious disease, in order to prevent a global health crisis. The EDV has proven to be a complex pathogen with a high infectious load; even a microscopic level of exposure can cause infection. Increased viral shedding and rapid spreading of the disease require specialized isolation and containment procedures. The Medical University of South Carolina (MUSC), a large academic medical facility with over 700 adult and pediatric beds and two emergency departments, recognized the need for global staff education in order to comply with CDC recommendations. MUSC also identified itself as a potential EDV treatment site and the need to establish an innovative training program with protocols and procedures for escalating care. All medical facility personnel were required to complete a basic educational PowerPoint with post-test to demonstrate knowledge of screening and isolation procedures for all patients. A specialized medical team (SMT) with advanced training in the procedure and care of the Ebola patient was then formed. This specialized team underwent a rigorous three day training course which was separated into two parts. A didactic approach was used to review Ebola disease virus pathophysiology, symptoms, and typical disease progression. Case studies and procedures for lab draws, telemedicine conferencing, and additional supportive equipment and tests were all also reviewed. The second portion of the training was interactive including the donning and doffing of personal protective equipment (PPE), practice in basic patient care while in PPE, and inter-disciplinary high-fidelity simulations including containment procedures, post mortem body shrouding, and the coordinated transition of care from a transport team to the designated unit. SMT members included pre-hospital staff, registered nurses, respiratory therapists, and physicians who volunteered for the training. The implementation of the SMT demonstrated a reduction in anxiety of staff by safely and proactively training personnel in a coordinated training environment. A specific tool "glow germ" was used in all simulation activities to mock Ebola disease transmission. Participants were screened for "glow germ" following any activity in order to detect any break in procedure and possible exposure. Further recommendations include a process for revalidation of skills including unannounced mock patient drills with team members donned in PPE. "Glow germ" measurement should also be used in all revalidation sessions. The recent spread of the Ebola disease virus to the United States has clearly demonstrated the need for preparation and training for healthcare personnel. All healthcare institutions should establish an education plan for staff in order to screen and isolate suspected patients. In addition, facilities preparing to care for an Ebola patient should form a specialized medical team (SMT) in order to provide advance training and practice. Meticulous adherence to policy and the ability to provide care in personal

protective equipment is essential to the safety of all team members. The formation of a specialized medical team utilizing interdisciplinary training establishes standardized protocols for care, prepares personnel in specialized protective equipment and disease containment, and proactively prepares healthcare workers for any global health crisis.

## CLIN PST 2 - Clinical Poster Session 2

### Do Not Smoke Educational Campaign: Collaboration with a School District to Prevent Teen Smoking

---

*Lisa Otto, MSN, BSN, RN, CMSRN, USA*

#### Purpose

The purpose of this presentation is to demonstrate how the clinical project, the do not smoke program, has significant implications to enhance clinical, patient and educational outcomes. The transformative program is designed to prevent and promote change in teen smoking behavior through early educational activities.

#### Target Audience

Nurse researchers, educators, clinicians, and administrators.

#### Abstract

Background: Smoking is a significant problem in the United States with health, societal, and financial cost. An estimated 42.1 million adults (18.1 percent) in the United States actively smoke cigarettes (Agaku, King, Dube, & Centers for Disease Control and Prevention (CDC), 2014; CDC, 2012). The purpose of this presentation is to demonstrate how the clinical project, the do not smoke program, has significant implications to enhance clinical, patient and educational outcomes. The transformative program is designed to prevent and promote change in teen smoking behavior through early educational activities. According to the CDC (2007) tobacco use among men and women is the single most preventable cause of death. Smoking causes cancer, lung disease, and cardiovascular disease. Exposure to tobacco smoke, including the total number of cigarettes smoked over the lifetime, smoking onset age, content of tar and nicotine, as well as smoking cigarettes that are unfiltered, directly relates to the development of lung cancer (Lewis, 2014). Active smoking causes 80 percent of lung cancers deaths (CDC, 2012). In the United States, lung cancer is the leading cause of death in both men and women with health care expenditures of \$289 billion (Jemal, et al., 2008).

Most smokers begin smoking during teenage years; therefore, prevention of teen smoking may be the most significant intervention in reducing incidence of lung cancer (Lewis, 2014). According to the Centers for Disease Control (CDC) (2006), 11.7 percent of middle school students reported using tobacco products, and 8.4 % used cigarettes. Daily, 3,900 youth younger than 18 years of age try cigarettes for the first time, and greater than 950 youth become new, regular smokers. According to Sargent et al (2005), movies that show smoking are a risk factor for youth smoking initiation. Exposure to marketing and media that promotes tobacco increases youth chances 2.2 times for starting tobacco use (Wellman, Sugarman, DiFranza, & Winickoff, 2006). Multiple approaches are in progress to prevent teenage smoking. Researchers are exploring the links between 1) a conduct problem and smoking, 2) advertising and smoking, and 3) policy implementation at the state and federal level such as higher cigarette prices, enforcement of minor in possession laws, and limiting advertisement on smoking. The development and implementation of an educational do not smoke program at the middle school level aims to prevent initiation of smoking. The educational program teaches youth about the negative physiologic and health consequences of smoking and discusses topics of interest to the youth that relate to smoking. These youth topics of interest include the effects of smoking on personal sport performance and smoking as seen in commercials, television shows, and movies. The program targets middle school age students to enhance their knowledge of negative health effects of smoking, and shape smoking beliefs.

Implementation: The do not smoke program purpose is to prevent youth smoking through education in a middle school environment. The science curriculum in the local middle school includes structure and function of the respiratory system. The do not smoke presentation is designed to correlate with the respiratory unit of study, and build on the middle school student's previously learned knowledge about respiratory physiology. The learning objectives of the do not smoke educational program include: 1) Effect of smoking on diffusion and oxygenation, 2) Cell mutation and development of cancer in structures of the

respiratory system, 3) Excess mucous production and frequent infections, 4) Strain on the heart and development of heart disease, 5) Yellow teeth color, 6) Smelly clothes, 6) Impact on daily activities and sports, and 7) media influence on smoking. In order to promote student interest and study of the effects of smoking on the human body, the middle school respiratory unit exam includes questions from the do not smoke program. The educational program incorporates images of excess mucous, bronchitis, lung infection, over distended alveoli, emphysema, lung cancer, and heart disease in the presentation to promote middle school student's comprehension and perception of real negative health consequences of smoking. The do not smoke program aims to reach large numbers of middle school students through smaller educational groups. The science classes in each period are grouped in the library for the do not smoke program. Smaller groups of 50 to 60 students promote learning activities, questions, and discussion. Some group activities include filling balloons with whip cream demonstrating mucous accumulation, infection, and pneumonia. Inflating paper bags and gathering the bags to form a barrel exhibiting over distended alveoli and the development of barrel chest.

Evaluation: Approximately 300 middle school students attended the do not smoke program in 2014. The middle school students responded and interacted positively during the educational program. Questions about smoking and oxygenation, performance in sports and activities, as well as teeth color changes, and smelly clothes occurred. The students identified many misperceptions of smoking such as smoking makes you skinny and smoking being cool. The middle school student's discussions centered on media literacy, smoking in movies, commercials about effects of smoking, cigars, e-cigarettes, second hand smoke, and smoking candy (crushing candies and inhaling the dust). The Student's demonstrated interest in knowing how long the effects of smoking last once someone stops smoking and smoking cessation resources. The middle school teachers expanded the core respiratory system curriculum to introduce the negative health effects of smoking.

Future plans: The do not smoke program clearly identified the value in following the smoking habits of middle school students that attended the educational program as compared to students without the education. Future studies will assess youth perception of smoking on health and wellbeing pre and post participation in the do not smoke program. Targeting the teaching strategies in the do not smoke program more specifically toward media literacy and gender themes, may reduce smoking risk (Mays, et al., 2014). Expanding the do not smoke campaign to other schools will increase the number of students exposed to the educational program and may further reduce the initiation of teen smoking and promote smoking prevention.

### Effects of the Simulation Education Program to Train Life-Saving Nurses

---

*Rika Mitoma, PhD, RN, Japan*

*Toyoaki Yamauchi, MD, ND, PhD, FNP, RN, Japan*

#### Purpose

The purpose of this presentation is to explore the possibilities of simulation education program to nurture life-saving nurses.

#### Target Audience

The target audience for this presentation is students interested in simulation education, faculty interested in simulation education and nurse who wants to develop knowledge and skill to predict sudden changes in the patient's condition and to deal appropriately with these sudden changes.

#### Abstract

**PURPOSE:** Five programs have been developed with the aim of educating nurses in the first three years of their career, nurturing professionals who are able to predict sudden changes in the patient's condition, who can deal appropriately with these sudden changes, and who can play the role of both a leader and a team member in response to such situations. The programs that have been developed are planned so that a new nurse can participate in the first program and, after passing the relevant exams, he/she will then proceed to the next program. The purpose of this study is to verify the efficacy of the five educational programs that have been developed.

**METHOD:** A simulation exam covering the entire contents of the five educational programs has been conducted in two groups: a trained group of 114 subjects who have completed the five educational programs developed, and a non-trained group of 58 subjects who have not participated in the educational programs. Subjects who have participated step-by-step in the five educational programs and have successfully passed both the knowledge and practical skills tests of each program are eligible to take part in the simulation exam. The simulation exam was evaluated using a checklist of 34 items (with a perfect score of 34), including the following four evaluation criteria of the five educational programs: "observation of premonitory symptoms of sudden changes in condition from the aspect of ABCDE," "request for backup and report by SBAR," "emergency measures necessary for patients," and "participant's role as a leader or as a team member."

**RESULTS:** In the score of the skill test, a significant difference between the two groups ( $p < 0.05$ ) was observed. There was a median value of 31.0 for the trained group, and a median value of 29.0 for the non-trained group. For the four items of the checklist, "observation of the movement of the thorax," "confirmation of the presence or absence of fever," "auscultation of breath sounds," and "preparation for intubation," a significant relationship ( $p < 0.05$ ) was observed between experience of participating in the educational programs and the level of ability to implement the skills. The number of subjects who were able to conduct the above four tasks was higher in the trained group than in the non-trained group.

**CONCLUSION:** The five programs that have been developed can be considered effective in the professional education of nurses who are able to predict sudden changes in the patient's condition, who can deal appropriately with these sudden changes, and who can play the role of both a leader and a team member in response to such situations.

### Benefits, Challenges and Considerations to Academic-Practice Partnerships in Implementing and Utilizing a Dedicated Education Unit (DEU) Model of Clinical Education

---

*Stacen A. Keating, PhD, RN, USA*

*Tami L. Jakubowski, DNP, RN, CPNP-PC, CSN, USA*

#### Purpose

The purpose of this presentation is to discuss the benefits, challenges/considerations, and costs to academic-practice partnerships in implementing and utilizing a Dedicated Education Unit (DEU) model of clinical education.

#### Target Audience

The target audience of this presentation is hospital nursing leadership, nurse educators, and nurses involved in clinical education of nursing students.

#### Abstract

**Purpose:** The purpose of this presentation is to discuss the benefits, challenges, and costs to academic-practice partnerships in implementing and utilizing a Dedicated Education Unit (DEU) model of clinical education.

**Methodology:** A systematic literature search was conducted using bibliographic databases, academic journals, and ancestry searching. Additional sources of information were found on The American Association of Colleges of Nursing Academic Practice Partnership and University of Portland Dedicated Education Unit databases. Search terms included dedicated education unit, academic-clinical partnerships, and academic practice partnership. The approach involved data analysis using a systematic iterative process. The authors went back and forth to analyze and interpret text and to categorize data. Notes were compiled regarding insights gathered during data collection. Data and notes were reviewed to answer the specific IR question: What is known about the benefits, challenges and costs associated with academic-practice partnerships that utilize a DEU for undergraduate clinical nursing education? From the data, major themes and categories were developed regarding the benefits, challenges, and costs to academic-practice partnerships in implementing and utilizing a DEU model of clinical education.

**Results:** Significant benefits, challenges, and costs of implementing a DEU to academic-practice partnerships were identified in this integrative review. Benefits included enhanced communication between the academic school of nursing and clinical agency, an environment with more productive and efficient use of learning time, and increased student exposure to skills and clinical practice without increasing clinical hours. In addition, students learned teamwork, collaboration, critical thinking, and independent problem solving. This arrangement may impact future nursing student enrollment capacity and clinical capacity.

**Conclusion:** This integrative review showed that there are a number of benefits, challenges, and costs related to implementing DEU's. Overall satisfaction appears high with the DEU model both in terms of student, staff nurse and faculty perceptions. The DEU has may have the potential to increase nursing faculty capacity and could be a possible factor in efforts to enhance the ability of schools of nursing to increase student enrollment as long as state regulations are taken into account. More collaborative research is needed especially in the area of cost implications to fully understand the impact of the DEU on the academic practice partnership.

### Development and Evaluation of Reflective Program Using Concept Mapping for Clinical Nurses

---

*Hyojin Kim, BSN, South Korea*  
*Hyunsook Shin, PhD, RN, CPNP, South Korea*  
*Yuna Lee, MSN, South Korea*  
*Hyejin Kim, BSN, South Korea*

#### Purpose

The purpose of this presentation is to share knowledge of development and evaluation of reflective program using concept mapping for clinical nurses

#### Target Audience

The target audience of this presentation is nursing faculties and nursing educator who are interested in teaching clinical nurses.

#### Abstract

Aims: To evaluate the effect of a reflective program based on self-regulated learning theory on competency of clinical nurses.

Background: Using concept mapping strategies have been used to help student nurses to achieve desired nursing competency, but their effectiveness has not been examined for clinical nurses. Also, reflection is an important education method for nurses. Thus, using concept maps for reflecting nursing experiences can improve their nursing competencies.

Design: A descriptive, comparative design was used. Comparisons between one group in different times using t-test were made. The same group did nothing for the first three weeks, and the group applied a reflective activity for next three weeks. Each time had checked of nursing core competency scales.

Methods. A total of 19 clinical nurses participated in this study in 2015. The reflective program using concept mapping based on self-regulated learning theory includes drawing concept maps and writing reflection diaries for three week. All 6 reflective episodes were completed for nurses.

Results: The overall scores of the nursing competency in the reflective group were higher than those not joined the reflective activity group. Also, the overall reflective level of reflective group improved after the reflective activity.

Conclusions: The findings of this study suggest that a reflective activity using concept mapping is useful for helping clinical nurses to gain competency and reflective continuum.

### Integrating Theory in an Alternative Community Health Nursing Clinical Experience

---

*Brandy E. Strahan, PhD, RN, RN, USA*

*Crystal Bennett, PhD, RN, RN, USA*

#### Purpose

To integrate theoretical concepts into an alternative community health nursing clinical experience.

#### Target Audience

The target audience of this presentation is nursing faculty and administration.

#### Abstract

Today's nursing students engage in various learning styles, presenting challenges for faculty to educate and create meaningful learning. Numerous other factors, such as limited clinical sites and increased competition for these sites, add to the challenge. Moreover, nursing faculty are pressured to increase the number of graduates and improve retention rates as education has become increasingly focused on didactic lecture and skill attainment negating students' learning styles. Nursing education needs to be relevant and responsive as student learning evolves and transitions from passive recipients to self-authorship. In an effort to attain relevancy and respond to students' learning needs, an alternative approach to community nursing clinical in a baccalaureate program was created utilizing Kolb's experiential learning theory as a framework. Kolb (1984) deemed learning as the process wherein knowledge is created through experience. This process is achieved through four modes of experiential learning: concrete experience learning (CE), reflective observation skills (RO), abstract conceptualization abilities (AC), and active experimentation (AE). Utilizing Kolb's first two components, senior nursing students were assigned a bus ride on public transportation in order to immerse themselves fully, openly, and without bias in a culturally diverse environment and were to also reflect on and observe their experience from many viewpoints. Students journaled to capture reflective observation from these experiences to display modes of adaptation that occur during learning, that is, moving from one dimension to another in varying degrees. This assignment helped empower students to take responsibility for their learning and created a transformative clinical experience. The alternative community nursing clinical experience will be used to guide the future development of learning activities for the undergraduate nursing program whereby students can conceptualize observations into theories and implement those theories into problem solving and decision making. Future exploration of Kolb's experiential learning theory includes utilizing the Learning Style Inventory to assess individual student learning styles and evaluation of the undergraduate curricula in addressing the needs of students.

### Learning Tool to Assist with Understanding of Common Statistical Tests in Quantitative Research Studies

---

*Sharon M. Jones, PhD, RN, CNE, USA*

#### Purpose

present a tool to improve understanding of common statistical tests in quantitative research studies.

#### Target Audience

Clinical nurse educators and nursing faculty

#### Abstract

Nurses and other healthcare professionals are engaged in evidence-based practice (EBP) to improve patient care in many settings. Nurses in the hospital setting may be members of teams to develop policies based on EBP. Quantitative research studies (non-random and randomized controlled trials) are frequently used as the basis for EBP. A barrier to reading published quantitative research reports may be lack of understanding of statistics and the data analysis used in quantitative studies. I developed a learning tool which is a simple diagram to help bedside nurses better understand the relationship between common statistical tests and their appropriate use based on the research hypothesis. Feedback from practicing nurses in the hospital and outpatient setting indicate this tool is helpful in providing a better understanding of statistical tests presented in reports of quantitative research studies. This diagram can be used for teaching in the clinical setting with nurses and healthcare professionals on interdisciplinary teams as well as for nursing faculty in undergraduate and graduate nursing courses.

## CLIN PST 2 - Clinical Poster Session 2

### Nurse Caring Enhancements of The Caring Model® (TCM): Education Modules Improve Nurse Communication and Patient Satisfaction

---

Sharon Kay Dingman, DNP, MS, BSN, RN, USA

#### Purpose

The purpose of this presentation is to identify nurses pre and post education perceptions of affective and technical aspects associated with caring, compassion, and presence with the perceptions of the patient and family that impact satisfaction with nursing care every encounter, every day.

#### Target Audience

The target audience of this presentation is the nursing individuals involved in the improvement and enhancement of patient and family satisfaction with nursing at the point of care delivery enhancements in all health care venues.

#### Abstract

**Background:** Patient satisfaction is an established indicator of quality care measuring the perception and expectation of nurse caring in human-to-human interpersonal interactions. Nursing theory and empirical research substantiates the value of caring behaviors in nursing practice. Caring interactions between nurses, patients, and families are highly correlated with value-based performance incentive payments specific to nurse communication. The patient experience is associated with how well nurses provide information and attend to the needs of patient and families in every encounter, every day. The education modules focus on the nurse's role in value-based innovations to improve patient satisfaction.

**Intervention:** Four new education modules provided participants an opportunity to review aspects of caring from the patients' perspective. The modules included: (1) Concepts of Caring and Application of Caring Theory; (2) Caring Behaviors and Models of Nursing Practice; (3) Caring Environments and Workforce Engagements; and, (4) Outcomes of Caring, Consumerism, and Satisfaction. A Caring Dimensions Inventory (CDI) of 25 core statements has a Cronbach's alpha reliability from 0.91 to 0.92 was used to measure the perceptions of caring by nurses in a pre and posttest for changes in perception. Perceptions of caring increased ( $t(8) = 4.04, p = 0.004$  overall). Affective aspects of nursing increased ( $t(8) = 5.20, p = 0.001$ ). Perceptions of technical caring approached statistical significance ( $t(8) = 2.16, p = 0.06$ ). The difference in the mean score average of affective questions of 4.67 and technical questions of 2.98 appear to be in response to education. On their first shift after the education experience, nurse participants completed a Personal Observation and Reflective Observation Summary of patient and nurse dialogue identifying ways of being (affective) and ways of doing (technical) care provided. These observations were used to help determine their responsiveness to patients and families care delivery experiences and application of the education modules.

**Implementation:** The nursing theories of Watson (1996), Leininger (1994), Swanson (1991), Boykin & Schoenhofer (2001) and Roach (2002) were used to identify the potential affective nature of nurse caring behaviors. Caring indicators for improving the perceptions of nurse caring were identified by participants. Enhanced education modules included examples of affective and technical nurse caring behaviors, as measured by the CDI, to support the interpersonal nurse-patient caring relationship in practice. Rogers' Innovation Decision Process model was used as a guiding framework for the education intervention.

**Results:** The participants identified differences between their intended and demonstrated caring behaviors in affective and technical aspects of care. Posttest perceptions of affective caring increased with statistical significance after the nurses received the education instruction. Technical aspects of caring also increased, to a smaller degree, at a rate that approached statistical significance. Participants who had been in their position in health care greater than three years, there was a greater change in mean scores than those for less than three years. The trend in the mean scores suggests there is a

pattern than requires further analysis. Translating existing research into nursing practice promoting affective and technical aspects of caring makes good economic sense.

**Conclusions:** Caring behaviors displayed through nurse interventions can influence the patients' perceptions of satisfaction with nursing care. These behaviors can be translated into practice with focused caring educational experiences and the adaptation of caring behaviors to accommodate the patient-family-nurse relationship in value-based patient-centered care in today's health care environment. There is a predictive relationship between patient-family-nurse perceptions of caring and satisfaction with care delivered. The phenomenon of caring is influenced by multiple perspectives of nursing practice and patient experience expectations. The economics of nurse caring and compassion in health care reform requires nurses to provide knowledge and insights into nursing practice efficiencies, costs and outcomes.

## CLIN PST 2 - Clinical Poster Session 2

### Situated Learning and Improved Simulations for Pre-Graduate Nursing Students

---

Maureen A. Barry, RN, MScN, Canada

#### Purpose

The purpose of this presentation is to describe the use of situated cognition learning techniques and impromptu student-driven simulations to prepare pre-graduate students for a final consolidation practicum.

#### Target Audience

The target audience of this presentation is nurse educators in the hospital or in academia and unit administrators.

#### Abstract

Nursing students in our accelerated undergraduate program participate in structured simulations in all clinical courses throughout their two-year program of study. This poster will discuss the pilot use of impromptu student-driven simulations to prepare pre-graduation students for their final clinical practicum. At least half of the student enter consolidation following a community placement and experience anxiety related to their skill level and lack of recent practice in a hospital setting. The purpose of the pilot was to help students develop their clinical reasoning skills, their clinical skills and feel more confident about their upcoming placement in the context of a situation as close to reality as possible.

Situated cognition or situated learning is a learning theory that lends itself to the preparation of pre-graduate nurses for higher order thinking in the context of an authentic environment such as simulation. In this pilot, students worked together collaboratively in impromptu simulations prior to their last clinical placement. Situated cognition learning techniques such as collaboration, coaching, use of multiple roles and perspectives, articulation of learning, use of technology and reflection were used to promote learning.

Senior students were invited to sign up ahead of time, specify their learning needs (e.g. giving injections, focused health assessment, prioritizing, etc.), and identify their upcoming clinical placement (e.g. medicine, surgery, etc.). Student groups of 3-4 students worked together in the lab for 2- 4 hours just prior to the start of their practicum placement. Two faculty members experienced in simulation-based learning led the scenarios and debriefing sessions. Little preliminary work was done on the simulation scenarios. Scenario development was tailored to the students in the scenario and created in the moment. Pre-simulation briefing was very important to ensure “a psychologically safe context for learning” and active engagement of student learners who did not know each other very well (Rudolph, Raemer & Simon, 2014). Highlights of this learner-centered activity as well as feedback from both students and faculty involved will be shared in this poster.

## CLIN PST 2 - Clinical Poster Session 2

### Simulation: An Evolutionary Concept

---

Margaret E. Curnin, MSN, RN, USA

#### Purpose

The purpose of this poster presentation is to present the use of simulation over time as found in the research, and to identify the most common attributes and consequences of the simulation experience.

#### Target Audience

The target audience of this presentation is individuals or groups using simulation as a teaching/learning strategy in nursing.

#### Abstract

Simulation has been used in nursing for many decades with little thought as to the actual definition. An early mention of simulation in nursing was made by Burns (1984) who used the term in competitive simulation or gaming, defining simulation as rules, challenges, or as a form of play. (pg. 214) Billings and Halstead (2005) presented one definition of simulation as "A near representation of an actual life event; may be presented by using computer software, role play, case studies, or games that represent reality and actively involve learners in applying the content of the lesson." (pg. 308) Changes in healthcare, such as lack of available clinical sites, shortage of nursing faculty, shorter patient length of stay, and increase in nursing schools/students, have impacted the clinical learning opportunities for nursing students. (Alinier, Hunt, Gordon, and Harwood, 2006; Brown and Chronister, 2009; Jeffries, 2005; Maran and Glavin, 2003; Weaver, 2011) Simulation has been identified as an acceptable alternative to learning experiences in the clinical arena. (Bearnson and Wiker, 2005) Beth Rodgers' Evolutionary method was used for this concept analysis as the method addresses the perspective held in nursing that human beings and nursing phenomena are in constant change, interrelated and overlapping, and interpreted in regard to multiple contextual factors. (Rodgers and Knafl, 2000, pg. 77) Using Beth Rodgers' Evolutionary method, the attributes of Simulation were found to include safety, teaching/learning, experiential, realistic or life-like, and elements of control. Antecedents were identified as acquisition of new skills, provision of safety in performing care, teaching of essential healthcare concepts, and achievement of learning objectives. The most recognized consequence of simulation is the provision of safety for both patients and learner. This poster describes research into Simulation using Beth Rodger's Evolutionary method to investigate the concept of Simulation over time.

## CLIN PST 2 - Clinical Poster Session 2

### Telephonic Health Coaching for the Type II Diabetic

---

Gale T. Klinshaw, MSNE, RN, USA

#### Purpose

The purpose of this presentation is to educate health care professionals about using a proposed telephonic health -coaching program that would assist patients who would otherwise not receive the education required to successfully control their diabetes. Telephonically this comprehensive intervention can assist diabetics without ever leaving their homes.

#### Target Audience

The target audience of this presentation is nurses who provide care to diabetics as well as educators. This evidence based telephonic health -coaching program could be applied to different diseases and applications, making it of interest to many health care professionals.

#### Abstract

This evidence based proposal is intended to reach new or unstable adult Type II diabetics who are members of a managed health care insurance program. The program proposed would be introduced immediately after diagnosis to improve patient outcomes. It would also provide a more comprehensive intervention for those in need of assistance with self-care. At the present time most diabetics receive care from a primary care physician. When the physician is busy or unavailable the diabetic turns to other places for a quick fix of their symptoms. They may also be more expensive options for care including the ED or an Urgent Care Clinic. Postponing care until their symptoms become more critical may lead to hospital admissions and long term negative effects on their health as a result of diabetic complications. The use of a telephonic health -coaching program would also assist those members who would otherwise not receive the education required to successfully control their diabetes. Telephonically more diabetics can be assisted without ever leaving their homes. Members will be monitored for the program's effectiveness including reductions in their HgbA1c, increase in diet, medication and overall self-care compliance, increase access to diabetic education resulting in increased customer satisfaction and health care cost savings for both the member and the health care insurance company. Telephonic health coaching, performed by specially trained registered nurses, with internet access to educational materials, may be an effective method of better educating patients with diabetes and controlling medical emergencies resulting in improved overall health for those members and a reduction in their health care costs.

## CLIN PST 2 - Clinical Poster Session 2

### Nursing Practice, Working Environment, and Educational Needs of Nurses in Socialist Republic of Vietnam

---

*Ayako Okada, PhD, RN, CNS, Japan*  
*Keiko Tanida, PhD, RN, Japan*

#### Purpose

The purpose of this presentation is 1) to describe the present situation of nurses' work environment in the clinical setting and their barrier or difficulties to provide patients care and 2) to identify the educational demands for clinical nurses to support continuous learning as one of health care providers.

#### Target Audience

A health related scholars and clinician who are working in and supporting in Southeast Asia, an administrator whose focus is on nursing practice and quality of care, nursing clinical educator who develop in-hospital nurses' training program, nursing educator whose focus is on continuous education for clinical nurses.

#### Abstract

Purpose: The purposes of this qualitative study were 1) to describe the nurses' experiences in daily nursing practice at the clinical setting, 2) to describe the nurses' perspectives on their clinical practice as a nursing profession, and 3) to explore the demand of educational supports for nurses to develop their own career as a nurse and to provide better care for the patients.

Methods: A convenient sample of 36 nurses who have more than three years of nursing experiences was recruited from three general hospitals in Socialist Republic of Vietnam. A semi-structured small group interview with open-end question method was used to collect data. The questions were 1) how is your daily nursing practice and any difficulty or problems that you concerns; 2) how would you like to obtain any skills or you wish to improve something about yourself; and 3) what would you request any learning opportunities or learning subjects for future. The set of data from interviews was analyzed through coding and categorization.

Findings: The nurses' experienced difficulties in daily nursing practice were characterized by 1) insufficient medical supply, materials or equipment that necessary for pressed patients care and treatment, 2) imbalanced between patients care demand and nurse staffing ratio which caused by the exceeding number of patients admitted to the hospital, 3) the gap between nursing skills implementing everyday nursing practice and being learned at nursing school, 4) required many nursing documents and other tasks, and 5) insufficient advocacy as one of the health care provider for claims or any clinical problem. Additional abilities that the nurses need to be acquired were 1) communication skills as a health care provider, especially to deal with the difficult patients and family and 2) disease specific knowledge and skills that fit with patients in their ward. The nurses wished to have more frequent opportunities of in-hospital training to learn communication skills especially for health care provider to deal with difficult relationship between nurses-patients and patients' family and the skills training that providing completely prepared or in condition for immediate action or use in their daily nursing practice. The nurses hoped to have opportunities to expose themselves to different health care institution both in Vietnam and foreign countries in order to observe and compare nursing working environment, nurse's scope of practice, and the relationships between patients and nurse, and nursing research.

Conclusion: The finding identified specific nurses' experiences and difficulties in daily nursing practice. Nursing in-hospital training demands were specified. The nurses wished to have training that providing completely prepared to use in some specific condition for immediate action, which implied nurses requested more practical and immediately usable "how-to" information instead of core universal knowledge or skills. In addition, nurses wished to have opportunities to expose different health care systems or environment such as outside of hospitals or countries.

Clinical relevance: Nursing practice, working environment in Socialist Republic of Vietnam is developing and progressing. It is crucial to support not only to meet their educational demand but also further follow up to improve the nurses work environment as well.

## CLIN PST 2 - Clinical Poster Session 2

### Suicide Risk Assessment Education for Counselors Who Work with Clients with Substance Use Disorders

---

Stacie L. Olson, DNP, APRN, PMHNP-BC, RN, NP (AdultPsych), USA

#### Purpose

The purpose of this presentation is to share how advance practice nurses can improve outcomes in suicide prevention education with evidence based suicide prevention training for licensed addiction professionals.

#### Target Audience

The target audience of this presentation is advanced practice and doctoral of nursing practice clinicians with a special interest in psychiatric mental health nursing practice.

#### Abstract

**Background/Significance:** Suicide is the leading cause of death in people who abuse alcohol and drugs. The role of the counselor is to assess a client's risk for suicide, yet according to the literature counselors have a limited background in formalized training on suicide prevention.

**Methods/procedures:** A suicide prevention training intervention designed for addiction counselors was conducted for 11 counseling and professional staff working in a substance abuse treatment center. The training intervention was compared and evaluated pre-intervention, post-intervention, and six weeks post intervention to assess changes in attitudes (using ASP scale), confidence (using COSE scale), knowledge (using knowledge quiz), and facilitative skills in suicide management (using SIRI 2) on suicide prevention.

**Outcomes/findings:** There were no statistically significant changes in subjects' scores post intervention in reference to counselors' attitudes, confidence, and facilitative suicide skills. However, the power of this study was low (48%) and sample size small. (N=11). Despite the lack of power, there was a large clinically significant effect size (0.64) between the pre and post SIRI survey scores which demonstrated a change in competence in recognizing facilitative suicide responses. In addition, 64% of the participants had prior training in suicide prevention, which also may have affected this studies results. Knowledge did show statistically significant changes in subjects' scores post intervention  $t = -2.68$  ( $p < .023$ ), which demonstrated a positive benefit of training on suicide prevention.

**Summary:** In the future a larger sample size should be used to assess changes in attitudes, confidence, knowledge, and skills of counselors and professional staff using the suicide prevention training. Training was well accepted by the participants, and there continues to be a need for education on suicide prevention for clients with substance use disorders.

---

# EBP PST 1 - Evidence-Based Practice Poster Session 1

## Implementing a Reverse Case Study Interactive Design in the Classroom Setting

---

*Benjamin A. Smallheer, PhD, MSN, RN, ACNP-BC, CCRN, USA*

### Purpose

The purpose of this presentation is to discuss the reverse case study design and demonstrate the planning, construction, and implementation of a involved in the successful utilization within a didactic pharmacology course of study.

### Target Audience

The target audience of this presentation is the educator dedicated to the development of critical thinking, rationalization, group interaction, and prioritization. Though this presentation focuses on a didactic setting, adaptation to a clinical environment is highly feasible.

### Abstract

Introduction: The primary goal of nursing education is to prepare students to meet the diverse needs of patients in variable situations. In doing so, students must be prepared to function as a leader and advance science within the confines of safe and quality care delivery. In keeping with these goals, nursing education has been transforming to maintain the increasing demands and responsibility of the nursing profession. Nursing educators have therefore been challenged with developing and utilizing diverse and challenging methods to enhance critical thinking and knowledge of nursing students.

Previously, the use of the unfolding case study provides an adaptive and integrative strategy of learning, incorporating nursing care, critical thinking, prioritization, and pathophysiology with pharmacology into a developing scenario. The unfolding case study allows a culture of quality and safety to develop in the classroom setting. It is through these diverse methods that incorporation of the higher domains of Bloom's Taxonomy into the academic and didactic setting is achieved.

The Theory of Multiple Intelligence highlights individuals' unique skills and capabilities of learning through various intelligences. Based on the variable and distinctive methods through which students learn, a newer permutation to the standard unfolding case study is the reverse case study.

The reverse case study involves students in the development of multiple scenarios, thus using a constructive approach to learning. This method is considered a rich scholastic challenge, more capable of accurately representing the responsibilities of the nurse within the safety of the classroom setting. Utilizing a reverse case study design accentuates the student's critical thinking and integration across content and provides a rich academic challenge involving the higher domains of Analyzing, Evaluating, and Creating within Bloom's Taxonomy.

Background: Traditional case studies are highly adaptable teaching strategies and have been utilized in a variety of disciplines. Within nursing academia, case studies may be used to examine nursing care, review principles of pathophysiology and/or pharmacology, challenge values and attitudes (ethical dilemmas), and investigate causes of error while enhancing clinical reasoning, critical thinking, facilitating self-learning, and promoting empathy

Though a creative way to stimulate conversation, integration, and critical thinking, the traditional unfolding case study is limited to the domains of remembering, understanding, and applying of Bloom's Taxonomy. The reverse case study, however, provides a rich academic challenge while adequately representing the responsibilities of the bedside nurse.

Methods: The students were assigned randomly in groups of 5 or 6. The students were told that ANY and ALL resources may be used in construction of the final project. The patient presented in the case study was unable to provide sufficient information. In doing so, the minimal subjective information would create

the dynamics within the case to catalyze free thinking and rationalization of decisions. A physical “bag of drugs” belonging to the patient was also given to each group. Students then analyze what information is provided, create the background information of “what happened”, and then completing the case aspects of “what to do next.”

Findings: Groups were highly engaged, interactive, and conversational on how specific aspects of the patient’s physical exam correlated with components of the medication table and past medical/surgical history. Teams often had to divide components of the project among themselves to assure adequate time for completion. Collaboration, teamwork, and critical thinking were essential in bringing these components of the assignment together and having proper cohesion and incorporation from one section into another.

Students reported feeling very stressed which required them to stay focused and not go off on tangents or “chase down a rabbit hole”. Numerous students identified the assignment as “fun”, “challenging” and very realistic to how a nurse must play the detective with patients who are unable to provide complete and adequate information to the medical provider.

Students commented on the gained perspective of the bedside nurse’s responsibility when admitting a patient who cannot give a clear history. The significant contribution of the bedside RN to both the admission and discharge process was more readily experienced and understood through this assignment.

Conclusion: Nursing faculty continue to search for variable approaches to learning which will better prepare students for not only the alternative format questions posed by NCLEX, but also the complex nature of quality and safety required of a licensed provider. Unfolding case studies within the classroom allow students to experience the integrated nature of client centered care compared to learning through a focused system-by-system approach. Reverse case studies allow students to utilize the higher domains of analyzing, evaluating, and creating in Bloom’s Taxonomy. In doing so, students can demonstrate the full spectrum of the taxonomy and exhibit critical thinking and mastery of nursing content presented throughout a program of study.

## EBP PST 1 - Evidence-Based Practice Poster Session 1

### Evaluation of the Pedi-CSI (Clinical Safety Investigation) Video Vignettes

---

*Judith A. Vessey, PhD, MBA, RN, FAAN, USA*

*Amanda J. Lulloff, MS, RN, USA*

*Rachel DiFazio, PhD, RN, FAAN, USA*

#### Purpose

This presentation describes an innovative approach using video vignettes to teach pediatric patient safety to practicing nurses and students. Through a process of self-evaluation, participants learn didactic and affective knowledge that positively influences their practice behaviors. Information regarding free global access will be provided.

#### Target Audience

The target audience for this presentation is nurses providing direct care to pediatric patients, educators designing learning activities for students, and administrators dedicated to strengthening pediatric patient safety practices in their institutions.

#### Abstract

Patient safety is a major component of quality patient care (World Health Organization, 2006) and pediatric nurses are integral in assuring safe care to young, vulnerable patients (IOM, 2004). Comprehensive, formalized patient safety training is needed by pediatric nurses and nursing students because ill children often present with different and often more complex safety issues than their adult counterparts. Failing to provide specialized training can lead to safety failures; and although difficult to quantify, financial costs of safety errors resulting in adverse events are high. Although population-specific training is necessary, the majority of pedagogical patient safety activities are designed towards adult inpatient settings; valid patient safety training programs specific to pediatric nursing care could not be identified (Agency for Healthcare Research and Quality [AHRQ], n.d.).

This project's goal was to address this gap in pediatric patient safety clinical education; the evidence-based-practice paradigm (Schaffer, Sandau, & Diedrick, 2013) was used in its development. Initially, relevant research findings, professional guidelines, the National Patient Safety Goals, selected pediatric clinical literature, and clinical educational strategies were reviewed. Using these findings and in consultation with pediatric patient safety experts, a series of pediatric patient care video vignettes were created. The clinical video vignette format was chosen as it can convey didactic information, influence the learner's affective knowledge and attitudes (Robertson, Kaplan, Atallah, Higgins, Lewitt, & Ander, 2010) and improve the learner's clinical judgment and critical thinking (Fero, Witsberger, Wesmiller, Zullo, & Hoffman, 2008; Lasater & Nielsen, 2009). Thus video vignettes are especially effective teaching tools as they help nurses identify breeches in patient safety, create a desire to adjust their care delivery accordingly, and influence others to adopt safe practices as well.

A series of twelve brief pediatric patient safety vignettes were created. To ensure that the most common pediatric patient safety errors were included, a grid was created that incorporated patient safety information from the National Patient Safety Goals, the National Institute for Children's Healthcare Quality initiatives, and the Agency for Healthcare Quality guidelines to common pediatric clinical situations. Scripts for each vignette were drafted that incorporated specific obvious and subtle patient safety errors and vulnerabilities. The vignettes were then filmed in acute care settings (with actors) to illustrate these elements. The central themes of the vignettes are: 1) skin breakdown, 2) handoffs, 3) IV site contamination, 4) cross contamination, 5) environmental services cleaning, 6) patient discharge, 7) mislabeled specimens, 8) medication administration, 9) oxygen administration, 10) alarm fatigue, 11) high alert medications, and 12) fall prevention. Upon their completion, an expert panel of pediatric professionals determined the full range of safety violations in each vignette. Two copies of each vignette, one without and one with the violations clearly explicated, were then produced. Participants initially watch the unmarked video vignette and independently record patient safety errors. Upon completion, the

vignette with the errors highlighted is then shown, allowing participants to compare their responses with those embedded in the scenario. Supportive materials including a patient safety goal briefing/de-briefing teaching materials and a training manual have been developed.

Further validation of the video vignettes has been accomplished by having pediatric inpatient nurses from all levels of clinical practice participate in their testing. The video vignettes, along with the teaching materials, are being prepared for inclusion in OPENPediatrics ([openpediatrics.org](http://openpediatrics.org)). OPENPediatrics is a free online community that is peer-reviewed and academically rigorous, sharing best practices for pediatric patients globally. This will allow their use by pediatric nurses in pediatric clinical and academic settings worldwide. This presentation will present the project's development, allow conference participants to test their patient safety knowledge with a sample vignette, and provide information regarding accessing the vignettes and supportive materials.

## EBP PST 1 - Evidence-Based Practice Poster Session 1

### The Psychometric Properties of the Portuguese Version of the Adolescent Pediatric Pain Tool (APPT-PT) in Children with Cancer

---

*Luís Manuel Cunha Batalha, PhD, Portugal*

#### Purpose

To examine the psychometric properties of the Portuguese version of the Adolescent Pediatric Pain Tool (APPT-PT) in Portuguese children with cancer

#### Target Audience

Health professionals particularly nurses and doctors and researchers

#### Abstract

**Aim** As pain is both subjective and multidimensional, tools that allow the assessment of other dimensions of pain besides intensity are needed. The aim of this study is to examine the psychometric properties of the Portuguese version of the Adolescent Pediatric Pain Tool (APPT-PT) in Portuguese children with cancer.

**Methodology** Prospective methodological study with 150 Portuguese children with cancer aged 8-17 years-old. Data collection occurred both in outpatients and inpatients. Hospitalized children reported their pain during a maximum of 4 times. Children completed the Portuguese version of the APPT according to their pain at the moment or their last pain episode. At the same time, the Visual Analogue Scale (VAS) was used to report pain intensity.

**Results** Two hundred and eleven self-reports of pain were obtained. Multiple correspondence analysis showed a factorial 4 factor structure with acceptable internal consistency. Correlation between the three components of the APPT was positive and significant, albeit weak. Criterion validity with VAS was strong, positive and significant.

**Conclusion** The Portuguese version of the APPT has acceptable psychometric properties and its use is supported in Portuguese cancer children aged 8-17 years old.

### The DEU and Effect on Self-Efficacy, Part II

---

*Katrina A. Pyo, PhD, RN, CCRN, USA*  
*Lynn E. George, PhD, RN, CNE, USA*  
*Lisa Wetmore Locasto, DNP, RN, USA*

#### Purpose

The purpose of this presentation is to report the findings of the second part of an exploratory study aimed at examining the effect of the DEU on nursing students' confidence in knowledge and ability to achieve expected clinical performance. A larger sample size is included in this extended study.

#### Target Audience

The target audiences of this presentation are nurse educators, clinical coordinators, administrators and staff of patient-care settings, registered nurses, student nurses, and those who are interested in establishing innovative and collaborative educational opportunities.

#### Abstract

The Dedicated Education Unit (DEU) is an innovative model for clinical education. Nurse educators and nurses form a collaboration that combines the expertise of both with a focus on creating the most effective clinical learning environment for the nursing student. Although the DEU has shown promise related to collaboration in the learning environment and the ability to increase faculty capacity only a few published research studies have examined student outcomes.

This is Part II of a previously reported pilot study aimed at examining the effects of the DEU on nursing students' perceptions of self-efficacy with regard to knowledge and ability to achieve expected clinical performance. More than 100 undergraduate, pre-licensure, nursing students participated in this quasi-experimental, exploratory study. Participants were assigned to either the DEU or a traditional clinical education model as part of enrollment in a 7- or 15-week course with a clinical education component. The construct of self-efficacy was measured prior to and at the completion of the clinical rotation using a general self-efficacy scale (SE) adapted for this study. The results from the DEU and traditional clinical models were compared.

## EBP PST 1 - Evidence-Based Practice Poster Session 1

### Assessing Interprofessional Competencies in an Asynchronous, Online Environment: A Roadmap to Success

---

Heidi C. Sanborn, MSN, RN, CCRN, USA

#### Purpose

Integration of globally defined interprofessional IPEC competencies to transform an online baccalaureate completion program, through program-wide revision of course and unit-level objectives, learning experiences and assessments. The outcomes demonstrate that interprofessional competencies can be successfully incorporated into an online nursing curriculum to enrich understanding of the multidisciplinary practice.

#### Target Audience

The target audience of this project is nursing faculty. Application would be appropriate to all levels of nursing education, including Baccalaureate, Masters and Doctoral programs. The outcomes of this project can guide course development for both hybrid and fully online programs.

#### Abstract

Development of the Core Competencies for Interprofessional Collaborative Practice by the Interprofessional Education Collaborative (IPEC) in 2011 has supported faculty as they work to incorporate interprofessional skills into learning objectives and activities. Yet the majority of advances in competency-based education focus on face-to-face courses and clinical experiences. Developing meaningful interprofessional education activities for on-line programs has been a significant challenge due to lack of research specific to cloud-based, asynchronous education. This presentation will share the results of a program-wide effort to revise learning outcomes and associated learning activities and assessments to effectively develop interprofessional competency for learners in the online baccalaureate completion program curriculum at Arizona State University. The curriculum consists of ten nursing courses offered to both concurrent enrollment pre-licensure students as well as current registered nurses in an entirely online format. Through a collaborative process with the program faculty, the unit level objectives and assignments were reviewed and revised in order to more closely reflect the IPEC competencies. The revision of courses will take effect in the spring 2015 semester.

## EBP PST 1 - Evidence-Based Practice Poster Session 1

### Developing Consistency in Capstone Preceptorship

---

*Cynthia J. Bowers, MSN, RN, CNE, USA*

#### Purpose

The purpose of this study was to examine the self-efficacy (confidence) of Capstone preceptors before and after completing an evidence-based online Capstone preceptor preparation module. This quasi-experimental study utilized a pretest-posttest survey method to examine the change in confidence.

#### Target Audience

The target audience consists of nurse educators, faculty, nurse preceptors, and those in leadership that manage units where clinical education occurs.

#### Abstract

**Significance of problem.** Literature reveals that preceptorship is well defined as an evidence-based way for Capstone student nurses to experience the real world of nursing before graduation. Preparation of preceptors is identified as an important factor related to the success of Capstone preceptorship programs. Preceptors that are not adequately prepared lack confidence for their role in Capstone preceptorship. The Doctor of Nursing Practice (DNP) Capstone project was guided by the clinical question: Will an online approach to Capstone preceptor preparation improve the confidence of preceptors to perform in the role?

**Theoretical framework.** Bandura's social cognitive learning theory provides the framework for the DNP project. This theory bridges behaviorist and cognitive learning theories by encompassing attention, memory, and motivation. Motivation for behavior is controlled by self-efficacy (confidence). Competent performance requires both skills and self-beliefs of efficacy to use them effectively.

**Method.** Two objectives of the DNP Project include: 1) create evidence-based online Capstone preceptor preparation modules; and 2) evaluate Capstone preceptor confidence pre and post intervention of the online preparation modules. To determine the impact online Capstone preparation modules had on the confidence of nurses to perform in the preceptor role, the paired t-test was utilized to compare the pre and post self-efficacy questionnaire scores at a 95% confidence interval. Statistical significance for the project study was defined as  $p < 0.05$ .

**Results.** The online Capstone preparation modules had a significant effect on nurse participants by increasing their confidence to perform in the preceptor role. Overall, posttest confidence scores were significantly higher than pretest scores for each of the 21 questions included on the self-efficacy (confidence) questionnaire with significance of  $p < 0.00$ .

**Conclusion.** Evidence suggests that the success of Capstone preceptorship is affected by the level of preceptor preparation. Online education methods are effective in increasing preceptor confidence in their role for preceptorship. Cost savings, flexible access time, and consistent content delivery are benefits of online preceptor preparation programs. In this time of shrinking resources, innovative methods of clinical education are indicated.

## EBP PST 1 - Evidence-Based Practice Poster Session 1

### The Effectiveness of the Chin-Down Posture in the Improvement of Dysphagia in Stroke Patients

---

*Shiu-Hao Tai, MSN, RN, Taiwan*  
*Hui Mei Huang, MSN, RN, Taiwan*

#### Purpose

The Chin-down swallowing posture is generally considered a safe adjuvant clinical technique for patients with dysphagia to prevent tracheal aspiration and silent aspiration pneumonia. This study investigates the effectiveness of the Chin-down swallowing technique in the improvement of dysphagia in stroke patients.

#### Target Audience

Stroke often incurs varying degrees of neurologic deficits, such as mobility, language, swallowing, and cognitive impairment. About 25% to 32% of the stroke patients develop dysphagia, especially choking during eating. The severe ones may have silent aspiration pneumonia. For these patients, nasogastric intubation may be vital for adequate nutritional needs.

#### Abstract

**Introduction:** This study investigates the effectiveness of the Chin-down swallowing technique in the improvement of dysphagia in stroke patients.

**Methods:** This study was a quasi-experimental design conducted in January 2013 to December 2013. Subjects were selected by purposive sampling from in stroke patients with dysphagia the rehabilitation and neurologic department of a medical center. Patients with brainstem stroke, brain trauma, or past cervical vertebra damage were excluded; patients with unstable vital signs, those who could not follow instructions, and those who could not perform the maneuver were also excluded. Those patients who met the inclusion criteria were alternately assigned to the experimental group and the control group, for 30 patients in each group and a total of 60 subjects. The experimental group applied the Chin-down swallowing technique at least 3 times a day, 3-5 minutes at a time, for a period of 4 weeks. Nurse completed "The Dysphasia Assessment Scale" and "The Swallow Self-assessment" as the evaluation of the experiment outcome at the beginning and after 4 weeks of training.

**Results and Conclusion:** The results of this research showed 68.3% with cerebral infarction, 66.7% on oral feeding, 78.3% first-time stroke. The chi-square and paired t-test were used to compare the effect of Chin-down swallowing training. There were significant differences ( $p < .05$ ) in the dysphasia assessment scale between the difference of pretest and post-test among 2 groups in the questions: (1) the need of careful swallowing, (2) inability to maintain food in your mouth, (3) awake up choking with saliva, (4) having swallowing difficulty, (5) having ENT problems. Comparing the differences between pretest and post-test in swallow self-assessment showed significant differences ( $p < .05$ ) between experimental group and control group in (1) difficulty with swallow causes weight loss, (2) swallow causes pain, (3) cough during eating, (4) pressure in the throat swallowing. This study confirmed the effectiveness of the Chin-down swallowing technique to improve dysphagia among the stroke patients.

## EBP PST 1 - Evidence-Based Practice Poster Session 1

### The Quality of Life Matters: The Benefits of Ethnic Nursing Homes for Ethnic Elders

---

*Ying L. Wohlberg, MSc, BSN, RN, USA*

#### Purpose

The purpose of this presentation is to explore the best model of long term care for ethnic elders and their families.

#### Target Audience

The target audience of this presentations are care provider and policy maker for geriatric patients.

#### Abstract

The long term care needs for minority ethnic elders has grown dramatically across the western world due to an aging population and global migration. According to the National Minimum Data Set (MDS), covering the ten-year period 1999–2008, the number of elderly Hispanics and Asians living in U.S. nursing homes grew by 54.9 percent and 54.1 percent respectively. The care disparity and barriers that ethnic elders face in traditional long term care settings has been well documented and included access, difficulties in transition, inefficient communication, discrimination, isolation, misdiagnosis and inappropriate foods services. This article was based on a through systemic review aimed to explore the best long term care model for the ethnic elders and their families.

Current long term care guidelines focus on culturally sensitive and person centered care, however the implementation and the outcomes of these policies are not clear. Those ethnic nursing homes that cater to specified ethnic groups have gained strong acceptance among ethnic minority populations and are growing, especially in Canada, the UK and Australia. Such homes provide a more accommodating environment to implement the current guidelines of culturally sensitive and person centered care to specified ethnic elders. It was well reported that such homes can ease the transition to institutional care for these ethnic elders and their families. There are a limited number of research studies on some individual ethnic nursing homes, mostly in the U.S., a few in New Zealand, Australia and Sweden. They have consistent findings that such homes improve the quality of life of the ethnic elderly nursing home residents. Studies of a large number of such homes with consistent research methods are needed.

## Eliciting the Childs' Voice in Patient Experience

---

*Pamela Hinds, PhD, RN, FAAN, USA*

*Mia K. Waldron, MSN-Ed, RN-BC, CPN, USA*

### Purpose

The purpose of this feasibility project is using a survey, to obtain the child's perspective on patient satisfaction with nursing care. Incorporation of the child's voice enhances nursing practice by eliciting the care experience feedback from the child as well as potentially linking patient experience and discharge outcomes.

### Target Audience

The target audience of this presentation consists of nurses and nurse administrators in acute care and ambulatory facilities providing patient care services to children and families.

### Abstract

**Practice problem** – Patient satisfaction surveys have become a widely accepted measure of the quality of health care and are an important nurse sensitive indicator. However, these surveys have been focused on adults or the parents of children who receive care. To provide the best care for each patient, using a patient-family- centered care approach; the child's voice must be considered.

**Purpose** – The project goal is to determine the feasibility of obtaining the child's perspective, in regards to patient satisfaction with the nursing care received. Patient satisfaction was evaluated utilizing a 5-item electronic survey. The survey documented the perspectives of three age groups: 6-8 year olds, 9-12 year olds, and 13-17 year olds. The survey response options were illustrated on a separate sheet with three faces that ranged from smiling fully, to a neutral (straight line), to a frown. Corresponding word response formats (TRUE, SOMETIMES, and NOT TRUE) were printed below each face for all participants. Children approached, were inpatients for at least 24 hours, or outpatients, at the conclusion of their PACUs stay.

**Summary of literature** – Every year approximately 3 million children are hospitalized in the United States according to the National Center for Health Statistics<sup>1</sup>. The well and ill child's voice in reporting on subjective symptom and quality of life experiences is now well established in the literature with emphasis on children ages 8 years and older with selective examples of younger children, including 5 to 7 year olds<sup>2-6</sup>. The concept of children having a voice in their own health care has also gained credibility with children being included on inpatient rounds and in end-of-life decision making<sup>7-9</sup>.

**Outcomes** – The primary aim of this project was to demonstrate the feasibility of querying children about their satisfaction with nursing care experiences here at a free standing Children's Health system in Mid-Atlantic. The children and families were all receptive to participation in this survey; we had no refusals from families or children. The anticipated time for completion of the introduction, instructions, and implementation of the survey was 15 minutes; however in practice the time spent was less than 10 minutes for each encounter, inclusive of instructions and reading questions aloud in certain cases. A total of 36 children were interviewed from the three clinical areas representing all age ranges. Outcomes for this project were overwhelmingly positive and demonstrated both the feasibility and lack of burden for this type of patient satisfaction survey.

**Conclusion and implications** – Implications for pediatric nursing as a result of this project are the opportunity for patient experience recovery on occasions there are issues with nursing prior to their discharge. Incorporation of the voice of children in planning care and decision- making is an important enhancement to nursing practice by eliciting the care experience feedback from the perspective of the child patient at the point of care in addition to only the parent. The further implications of this work will be

the groundwork for establishing a link between patient experience perceptions of both parents and children, and post-hospital outcomes.

## EBP PST 1 - Evidence-Based Practice Poster Session 1

### The Effect of a Nurse Centered Foot Care Protocol on Nurse Competency and Confidence

---

*Monique Batchelor, MSN, RN, CFCN, USA*

#### Purpose

The purpose of this presentation is to describe the effects of a nurse centered protocol on foot care on nurse competency and confidence.

#### Target Audience

Nurses and multidisciplinary staff who may have to perform foot care, encourage staff to perform foot care, or those who may audit patient satisfaction in provider knowledge on foot care.

#### Abstract

**Objective:** To determine whether nurse training in foot assessment and foot care increases nurse confidence and competence in foot care.

**Background:** While working in a rural inpatient healthcare facility where there is a high incidence of lower extremity complications, it was noted that many nursing staff do not follow a centralized foot care protocol. Although there are policies in place to guide staff on foot care, the working reality is that feet are neglected, and nurse confidence is poor pertaining to the care of feet.

**Method:** Nurses at an inpatient facility were recruited to participate in a 30 minute workshop designed to improve nurse knowledge of foot care and assessment. Nurses were taught to use a 60 second foot assessment tool and also viewed a 3 minute nail trimming video. A pre and post-test study design was used to evaluate nurse confidence and competency in assessment and nail care. A 60-day post-test survey will also be completed by participants to determine ongoing use of the assessment tool and training.

**Results:** The expected findings are that nurse training does increase nurse confidence in providing foot care. Nurses are able to incorporate an assessment instrument that increases competency into daily care. Podiatry care in the facility will increase after the workshop but decrease over time as nurse assessments increase, and lower extremity complications are found early.

**Conclusions:** A successful foot care training program impacts nurse confidence and competence in several areas. First the use of a valid instrument for assessment standardizes nurse practice in foot assessment. Next, it adds to the evidence-based culture into which health facilities must transform in order to give cost-effective care. Lastly this research endorses findings from researchers in inter-related disciplines who have studied nurse confidence in foot care.

### An Increase in the Number of Nurses with Baccalaureate Degrees is Linked to Lower Rates of Mortality and Improved Patient Outcomes

---

*Kristen Magnuski, BSN, RN-BC, USA*

*Katherine Connelly, BSN, RN, CCRN, USA*

*Nancy Ricciardi, BSN, RN, USA*

#### Purpose

The purpose of this presentation is to show that higher education levels in nursing are associated with improved patient outcomes.

#### Target Audience

The target audience of this presentation is all nursing professionals from nursing educators and administrators to staff nurses interested in increasing their educational levels.

#### Abstract

With more than 3 million members, the nursing profession is the largest segment of the nation's health care workforce. Patient needs have become more complicated, and it is essential that nurses attain requisite competencies to deliver high-quality care. The purpose of this research was to examine whether higher education levels in nursing are associated with improved patient outcomes. The information used for this study was obtained through online searches of journal articles. Most of the articles reviewed focused on Registered Nurse (RN) education levels and hospital mortality rates, while others expanded their research to include the effects of education on other nurse-sensitive outcomes. The Institute of Medicine (IOM) recommends increasing the percentage of RNs with baccalaureate degrees (BSN) from 50% to 80% by the year 2020 (Institute of Medicine, 2010). Articles that supported the growing body of research to move towards BSN education for RNs in order to decrease mortality and improve patient outcomes were explored. In reviewing these articles, the recommendations of the IOM's report to increase RN educational levels are supported. Policy makers, educators, and administrators have a strong evidence base on which to make their decisions regarding the encouragement and funding for nurses' higher education (Blegen, Goode, Park, Vaughn, & Spetz, 2013).

## EBP PST 1 - Evidence-Based Practice Poster Session 1

### The Impact of a Standardized Handoff Tool on Student Communication in the Clinical Setting

---

*Kim R. Hinds, DNP, MS, BSN, BSEd, RN, CNE, USA*

#### Purpose

The purpose of this presentation is to demonstrate the impact of a standardized patient handoff tool on student communication in the clinical setting for baccalaureate nursing students

#### Target Audience

The target audience of this presentation is nurse educators and staff nurse preceptors.

#### Abstract

**Purpose:** What is the impact of a standardized patient handoff tool on student communication in the clinical setting for nursing students?

**Background/Introduction:** According to the Joint Commission, approximately 80% of medical errors involve ineffective communication when patients are transferred between healthcare workers (Nether, 2009). Lack of standardization contributes to errors of omission during patient handoff (Ong & Coiera, 2011). Lack of professional education in effective ways to communicate leads to miscommunication and suboptimal care. Use of standardized communication techniques improve transfer of important patient information during handoff (Pothier, Monteiro, Mooktiar, & Shaw, 2005). Education in communication allows nursing students to share information effectively. Improved handoff report leads to fewer medical mishaps and lower liability for healthcare facilities (Nether, 2009; Pothier, Monteiro, Mooktiar, & Shaw, 2005). Nurse faculty should prepare nursing students to become effective communicators.

**Implementation:** This pilot project used a standardized tool to improve transfer during handoff. Participants were recruited from a convenience sample of students in a Baccalaureate of Nursing program. This project used a pre/post-implementation design. Two recordings of patient handoff were made by participants; the first recording was in an unscripted manner prior to instruction in use of the tool and the second recording was made after education and practice with the tool.

**Evaluation:** Recordings showed an improvement in the percentage of critical patient data transferred with use of the tool. Student participants recorded a mean of 22.75% of all patient data without the use of a tool and a mean of 92.5% with the use of a tool. This shows an improvement of 69.75% transfer of all critical patient data.

**Conclusions:** The findings of this pilot project demonstrated an increased percentage of patient information included with use of the tool. Nursing students need to communicate effectively to ensure safe, positive outcomes; nurse educators must prepare nursing students for this role by teaching effective communication skills and accurate transfer of information to ensure continuity of patient care and safety. Recommendations include further study with more participants to determine the benefits of educating nursing students to use a standardized tool during handoff.

### Skin to Skin Bonding: Maternal Infant Nursing is Fun!

---

*Felicitas T. Cacal, MSN, RNC-OB, C-EFM, USA*

*Laura L. Peters, MSN, RNC-OB, C-EFM, USA*

#### Purpose

To present a quality improvement project that demonstrates an increase in patient satisfaction scores, collaboration between Labor and Delivery and Postpartum, and gain in breastfeeding exclusivity.

#### Target Audience

Registered Nurses, Certified Nurse Midwives, Lactation Consultants, Physicians

#### Abstract

**Problem:** In the fast paced Labor and Delivery and Mother Baby Units, patient care is focused on care that is perceived by patients as family centered and providing a birth experience that is unique and memorable. Recent evidence has shown that allowing a mother and her healthy full-term infant a period of uninterrupted skin to skin bonding within the first hour of life will help the infant transition from fetal to newborn life with more stable temperature, improved glucose control and effortless respiratory transition. Numerous evidence-based research studies demonstrated that early mother-infant skin to skin stimulate the most innate biological instinct that evokes breastfeeding and early interaction. Skin to skin bonding is a unique experience that should occur during the first meeting of the parents and the infant. This is the golden hour that should be respected and treasured. Protocols in a hospital may be adapted to support the initiative of uninterrupted skin to skin soon after the birth of the stable infant and mother. The most recent results collected by Quality Improvement for exclusivity in breastfeeding and skin to skin revealed that interventions are needed to increase the scores. Current data for skin to skin = 58%, Breastfeeding in the first hour = 60% and Exclusivity in Breastfeeding revealed score of 38.9%. Nursing is focused on completing task rather than allowing family to experience uninterrupted bonding between infant and parents in the first hour of life.

**Purpose:** The purpose of the quality improvement project is to achieve the target measure of skin to skin to a minimum of 1 hour immediately after birth to promote achievability of the interventions and for staff to accept and achieve early adoption. The aim is also to increase the bonding time between the mother and baby dyad and promote Family Unit Nursing (FUN)

**Program Development:** Iowa Based Model of Evidence Based Practice and Lewin's Theory of Change were utilized to improve quality care.

- Two evidence based research articles were sent by email to the Transitional Workforce Team. This team consists of staff from Labor and Delivery and Mother Baby Units
- Transitional Team meeting was held and the need for change was discussed
- Survey was sent to staff to review skin to skin definition as it applied to the Golden Hour
- Golden Hour Optimization ( Skin to skin and initiation of breastfeeding in the first hour of life) for term newborn was addressed
- Golden Hour signs were made available to patients, families and visitors posted on each of the labor rooms and Family Waiting Area.
- Partnership between Mother Baby staff and Labor and Delivery staff is evident when admission process for the mother and infant is done at bedside. This collaboration fosters teamwork that is significant to best practice.

#### **Implementation:**

1. Identified trigger
2. Obtained support from leadership and administration that the change is necessary
3. Transitional Workforce Team was utilized as catalyst to the change

4. Assembled and reviewed the evidence at the Transitional Workforce Team meeting
5. Transformed research into practice through analysis
6. Piloted the change
7. Full implementation utilizing the pilot evaluation and feedback of staff from Labor and Delivery and Mother Baby units

**Evaluation/Outcomes:**

- The APN, Educator and Quality Team from Labor and Delivery and Mother Baby Units are currently collecting data for skin to skin and breastfeeding in the first hour.
- Exclusivity in Breastfeeding data is being collected by Quality Department
- Skin to skin as it relates to the Golden Hour survey was sent to 84 staff members
- 26 responses ( 30%)were received with 80% correct responses to skin to skin as it related to the Golden Hour
- Positive comments from patients, family and providers are consistent
- Collaboration between the Labor and Delivery continues to be strong
- Leadership rounding is maintained to obtain feedback from patients and families

## EBP PST 1 - Evidence-Based Practice Poster Session 1

### Patient Medication Education: It's Impact on the Discharged Medical/Surgical Patient

---

*Cathleen D. Butenewicz, MSN, BSN, RN-BC, USA*

#### Purpose

The purpose of this project was to identify barriers patients and their caregivers face upon transition to home from a medical/surgical unit, and to implement a new process which will increase the likelihood of avoiding readmission.

#### Target Audience

The target audience of this presentation is for clinicians and leaders who are directly involved in the discharge process from an acute care facility. However, this work could be implemented during any transition of care.

#### Abstract

Acute care settings have an issue with readmission rates evidenced by the increasing frequency of their discharged patients returning as readmissions within a short time frame. A large contributor of these patients returning is due to their lack of medication understanding according to the Agency of Healthcare Research and Quality (2009). The issue of lack of, or limited, medication understanding has been on a steady incline as our population ages and with more patients being on a variety of medications upon discharge from the acute care setting. This widespread concern has caught the attention of healthcare providers, governmental agencies, as well as the nursing profession.

The purpose of this project was to identify barriers patients and their caregivers face upon transition to home from a medical/surgical unit, and to implement a new process which will increase the likelihood of decreasing their readmission potential. The goal was to provide a seamless transition of care, regardless of where they were being discharged to, while moving them on the next step of their healthcare journey.

The healthcare team is tasked with ensuring both patients and their caregivers have the necessary information to ensure optimal health outcomes. Nurses work to promote health, prevent disease, and help patients and their loved ones cope with their healthcare needs. They are advocates and health educators for patients, families, and consumers (Mayo Clinic, 2014). "Informed patients are more likely to comply with prescribed medication regimes and understand the risks related to medications and adverse events post discharge" (Allaudeen, Vidyarthi, Maselli, & Auerback, 2011, p. 54).

The literature review completed on medication understanding and its impact on the discharged medical surgical patient was found to wide ranging. From the obvious, patient understanding, all the way through to follow up care, and governmental agencies, patient education is extensive. For the purpose of this lit review, the focus was on patient education prior to and post discharge, government agencies and how they impact this issue, as well as the nursing profession and its impact on decreasing hospital readmissions.

While utilizing a theoretical framework which included Patricia Benner, Virginia Henderson, and the Cognitive Learning Theory, our unit based council evaluated our post discharge survey results from the National Research Corporation which were reflective of medication understanding, purpose, and side effects, and developed an educational module for patients and caregivers. The baseline metrics showed a combined score of 69.26 for the last two quarters of FY14. With these results, an enhanced medication education was soon developed. Laminated medication education cards were developed individualized to each patient and which included a picture of the medication, dose ordered, purpose, interactions, and side effects. These cards were left at the patient bedside for the duration of their stay and were utilized with each medication moment. As new medications were ordered, they were added to the education module. Upon discharge, these cards were sent home with our patients which gave them an accessible

resource of all medications they were prescribed. Not only were our patients being educated across the continuum of their stay, but were also provided a tangible tool that was familiar and individualized to their care for use at home.

Upon completion of this project at the end of FY15 Quarter 1, the combined score for the medical surgical unit had risen to 77.23% understanding of medication purpose and side effects. This far exceeded our goal of a 5% increase overall. These results clearly indicate early success of this tool, however, measurements will need to continue in order to sustain these results, which in turn will hopefully help in decreasing the overall hospital readmission rates.

Health advocacy supports and promotes patient's health care rights as well as enhances community health and policy initiatives that focus on the availability, safety, and quality of care. As a nurse, it is our responsibility to get the information out to the public and to advocate for our patients and their loved ones. Professional nurses are ideally placed as information providers given the nature of their contact with patients, and they will need to ensure they work within a philosophy of patient-centered care to ensure continuity of contact with their patients in order to meet the ongoing challenges of patient medication education.

Medication education is clearly a domain in which the professional nurse can take the lead. It is our responsibility to ensure patients have what is needed for safe, effective transitions of care. This project is a clear example of increasing the patient's comfort with medication purpose and side effects, and the positive outcomes it can reap including decreasing readmission rates.

## EBP PST 1 - Evidence-Based Practice Poster Session 1

### Utilizing Simulation in Nursing Education to Develop Confidence and Diminish Anxiety in Clinical Practice

---

*Dana R. Martin, DNP, RN, USA*

*Susan Furr, DNP, RN,, USA*

*Martha Hains Bramlett, PhD, MSN, BSN, RN,, USA*

*Rachel W. Cozort, PhD, MSN, BSN,, RN CNE, USA*

#### Purpose

to disseminate findings of a study to evaluate the impact of simulation-based learning experiences on nursing students' confidence and anxiety levels in clinical practice settings. This presentation demonstrates enhanced educational outcomes through the transformative educational intervention of simulation.

#### Target Audience

nurse educators and those who are interested in simulation-based learning experiences.

#### Abstract

The purpose of this study was to evaluate the impact of simulation-based learning experiences on nursing students' confidence levels and anxiety levels in clinical practice settings. This study enhanced nursing educational outcomes through the transformative educational intervention of simulation. The convenience sample consisted of 19 nursing students enrolled in a baccalaureate program at a small, rural university in the southern region of the United States. This study explores the influence of simulation on confidence levels in the nursing students' junior year and anxiety levels in their senior year of a nursing program. It is hypothesized that the use of simulation will increase confidence and decrease anxiety as a student progresses through their educational trajectory.

Confidence levels in the junior nursing students were measured by the Confidence Scale and the National League for Nursing (NLN) Student Satisfaction and Self-Confidence in Learning instrument. The simulation for the junior nursing students mimicked a typical day in the clinical setting of the students' first semester in the nursing program. The Confidence Scale was administered before and after the simulation experience. The NLN Student Satisfaction and Self-Confidence in Learning instrument was also administered after the simulation experience to provide additional information regarding the students' confidence.

Studies indicate that nursing students, as well as practicing nurses, experience high levels of anxiety while working with clients diagnosed with mental illness. Therefore, subscales of the Mental Health Nursing Survey Part 1 (MHN-1) and the Mental Health Nursing Survey Part 2 (MHN-2) were utilized to measure the senior nursing students' anxiety levels before and after a four-hour simulation-based learning experience that introduced them to mental health scenarios and symptoms of mental health illnesses.

Findings from this study underscore the utility of simulation as a means to impact students' confidence and anxiety as they approach new and different clinical settings; thereby, enhancing their learning experience.

## EBP PST 1 - Evidence-Based Practice Poster Session 1

### The Effectiveness of Simulation in Increasing Nursing Student's Knowledge Regarding Their Role in Adverse Drug Events in an Undergraduate Medical-Surgical Theory Course

---

*Elizabeth A. Tinnon, PhD, MSN, BSN, RN, CNE, USA*  
*Rebecca H. Newton, DNP, MSN, BSN, RN, CHSE, USA*

#### Purpose

The purpose of this presentation is to measure the effectiveness of simulation in increasing students' knowledge regarding their role in recognition of risk factors, identification of errors and their ability to mitigate harm as it relates to adverse drug events.

#### Target Audience

The primary target audience for this presentation is nursing faculty. However, individuals responsible for staff development, nurse residency programs and other clinical educators may also find this information useful. In addition other health care disciplines involved in the patient medication administration process would benefit from this research.

#### Abstract

**Purpose:** The purpose of this presentation is to measure the effectiveness of simulation in increasing students' knowledge regarding their role in recognition of risk factors, identification of errors and their ability to mitigate harm as it relates to adverse drug events. errors and their ability to mitigate harm. in adverse drug events specifically:

1. Measure the effectiveness of simulation on the student's ability to recognize risk factors related to adverse drug events
2. Measure the effectiveness of simulation on the student's ability to identify errors and harm related to adverse drug events
3. Measure the effectiveness of simulation on the student's ability to mitigate harm related to adverse drug events

**Background:** High alert medications have the potential to cause harm to patients with an increased frequency and a greater degree of adverse effects than other medications produce. The Institute of Medicine estimates that 1.5 million preventable adverse events occur yearly in the United States resulting in an estimated \$3.5 billion in additional costs sustained my hospitals. The top four high alert medication classification identified as primary contributors to adverse drug reactions include: anticoagulants, opioids, sedative and antidiabetics (Institute for Healthcare Improvement [IHI], 2012).

Reversing the trend of inefficient medication management should not only necessitate reducing errors, but should incorporate changes in the root cause of adverse events. Pharmacology and medication administration are two crucial areas of nursing education that contribute to the knowledge and patterns of behavior nurses develop as primary caregivers with significant responsibilities for medication administration (IHI, 2012). A substantial body of evidence has been amassed scrutinizing the incidence of adverse events related to medication errors sustained by hospitalized patients. Educational preparation, nurse staffing and skill levels, years of clinical experience, communication, teamwork, patient acuity, and process limitations represent a multitude of causes that have been attributed as root causes (Aiken, Clark, Sochalski, Sloane, & Silber, 2002)

As the largest group of caregivers, nurses practice at the point of care and represent the greatest opportunity to intervene and mitigate the risk and potential harm to patients (DeBourgh and Prion, 2011). Experienced nurses understand the impact of systematic measures to ensure patient safety, but nursing students do not have the experience to fully comprehend this. As nurses practice in a clinical environment over time, they become able to identify and foresee patient safety risks. The ability to critically think plays

a significant role in patient safety, when the nurse is able to identify potential problems and intercede by catering care to individual patient needs (del Bueno, 2005). Nursing students have not developed critical thinking skills; rather they tend to be task-oriented when providing patient care. Nurse educators must revise the teaching learning experience for pre-licensure nurses to integrate a better understanding of the student role and responsibility in patient safety.

High fidelity patient simulation has become an integral part of nursing education as more research has been conducted to support its use. Merging didactic instruction with large group simulation represents a promising approach to help students develop a critical thinking process by incorporating a skill with theoretical knowledge. Simulation is an experiential learning strategy that provides an environment that promotes student engagement while encouraging peer collaboration and teamwork. Simulation can be adapted to meet the student level of competency allowing for complexity as students progress through a nursing program (Cardoza and Hood, 2012). The simulated environment parallels the clinical environment, but allows students to practice without the possibility of harm. At the conclusion of a simulated scenario, the debriefing process offers an opportunity for reflection and recognition by students of their knowledge and understanding of the situation. The reflection allows students to grasp the larger picture of the events in the scenario and develop their critical thinking ability.

**Methodology:** A quasi-experimental design will be used with one repeated factor (pre-test, post-test) and one between groups (lecture, lecture + simulation).

The sample consists of seventy-nine second semester nursing students enrolled in the first medical surgical course within an undergraduate curriculum. Other defining characteristics of the sample population are: 65 female students; 14 male students; 11 African American students and 68 Caucasian students. Criteria for inclusion in the study includes: official university student enrolled in Chronic Conditions Across the Lifespan; older than 21 years of age.

Following approval from the university Institutional Review Board (IRB) informed consent will be obtained. Students wishing to participate in the research study will be randomly assigned into either the simulation group or the non-simulation group. The pre-test will be administered to both groups prior to the lecture. At the conclusion of the lecture the non-simulation group will be administered the post test. The simulation group will proceed with the simulation learning. Simulation scenarios will last approximately 15-20 minutes. Students not actively participating in the scenario will be observing the simulation scenarios via live streaming video. There will be a total of 3 simulation scenarios conducted. The situational simulation scenarios were developed based on the learning objectives which focused on three of the high risk medication classifications (anticoagulant, insulin and opioids). There will be a 15-20 minute debriefing after each of the simulation scenarios. The simulation scenarios will be conducted by Dr. Rebecca Newton and the course faculty member. At the conclusion of the debriefing the simulation students will be administered the post-test

The pre-and post-test are instructor created exams which are a 10 question multiple choice exams designed to measure student's ability to recognize risk factors, early signs and symptoms and appropriate nursing action to intervene in adverse drug events. Face and content validity of the exam was determined by 3 medical surgical instructors each with at least 20 years of nursing experience. In addition to teaching med surgical content one instructor is responsible for teaching math calculations and the introduction to med administration. One of the three instructors teaches the pharmacology course in the undergraduate curriculum and the third instructor is a credentialed simulation expert.

**Results:** Test items will then be analyzed using ParScore® for validity and for adequacy of each question, and overall quality of the exam. Analysis of the data will also include descriptive and mixed factor 2 way ANOVA statistical tests.

**Discussion:** It is expected that the use of simulation with lecture will be effective in increasing the student's awareness of their role in adverse drug events. Nursing is not the only discipline involved in adverse drug events in addition to informing nursing education, the information obtained from the study could also be used within other health care disciplines program of study. Thus exponentially increasing

the number of healthcare providers with increased awareness of their role in preventing adverse drug events. Subsequently this may decrease the number of patients harmed around the globe.

## EBP PST 1 - Evidence-Based Practice Poster Session 1

### SOS...”I Need Help” Seminar of Success for Struggling Limited English Proficiency (LEP) Online Nursing Students

---

*Melissa D. Myers, MSN, BSN, RN, CNE, CPN, USA*  
*Virginia L. Hall, DNP, MSN/Ed, BSN, RN, CNE, USA*

#### Purpose

The purpose of this presentation is to share our findings on limited English proficiency nursing students in the online environment. Included will be the current mentoring strategies we are implementing to help overcome some of the barriers these students may face.

#### Target Audience

The target audience is nursing instructors and faculty that educate limited English proficiency (LEP) students. While our focus is the online environment, this can be applicable to ground campuses as well.

#### Abstract

##### Objectives:

- Describe three important considerations of the online learning environment related to limited English proficiency students.
- Summarize how understanding of the specific needs for limited English proficiency online nursing students can empower educators in leading students to success in the online environment.
- Recognize the impact that faculty mentors and specific resources for limited English proficiency students can have on improved graduation and retention rates.

Introduction: Student demographics and cultural characteristics reach across the globe, thanks to the advances of technology. The number of non-native English speakers in nursing programs is growing as more nursing programs adopt an international focus. Chamberlain College of Nursing serves a culturally diverse student population in its three major online nursing programs, RN-BSN completion, MSN programs and DNP programs. One of the major barriers of success is Limited English proficiency (LEP). In our initial study, we found most students feel that they can be successful in the online environment, however would like to have a mentor. The second phase of our study focused on academic integrity in the online environment finding that academic integrity is a concern with LEP students. In order to address the concerns of the study findings and literature reviews, a Seminar of Success (SOS) online module has been created to address the specific needs of LEP online nursing students.

Background: Literature validates the need to take action on reducing attrition rates and recruiting more multicultural nurses. It is believed that limited English speaking students will be more successful if the educational environment is designed and aimed to assist the specific needs of these students. Responses to a survey administered to students at Chamberlain College of Nursing believed they would be more successful in the online environment with assistance of mentors. In one 8-week session of 23 identified suspected plagiarism cases, we found that 42% percent (or 9 of 21) of academic integrity concerns, involved LEP students. Although the majority of the cases involved non LEP students, it was also concluded that only 28 percent of these events were used as teaching moments where the student needed more education and coaching.

Methods: A Seminar of Success (SOS) course has been created for all online RN to BSN students. Within this course are several modules including scholarly writing, basic computer literacy, stress and time management, student resources, and LEP resources. The LEP module includes resources such as tutor sources, plagiarism information, help with grammar, outside resources, and the option for a mentor. Over the course of several months faculty mentors have been recruited from across campuses. Many of the mentors are not native English speakers so they come with a rich history including first-hand experience. LEP students are able to work with a mentor short term or long-term.

Conclusion: It is believed that non-native English speaking students will be more successful if an educational environment is designed and aimed to assist the specific needs of these students. As online programs continue to grow, it is essential schools are equipped with resources to aid in LEP student success. In particular, a faculty-student mentoring program for the online students incorporated into the curriculum will provide an effective learner experience. It is anticipated that mentoring programs will assist these students to successfully complete their baccalaureate degrees in nursing..

Mentoring offers strategies to break barriers of learning and success in nursing academics (Wilson, Andrews & Leners, 2006). Benefits of mentorship include a commitment to learning, increased motivation to learn and critical thinking skills. Mentors and mentees should be matched by similar ethnicity (Escallier & Fullerton, 2009). Relational mentoring prescribes to the basics of mentoring but adds much more in a reflective mentor-mentee relationship that empowers, inspires and guides in the process of a caring relationship (Wilson, Andrews & Leners, 2006). With the inclusion of mentoring, the LEP SOS module will assist students in a variety of ways.

# **Evidence-Based Practice Poster Presentations**

## **Session 2 (EBP PST 2)**

---

## EBP PST 2 - Evidence-Based Practice Poster Session 2

### Effective Dedicated Unit for Students' Practice: An Evidence Based Review

---

*S. Stephanie Unger, PhD, MSN, BSN, RN, CNE, USA*  
*Lisa Ward, MSN, BSN, RN, USA*

#### Purpose

1. Identify the strategy to implement effective dedicated unit for pre-licensed students practice from the results of systemic review 2. Discuss the method in conducting an evidence based review

#### Target Audience

Nurse leaders, nurse academia, nursing administrators, and nursing staff who are responsible and/or involve in pre-licensed nursing students' practice.

#### Abstract

Preparing new nurses to practice independently and more important to practice safely has been a priority for nurse leaders in academics. The Institute of Medicine (2011) has recommended that nursing leaders improve how nurses are prepared and educated. The gap between classroom teaching and clinical teaching needs to be closed. Nursing leaders and Educators need to utilize the available resources and partnerships with health care facilities. The development of a dedicated education unit is one strategy to address this gap.

Clinical learning encompasses learning experiences that occur in an environment where healthcare is delivered. It also includes the development of critical thinking around experiences to help students uncover the link between theory and practice (NENZ/NETS, 2007). According to Glazer, Erickson, Mylott, Mulready-Shick, & Banister (2011), creating a vision to engage in a partnership between academic and healthcare facilities would be the start of the process. Furthermore, the nurse leaders would agree to create a cross-institutions task force charged with examining the dedicated unit concept. Although it will require roles' adjustment from both parties in implementing the new designed dedicated unit module, there was no significant different in the care from client perspective (Castner, Ceravolo, Tomasov, & Mariano, 2012)

This poster presentation will illustrate a part of a collaborative project between PennState Mont Alto nursing program and a local hospital in development of a dedicated unit for pre-licensed nursing students' practice. Following the initial dialogues with nursing administrators at the local hospital, an evidence based review of literature was conducted to be a guideline for the dedicated unit creation. The PICO was used to identify the core elements for the project. A systematic review, suggested by the Johns Hopkins Evidence Based Model (Dearholt, & Dang, 2012) provides framework in this review. Results from the review will be proposed to the collaborative team for the dedicated unit pilot project. The results will assist in conceptualization an evidence based framework for creating an effective dedicated unit. The framework will also be rendered in the poster in addition to the highlights from systematic review.

### Healthy Skin Wins: A Glowing Pressure Ulcer Prevention Program

---

*Donna Martin, PhD (Nursing), MN, BN, RN, Canada*

*Lisa Albensi, MScN, BN, RN, Canada*

*Stephanie Van Haute, BN, RN, Canada*

*Lorna Guse, PhD, MA, BN, RN, Canada*

*Mary Montgomery, OT, Canada*

*Kendra Gierys, BN, RN, Canada*

*Maria Froese, PT, BMR-PT, Canada*

*Mavis Lam, Canada*

*Nataliya Basova, Canada*

*Rob Lajeunesse, BN, RN, Canada*

#### Purpose

The purpose of this poster presentation is to report the findings of a mixed methods study that was employed to determine the effectiveness of a pressure ulcer prevention program in an acute care hospital located in a Western Canadian city.

#### Target Audience

The target audience of this poster presentation is nurse administrators, nurse educators, wound care specialists, and nurse clinicians.

#### Abstract

Pressure ulcers (PUs) are one indicator of the quality of health care. The prevalence of PUs in acute care hospitals in Canada is estimated at 25.1% with half of PUs assessed as Stage 1. In 2013, an observational survey using a modified Braden Scale was conducted among 272 patients in an acute care hospital located in a Western Canadian city. The prevalence rate of PUs was 34.9% with only one third of the PUs at Stage 1. In this poster presentation, we describe how a multidisciplinary research team implemented and evaluated a PU prevention program (PUPP). The multi-disciplinary research team was comprised of a physiotherapist, an occupational therapist, a dietician, wound care specialists, and several nurses. The team used the Iowa Model of Evidence-Based Practice to Promote Quality Care in conjunction with Rogers' Diffusion of Innovations Model as guiding frameworks. The PUPP included the establishment of specialized mattresses hospital-wide, new products for patients with incontinence, use of sliders, and discontinued use of soaker pads. A staff awareness campaign was launched; it was entitled, "Healthy Skin Wins" with posters and weekly newsletters about changes in practice, nutritional support for at-risk patients, and a 20-minute online tutorial about PUs and PU prevention. A mixed methods study, funded by the Manitoba Centre for Nursing and Health Research, was employed to determine the effectiveness of the PUPP with a pre-test/post-test design, a repeat observational PU prevalence survey, and three focus group interviews. Health care aides, licensed practical nurses, registered nurses, and allied health care professionals were invited to complete an anonymous 18-item knowledge assessment tool before and after an online tutorial about PU prevention using FluidSurveys.com. Eighty staff members volunteered to participate in the pre-test/post-test with a statistically significant increase in their knowledge about PUs and PU prevention. A repeat PU prevalence observational survey was conducted after the launch of the PUPP in 2014 with 240 in-hospital patients, and a statistically significant reduction in the prevalence rate (7.5%). Following analysis of the quantitative data, health care aides, nurses, and allied health professionals were invited to participate in three semi-structured, audio-recorded focus group interviews to share their perceptions of the PUPP. The audio-recordings of the interviews were transcribed verbatim. Transcripts were read and reread to facilitate a process of thematic analysis to describe hospital staff's experiences of the PUPP. In this poster presentation, we share the results of the mixed methods study that determined the effectiveness of the PUPP. This mixed methods study can be used as a template to incorporate and evaluate evidence-based practice changes in various health care facilities around the world.

### Now You See Me

---

*Milena P. Staykova, EdD, APRN, FNP-BC, USA*

#### Purpose

To discuss the usefulness of a checklist for online nursing faculty.

#### Target Audience

Academic Faculty

#### Abstract

The online education is becoming a desirable form of education in the contemporary academic system. According to research published in 2013, 6.2 million students are taking online educational courses. Millennial generation is entering the higher education with advanced technology skills and social network connections. However, these students feel isolated if the faculty does not provide a constant feedback or reply to questions and emails instantaneously. The faculty are challenged to stay visible in the online environment without clear guidelines and expectations. Furthermore, the online faculty members are overwhelmed but the time and efforts required to email students individually, answer multiple discussion forum threads, and grade a larger number of assignments. To address these issues, an online faculty checklist was developed for pre-during-and post-course expectations. Faculty members were mentored on how to use the checklist and create a presence in the online class. The purpose of this presentation is to share the mentoring strategies to new or seasoned faculty who have transitioned from teaching in a traditional face-to-face classroom to online coursework. The presenter will share challenges experienced by the director of an online RN-BSN program in mentoring online faculty members due to the distant physical environment, unique course composition, and diverse student population.

### Faces of Change: Using Masks to Capture a Moment in Time

---

*Cheryl Crisp, PhD, MSN, BSN, ASN, RN, PCNS-BC, CHPPN, CRRN, USA*

#### Purpose

describe how allowing students to design a mask capturing a specific moment in time helps them learn principles of effective communication.

#### Target Audience

nurse educators, new faculty, and other nurses seeking to find creative ways for students to express their learning.

#### Abstract

Purpose: The purpose of this presentation is to describe how Arts-Based Learning (ABL) be used in a traditional BSN program to enhance student learning, engagement, and understanding. ABL is a "creative strategy with the potential to engage learners, foster understanding of multiple perspectives, and simultaneously connect cognitive and affective domains of learning,"

Description: Students in a sophomore level BSN program were asked to create a mask capturing a specific moment in time and then to discuss the communication principles involved with the mask and the selected moment in time. Students were given the assignment on the first day of class and presentations were the last two weeks of class to allow the students adequate time over the semester to complete the project. The excitement surrounding the ability to create something while learning was almost palpable. Students were energized and engaged in the process from the first class up until their presentations. The final products were phenomenal. The students did a wonderful job of designing their masks and discussing them as their final project for the class.

Implications for educators: Students in a traditional BSN program who are allowed to creatively express themselves by using ABL have the potential to be more excited about learning, more actively engaged in the learning process, and feel more actively involved in their learning process.

### A Comparison of RN-NCLEX First Time Pass Rate for Online Nursing Students and Traditional Face-to-Face Nursing Students

---

*Louise Salmond, MSN, RN, USA*

#### Purpose

The purpose of this presentation is to look how effective is online nursing education in regards to NCLEX-RN pass rate success

#### Target Audience

The target audience of this presentation is nursing faculty and clinical educators.

#### Abstract

Nursing schools have always tried to educate their nursing students in such a way that when they take the National Council Licensure Examination for Registered Nurses (NCLEX-RN), they have a first time success. This success has always been the number one goal of all nursing programs. At the same time, nursing schools are feeling the pressure of the growing need to increase the number of nursing graduates. Many schools of nursing in the United States have tried to ease the burden of not having enough classroom space or faculty by increasing the number of online nursing programs. Nursing programs are loaded with teaching the necessary hands on skills required to be a competent nurse along with the didactic knowledge required. With these requirements of a nursing graduate, is an online nursing program as effective as the traditional classroom nursing program in producing competent nurses and achieving the NCLEX-RN first time pass rate?

### Team Faculty Approach to Introduce Grant Writing Experience in an Undergraduate Nursing Service Learning Course

---

*Kelly Vandenberg, PhD, MSN, RN, USA*

*Pamela J. Hodges, PhD, MSN, RN, USA*

*Claudine Dufrene, PhD, MSN, BSN, ASN, RN-BC, GNP-BC, USA*

*Poldi Tschirch, PhD, MSN, BSN, RN, CNE, USA*

*Corinne M. Oppermann, MSN, RN, USA*

#### Purpose

The purpose of this presentation is to disseminate valuable information regarding an innovative strategy and learning outcomes to promote inclusion of grant writing experience for undergraduate nursing students.

#### Target Audience

Nursing Educators, nurse researchers, clinical researchers and nursing students

#### Abstract

Introduction: During the nursing program, students of great diversity are able to achieve knowledge, leadership and professional qualities while fostering collaboration with four diverse communities. Undergraduate nursing students are introduced to research, but the development of their research skills does not end after the research class. Threading service learning activities across the curriculum that promotes research skills such as grant writing is a faculty team approach.

The purpose of this innovative educational project is to use an evidenced based approach to strategically identify high impact research activities to inspire service learning and research skills among nursing students in a newly developed undergraduate nursing program. The first step is providing a grant writing opportunity. This includes the collaboration of the faculty team, nursing students, and community leaders to support the activity. Faculty will direct students toward service learning activities that incorporate research skills.

Background: A newly developed nursing program that began in 2012 at a faith-based Hispanic serving university in southeast Texas explored evidence to support the strategic placement of "real-world" experiences in development of nurse research scientists. The program requires the research course, clinical inquiry, during the second semester. The grant writing service learning activity is incorporated in the third semester community nursing course. The project is consistent with the BSN nursing program outcomes listed below.

- Provide relationship-centered nursing care that is grounded in nursing theory and guided by evidence based best practice standards to support individuals, families and communities in achieving their goals for healing and wholeness.
- Utilize nursing theory, nursing research and methods of clinical inquiry as the basis for continuously enhancing the quality of care.
- Participate in the social advocacy role of the nurse through membership in professional organizations and engagement in community service.

Methods: The project will be evaluated using qualitative and quantitative surveys that target the faculty team, community nursing students, and community leaders.

Surveys are focused on five areas.

2. Provide instruction and guidance in grant writing

3. Allow student groups to submit for actual funds made available through a Teaching Enhancement Grant
4. Provide the ability to disseminate results via posters at various venues
5. Support the missions of the four designated communities during service-learning experiences
6. Support the goals and mission of the University and the School of Nursing

Implementation: The 2016 nursing cohort completed a nursing research course the second semester of their nursing program. The community course (third semester of nursing program) continues to build toward the on-going professional development of nursing students. Students in the community course are divided into four groups and partnered with four identified diverse communities that have volunteered to participate in the following phases.

- Community Assessment
- Development of community diagnosis of problem/needs and goals
- Project Planning
- Project Implementation
- Project Evaluation and Dissemination of Results

A team of five faculty members in the community course are charged with guiding, instructing, and mentoring students in the application process, poster development and dissemination of results. The course coordinator will determine the grant awards based on the standardized criteria of feasibility, sustainability, merit, evaluation plan, and budget. Total project time allowed is three months.

Results: Results pending.

Survey results from the faculty team, students, and community leaders will be analyzed and presented at the end of the project. In addition, the number and quality of proposal applications submitted, and the number of proposals funded will be evaluated and presented.

Conclusion: The project seeks to provide evidence to support a service learning grant writing activity in the curriculum. Findings will help to identify additional activities to enrich future courses and achieve enhanced community collaboration by transforming nursing practice.

## EBP PST 2 - Evidence-Based Practice Poster Session 2

### Building Community Nursing Competencies in Undergraduate Nursing Students: An Interprofessional Collaboration for Designing Reality-Based Field Simulations

---

*Ellen D'Errico, PhD, NEA-BC, USA*  
*Kelly McHan, MPH, RN, USA*

#### Purpose

The purpose of this presentation is to showcase an evidenced-based teaching strategy involving interprofessional collaboration in designing simulations of reality-based experiences community nurses encounter in the field (e.g. medication reconciliation (pharmacist), wound care (physician), mobility (physical therapy), urinary catheterization and physical assessment (nursing) and elder abuse (social work)).

#### Target Audience

The target audience of this presentation is undergraduate nursing faculty.

#### Abstract

**Purpose/Aims:** Develop reality-based field simulations in an undergraduate community health nursing course, engaging students using visual and psychomotor skills, as well as critical and reflective thinking to enhance community-based nursing competencies. Curriculum development was done in collaboration with pharmacists, physicians, nurses, and physical therapists focusing on low fidelity simulation techniques done in a classroom setting.

**Background:** According to the Forum on the Future of Nursing: Care in the Community (2009), there is an anticipated 109% increase in the demand for full-time home health nurses from 2000-2020. If not fulfilled, this workforce shortage can be expected to negatively influence the health of communities. Schools of nursing must find ways to promote careers in community health nursing roles. The Carnegie Nursing Education Study stressed the importance of connecting theory with practice without relying so heavily on didactic teaching methods in order to close the theory/practice gap. Greater use of active simulation exercises in the curriculum may improve cognitive learning and retention, and increase student engagement in community nursing roles.

**Intervention:** A classroom laboratory of activities such as home medication reconciliation, identification of elder abuse, wound/ostomy care, urinary catheterization using models, and physical assessment is done at several home-like setting stations where students practice skills and problem solving and are signed off by faculty. Students are asked to evaluate the learning experience.

**Implication for Nursing Education:** Increasing knowledge, skills and competencies in community health nursing curricula may attract greater numbers of students to consider nursing careers based in the community.

## EBP PST 2 - Evidence-Based Practice Poster Session 2

### Fighting a New Battle: A Bathing Care Standard for Caregivers of Elderly Male Military Veterans with Delayed Onset Post Traumatic Stress Disorder

---

*Michelle Rose, MSN, RN, USA*

#### Purpose

The purpose of this presentation is a best practice bathing care standard specific designed for elderly male veterans with Delayed- Onset Posttraumatic Stress Disorder in long-term care facilities and residential settings based on nursing research. This project seeks to translate the body of research associated with Bathing Without a Battle.

#### Target Audience

The target audience of this presentation include: Assisted Living facility Administrators Care/Case Managers Nurses Nursing Home Administrators Mental Health Professionals

#### Abstract

Despite many veterans' hopes that the invisible wounds of war can be healed; they leave scars. Most survivors of military combat who have experienced or witnessed life-threatening events such as, terrorist incidents, and serious accidents can adjust to incidents without lingering effects. Many years after a war, other aging veterans find themselves fighting a new battle as they strive to cope with delayed-onset posttraumatic stress disorder (DOPTSD). For many aging military veterans with Post Traumatic Stress Disorder (PTSD) activities of daily living, particularly bathing can be an improbable, exasperating, and stressful task. An evidence-based bathing care standard was created for direct care staff at a local Mid Western Hospice organization who have been experiencing the challenges during bathing of their patients. The body of research evidence guiding this project is the Bathing Without a Battle (BWOB) learning tool for long-term care nursing personnel and families who have been affected by Alzheimer's disease and related dementias. This care standard seeks to translate the body of research associated with the BWOB movement applied in the care of veterans with dementias to those with evidence of the agitated and aggressive behaviors associated with DOPTSD triggered by bathing. This project hypothesized that bathing can be accomplished "without a battle" and modeled into a more humane, gentle experience for elderly male Veterans with DOPTSD and their caregivers. Maladaptive behaviors such as kicking, biting, hitting, scratching, throwing objects, spitting, and cursing were measured using a Log for Maladaptive Behavior. Results reflected an effective means of improving the bathing experience of veterans with delayed onset PTSD in long term care and residential settings and caregivers. By changing the bathing routine and environment, and implementing patient centered care (PCC) interventions these men may be better able to adapt to bathing, which will no longer be a battle. This topic is very essential in geriatric and veteran care. The bathing process for elderly male military veterans suffering from DOPTSD is often a challenging experience for both veterans and their caregivers. Similar to dementia, persons with DOPTSD can become confused and may misinterpret actions and verbiage by caretakers.

## EBP PST 2 - Evidence-Based Practice Poster Session 2

### Teaching Care of Veterans and Their Families in an Online Nursing Program

---

*Penny R. Marzalik, PhD, APRN, RN, CNM, IBCLC, USA*  
*Tara Lynn Spalla, PhD, RN, USA*

#### Purpose

(1) describe how to incorporate veteran specific care content into an online nursing program, and (2) discuss the impact of veteran specific content on nursing students' awareness and empathy for this unique patient population.

#### Target Audience

nurse educators who would like to incorporate veteran specific content into their curricula; and find ways to encourage student reflection, application, analysis and evaluation of current veteran resources and care.

#### Abstract

Due to improvised explosive devices, along with other weapons of war, United States (US) veterans of Operation Enduring Freedom (OEF) and Operation Iraqi Freedom (OIF) have experienced more post-traumatic stress disorder (PTSD) and traumatic brain injury (TBI) than at any other time in American history. It is estimated that as many as 18.5 percent of these veterans suffer from PTSD or depression and 19.5 percent report experiencing a probable TBI during deployment (Rand, 2008). The diagnosis of PTSD is high among veterans exposed to trauma themselves or who have witnessed trauma to another (USDVA, 2014). Further, as a result of the injury of war, it is estimated that 22 US veterans take their own lives each day (Kemp & Bossarte, 2012). Of OEF/OIF discharged veterans, just over half receive care from a US Department of Veterans Affairs (VA) facility. The remaining veterans obtain private health care in their local communities, particularly those without access to nearby VA facilities, such as residents of rural communities (National Council for Behavioral Health, 2012). Clearly, this data supports the need for a new skillset within the health care community, especially for registered nurses who work around the clock and calendar providing health care.

The average age of a registered nurse in the US is 44-years-old. Most did not have veteran-specific content in their original nursing programs. Today many nurses are caring for returning veterans exhibiting symptoms of PTSD and TBI, and lack the knowledge and clinical skills to competently provide appropriate care. A unique challenge to fill this educational gap exists in RN-BSN Completion Programs.

Joining Forces, established in 2011, is a 3-part national initiative created to serve America's military families through employment, education and wellness. The wellness component "encourage[s] and facilitate[s] commitments to train and educate healthcare providers on the unique needs of service members, veterans, their families, and caregivers" (Whitehouse.gov, 2015, para. 4). This initiative provides a call to action and is supported by the American Association of Colleges of Nursing (2012) and the National League for Nursing (2012).

Teaching/learning strategies that incorporate care of veterans must be adaptable to online education if this is the delivery method used for the nursing program. One method for threading content related to the care of veterans into the curriculum for an Online RN-BSN Completion Program will be presented. Methods for obtaining faculty commitment in this venture will be explained.

## EBP PST 2 - Evidence-Based Practice Poster Session 2

### A Concept-Based Curriculum Revision of a PN Program

---

*Kristen L. Smith, MSN, BSN, RNC-NIC, USA*

#### Purpose

The purpose of this presentation is to outline a practical nursing program revision to a concept-based curriculum (CBC). More and more RN curriculum's are being revised to a CBC program in order to advance and streamline the students learning. We have revised a PN program to a CBC.

#### Target Audience

The target audience for this presentation would include faculty and administration of nursing programs who may be interested in a concept-based curriculum. Most nursing curriculum's are designed around a medical model and redesigning it around nursing concepts decrease the overabundance of material while advancing critical thinking skills in nursing students.

#### Abstract

The revision of a practical nursing curriculum in order to have a more up-to-date approach of teaching, increase student satisfaction, and yet meet or exceed the outcomes of the previous curriculum. A concept-based curriculum (CBC) is one that is formed around the concepts of nursing practice rather than formed around the medical model. The traditional way of laying out a nursing curriculum is similar to the medical model with Medical/Surgical, Pediatrics, and Obstetrics (Lee-Hsieh, Kao, Kuo, & Tseng, 2003). This way of setting up a curriculum causes an overabundance or oversaturation of information for the students to memorize and try to learn. Concept-Based Curriculum is being looked at nationwide in nursing programs and is becoming a "major trend for the future of education" (Giddens, 2013, p. xiii). Changing curriculum to a concept based approach will decrease repetition of information and create a paradigm shift from volume of information to value of information (Godfrey, 2013).

Some examples of concepts within a concept-based curriculum could be oxygenation, clotting, electrolyte balance, and nutrition. When you examine the concept or teach to the concept you could start off with an explanation of what oxygenation is and how it is seen or treated. Then you could break the class up into groups and have an activity where they need to create short ten minute talks for their classmates about different diagnosis related to oxygenation, what abnormal labs are seen, what medications are given for that disease, as well as what the assessment findings are for the patient with the diagnosis. When you consider that it will not only be a Medical/Surgical class but also a Pediatric class you could give oxygenation issues like asthma, croup, chronic obstructive pulmonary disease (COPD), and pneumonia. When the groups talk about their findings or research in class you are not only making this a student centered activity and active learning activity but you are also helping to improve the students' critical thinking ability and fostering a commitment to lifelong learning" (Giddens & Morton, 2010).

Another important question is whether we will be able to have the same outcomes with a concept based curriculum change? The literature states that the results have been the same if not better, that the students from concept-based curriculums feel they are thinking like a real nurse and being able to put different ideas and concepts together in order to create a plan (Nielsen, 2009). After making a change the school of nursing would need to continue to assess HESI and NCLEX scores and pass rates as well as satisfaction of students and faculty to reevaluate the curriculum. According to Elsevier Publishing, CBC is not currently being utilized by LPN programs, only by bachelor and associate programs throughout the country. The benefits to a CBC is that it creates critical thinkers who can connect concepts more readily and solve problems.

The National League for Nursing (NLN, 2003) called for dramatic reform of nursing education as healthcare is ever changing so education needs to move along with it. Overall, nursing curriculum is in need of a redesign nationwide in order to keep up to speed with the healthcare changes of today. Nurses need to be able to critically think and problem solve on a daily basis while providing the highest quality of

care to their patients. As Nielsen states (2009), we can no longer just fill student's heads with information; we must ensure that they truly understand the needs of the patients in order to provide safe quality care. Lasater & Nielsen (2009) believe that the traditional nursing program has become inadequate and we must create new models to foster deeper clinical thinking and sound clinical judgment.

## EBP PST 2 - Evidence-Based Practice Poster Session 2

### Examination of Factors Related to Elderly People's Purpose of Life in Japan

---

*Takashi Ohue, PH.D, RN, PhD, Japan*

#### Purpose

Older adults' sense of purpose in life has been an important subject in Japan along with their well-being and healthy long life. The purpose of this research is to examine factors related to elderly people's purpose of life in Japan.

#### Target Audience

The life which has sense of purpose in life in an elderly-people well-being of Japan in addition to a healthy long life has been an important subject.

#### Abstract

**Purpose:** Older adults' sense of purpose in life has been an important subject in Japan along with their well-being and healthy long life. The purpose of this research is to examine factors related to elderly people's purpose of life in Japan.

**Methods** Older adults (N = 250) aged 65 and over gathering in the Kakogawa public hall in Japan were asked to participate. They were asked about their individual attribution and maintenance of healthy condition. Moreover, These items were measured using the Philadelphia Geriatric Center Morale Scale covering "Agitation," "Lonely dissatisfaction," and "Attitude toward own aging", General Health Questionnaire (GHQ) and Instrumental Activities of Daily Living (IADL) Scale. Ethical considerations: The protocol of this study was approved by the Hyogo University Ethics Committee, Japan.

**Results** Questionnaires were distributed to 250 elderly people and answers were collected from 244. After exclusion of missing values and outliers, data from 234 elderly people (male: 49, female: 185) were used in the analysis. "Attitude toward own aging" had young old higher than the late elderly ( $p < 0.05$ ). "Agitation" was higher to the male than to the female ( $p < 0.05$ ). Number of events leading to purpose of life showed positive correlations with "Agitation"; "Lonely dissatisfaction"; "Attitude toward own aging" ( $p < 0.05$ ). Specifically, it was an occurrence improve sense of purpose in life where "Educational and cultural enrichment activities", "Sports or recreational activities", "Volunteer activities", "Activities for an elderly's club", "Care of grandchildren, and family get-together", "Going for shopping or on a trip". Number of diseases showed negative correlations with sense of purpose in life ( $p < 0.05$ ). Specifically, cardiopathy, fracture, liver disease, and dementia were diseases for which reduce the sense of purpose in life. Purpose of life showed correlation with mental health and ADL ( $p < .05$ ).

**Conclusion:** In order to improve elderly people's sense of purpose in life, it is important to intervene to a disease and not to increase the number of diseases. Moreover, it proved that study and activity raise elderly people's sense of purpose in life. Therefore, it is necessary to adopt contents, such as prevention of a disease, and study and activity of elderly people, by the contents of the intervention program which raises elderly people's sense of purpose in life.

### Waist Circumference as a Measurement Tool for Pediatric Obesity

---

*Jeanette Marlene Weiser, DNP, MSN, BSN, ADN, RN, APRN, FNP-C, USA*

#### Purpose

The focus of this project was exploring methods for the early identification of childhood obesity. Waist circumference was utilized, in combination with height, weight, and BMI for variables. The study design was quantitative, correlational. This project took place at a rural health clinic in a community of 2500 in Kansas.

#### Target Audience

The target audience for this presentation includes clinical staff working with the routine developmental screening of the pediatric population.

#### Abstract

**Background:** The focus of this project was exploring methods for the early identification of childhood obesity.

**Significance:** With the advent of electronic health records, and Meaningful Use requirements, there has been an additional push to obtain accurate height, weight, and BMI measurements on all patients, both child and adult. Unfortunately, BMI alone does not provide an accurate representation on the health status of the patient. An extensive literature review revealed that the waist circumference measurement has been utilized in other countries (Germany, Turkey, and Brazil) in order to answer this need.

**Methods:** The study design was quantitative, correlational. This project took place at a rural health clinic in a community of 2500 in Kansas. Several months prior to implementation of the project, education was provided for office staff on the process of obtaining a waist circumference measurement. A PDS/McKesson Practice Partners electronic health record (EHR) was utilized.

**Results:** 251 eligible patients, 201 w/ BMI values, 53 w/ waist circumference values, and 29 with eligible ICD-9 codes. ANOVA testing and post hoc Tukey HSD testing was completed. BMI and/or waist circumference measurements led to the identification of an overweight/obese diagnosis 14% of the time. In addition, patient's age and/or gender did not have a significant relationship to BMI and/or waist circumference measurements.

**Discussion:** The novel environment of a rural health clinic in the Midwestern USA added a dynamic to the research that was beneficial in filling a knowledge gap. The addition of anthropometric measurements within the pediatric practice of this clinic location was beneficial for the purpose of early identification of overweight/obesity related health trends. This is anticipated to make a positive effect in the long term care of the pediatric patient population.

## EBP PST 2 - Evidence-Based Practice Poster Session 2

### The Effects of Psycho-Educational Intervention on Quality of Life in Patients with Implantable Cardioverter Defibrillators: A Meta-Analysis

---

*Miao-Yi Chen, BS, RN, Taiwan*

*Pai-Hui Lin, BS, RN, Taiwan*

*Chi-Wen Kao, PhD, RN, Taiwan*

#### Purpose

The purpose of this presentation is to show the evaluation of the effects of psychological and educational interventions on quality of life in patients with implantable cardioverter defibrillators.

#### Target Audience

The target audience of this presentation is clinical nurses, nursing educators, and nursing administrators.

#### Abstract

Background: Sudden cardiac death (SCD) is an important clinical and public health problem. The implantable cardioverter defibrillator (ICD) is developed for primary and secondary prevention of SCD. Once the device is implanted, it becomes important for patients to regain life quality for integrating the devices into their lives. Quality of life has been identified as a significant predictor of mortality in ICD recipients.

Purpose: The aim of this meta-analysis was to evaluate the effects of psychological and educational interventions on quality of life in patients with ICDs.

Methods: We systematically searched the following databases: PubMed, Medline, Cochrane Library, and CINAHL up to November 2014 and references of relevant restricted articles. Studies were recruited in analysis if they met following criteria: (1) randomized controlled trial design, (2) participants in study were adult patients with ICD implanted, and (3) providing sufficient data to evaluate the effect of psychological or educational intervention on quality of life which was measured by SF-36 or SF-12. Two reviewers selected studies and extracted data independently. We used modified Jadad scale to evaluate the quality of these studies. The Cochrane Collaboration's Review Manager Software Package (RevMan 5) was used for this meta-analysis. We pooled data across trials using the fixed-effects model. Heterogeneity was assessed by  $\chi^2$  test and  $I^2$  statistic.

Results: Seven randomized controlled trials fulfilled the inclusion criteria. A total of 1048 participants were recruited in these studies. The psychological and educational interventions improved more physical component summary (PCS) scores in the intervention groups (mean difference 1.97, 95% CI 0.76 to 3.19; test for overall effect  $Z= 3.19$ ,  $p= 0.001$ ), and mental component summary (MCS) scores (mean difference 1.23, 95% CI 0.02 to 2.44; test for overall effect  $Z= 2.00$ ,  $p= 0.05$ ) as well, compared with the control groups.

Conclusion: The meta-analysis demonstrates that psychological and educational interventions improve overall quality of life in patient with ICDs.

## EBP PST 2 - Evidence-Based Practice Poster Session 2

### Virtual Patient and Simulation: Strategies to Teach End-of -Life Care

---

*Leona A. Konieczny, DNP, MPH, BSN, ADN, RN-BC, CNE, USA*

#### Purpose

present educators with strategies using technology to prepare student nurses to provide the physical, emotional, and spiritual care to an individual and the support person(s) at end-of-life.

#### Target Audience

educators in nursing education programs who educate students on providing palliative and end-of-life care or educators in practice who prepare and support staff in providing end-of-life care.

#### Abstract

How does the educator prepare students for the profound experience of providing care at end-of-life? Technology can be used to provide the knowledge and skills needed before the nursing student faces this situation in the reality of the clinical experience. The learning laboratory using simulation provides exposure in the affective area. In a gerontological course prior to the clinical experience, nursing students meet a virtual patient. Over the course of the semester, the students meet, interview, and assess this a virtual female adult patient. There is an unfolding case study that is presented to students throughout the semester. The students have practice communicating with the virtual patient before they are caring for patients in a long term care setting. This virtual patient is used as an exemplar in teaching various concepts such as communicating with a person who has sensory deficits related to aging or providing care to a person with a chronic condition. In addition to interaction in the virtual world, the faculty posts discussion board threads in BlackBoard incorporating other concepts related to caring such as safety risks, comfort in chronic conditions or the social isolation that can happen to older adults. Students post and respond to each other to share their plan of care and feelings about the situation. Most of the students are in the sophomore year of study and may have limited contact with older persons outside of possible personal experience. The technology and virtual setting support classroom learning and provide a safe place to practice and confront feelings about caring for someone whose health issues may not resolve. The use of technology can meet diverse learning styles. The students can virtually experiment by practicing interviewing and assessment. One section of the virtual experience is reflection on performance. Novice nursing students may approach nursing as solely health restoration. The technology is used to introduce the concept of the provision of palliative nursing care. The experience with this virtual patient concludes with an experience in the laboratory on campus with the human patient simulator. During the simulation, the simulated patient experiences a deteriorating change in status. In this scenario, there is another person in the role of family member or support person. The simulated patient dies during the scenario. This technology presents the opportunity to confront the end of life and the nursing care required for the patient and the family. The students apply the skills and knowledge related to end-of-life. During the debriefing of the simulation, students verbalize their feelings related to the scenario. The student has flexibility to interact with the virtual patient. The student encounters with this virtual patient meets the student need to manage the amount of time and schedule. The student has unlimited access to learning in the virtual world. The use of simulation can provides experience that offsets the variability of experience in clinical sites. Multiple technologies including virtual patient experience, web assisted learning management system, and high-fidelity human patient simulation are used to educate and support nursing students on the caring and compassion given at the time of death.

## EBP PST 2 - Evidence-Based Practice Poster Session 2

### The Effect of Collaborative Testing on Nursing Students

---

*Jean Ruiz, MA, RN, CCRN, USA*

#### Purpose

The purpose of this presentation is to compare the effects of two methods of conducting collaborative testing as a peer learning tool for undergraduate nursing students.

#### Target Audience

The target audience of this presentation is... nursing education participants interested in collaborative testing as a teaching/learning strategy.

#### Abstract

Teaching strategies in nursing education call for active student participation. Collaborative learning involve students in group learning. Collaborative learning can take the form of students working in groups on assignments, often in a structured format, but involved in a social constructive process. Involving students in these types of learning approaches relies on assumptions that learning is an active process, the teacher becomes the facilitator of learning, teaching and learning are shared experiences and small group activities contribute to the development of critical thinking skills and knowledge utilization.

As a strategy in active learning, collaborative learning has been shown to contribute positively and impact student development in many ways. The literature reports on improvement in student motivation to learn, knowledge retention of material, teamwork, problem-solving and collaboration with others as benefits of collaborative learning. Sandahl (2010) suggested using collaborative testing as a collaborative learning strategy in nursing education. The limited research studies on the topic support its effect of increasing examination scores with inconsistent report on its effect on knowledge retention.

Several strategies of conducting collaborative testing are reported in the literature. The purpose of this study is to compare the effects of two methods of conducting collaborative testing as a peer learning tool. This is a quasi-experimental design using two groups of diploma nursing students enrolled in a second level nursing course at two campuses of the school of nursing. Using a convenient sample of students enrolled in the nursing course, informed consent was obtained with a description of the study methodology.

Student exam results were recorded in Excel format and descriptive statistics were calculated. Independent t-tests were calculated to examine the effect of collaborative testing on the course exams. An evaluation questionnaire was collected to obtain student perceptions of the total experience. The study showed students increased their test scores after engaging in collaborative testing by an average of 12% using both methods of conducting collaborative testing. Students report positive perceptions about their learning experiences during collaborative testing sessions. The process of critically thinking and learning how to work together in a respectful and professional manner contributes to the professional preparation of nursing students. Opportunities to communicate, cooperate and collaborate have the potential to translate into better prepared beginning professional nurses. Small sample size and unmatched groups in one type of nursing program limits the applicability of the results.

## EBP PST 2 - Evidence-Based Practice Poster Session 2

### Improving Quality in Long-Term Care: A Collaborative Evidence-Based Practice Project

---

*Elizabeth Roe, PhD, RN, USA*

#### Purpose

This presentation will describe a collaborative EBP project in long-term care. The goals of the project are: 1. To involve staff in EBP in the LTC setting, 2. To increase the knowledge and use of EBP in the LTC setting, and: 3. Improve quality and safety in the LTC setting.

#### Target Audience

The target audience for the presentation is are educators, administrators, and clinicians that are interested in creative strategies to implement EBP in long-term care.

#### Abstract

This presentation will describe an ongoing collaborative evidence-based practice (EBP) project to improve quality in long-term care (LTC). The project is mutually beneficial to the University and the clinical settings involved. The goals of this project are: 1. To involve staff in EBP in the LTC setting, 2. To increase the knowledge and use of EBP in the LTC setting, and: 3. Improve quality and safety in the LTC setting. The project began five years ago when a Nursing faculty member from the University functioned as an EBP mentor in an acute care hospital, providing education on EBP and assisting staff in the identification of evidence-based questions with subsequent evidence reviews and recommendations. One year ago this project extended to the LTC setting where the faculty member has been working with LTC staff in three different local agencies to identify clinical problems, complete EBP reviews, make recommendations, and assist with implementation of recommendations if needed. The faculty member serves as a mentor, helping nurses in LTC (at all levels) who are often unaware of EBP, integrate evidence into practice. This is especially relevant in LTCs which have a very low percentage of Registered Nurses, let alone nurses with baccalaureate degrees that are knowledgeable about EBP. This project has benefits for both the University and LTC agencies. Clinical agencies have increased the use of EBP and improved quality and safety in areas such as care of dementia residents, prevention of urinary tract infections, and retention of staff. In addition, staff at the agencies have increased their competency in EBP and seen firsthand the importance of EBP. Examples of the EBP reviews include prevention of UTIs in residents of LTC, recruitment and retention of LTC staff, and family communication. Changes in policies and procedures have occurred, along with recommendations for further research. The Nursing program at the University has benefited by the increase in the collaborative relationships with the agencies and opportunities for students.

## EBP PST 2 - Evidence-Based Practice Poster Session 2

### Effectiveness of Surgery and Percutaneous Catheter Drainage (PCD) with Antibiotics for Pyogenic Liver Abscess Patients

---

Meng-Shan Wu, RN, Taiwan  
Shu-Fen Su, PhD, RN, Taiwan

#### Purpose

The purpose of this presentation is to compare the effectiveness of surgery and percutaneous catheter drainage (PCD) with antibiotics for pyogenic liver abscess patients.

#### Target Audience

The target audience of this presentation is clinical nurses and APNs.

#### Abstract

**Background:** Pyogenic liver abscess is a life-threatening disease with high morbidity and mortality rates. In clinical, intra-venous antibiotics with percutaneous catheter drainage has been widely used to take place of surgery. However, which one has better effects is still lack of study.

**Objective:** This study compared the effectiveness of surgery and percutaneous catheter drainage (PCD) with antibiotics for pyogenic liver abscess patients.

**Method:** A systemic review of related articles, from 2008 to 2014, which focused on surgery or treatment for pyogenic liver abscess. The databases of Cochrane library, PubMed, CINAHL, Science Direct, and OVID were used. In total, 40 studies were found, and 5 of them met the inclusion criteria were carefully assessed. R program was applied to perform meta-analysis of 379 participants (335 received PCD and 44 received surgery).

**Results:** Percutaneous treatment includes PCD and needle aspiration, and PCD is more effective than needle aspiration which only has good effects on simple small abscess. There was significant difference in hospital stays, duration of antibiotics uses, and symptoms relief between these two groups. PCD has lower morbidity and costs. Surgery is suitable for patients who failed in PCD.

**Conclusions:** PCD and surgery are both effective for pyogenic liver abscess patients. Past history, infectious source, pathogen and abscess distribution play importance roles in therapeutic plans. Surgery only suits for patients with large >10cm abscesses, or failed in PCD. As primary caregiver, nurse practitioners should carefully assess patients' symptoms, laboratory results, and images in finding out patients' treatment problem and care needs.

### A Comparison of Nursing Students' Satisfaction and Self Confidence in Learning Medication Administration Using Simulation

---

*Stephanie L. Turrise, PhD, MSN, BSN, RN, BC, APRN, CNE, USA*  
*Kelly Laham, MSN, BSN, ADN, RN, ANP, BC, CNE, USA*

#### Purpose

The purpose of this presentation is to report the findings of a descriptive, comparative, correlational study of nursing students' satisfaction and self confidence in learning medication administration using simulation.

#### Target Audience

The target audience of this presentation is nursing educators in academia that teach medication administration skills. However, this strategy could also be utilized and studied in the practice setting.

#### Abstract

Background: Simulation is a technique that uses a situation or environment which is created to allow individuals to experience a representation of a real event for the purpose of practice, learning, or to gain understanding of systems or human actions (<http://sirc.nln.org/>). Students that are actively involved in simulation exercises are using a higher order of learning and decision making skills and critical thinking is reinforced (Jeffries, 2012). Nursing students are taught many skills that they are expected to retain and utilize throughout their program. Medication administration is a common intervention in the nursing care of patients and is considered a high volume, high risk process. Simulation may be a method of instruction that results in better perceived student learning that in turn, may result in improved student learning outcomes.

Purpose: The purpose of this descriptive, comparative, correlational study was to evaluate if students were satisfied and felt confident with learning the skills of safe medication administration using current teaching strategies in the Foundations of Professional Nursing Practice course (discussion and hands on activities) and Adult Health Nursing course (discussion, hands on activities and simulation) and to compare differences between students in these two courses.

Methods: Institutional review board approval was obtained. Prelicensure nursing students enrolled in the Foundations of Professional Nursing Practice course, first semester of the program and students enrolled in the Adult Health Nursing course, second semester of the program participated in their respective course's medication administration skills lab in the Simulation Learning Center as assigned as part of their course work. Upon completion of the skills lab, students were invited to participate in the study. Students that were interested in participating were given a packet with the study information, demographic questions and survey questionnaire, the NLN Student Satisfaction and Self Confidence in Learning scale.

Results: Preliminary results are being reported. A total of 87 students voluntarily and anonymously participated (Foundations N=48, Adult Health N=39). Students in the Adult Health Nursing course which used simulation, had a higher mean score (M=23.87, SD=1.88) than students in the Foundations course (M=22.58, SD=2.29) on satisfaction with learning. However, students in the Adult Health Nursing course had a lower mean score on self-confidence in learning (M=34.54, SD=3.38) than students in the Foundations course (M=35.20, SD=3.28).

## EBP PST 2 - Evidence-Based Practice Poster Session 2

### Daily Interruption of Sedation versus Continuous Sedation and Length of Mechanical Ventilation

---

*Crystal Nicole Weise, BSN, RN, USA*

#### Purpose

The purpose of this presentation is to inform other critical care nurses about the importance and benefits of doing daily spontaneous awakening trials in mechanically ventilated adult patients. Another important aspect is that spontaneous awakening trials are safe to implement.

#### Target Audience

The target audience of this presentation are registered nurses and advanced practiced registered nurses that practice in adult critical care units with mechanically ventilated patients.

#### Abstract

Hundreds of thousands of critical care patients are intubated every year. Many of these patients are sedated for comfort. However, continuous moderate to deep sedation can lead to increased ventilator days and other morbidities, including delirium. Every intensive care unit uses a variety of sedation practices. Furthermore, there are barriers to the healthcare team using daily sedation interruptions. These include the concern that the patient will self extubate and that it will worsen the patient's respiratory status. This leads to practitioners not implementing the practice.

**Objective:** The objective of the systematic review is to determine if conducting daily sedation interruptions for ventilated adult intensive care patients will decrease the length of mechanical ventilation. The secondary objective is to determine if the sedation interruptions are safe and feasible.

**Method:** A literature search was conducted using CINAHL, Ovid/Medline and Embase databases. Eleven primary studies and one systematic review was kept after using key words and limiting the articles to articles no older than 2008, English and adult patients. These articles were critiqued based on their methods, number of participants and results. Then they were assigned a SORT level of evidence. There were seven level 2 articles and 3 level 1 articles. The main limitation of the studies were the inability of the studies to be blinded.

**Results:** The data provided by the studies were inconclusive. However, based on the findings of the studies it is safe and feasible to conduct the daily sedation interruptions in mechanically ventilated patients in the intensive care unit. Many barriers still exist, including the fear of self extubation, patient agitation and worsened respiratory status.

**Recommendation:** It is recommended that in patients that have been intubated for more than 48 hours that a sedation interruption and when the patient's RASS is zero a spontaneous breathing trial should be conducted. If the patient passes the spontaneous breathing trial the patient can be extubated per physician order. If the patient becomes agitated or has worsening respiratory status during the sedation interruption, the patient fails and will be put back on the sedative medication at half the current rate. This process will be conducted daily as long as the patient is intubated and hemodynamically stable. Starting this practice in the intensive care unit will better patient outcomes, decrease ventilator days and decrease health care costs.

**Change Model:** To implement this change the Kotter and Cohen change model is to be used. The key stake holders that need to be involved in the process are the mechanically ventilated patients and their families, the nurse manager, nursing and physician staff. The leaders of change are the nurse manager, lead intensive care attending and senior nursing staff. When the change is implemented it will be evaluated by using staff questionnaires and tracking individual patient's outcomes, any adverse events and the average number of mechanical ventilation days before and after the intervention.

### The Experience of Newly Qualified Professional Nurses Allocated to Critical Care Units in Their First Year Post Graduation

---

*Thembekile Masango, PhD, RN, South Africa*

#### Purpose

to explore and describe the lived experiences of newly qualified professional nurses allocated in Intensive Care Units (ICU) during their first year post graduation. Further, to interpret the meaning that these newly qualified nurses attach to these experiences during their first year in critical care unit.

#### Target Audience

registered nurses working in ICU, operational managers, nursing service managers, nurse educators, clinical instructors, mentors and preceptors.

#### Abstract

**The purpose:** The study was to explore and describe the lived experiences of newly qualified professional nurses allocated in ICUs during their first year post-graduation. Further it was to interpret the meaning that these newly qualified professional nurses attach to these experiences during their first year in the critical care unit.

**Method and design:** An explorative, descriptive, interpretative and qualitative design was conducted to explore the nurses' experiences. Purposive sampling was used which is based on belief that the researcher's knowledge about the population can be used to hand pick sample elements. Data was collected through in-depth unstructured interviews and written narratives which were transcribed into verbatim transcripts. A Colaizzi's method of data analysis was used.

**Results:** The study findings revealed that newly qualified professional nurses experienced difficulties and challenges in adjusting to the unit due to lack of mentors caused the shortage of staff and by the fact that the ICU environment different from the wards that they are used to. Positive and negative feelings regarding their relationship with colleagues in terms of support received were alluded upon.

**Recommendations:** The study recommended that nurses be exposed to intensive care units during their training. Even after completion they should be introduced to ICU after they have gained confidence in themselves as registered nurses. The study further recommended that mentoring of newly qualified professional nurses should be mandatory in ICU.

**Key Concepts:** Critical care unit, critical care nurse, experience newly qualified professional nurse

## EBP PST 2 - Evidence-Based Practice Poster Session 2

### Optimizing ED Throughput

---

*Puneet G. Freibott, MSN, RN, CCRN (Alumnus), NE-BC, USA*

#### Purpose

The purpose of this presentation is to help audience discover the challenges of patients crowding in the emergency rooms; help appreciate the time stamps levied upon the emergency rooms via CMS core measures; and how to leverage multidisciplinary teams to improve ED throughput, and decrease left without being seen rates.

#### Target Audience

The target audiences of this presentation are hospital administration, including CNOs, CFOs, CEOs; Emergency room Administration, Emergency room nurses, physicians, laboratory, radiology, and patient access services administration teams.

#### Abstract

Emergency Departments (EDs) play a pivotal role in the delivery of emergent and urgent ambulatory patient care. EDs bridge the gap in care presented by the current healthcare system related to a decrease in primary care physicians and clinic appointments and higher rate of uninsured or underinsured patients (Schoor & Venkatesh, 2012). Stauber (2013) reported closure of 425 hospital based EDs nationwide, which is inversely proportionate to an 18.9 million increase in ED visits in the years 1996 to 2006, alongside a decrease in 198,000 inpatient beds. This increased input and decreased output poses a stagnation of patients being able to move out of the ED, leaving a majority of the EDs struggling with overcapacity. With more patients utilizing ED for their primary care needs, moving patients through complex levels of services can be challenging. Baylor St. Luke's Medical Center (BSLMC) struggles with its bed flow capacity and management in the ED.

In 2006, the Institute of Medicine (IOM) published a report on the future of emergency

care. Some of the challenges listed included, demand outpacing capacity, ED crowding, boarding, ambulance diversion, uncompensated care, inefficient use of resources, inadequate surge capacity, inadequate protection for staff, inadequate supply of on-call specialists, medical liability, fragmented systems, lack of performance measurement and accountability, and inadequate research funding and infrastructure (Bernstein et al., 2009; Institute of Medicine, 2006). These barriers had severe consequences on the clinical, quality, financial, and service outcomes on the patients and the institutions. The clinical and quality impact included delay in the provision of care and patients leaving the ED without receiving care. Decreased admissions from the ED and lost revenue associated with diversions and patients leaving the institutions without receiving care were some of the financial burdens associated with ineffective ED throughput. Service impact included low patient satisfaction scores and decreased utilization of other hospital services.

The Centers for Medicare and Medicaid Services (CMS) announced ED-related measures for Hospital Value-Based Purchasing (HVBP) in 2010. The measures were (1) Median time from door to diagnostic evaluation by a qualified professional; (2) Median time from ED arrival to ED departure for patients subsequently admitted to an inpatient setting; (3) Median time from disposition decision to admit to the time of transfer to an inpatient care setting; and (4) Median time from arrival to ED departure for patients discharged from the ED. CMS's reimbursement based on the ED-related measures were effective starting 2014. Two percent reductions on reimbursement were at stake if metrics were not met.

At the commencement of the PIP, CHI Baylor St. Luke's Medical Center's (BSLMC) ED was faced with inefficient throughput process that placed the patients at safety risk, and the institution at risk for quality of care and financial loss. The metrics with the most opportunities to improve were (1) Median time from door to diagnostic evaluation by a qualified professional was 38 minutes as compared to 14 minutes

(National Performance); (2) Median time from ED arrival to ED departure for admitted patients was 339 minutes as compared to 277 minutes (National Performance). (3) BSLMCs ED diversion rate for the six months prior to the PIP implementation were 15% (No national benchmark). (4) Monthly average of patients that left the ED without being seen was six patients (No national benchmark). One of the organization's goals was to improve efficiency, and surpass internal and external metrics without incurring additional costs.

The goal of the PIP was to improve the ED throughput times, diversion rates, and the number of patients who leave without being seen by utilizing Rodger's change management theory, and IOWA model's framework and stay budget neutral. The relevant stakeholders formed a team and settled on these evidence based focused points, (1) Provide an evaluation area for the ED physicians to evaluate patients in the waiting room when needed, (2) Engage the ED physicians to promote the shift in culture of evaluating and treating patients in the waiting room when needed, (3) Utilize evidence based standing delegation orders in the waiting room to initiate evaluation of patient's chief complaint, (4) Provide training for ED charge nurses to fulfill the role of patient flow coordinators in the waiting room, promoting communication and safety, (5) Engage the ancillary departments of laboratory and radiology to provide better efficiencies for patients in the ED by reducing the turnaround times on tests and procedures. Training, education, and communication were disseminated and the project initiated its six months pilot on August 1, 2013.

The project was successful in statistically decreasing the time intervals for (1) Median time from door to diagnostic evaluation by a qualified professional,  $p < 0.001$ ; (2) BSLMCs ED diversion rate  $p < 0.005$  (3) Patients that left the ED without being seen,  $p < 0.001$ ; (4) Radiology and laboratory turnaround times, both at  $p < 0.001$  levels. The project remained budget neutral, by not adding any additional resources or costs to the organization. The project failed to decrease the median time from ED arrival to ED departure for admitted patients,  $p > 0.05$ . Strategies that were successful included, interdisciplinary collaboration towards a common vision, formative evaluation for barriers presented during the course of the PIP, engagement and buy-in from all stakeholders, and an organizational goal to improve the stated benchmarks. Some of the barriers presented during the course of the PIP were, organizational change of St. Luke's Episcopal Hospital System being bought out by Catholic Health Initiatives and Baylor Institute of Medicine, and its impact on the organization and, unseasonal influx of influenza patients and its encumbrances on hospital resources, patient volume, and length of stay in the hospital presenting a bottle neck for the ED patients awaiting inpatient beds.

Evaluation of this PIP lures the idea to dive deeper into the impact of ancillary department's productivity and efficiencies to the ED throughput. There were different models of care, such an ED based laboratory that was not contemplated during this PIP. The effects of housekeeping and staffing of all services, was not pursued during this project and could play a part in ED throughput. The PIP utilized the metrics as required by the CMS; it would have been beneficial to review all patients' charts to fully understand the impact of each patient's scenario and the barriers and facilitators of ED throughput at the organization. The PIP has managed to change the physician and nursing culture at the BSLMC ED, but needs constant vigilance and prioritization by ancillary and inpatient departments to promote ED throughput. The problem of ED crowding continues throughout the nation and needs translation of evidence based solutions into practice, and policy changes to increase access to care in the U.S.

## EBP PST 2 - Evidence-Based Practice Poster Session 2

### Ongoing Nasogastric Tube Verification: The Evidence

---

*Roxy Lee Decker, USA*

*Andrea Elizabeth Black, USA*

#### Purpose

The purpose of this presentation is to examine the evidence using an evidence-based practice approach to provide guidance for the difficult clinical issue of on-going nasogastric tube verification. The goal of this project was to be able to make an evidence-based recommendation for nursing practice.

#### Target Audience

The target audience of this presentation is nursing students and bedside clinicians involved with the safe care of patients with nasogastric tubes.

#### Abstract

The ongoing verification of Nasogastric Tube location presents a challenging clinical dilemma and the risk to the patient of incorrect placement is grave. Current practice demonstrates almost universal continuance of practices that have been demonstrated to be unsafe. Chief among these would be the continued use of auscultation as a verification strategy. The purpose of this project was to examine the body of evidence using a structured Evidence-Based Practice (EBP) process to determine research based strategies. The background search resulted in consistent recommendation for the use of X-ray for initial verification. In addition, this phase of the search also resulted in a recommendation regarding proper measurement of the tube length prior to insertion. These recommendations will be included with the recommendations made regarding ongoing verification. The evidence was searched using a PICO question: "In patients with NG tubes, how does pH testing of gastric aspirate affect verification of correct tube placement?" The choice of the pH technique was selected based upon its consistent representation in the body of available evidence. Appraised evidence included primarily Level IV studies and Level VII expert opinion. This issue appeared to have been intensively studied in the late 1990's and early 2000's, and therefore some of the selected evidence exceeds ten years. After synthesis of the evidence, six recommendations for practice were made related to initial placement technique, initial X-ray verification and ongoing verification. The primary recommendation that would improve practice is the need to do pH testing of aspirate and one additional verification strategy every time the tube is accessed for care. Current practice is auscultation of an air bolus, which the evidence supports as being unreliable and unsafe. This project, if disseminated, has the potential to improve patient safety by reducing the risk of untoward events related to displacement of the tube. The investigation indicates that more research is needed in identifying a consistently safe and reliable method for ongoing bedside verification of nasogastric tube placement.

## EBP PST 2 - Evidence-Based Practice Poster Session 2

### Promoting Self-Efficacy in Senior BSN Students in the Community Setting

---

*Mary Elizabeth Fortier, EdD, MA, BSN, RN, CNL, USA*

#### Purpose

The purpose of this presentation is to inform the attendees of the significance that self-efficacy plays in the success of senior baccalaureate nursing students in the Community Clinical setting.

#### Target Audience

The target audience of this presentation is nurse researchers, educators, clinicians, and nursing students.

#### Abstract

Fact: Clinical sites are becoming harder to secure for our baccalaureate prepared nursing students (BSN) challenging colleges and faculty to look for creative solutions to meet this challenge, while providing sound clinical learning.

Fact: Patients are discharged early from the hospital to their homes with little or no health supports in place.

Fact: The general population is ageing; healthcare issues that one once viewed as acute events are now viewed as chronic illness; congestive heart failure, DM type II, atrial fib, and HIV/AIDS.

Fact: Education and follow-up are needed for these clients in the environment where the healthcare system expects them to function and live.

Solution: As a creative solution our baccalaureate nursing program looked to the community in which we are located and partnered with a group of senior buildings. These senior buildings, a total of 8 buildings, had in place a registered nurse, who over sees the general health of the community and a social worker assigned to each building. We assigned 8 senior BSN nursing students to 4 of the buildings along with one clinical instructor. The students completed a needs assessment on their assigned buildings and created a schedule specific to their building and its population. Schedules were created for each building and a typical schedule was as follows: 8am: Senior BSN students arrived to set up the office space in which they would conduct interviews, B/P's, BGM's, weights, and client specific education.

8:30am: BSN students met with the Social Worker to review and follow-up on any clients and changes that occurred since the last time the students were in the building.

9:00am to 11:00am: Building residents began to arrive and be seen by the BSN students. Records were kept in locked cabinets in the Social Workers office. Collaboration and communication was constant and consistent among the Students, the instructor, the RN, and the social workers.

11:00am to 11:30am: Education Sessions were done in a group setting in the community rooms, based on the needs assessment of the building population.

11:30 am to 12pm: Questions and answer periods were held.

12pm to 1pm: Students, in pairs, did apartments visits (checking B/P's, medication & diet education, dressing changes) for those residents identified by either Registered Nurse or the social worker.

1pm to 2pm: Students met with the Clinical Instructor, the Registered Nurse, and the Social Workers. Care Plans were updated, referrals made, and needed follow-ups were identified.

It needs to be noted that the area which these buildings are located is low income and the buildings were home to not just seniors, but to individuals who had physical and mental disabilities. The age range for this population was from 48 to 88 years, providing the BSN students with a rich lifespan experience of a population successively living in the community. In addition, the experience provided the students with a first-hand experience of working as leaders in a collaborative setting: Client – Registered Nurse – Social Worker, increasing their self-efficacy as future professional registered nurses. This experience also provided the BSN students and the college of nursing to give back to the community in which it is located: fulfilling their mission statement through service to the community.

## EBP PST 2 - Evidence-Based Practice Poster Session 2

### Finger Food: Intervention for Persons with Eating Difficulties

---

*Bianca Ivonne Buijck, PhD MScN RN, PhD, MScN, RN, Netherlands*

#### Purpose

to show that the practice based intervention "finger food" seems to be effective

#### Target Audience

nurses, researchers, teachers

#### Abstract

**Background:** Finger food is a way of offering food to people with eating difficulties, for example patients with dementia, stroke or Parkinson disease. Eating is one of the most important activities in human life and the way food is eaten is mostly cultural determined. One of the western habits is to eat with utensil. Even though, more than half of the patients in nursing homes have difficulties (in recognizing or handling) when eating with utensil. The aim of this practice based study was to explore the experiences of patients, their relatives and caregivers with finger food.

**Methods:** This was an observational and survey research. In a nursing home, patients with dementia were observed during finger food meals and regular meals. Caregivers and patients' relatives filled in a Likert scale questionnaire in which they were asked about their values concerning finger food: eating with fingers, hygiene and patients' independency. The questionnaire was developed after literature study. Data were analyzed by using SPSS version 20.

**Results:** Five patients were observed during three finger food meals and during three regular meals. The patients took a mean 239 grams of a regular meal when being fed by a nurse, and 195 grams of an independent eaten finger food meal. The regular meal took them a mean 26 minutes to eat and the finger food meal 27 minutes. Patients expressed more positive feelings during the finger food meal compared to the regular meal. During the finger food meal the patients received less help with eating. A total of n=20 relatives and n=40 caregivers participated in the study. Sixty percent of the relatives and 94% of the caregivers had a positive opinion about finger food. Fifty percent believed that finger food influenced independency of patients positively, compared to 88% of the caregivers.

**Discussion:** Patients needed less help during the finger food meals. Finger food contributes to patients' independency and more positive feelings about eating. The increasing amount of grams for regular meals may be due to more moist in the meals (milk, butter, water), which contributes to easier swallowing when nurses are feeding patients. More research in a bigger sample is needed.

### Developing University and Hospital System Partnerships to Promote Use of Evidence-Based Practice among Baccalaureate Nursing Students

---

*Kae R. Livsey, MPH, PhD, RN, NC-RN, USA*

*Vallire D. Hooper, PhD, MSN, BSN, RN, CPAN, FAAN, USA*

#### Purpose

This presentation will outline use of a University and Hospital System partnership was used to integrate teaching, research and applied learning experiences to provide realism and relevance in an undergraduate evidence based practice course.

#### Target Audience

The target audience of this presentation include undergraduate nurse faculty as well as nurse researchers working in healthcare systems.

#### Abstract

This paper describes an academic and clinical agency partnership to enhance the delivery of an undergraduate evidence based practice nursing course. The agency partner research director and faculty member from the university partner co-taught the course which allowed students to become engaged in a specific unit research project, for which the agency partner needed additional data collection support. Students enrolled in the course served as data collectors for a specific unit research project that was underway at the clinical agency. By incorporating these service learning activities, students gained hands on experience with clinical research activities. Additionally, student course assignments and projects were specifically designed to incorporate an evidenced based practice recommendation for the clinical unit on which they were placed for their initial medical surgical rotation (4 separate agencies). This allowed to students to examine evidence and incorporate these new skills to “give back” to the units and help to promote use of evidence based practice.

## EBP PST 2 - Evidence-Based Practice Poster Session 2

### Falls Reduction

---

*Amy Hart, MSN, RN, USA*

*Mickey L. Parsons, RN, PhD, MHA, FAAN, USA*

#### Purpose

The purpose of this presentation is to describe a macrosystem (hospital wide) falls reduction practice bundle change strategy that reduced falls by 68% from the prior year and has continued to sustain the outcomes for the current 10 months post implementation.

#### Target Audience

The target audience for this presentation staff nurses, clinical nurse leaders, nurse educators and nursing administrators in acute care, emergency care, and rehabilitation care.

#### Abstract

Purpose: The purpose of the macrosystem practice change project was to become a "Falls Free" Hospital.

Objective: Engage and involve the clinical leaders of all microsystems (patient care units) in the change process and to implement the evidenced based fall reduction/safety reduction bundle.

Methodology: Through the use of the Method for Microsystems Change Process a falls reduction plan was created utilizing the thirteen steps in collaboration and commitment of all clinical leaders. The opportunity for improvement and expected outcome were identified, evidence based best practices reviewed, and all hospital wide stakeholders engaged. Expected staff patient care practices were identified and the clinical policy revised substantially. The leaders designed and committed and to a new practice bundle process which is summarized as follows:

1. A fall risk assessment upon each patient's admission, transfer, each shift and change of condition.
2. A 'falls report' to identify all high risk fall patients on each unit would be printed from the clinical documentation system each shift by the Charge Nurse.
3. A safety huddle, with all scheduled staff highlighting all of the patients considered to be a high risk for falls, would be lead each shift by the Charge Nurse.
4. Hourly patient care rounds would be made by a nurse or certified nursing assistant.
5. The 'falls report' would be reviewed by the Nursing Manager to follow-up and assure the staff were practicing the new patient care bundle.
6. Weekly and monthly outcome reports would be reviewed by Nursing Managers.
7. If a fall occurred, review and follow up would be provided by the appropriate Nurse Manager and a report at the monthly Falls Review Committee Meeting. The

Nurse Manager, where a fall occurred, was accountable for appropriate counseling and possible disciplinary action per the revised policy and practice bundle.

Results: The practice bundle went into effect ten months ago. During the first month falls were reduced by 68% from the year prior. The outcomes have been maintained for ten consecutive months.

Conclusions: Fall reduction has continued with the comprehensive change strategy. The key difference has been the structured planning process that clearly delineated the expectations and accountability for patient care practices and management.

Implications: The microsystem practice change method contributed to the hospital's success in assuring practice sustainability and through that, outcome sustainability. A comprehensive falls reduction practice bundle may be useful to other facilities to achieve significant clinical outcomes.

### Research Utilization by Staff Nurses in the Acute Care Setting

---

*Marilyn Sue Ayars, BSN, BA, AA, RN, USA*

*Gianpaolo Femino, BSN, MSS, BSS, RN, USA*

#### Purpose

The purpose of this presentation is to ascertain how often staff nurses apply research findings in their practice, and what factors enhance or obstruct the process.

#### Target Audience

The target audience of this presentation is nurses of all levels, nursing students, staff managers, administrators, and educators. The intended audience encompasses clinical, administrative, and academic disciplines across local, regional, and international settings.

#### Abstract

**Background:** Research utilization in nursing practice has brought dramatic improvements in patient outcomes and is considered one of the pillars of evidence-based practice (EBP). Research in nursing practice is utilized in generating evidence-based practice to influence policies and procedures, and to have an effect on individual, organizational, regional and international attitude and culture. Research includes scientific-based research, as well as broad-based general knowledge research, with the goal of using best evidence in the provision of patient care in the health care system.

**Methods:** To ascertain how often staff nurses apply research findings in their practice, and what factors enhance or obstruct the process. The methodology design employed was an exploratory, descriptive sample survey. A five point Lickert scale was used with a value of one point being equivalent to "strongly disagree," a value of five points being equivalent to "strongly agree," and a value of three points being neutral. The questions determined the type of knowledge that participants rely on during the decision making process in their nursing practice. Items addressed included the participant's reliability on nursing experience, policies and procedures, in-service education, continuing education, conferences, knowledge learned from colleagues and peers, nursing journals, and information sought through research. The survey also measured the participant's use of research for evidence-based practice, general knowledge, research projects, and educational requirements. Additionally, the survey addressed the reasons that nurses utilize research, and questioned how often research was conducted to educate patients and peers, or to improve their practice.

**Participants:** The participants were registered nurses from a Western regional, mid-sized hospital in the United States. Demographics were collected on each participant's age, gender, level of nursing education, number of years practicing as a nurse, and the number of years in the present position. Participation was encouraged by the use of anonymous data collection.

**Targeted Audience:** Nurses of all levels, nursing students, staff managers, administrators, and educators. The intended audience encompasses clinical, administrative, and academic disciplines across local, regional, and international settings.

**Barriers:** It was found that research utilization is impeded by lack of access to research materials, computer data bases, or research engines; inadequate support systems within the organization; lack of research skills or knowledge; unawareness of the importance of research; insufficient time to research and utilize findings in evidence-based practice; not knowledgeable of autonomy to research and apply evidence-based practice; and no pay for off-floor time.

**Results:** Nurses relied mostly on hospital policy and procedures, personal experience and colleagues' experience. The obstacles reported were similar to those found in other studies, which included lack of time, lack of support, and lack of resources. The sample's general attitude toward research utilization and

evidence-based practice was positive. There was an expectation for more guidance from the management level.

**Conclusion:** The results of the study were similar to other analogue researches. In order to improve research utilization by staff nurses, more assistance and educational support is needed. Nurses with Master's or Doctorate degrees could be promoted as EBP coaches, as well as staffing one or two librarians in hospitals.

**Keywords:** Registered Nurses, nursing research, evidence-based practice, research utilization

### Relationship Grandparents: Grandson Analysis by Genogram

---

*Luis Cortez-González, MN, RN, Mexico*  
*Diana Berenice Cortes-Montelongo, MSN, RN, Mexico*  
*Maria Ascencion Tello, MSN, RN, Mexico*  
*Martha Alicia Magallanes-Monrreal, PhD, RN, Mexico*  
*Gnalen Kourouma, BS, Mexico*

#### Purpose

Describe grandfather grandson relationship by genogram tool for students of the Faculty of Nursing Unit Saltillo

#### Target Audience

The target audience of this presentation are nurse researchers and clinical nursing interested in the relationship of the older adult and the global attention in nursing.

#### Abstract

The grandparent-grandson relationship in recent decades has been of interest to researchers, but the elements that are valued in this relationship have been little studied, where the role of grandparents changes with age of one and another.

Demographic and social changes have led to observe more closely the grandparents-grandson relationships and interest increases. Increased life expectancy allows a new relationship as grandparents and grandson can live longer and exclusive relationships

The genogram is a graphical tool that records the investigation of the main characteristics of a family group over time. This allows us to observe the family structure and interaction you have with the cycle and stages of life, intergenerational relationships, family relationships and the kind of family that forms later. It also displays the life cycle of the family, where family according to the World Health Organization is defined as: "A group of people united by kinship ties are of three types: affinity, consanguinity, filiation". Within inbreeding is considered the bond of blood that can be ascending (parents, grandparents, great-grandparents and others) and downstream (children, grandchildren, great-grandchildren and others).

Objectives: Describe grandfather grandson relationship by genogram tool for students of the Faculty of Nursing Unit Saltillo

Methodology: Cross sectional study was to analyze the grandfather- grandson relationship, genogram tool was used, which symbols and drawings by the student project relationship with their grandparents. Pilot test was conducted with 27 students of the Faculty of Nursing Unit Saltillo in January 2015. They also observe the processing time of the genogram, correctly capture the symbolism of the genogram, the data were analyzed in SPSS v. 23

Results: The pilot test consists of 27 students from the Faculty of Nursing, which have an average age of 17.59 and SD 1.24. 85% of participants were women. 18.5% mentioned that Grandpa lives at home, 33.3% said long-distance relationship with her grandfather and 40.7% with his paternal grandmother, however the relationship with the maternal grandparents nearest since only 14.8 % had a distant relationship with his maternal grandfather, 22.2 a close relationship with this, while 7.4% maintained a distant relationship with his maternal grandmother and 51.9% mentioned that it is near the relationship they have with her.

The processing time of the genogram was 20 minutes and there was no difficulty to capture the symbolism.

Conclusions: The genogram can be a useful tool for the analysis of the grandparent-grandchild relationship among university students, in addition to an overview of family structure and interaction you have with each member.

Having considered the grandfather relation grandson of students of the faculty allows can live longer and live longer, exclusive relationships to improve life expectancy AM.

## EBP PST 2 - Evidence-Based Practice Poster Session 2

### The Effectiveness of the Fall Prevention Guideline in a Long-Term Care Facility

---

*Dukyoo Jung, PhD, MSN, RN, South Korea*

*Minkyung Lee, MSN, RN, South Korea*

*Jinyee Byun, MSN, RN, South Korea*

*Hyejin Kim, MSN, RN, South Korea*

#### Purpose

The purpose of this study was to identify the effects of the fall prevention guideline on fall attitude, fall knowledge, and fall prevention self-esteem of care workers in a long-term care facility.

#### Target Audience

The target audiences of this presentation are all health care practitioners in long-term care facilities, researchers, educators, advanced nursing students specifically interested in fall prevention of older adults living in long-term care facilities.

#### Abstract

**Purpose:** The purpose of this study is to identify the effects of the fall prevention guideline on fall attitude, fall knowledge, and fall prevention self-efficacy of care workers in a long-term care facility. **Method:** The research design of this study is a nonequivalent control group pretest-posttest design. The subjects consisted of 58 care workers in a long-term care facility in Seoul, South Korea. The number of participants in the experimental group was 27 and the control group had 31 participants. Participants in experimental group were provided the fall prevention guideline program for 12 times, once a week. The structure-questionnaire consists of fall attitude, fall knowledge, and fall prevention self-efficacy. The collected data were analyzed using SPSS 22.0 program which utilized paired t-test, independent t-test. To examine the effect of the fall prevention guideline in a long-term care facility based on the pretest and posttest, a paired t-test was used. An independent t-test was performed to determine if there were differences between the experimental and control groups. **Results:** Following the independent t-test analysis in this study, attitude ( $t=2.19$ ,  $p=0.02$ ) and efficacy ( $t=1.91$ ,  $p=0.03$ ) in experimental group were significantly higher than control group. Following the paired t-test, knowledge ( $t=2.01$ ,  $p=0.03$ ) and efficacy ( $t=2.53$ ,  $p=0.01$ ) were observed to be improved in experimental group. On the contrast, it is observed that attitude ( $t=-3.18$ ,  $p=0.00$ ), and knowledge ( $t=3.17$ ,  $p=0.00$ ) is significantly regressed in control group. **Conclusion:** The finding of this study suggests that the fall prevention guideline has an effect on fall prevention self-efficacy of care workers in a long-term care facility. Thus, implementing the fall prevention guideline in long-term care facilities will facilitate systematical fall prevention approach and enable to decrease fall rate of older adults living in long-term care facilities. The longer term development and practical application of the fall prevention guideline is recommended for intervention

**Keywords:** fall prevention, fall attitude, fall knowledge, self-efficacy

### Gender-Based Sexual and Reproductive Health among Urban Adolescent Students in South India

---

*Varalakshmi Manchana, MSN, MBA, PGDBE, (PhD), RN, RM, RPHN, India*

#### Purpose

To reinforce the importance of empowering adolescents about Reproductive and sexual health to enable healthy and right decision making in their sexual and reproductive behaviors.

#### Target Audience

Nursing students, professionals in clinical practice and education/Research.

#### Abstract

Adolescence is stated as the period of transition from childhood to adulthood, which starts with the onset of puberty. It comprises the individuals between the ages of ten to nineteen years. It is a stage of behavioral and attitude formation. Sensitization and appropriate guidance helps them to take right decisions and develop healthy behaviors. Adolescent health needs are unique. If they are not well guided, they are likely to experiment with risky behavior that could harm them and others. Aim: The study aimed to assess the Knowledge on sexual and reproductive health (SRH) and Gender perceptions among school going adolescents. Methodology: 150 Adolescent students between age group of 13 – 18 years were chosen by random sampling. Single group pre test post test design was used. Structured questionnaire on identification data, gender attributes and attitudes and sexual and reproductive health was administered before and after the Educational program. Findings: Gender equality scores indicate 13% students were highly gender equitable, 52% with moderate gender equality scores and 25% were with low gender equitable scores in the pre test. After the intervention, 78% were with higher gender equality scores and 22% with moderate scores. 56% of girls and 32% of boys have reported experience of some sort of violence and 12% of them denied of experiencing any sort of violence. Conclusion: Gender balanced adolescent friendly health care approach is the need of the hour. Parents, Teachers and health care providers need to be sensitized about “Gender balanced adolescent reproductive and sexual health”.

### Preliminary Study of the Effects of Complete Bed Baths with Synthetic Towels: Comparison between Inpatients and Healthy Individuals

---

C. Matumura, PhD, MSN, RN, Japan

#### Purpose

To establish safe and comfortable bed baths with synthetic towels in actual clinical settings, this preliminary study aimed to verify effects of these baths with synthetic towels on inpatients.

#### Target Audience

Clean care technologies with the nurse researchers

#### Abstract

**Purpose:** To establish safe and comfortable bed baths with synthetic towels in actual clinical settings, this preliminary study aimed to verify effects of these baths with synthetic towels on inpatients.

**Methods:** Due to ethical limitations, we used a one group pre-post design targeting inpatients. Results were compared with healthy individuals who underwent an identical experiment. Subjects comprised five inpatients ( $73.2 \pm 12.1$  years, males: 3, females: 2) who could communicate verbally but had a low independence level and required complete bed baths. Towels were heated ( $55.7 \pm 0.5$  °C) in a thermostatic device. Complete bed baths excluding the genital area were given in the same manner to both inpatients and healthy individuals (15 healthy, male students in their twenties). Effects were evaluated using indicators such as core body and skin temperature, blood pressure, electrocardiogram (heart rate variability), short form of the profile of mood states (POMS-SF), alertness and relaxing visual analogue scale (VAS), and 1 to 3 Likert scales for each of the six items of towel material texture. This study was conducted with approval of the ethics committee of the affiliated institutions.

**Results and Discussion:** Inpatients exhibited significant increases in core body temperature from the start; mean skin temperature tended to increase after temporarily dropping directly after completing the bath. No marked changes were observed in blood pressure, heart rate, or autonomic nerve activity upon completing the bath, suggesting that results were affected by aging. Decreased alertness and lower POMS scores were observed, and scores for 3 of 6 texture items were high. Although no marked changes in autonomic nerve activity were observed in healthy individuals from the start, significant increases in core body and skin temperature and significant decreases in heart rate and systolic blood pressure were observed, showing marked temperature sensation and circulatory response. Further, after completing the bath, significantly decreased alertness and increased VAS were observed, and only one texture item received high scores.

**Conclusions:** Marked temperature sensation and circulatory response occurred in healthy individuals, but very little response was observed in inpatients.

### Gene Mutations and Pregnancy Induced Hypertension: A Meta-Analysis

---

Ya-Ling Yang, RN, PhD, Taiwan  
Shyang-Yun Pamela K. Shiao, PhD, RN, FAAN, USA

#### Purpose

The purpose of this presentation is to disseminate current evidence on population genome health and related epigenetic factors, through the meta-analyses of methylenetetrahydrofolate reductase (MTHFR) gene in pregnant women who developed hypertension.

#### Target Audience

The target audiences of this presentation is include nursing and inter-professional colleagues who are interested in learning about personalized genome care and the epigenetic factors associated with pregnancy induced hypertension.

#### Abstract

The purpose of this study is to disseminate current evidence on population genome health and related epigenetic factors, through the meta-analyses of methylenetetrahydrofolate reductase (MTHFR) gene in pregnant women who developed hypertension (PIH).

PIH including preeclampsia are the leading causes of maternal and perinatal mortalities. Preeclampsia presents not only more severe form of PIH, but also additional dysfunctions including edema, proteinuria, headache, and impaired vision. Literatures were searched from various databases using a set of key words for the meta-analyses. Quality scores for the studies and inter-rater evaluation on data coding were completed to ensure data accuracy for pooled meta-analyses.

Preliminary results included 6079 cases and 11061 controls from 53 studies. MTHFR 677 homozygous (TT) mutation genotype was significantly associated with increased risk of developing PIH (RR= 1.23,  $p < 0.01$ ). Subgroup analyses revealed that MTHFR 677TT subtype was a significant risk of PIH in European (RR= 1.20,  $p < 0.01$ ; 2478 cases and 6175 controls in 19 studies) and in Asian (RR= 1.56,  $p < 0.01$ , 1261 cases and 2238 controls in 13 studies). For lifestyle factors, body mass index (BMI) before pregnancy ( $\text{Kg/M}^2$ ) was an important predictor for the development of PIH. Normal weight (BMI < 25) was protective against the development of PIH and preeclampsia (RR = 0.75,  $p < 0.0001$ ); whereas, overweight (BMI = 25-29, RR = 1.52,  $p < 0.0001$ ) and obesity (BMI > 30, RR = 1.80,  $p < 0.0001$ ) were associated with increased risk of developing PIH and preeclampsia (376 cases and 2294 controls in 2 studies of Caucasian women). Future studies are needed to examine epigenetic factors associated with MTHFR gene mutations in the prevention PIH.

## EBP PST 2 - Evidence-Based Practice Poster Session 2

### Why Do Nurses Come into Contact with Blood during Intravenous Catheter Placement?

---

*Shotaro Sumitani, PhD, RN, Japan*  
*Yoriko Watanabe, PhD, RN, Japan*

#### Purpose

The purpose of this presentation is we elucidated the state of coming into contact with blood and related issues by observing nurses' intravenous placement skills with the peripheral-short catheter.

#### Target Audience

The target audience of this presentation are nurses and teachers who are implementing the catheter placement.

#### Abstract

**Purpose:** We elucidated the state of coming into contact with blood and related issues by observing nurses' intravenous placement skills with the peripheral-short catheter.

**Methods:** Subjects comprised 90 Japanese nurses. Videos of actual intravenous placement of catheters were recorded with qualified nurses taking on the roles of both the nurse performing the intravenous placement and of the patient. Direct contact of the patient's blood with the skin of the nurse was defined as contact with blood. Data regarding the part of the process of intravenous placement during which the nurse was exposed to the spilled blood and whether or not the nurse was wearing gloves is gathered.

**Results:** Contact with blood was observed in the video recordings of 13 of the 90 subjects (14%). Gloves were worn from placement of the needle to clean-up up by 34 of the 90 subjects (38%). Results of a chi-squared test revealed a correlation between contact with blood and whether or not gloves were worn (level of significance: 5%). Twelve of the 13 subjects who came into contact with blood were exposed to blood that flowed out of the catheter hub during the period between removal of the stylet and connection of the stylet to the infusion route. Contact with blood during clean-up occurred in 2 of the 13 subjects. One nurse came into contact with blood twice; once when blood flowed out of the hub and once during clean-up. Gloves were removed partway through the procedure by 35 of the 90 nurses (39%), and of these 35 nurses, 28 removed their gloves during dressing of the venipuncture access site or during clean-up. Thirty-five of the 90 nurses (39%) applied pressure to the needle including the tip of the catheter (22 G catheter 25 mm in length) and no bleeding was seen from the catheter hub.

**Discussion:** The Centers for Disease Control and Prevention guidelines stipulate that gloves should be worn during placement of intravascular catheters to prevent infection with blood-borne pathogens. Meanwhile, the Infusion Nursing Standards of Practice (2011) by the Infusion Nurses Society stipulate that gloves should be worn when there is a possibility of contact with blood and that gloves should only be removed after destroying the items used. However, only 34 of the 90 nurses (38%) in this study wore gloves throughout needle placement and clean-up. Results revealed a correlation between contact with blood and whether or not gloves were worn. When gloves were removed partway between needle placement and clean-up, contact with blood was observed in 6 of the 35 nurses (17%). There is a risk of blood adhering to the fingers during actions such as wiping up blood with a cotton swab soaked in alcohol with bare hands. Gloves need to be worn until clean-up is finished. This study revealed that nurses tend to remove their gloves for dressing of the puncture site once the needle has been placed. This is likely due to a lack of awareness of countermeasures for contact with blood in vascular access. An effective method of applying pressure to prevent outflow of blood during removal of the stylet is to estimate where the tip of the catheter is and to press down on the skin in the area including the catheter tip. Learning this method (Photograph 2) can reduce the chance of contact with blood. Using a device with a hemostasis valve and closed IV catheter system is also considered effective.

### Conclusions:

1. Contact with blood was observed in 13 of the 90 nurses (14%).
2. Contact with blood that flowed out from the catheter hub accounted for 92% of all contact.
3. In the future, nurses should wear gloves throughout catheter placement and clean-up and use techniques to prevent outflow of blood such as pressing down on the skin where the catheter tip is located during stylet removal.

### Educational Needs and Learning Needs of Visiting Nurses in Japan: Difference According to the Years of Home-Visit Nursing Care Experience

---

Miwa Suzuki, DNSc, RN, PHN, Japan  
Naomi Funashima, DNSc, RN, Japan

#### Purpose

Leaner Objectives #1.The leaner will be able to identify the difference in educational needs and learning needs according to the years of home-visit nursing care experience. Leaner Objectives #2.The leaner will be able to discuss about continuing education for visiting nurses that met educational needs and learning needs.

#### Target Audience

This study target visiting nurses and the others who are interested in the educational needs and learning needs for visiting nurses. The goal is to promote professional development of visiting nurses for an improvement in quality of home-visit nursing care.

#### Abstract

Objective:To explore the difference in educational needs and learning needs according to the years of home-visit nursing care experience.

Methods:Participants completed the Educational Needs Assessment Tool for Visiting Nurses (ENAT-VN) , the Learning Needs Assessment Tool for Visiting Nurses (LNAT-VN) and the Visiting Nurses' Attributes Questionnaire.The ENAT-VN was used to measure the educational needs of visiting nurses identified through a qualitative study (Yokoyama & Funashima, 2010).It has 36 items on a 4 point Likert-type scale, and has satisfactory reliability and validity (Suzuki & Funashima, 2014).The LNAT-VN was used to measure the learning needs of visiting nurses identified through a qualitative study (Miura & Funashima, 2005).It has 25 items on a 6-point Likert-type scale, and has satisfactory reliability and validity (Suzuki & Funashima, 2012).Questionnaires were distributed to 906 randomly sampled visiting nurses working at Home Visit Nursing Care Stations in Japan. The answers were returned by mail and were analyzed statistically.

Results:Of 559 (61.5%) responses,463 were valid and the data were analyzed.The mean total score of the ENAT-VN is as follows;visiting nurses with less than 1 year of home-visit nursing care experience(n=38) were 74.6(SD=20.1),visiting nurses with over 1year and within 4 years(n=122) were 73.0(SD=18.3),visiting nurses with over 4 years and within 6 years (n=60) were 70.5(SD=20.4),visiting nurses with over 6 years and within 10 years (n=109) were 69.6(SD=18.3),visiting nurses with over 10 years (n=134) were 66.4(SD=16.6).The mean total score of the LNAT-VN is as follows;visiting nurses with less than 1 year of home-visit nursing care experience(n=38) were 132.8(SD=12.1),visiting nurses with over 1year and within 4 years(n=122) were 130.5(SD=13.3),visiting nurses with over 4 years and within 6 years (n=60) were 131.8(SD=11.8),visiting nurses with over 6 years and within 10 years (n=109) were 129.6(SD=13.4),visiting nurses with over 10 years (n=134) were 131.6(SD=10.6).There was a significant difference between visiting nurses with less than 1 year of home-visit nursing care experience and visiting nurses with over 10 years on the mean total score of the ENAT-VN( $p<.05$ ).Among five groups, thirteen items had a significant difference on the mean item score of the ENAT-VN( $p<.05$ ).And it was one item that there was a significant difference on the mean item score of the LNAT-VN( $p<.05$ ).

Implications:The results suggested that there were some significant difference on the mean item score of the ENAT-VN and the LNAT-VN.Developing effective continuing education programs for visiting nurses based on the findings of this study will help to promote quality of home-visit nursing care.

### Functional Dependency and Cognitive Impairment in Older Adults of a Community of Saltillo Coahuila

---

*Diana Berenice Cortes-Montelongo, MSN, RN, Mexico*  
*Angeles Villarreal-Reyna, PhD, RN, Mexico*  
*Raul Castillo Vargas, MSN, RN, Mexico*  
*Luis Cortez-González, MN, RN, Mexico*  
*Catalina Alejandra Rivera Reyes, BS, Mexico*

#### Purpose

Analyze the relationship between functional dependence and cognitive impairment of seniors in a community of the city of Saltillo Coahuila Mexico.

#### Target Audience

The target audience of this presentation are family nurses and reserach nurses and ederly

#### Abstract

In recent years, it is producing an increase in chronic diseases among the population over 60 years. These diseases can affect the ability to perform basic activities of daily living (ADL) and therefore the level of functional dependency.

Aging brings cognitive and physiological decrease causing isolation and loss of autonomy and independence, because the physical and social performance of the elderly depends on the integrity of all its functions. The loss of short term memory and inability to perform calculations are sensitive indicators of reducing these functions.

Objectives: Analyze the relationship between functional dependence and cognitive impairment of seniors in a community of the city of Saltillo Coahuila Mexico.

Methodology: A correlational descriptive study was conducted on a group of people over 60 years (n = 540), the instruments used were the Barthel scale to measure functional dependency and SPMSQ PFEIFFER scale to assess cognitive impairment. For data analysis Descriptive statistics and bivariate correlations used.

Results: The mean age was 71.56 (SD 9.1) 50.9% of the sample consists of the female gender. As for the study variables, we found that 46.1% shown to be independent while 3.7% have a severe dependence. With regard to cognitive impairment 53.3% showed no cognitive impairment, compared with 4.4% who presented severe cognitive impairment.

## EBP PST 2 - Evidence-Based Practice Poster Session 2

### Factors That Promote the Practice of Airway Suctioning of Clinical Nurse

---

Saori Sakuma, MEd, RN, Japan  
Rie Kashihara, MSN, RN, Japan  
Yoriko Watanabe, PhD, RN, Japan  
Shotaro Sumitani, PhD, RN, Japan

#### Purpose

The purpose of this presentation is to clarify the performance of procedure according to the evidence-based guidelines on the airway suctioning practice by hospital nurses in Japan.

#### Target Audience

The target audience of this presentation is the nurses to practice airway suctioning in clinical.

#### Abstract

**Background:** Airway suctioning practices have been standardized in accordance with evidence-based guidelines (American Association for Respiratory Care, 2010, Japan Society of Respiratory Care Medicine, 2013). Evidence-based procedures in guidelines, has been reported to reduce the physical invasion of the patient. However, there have been few studies on airway suctioning procedure performed by clinical nurses in Japan. It has not been clarified whether the clinical nurse to properly perform evidence-based procedures in guidelines. And not disclosed also factors related to performing the procedures.

**Purpose:** To clarify the performance of procedure according to the evidence-based guidelines on airway suctioning practices by clinical nurses in Japan.

**Method:** Registered nurses who provided respiratory care to patients were recruited to complete an anonymous questionnaire. The questionnaire was composed 15 items on airway suctioning procedures based on Nursing Interventions Classification.

**Results:** The subjects were 602 nurses (experience range: 1-35 years). 31.2% nurses worked in intensive care unit (ICU), and 68.8% nurses worked in general nursing unit. 26.9% nurses had physical assessment education in school, and 54.5% nurses had after graduation.

Eight among the 15 items in the questionnaire were procedures that were recommended in the guidelines, in accordance with the GRADE criteria. For four items, 'Observation of secretions', 'Assessment of need', 'Infection prevention', and 'Monitoring of oxygenation and hemodynamics', the rate of implementation was more than 80%. However, for four items, 'Pre-Oxygenation', 'Decision on time of suctioning', 'Decision on minimum pressure', and 'Choice of catheter size', the rate of implementation was less than 80%.

Physical assessment education after graduation increased the rate of implementation of the following techniques: 'Assessment of need', 'Monitoring of breath sounds before suctioning', and 'Monitoring of breath sounds after suctioning'. No correlations were found in regard to the physical assessment education in school.

ICU nurses increased the rate of implementation of the following items: 'Monitoring of breath sounds before suctioning', 'Monitoring of breath sounds after suctioning', 'Monitoring of oxygenation and hemodynamics, and 'Discontinue and Oxygenation in hazardous situations'.

**Conclusions:** Most nurses practiced procedures for infection prevention, monitoring and observation in airway suctioning. However, procedures for minimally invasive suctioning were less practice in Japan.

To promote airway suctioning practice effective, nurses need to have more education program after graduation.

## EBP PST 2 - Evidence-Based Practice Poster Session 2

### Does the Hospital Medical Home Increase Primary Care Follow-Up among Pediatric Medical Patients?

---

*Deborah A. Cleveland, MS, BSN, FNP-BC, RN, USA*

#### Purpose

The purpose of this presentation is to educate all nurses on the Hospital Medical Home and how the Hospital Medical Home can be used to improve care coordination between the inpatient and outpatient settings through care coordination by a nurse practitioner and a multidisciplinary team approach

#### Target Audience

The target audience are staff nurses, nurses in the ambulatory care setting, administrators, nurse managers, and advanced practice nurses who works in the outpatient or inpatient setting

#### Abstract

**Background:** The New England Journal of Medicine (2009) found that over 50% of Medicare beneficiaries who were re-admitted to the hospital within 30 days did not have a follow up visit in the ambulatory care setting upon hospital discharge. O'Reilly (2011) stated that Piedmont Hospital in Atlanta reduced their hospital re-admission rate from 13.05% to 3.97% after implementing measures to improve medication reconciliation and identify high risk patients who are increased risk for hospital re-admission. Therefore, research suggests that primary care follow up visits may reduce hospital re-admissions. New York Methodist Hospital received funding from the New York State Department of Health to create a Hospital Medical Home in April 2013. The Hospital Medical Home sought to increase compliance with primary care hospital follow up visits within 14 days of hospital discharge and improve medication reconciliation upon hospital discharge among Medicaid pediatric medical patients. Another goal involved increasing collaboration with the inpatient and outpatient setting to identify high risk patients who were at high risk for hospital re-admissions in order to reduce hospital re-admissions and improve patient satisfaction.

**Methods:** A nurse practitioner/care coordinator began working with the attending physicians and resident physicians at NYMH to increase primary care follow up among pediatric clinic patients. The nurse practitioner was notified of all upcoming discharges from the pediatric floor and pediatric intensive care unit and began meeting with patients and families to educate them on the importance of hospital follow up visits. In addition, the nurse practitioner called all pediatric and PICU discharges within 48 hours to remind them to attend a hospital follow up visit within 14 days of discharge. The nurse practitioner often saw these patients for their primary care follow up visits at the pediatric outpatient clinic, especially high risk patients. An electronic medical record was used to assess whether or not the implementation of the Hospital Medical Home improved patients' compliance with primary care follow up visits within 14 days of discharge by comparing hospital admissions between Jan 2012 through June 2012 to hospitalizations between Jan 2014 through June 2014.

**Results:** 0 out of 75 pediatric patients who were admitted to the pediatric floor or pediatric intensive care unit between Jan 2012- June 2012 returned to the outpatient pediatric clinic for a primary care hospital follow up visit within 14 days of hospital discharge. However, 45 out of 65 (69%) pediatric patients who were admitted to the pediatric floor or pediatric intensive care unit between Jan 2014-June 2014 returned to the outpatient clinic for their primary care hospital follow up visit within 14 days of hospital discharge.

**Conclusion:** The Hospital Medical Home project improved patient outcomes by increasing patient's compliance with a primary care follow up visit within 14 days of hospital discharge. The primary care follow up visit sought to coordinate care between the inpatient and outpatient setting and identify patients who are at high risk for re-admission. Further research needs to be done to reduce the number of hospital re-admissions that occur among all pediatric medical patients, especially among patients with chronic conditions such as sickle cell anemia and seizure disorder.

### Pain Care Quality and Patient Perception of Pain Care

---

Laura K. Martin, MSN, RN, USA

#### Purpose

to enable the learner to identify a framework for implementing a pain care toolkit to improve patient perception of pain care through interprofessional collaboration.

#### Target Audience

registered nurses, interprofessional team members, and hospital administrators who have the desire to implement evidence-based best practices to improve patient perception of pain care.

#### Abstract

Background: Evidence supports that quality pain management improves the patients' report of satisfaction even if pain is not always eliminated. The goal of this Doctor of Nursing Practice project was to implement/sustain processes to enhance the patients' perception of pain care quality by implementing a Pain Care Quality Toolkit into the standard of care for three inpatient nursing units. The setting was a 110-bed community hospital that is a part of a large multi-facility healthcare system. An interprofessional team was formed to plan, implement, and monitor all project activities.

Methods: A Plan, Do, Study, Act methodology guided project implementation and evaluation. In July 2014, an evidence-based Pain Care Quality Toolkit was adopted involving: communication whiteboards, pain scales, patient education, hourly rounding, and non-pharmacologic strategies (positioning, heat/ice, guided imagery, distraction). Project outcomes included: 1) monthly collection of Hospital Consumer Assessment of Healthcare Providers and Systems (HCAHPS) pain scores and 2) inpatient responses to the 6-item Pain Care Quality–Nursing (PainCQ-N<sup>®</sup>) survey using a prevalence methodology. Weekly Pain Care Quality Toolkit adherence audits were conducted and reported monthly. Comparisons between pre-intervention (March-June, 2014) and post-intervention (July-November, 2014) outcomes were performed using paired t-tests (HCAHPS) or Wilcoxon signed rank test (PainCQ-N<sup>®</sup>).

Results: There was a significant improvement ( $t=4.3822$ ,  $p < 0.0001$ ) in HCAHPS pain scores for all units when pre-intervention outcomes ( $n=112$ ,  $M=66.25\%$ ,  $SD=10.5\%$ ) were compared to post-intervention outcomes ( $n=120$ ,  $M=71\%$ ,  $SD=5.34\%$ ). Adherence to pain education and adjunctive pain management strategy components of the toolkit improved compared to communication of the pain plan component of the toolkit. There were no significant differences in pre- intervention ( $n=23$ ) and post-intervention ( $n=65$ ) PainCQ-N<sup>®</sup> survey ratings in any of the three subscales ( $p > 0.05$ ): Being Treated Right pre-intervention  $M=5.80$ ,  $SD=0.39$ , post-intervention  $M=5.35$ ,  $SD=1.10$  ( $Z=1.51$ ,  $p=0.13$ ); Comprehensive Nursing Pain Care pre-intervention  $M=4.72$ ,  $SD=1.64$ , post-intervention  $M=4.10$ ,  $SD=1.93$  ( $Z=1.35$ ,  $p=0.18$ ); Efficacy of Pain Management pre-intervention  $M=5.55$ ,  $SD=0.67$ , post-intervention  $M=4.98$ ,  $SD=1.53$  ( $Z=1.09$ ,  $p=0.28$ ).

Discussion: PainCQ-N<sup>®</sup> ratings have not demonstrated improvement despite significant increases in HCAHPS scores post-intervention. However, there are too few data points post-intervention to support any trend in improved pain care quality. Continued monitoring of adherence with utilization of the toolkit and pain care quality measures is warranted to guide and sustain process improvement.

## EBP PST 2 - Evidence-Based Practice Poster Session 2

### Reducing the Disparities in Breastfeeding Initiation among Urban Adolescent Mothers through a Prenatal Intervention

---

*Jamie Lynn El Harit, BSN, RN, ASQ, CSSBB, USA*

#### Purpose

The purpose of this presentation is to describe an EBP antenatal intervention program within an urban, public high school to increase breastfeeding self-efficacy and initiation rates in this high risk population.

#### Target Audience

The target audience of this presentation is nurses focused on improving public health through the promotion of breastfeeding among high risk inner city, minority adolescent mothers.

#### Abstract

Breastfeeding has been correlated with many health benefits to both infants and mothers. According to Healthy People 2020, infants who are breastfed have improved nutritional, immunological, developmental, and social outcomes. Despite the benefits of breastfeeding and the focused international efforts to increase levels of breastfeeding, adolescents remain largely unaware (Spear, 2006). According to the Centers for Disease Control (CDC, 2013) adolescents have among the lowest levels of breastfeeding. This is further impacted by socioeconomic status and race (Apostolakis-Kyrus, Valentine, & DeFranco, 2013; CDC, 2013). Disparities thus exist in breastfeeding initiation and potential health outcomes to those populations most at risk for disease. Adolescent mothers are uneducated about the health benefits and protections of breast milk and this population is often overlooked in the promotion and protection of breastfeeding (Hunter, 2012; Moran, Dykes, Burt, & Shuck, 2006). This evidence-based practice (EBP) project aims to reduce the disparities of breast feeding initiation among a group of adolescent pregnant women in an inner city high school by increasing breast feeding self-efficacy and breast feeding intention.

After an exhaustive search in the major databases including CINAHL, ProQuest, MEDLINE, and PsychInfo eleven articles were chosen for inclusion in the development of the EBP solution. Social Cognitive Theory is the framework that is utilized in the development of the EBP solution. The EBP intervention includes psychological and environmental determinants of behavior, observational learning, self-regulation, and moral disengagement. The EBP implementation will include a series of three group learning activities utilizing an International Board Certified Lactation Consultant (IBCLC) and two peer breast feeding counselors and will focus on increasing self-efficacy and intention through various educational techniques focusing on the benefits of breast feeding, common difficulties, and mechanisms to overcome barriers.

The combined use of various techniques to engage adolescent learners in improving their self-efficacy will be utilized with a team approach, during the second trimester of pregnancy, over the course of three lunch-time educational sessions. Techniques include didactic, discussion, hands-on, demonstration, and literature. Support by a lactation expert will continue through to delivery within their school environment on a weekly basis.

The Prenatal Breastfeeding Self-Efficacy Scale will be utilized to measure pre and post-intervention. The Breast feeding Self Efficacy-Short Form (BFSE-SF) will be administered postpartum to determine postpartum self-efficacy as a mechanism to determine the impact of the intervention. Additionally, stated feeding intention will be collected pre and post intervention, as well as self-report data on initiation and continuation of any breast feeding during a telephone interview conducted between two to four weeks postpartum.

### Enhancing Care of Vulnerable Populations through Development of a Holistic Model to Evaluate Interprofessional Education

---

*Rebecca Lee, PhD, MSN, BSN, BS, ADN, RN, PHCNS-BC, CTN-A, USA*

*Gwen Sherwood, PhD, RN, FAAN, USA*

*Carol L. Huston, DPA, MSN, RN, FAAN, USA*

#### Purpose

The purpose of this presentation is to highlight the journey of an ENFLA scholar as she led a team in the development of a holistic model to evaluate interprofessional education experiences for health professions students caring for vulnerable populations in a community based setting.

#### Target Audience

The target audience of this presentation is faculty, clinicians, and students interested in enhancing the care of vulnerable populations through the use of interprofessional service learning, and the use of a holistic model to assess student learning as a result of those experiences.

#### Abstract

This change project was implemented as part of the Experienced Nurse Faculty Leadership Academy (ENFLA) by Rebecca C. Lee (Scholar), in collaboration with Gwen Sherwood (ENFLA Mentor) and Carol Huston (ENFLA Faculty). The ENFLA experience was sponsored by Sigma Theta Tau International and Chamberlain College of Nursing Center for Excellence in Nursing Education.

Introduction/Background: Interprofessional teamwork and collaborative practice are key elements of efficient and productive efforts to promote health and treat patients in an increasingly complex health care system. Team-based care involves health and/or social professions that share a team or network identity and work closely together in an integrated and interdependent manner to solve problems and deliver services. Inadequate preparation of health professionals for working together, especially in interprofessional teams, has been implicated in a range of adverse outcomes, including lower provider and patient satisfaction, greater numbers of medical errors and other patient safety issues, low workforce retention, system inefficiencies resulting in higher costs, and suboptimal community engagement. Therefore, reforming health professions education in order to prepare all future health professionals for deliberately working together through advancement of Interprofessional Education (IPE) opportunities is vital for increasing health professional's work satisfaction as well as improving the quality and safety of health care, while ensuring patient-centeredness.

Health professions faculty have long recognized that interprofessional experiences should be geared toward meeting a set of standards and competencies. The report of the Interprofessional Education Collaborative (IPEC) Expert Panel (2011) proposed four domains of Interprofessional Collaborative Practice: Values/Ethics, Roles/Responsibilities, Interprofessional Communication, and Teams and Teamwork. Thirty-eight specific competencies further define the domains to assist educators in designing relevant learning experiences across all health care professions and promote dialogue to evaluate the fit between educationally identified core competencies for interprofessional collaborative practice needs and demands. Development of the IPEC domains and competencies were developed primarily by educators and professional societies with limited or no input from active healthcare practitioners, students, and members of the communities we serve. While there are numerous surveys to assess various aspects of IPE, educators continue to seek comprehensive assessment strategies that consider the full range of the competencies. Development of a holistic model for measuring the impact of IPE on the professional growth of health professions students during their education is needed to examine the linkage between interprofessional education and collaborative practice, as recommended by the Institute of Medicine in

their 2015 report, *Measuring the Impact of Interprofessional Education on Collaborative Practice and Patient Outcomes*.

**Purpose:** The purpose of this project was to facilitate leadership development of an experienced nurse faculty member through the expansion of the skills needed to successfully lead an interprofessional team in the development of a holistic model to evaluate interprofessional education experiences for health professions students caring for vulnerable populations in a community based setting.

**Methods:** The first step of the project was to convene a team consisting of interprofessional colleagues from across the Academic Health Center of a large Midwestern University. This group included representatives from the Colleges of Nursing, Medicine, Pharmacy, and Allied Health. Faculty and students had partnered with a local social service agency since 2010 to hold an interprofessional self-management clinic at the agency's community food pantry. Despite anecdotal data related to the value of this IPE experience, no data has been collected to assess student learning outcomes. A series of collaborative forums were planned with key stakeholder groups involved with the self-management clinic to examine the IPEC domains and competencies including: (1) Health professions students; (2) Health professions faculty; and (3) Community partners including the agency and clients. Following each presentation and review of the domains and competencies, stakeholder representatives provided both written and verbal feedback regarding the existing domains and competencies, as well as suggestions for additional items needed to formulate a holistic assessment of the IPE experience. Following each of these collaborative forums, the IPE Team members met to analyze data and refine the emerging model.

**Results:** Collaborative forums were completed with each of the key stakeholder groups. Participants were appreciative of the opportunity to contribute to development of the model, identifying areas that they felt were important for inclusion. As a result, a final model was created by the IPE team that expanded the original four IPEC domains to six. Faculty and students identified a fifth domain, Environment of Care, which involves actively contributing to improving the environment of care for self and other health care professionals and staff in order to increase satisfaction, enhance retention, and reduce burnout. The Community Partners, which included both representatives from the agency and community residents, identified additional competencies to be included under the Teamwork & Collaboration domain and added an additional domain, Patient Centeredness, which was determined by the group to be central to the new model. Patient Centeredness was defined as purposefully placing the patient and his/her family at the center of the health care experience through holistic, relationship-based care delivery.

During the ENFLA experience, the scholar gained valuable self-awareness, insight, and skills which allowed her to strategically create a dynamic leadership plan to facilitate her continuous development as a member of the academy in her new role as a tenured faculty member, as well as a leader in IPE initiatives designed to enhance the care of vulnerable populations. Self-reflection, skillfully facilitated by both the ENFLA mentor and ENFLA faculty, was a crucial component of the ongoing leadership development process, and prepared the scholar to move from relying on external definitions and indicators of successful professional development and leadership to embracing a model which includes knowledge of her own unique personal leadership qualities and style while setting leadership goals. As a result of this process, the scholar identified servant leadership as the leadership style most in keeping with her personal philosophy of nursing, and life. Thus the ENFLA experience resulted in greater knowledge of, and acceptance of self, as well as the recognition of opportunities for future leadership in advancing the care of vulnerable populations, locally, nationally, and globally.

**Conclusions:** Plans are underway for future testing and refinement of the Holistic IPE Model. An IPE grant has been submitted to an external funding agency that will use the model to evaluate student learning as part of involvement with the proposed project. A master's student in Allied Health is using the model to evaluate learning outcomes for former health professions students participating in the IHI Open School clinic. As part of her project, she will utilize cognitive interviews of students to further refine the holistic model.

Development of a nurse leader, as well as a holistic model to evaluate IPE, requires thoughtful strategic planning and partnerships. Participation in the ENFLA provides experienced nurse faculty with the

opportunity to reflect on personal leadership qualities and styles, and incorporate this self-knowledge in the creation of a tailored leadership development plan under the guidance of mentors and faculty accomplished in the field of nursing leadership. Leadership skills are further refined through the planning, implementation, and evaluation of the leadership project in partnership with colleagues in our respective universities. Thus an essential element of the ENFLA leadership development process is collaboration with a supportive team whose members possess diverse perspectives and expertise who challenge the scholar to expand previous boundaries and envision future leadership potential. An African proverb states, "If you want to go fast, go alone. If you want to go far, go together."

## Leadership Development through Journal Editing

---

*JoAnn S. Oliver, PhD, RN, CNE, USA*  
*Sandra M. Underwood, PhD, RN, FAAN, USA*  
*Pamela Jeffries, PhD, RN, FAAN, ANEF, USA*

### Purpose

The purpose of this presentation is to share the process and outcomes of a journal editing and publication leadership project completed within the Sigma Theta Tau International Experience Nursing Faculty Leadership Academy.

### Target Audience

The target audience is convention attendees who are interested in leadership development and/or publication.

### Abstract

**Introduction/Background:** Nurses are highly regarded in the healthcare community. Having diverse educational preparation and expertise accentuates their ability to collaboratively and holistically address health care issues. For example, the PhD prepared nurse researcher may coordinate and collaborate with a clinical expert such as the Doctor of Nursing Practice prepared nurse to address health care issues. Nurses have been noted to be a critical advocate for change relative to addressing the needs of individuals, including disparate groups and populations.

Our understanding of the needs and concerns of rural and medically underserved populations and our experiences working in rural and other medically-underserved areas, served as the impetus for this Experienced Nursing Faculty Leadership Academy (ENFLA) nursing scholar project. The nurse scholar, who led the project, identified a need to increase collaboration among doctoral-prepared faculty in the areas of scholarship and service.

**Aim/Goal/Purpose sentence:** The goals are 1) Increasing personal and professional skills, particularly in leadership, collaboration, and publication and 2) promoting inclusivity, leadership, and growth among nursing faculty.

**Methods:** The ENFLA sponsored by Sigma Theta Tau International/ Chamberlain College of Nursing Center for Excellence in Nursing Education used a triad team approach. The triad consisting of the nurse scholar, JoAnn Oliver, the ENFLA mentor, Sandra Millon Underwood and ENFLA faculty member, Pamela Jeffries was instrumental in the completion of the leadership project. The ENFLA mentor and ENFLA faculty member facilitated the nurse scholar's development and completion of an individual leadership plan. The main goals of the leadership plan focused on increasing personal and professional skills and promoting inclusivity, leadership, and growth among nursing faculty.

In collaboration with the mentor, a time line was developed. A table of contents was established on specific healthcare topics. Author's manuscripts were submitted to an Electronic Manuscript Submission System and reviewed using the criteria established by the Journal.

Junior nursing faculty members were recruited to participate in the review of select manuscripts for educational purposes and as a service opportunity. Faculty members who participated in the learning opportunity were provided with written documentation as evidence of their participation and service.

**Results:** With the support of both Pam Jeffries, faculty and Sandra Millon Underwood, mentor, the ENFLA scholar developed and implemented an individual leadership plan. The main goal focusing on

increasing personal and professional skills and promoting inclusivity, leadership, and growth among nursing faculty was met. Faculty members of diverse educational backgrounds collaborated on articles. Faculty participated in manuscript review service opportunities. Significant learning and personal growth and development was experienced by the nurse scholar through the co-editing leadership experience. Oral and written communication with colleagues from across the nation occurred. The scholar led the process of co-editing the September 2015 issue of Nursing Clinics of North America. Sandra Millon Underwood provided support as ENFLA mentor and co-editor. Fourteen articles were included in the final edited publication. Specific topics addressed in the publication are: 1) Diabetes and Hearing loss 2) Cardiovascular health 3) Food insecurity 4) Assessing clinical health issues 5) Best practices for effective clinical partnerships 6) Integrating family health history 7) Health information seeking 8) Cervical and breast cancer literacy 9) Tailoring interactive multimedia to improve diabetes self-management 10) Smoking Cessation 11) Diabetes and children 12) Using mobile devices to access information in a rural setting 13) Obesity Assessment 14) Rural health and non-emergency use of emergency medical services.

**Conclusions:** The ENFLA facilitated in further developing a myriad of leadership skills. Enhanced opportunities to plan, develop, and implement a leadership project resulted in a high quality and disseminated outcome. This leadership project promoted personal and professional leadership growth among the ENFLA nurse scholar. This project served as a unique opportunity to increase inclusivity and collaborative efforts among a diverse group of nursing faculty and clinical experts. Additionally, the project dissemination forum also served as a mechanism to expand the influence of the nurse scholar within the institution, community, and nursing profession.

### Engagement of Clinical Teaching Faculty in Scholarship of Teaching and Learning: What Really Occurred

---

*Karen Gorton, PhD, MS, MSN, BS, BSN, RN, ATC, USA*

#### Purpose

to provide the participant with a deeper understanding of the interconnectedness of a leadership project and a personal leadership journey.

#### Target Audience

current and aspiring leaders within nursing.

#### Abstract

Background: Historically, the engagement of Clinical Teaching Track Faculty (CTTF) in the scholarship of teaching and learning (SOTL) has not been at the same level as faculty who are tenured, or on the tenure track. In order to increase the engagement of CTTF in the SOTL and dissemination of this work, a project was developed to increase the engagement of this group in scholarship and dissemination of their scholarship.

Methods: Through the Experienced Nurse Faculty Leadership Academy (ENFLA) sponsored by Sigma Theta Tau International/Chamberlain College of Nursing Center for Excellence in Nursing Education, the scholar participated in a faculty guided leadership program and mentorship over a 12 month period to increase engagement of the CTTF in the scholarship of teaching and learning, hone existing leadership practices, deepen existing strengths, and develop new leadership practices. The triad team, scholar Dr. Karen Gorton, mentor, Dr. Angela McNeils and faculty, Dr. Karen Carlson, were instrumental in facilitating scholar growth as a leader and implementation of the project even as the environment changed.

Results: The ENFLA scholar developed and implemented a plan to increase the engagement of CTTF in the SOTL. Additionally, needed infrastructure was created with the Area of Excellence – Scholarship of Teaching and Learning; 6 month “touch-base” process was implemented with CTTF; significant personal growth continues; and increased numbers of CTTF have engaged in the dissemination of scholarship.

Conclusions: The ENFLA experience has provided the scholar with the opportunity for mentorship, leadership development, personal growth and facilitated the development and implementation of a project aimed to facilitate increased engagement of CTTF in the scholarship of teaching and learning. Additionally, growing challenges were presented to the scholar by the mentor and faculty which facilitated self-reflection and positive change.

### Developing Telehealth-Focused Advanced Practice Nurse Educational Partnerships

---

*Shelley Hawkins, PhD, MSN, BSN, FNP-BC, GNP, FAANP, USA*

*Donna M. Nickitas, PhD, RN, NEA-BC, CNE, USA*

*Debra Lyon, PhD, MSN, BSN, RN, PMHNP, FAAN, USA*

#### Purpose

The purpose of this presentation is to establish and operationalize telehealth-focused educational partnerships between the University of San Diego (USD) Hahn School of Nursing and Health Science and 4 community stakeholders in order to enhance the preparation of APRN NP students for practice, teaching, and/or scholarly endeavors.

#### Target Audience

The target audience of this presentation is advanced practice academicians, practitioners, and administrators of health care systems with an interest in developing roles for advanced practice nurses in telehealth clinical practice.

#### Abstract

**Introduction/Background:** As technology has grown exponentially in healthcare, nurse educators must prepare Advanced Practice Registered Nurse (APRN) graduates with the knowledge and skills in information systems/technology to support and improve patient care and health care systems. APRN's are expected to lead in caring for populations who lack accessibility and availability through the use of technology, specifically telehealth. The capacity to effectively and efficiently use technology in patient care delivery is clearly delineated in the American Association of Colleges of Nursing (AACN) Doctor of Nursing Practice (DNP) and Master of Science in Nursing (MSN) Essentials. However, APRN's have minimal, or no, exposure to formalized telehealth education and lack necessary technical skills needed to incorporate telehealth into their patient care. APRN's must successfully master the technology using telehealth/telemedicine, electronic health records, health information technology, and clinical decision support systems to advance health. Furthermore, DNP APRN's must be prepared to lead the coordination and collaboration with other healthcare providers in their use and application.

**Aim/Goal/Purpose:** The purpose of this presentation is to establish and operationalize telehealth-focused educational partnerships between the University of San Diego (USD) Hahn School of Nursing and Health Science and 4 community stakeholders in order to enhance the preparation of APRN NP students for practice, teaching, and/or scholarly endeavors.

**Methods:** The proposed project was initially presented by the project director to selected multidisciplinary stakeholders including leadership, home telehealth personnel, primary care providers, and decision support systems within two major health care systems to garner their support for acceptance and implementation. Concurrently, backing was obtained from several key USD colleagues including the Director of Simulation and Innovative Learning Lab and Coordinator of the Health Care Informatics Program. Technology experts skilled in design and production in web applications and electronic modules were secured from two San Diego based technology companies.

**Results:** Four telehealth-focused partnerships have been established with the USD DNP & MSN NP Programs. Two educational pilot programs are being developed with these San Diego based partnerships including 2 health care systems and 2 technology/media based companies. Students will have opportunities to engage in clinically based telehealth experiences focused on: (1) providing patient care while incorporating various technology with a specific emphasis on telehealth; (2) conducting research and/or evidence-based practice projects in order to further develop the scientific foundation

regarding incorporation of telehealth with patient care; and (3) participating in the production of patient-level educational materials related to specific topical areas.

**Conclusions:** Evidence-based APRN student telehealth clinical experiences will assist in preparing graduates who can effectively incorporate telehealth into their clinical practice. Greater access for diverse populations will be available as a result of the telehealth service model as well as better care and better outcomes at lower costs. Furthermore, APRN's will provide the necessary leadership and coordination through interprofessional practice by transforming health care through new innovative care models using information systems and technology.

## ENFLA - Experienced Nurse Faculty Leadership Academy Invited Posters

### Leading Change in Admission and Progression Requirements to Promote Retention in a Pre-Licensure BSN Program

---

*Deborah A. Greenawald, PhD, MSN, RN, CNE, USA*

*Zane Wolf, PhD, RN, FAAN, USA*

*Suzanne Prevost, PhD, RN, COI, USA*

#### Purpose

The purpose of this project is to examine patterns of retention/progression within the Nursing major for students admitted to the pre-licensure BSN program of a small Catholic Franciscan university, with a goal of making changes to existing policies to increase student retention/progression from the time of admission to graduation.

#### Target Audience

The target audience for this poster presentation is nurse educators and chairs/deans of pre-licensure baccalaureate in nursing programs.

#### Abstract

This change project was implemented as part of the Experienced Nurse Faculty Leadership Academy (ENFLA) by Deborah A. Greenawald (Scholar), in collaboration with Zane R. Wolf (ENFLA Mentor) and Suzanne Prevost (ENFLA Faculty), and with additional support from Sigma Theta Tau International/Chamberlain College of Nursing Center for Excellence in Nursing Education.

**Introduction:** Each year across the United States, students compete for a limited number of seats in pre-licensure BSN programs. With the increasing costs associated with nursing education and college in general, it is important to attempt to admit only students who have the best chance for success in the intended nursing major, and then to monitor their performance closely in foundational courses to determine their continuing ability to be academically and clinically successful in subsequent semesters. By “casting a wide net” with less stringent admission and progression guidelines for nursing students, many are academically unsuccessful after initial semester/s or lower level nursing courses, negatively impacting retention within the nursing major and, in many cases, overall attrition at a university. Although many admission and screening strategies are being utilized by baccalaureate nursing programs around the U.S., there have not been any singularly definitive indicators of potential nursing student success identified in the literature. Although the factors which influence nursing student success are complex, one approach to increasing overall retention in a nursing program is to examine current admissions guidelines and progression policies and relate them to historic patterns of nursing student retention and success.

**Purpose:** The purpose of this project is to closely examine the historic patterns of retention and progression within the Nursing major for students admitted to the pre-licensure BSN program of a small, Catholic, Franciscan university as either traditional or transfer students, with a goal of making changes to existing policies and guidelines to better support increased student retention and progression from the time of initial admission to the university to graduation. To support a student’s academic and clinical learning in nursing, better screening must be done at the time of application and admission to only admit those with the greatest chance for success. By better controlling the quality of students admitted to the Nursing program and thereafter more closely monitoring their progression, using (proposed) stricter guidelines than those currently in place, it is hoped that retention in the program will increase and that a greater number of students who are initially admitted will progress to graduation with a BSN and, ultimately, success on the NCLEX-RN licensure exam.

**Methods:** Existing data on nursing student admission and retention at the university were reviewed, noting patterns among students who were unsuccessful in the nursing major. The researcher met with

key members of the Admissions Department and Nursing faculty, including on-going discussions with the Chair of Nursing, who shared considerable data on student retention, and the Dean of the College of Professional Programs, whose support would be necessary to move the final proposal through administrative channels. Evidence from the current literature regarding best-practices for admission standards and progression guidelines related to nursing student success was reviewed, with consideration of the university's mission and values as proposed changes were being considered. An initial list of eight potential changes to current policies and procedures was developed and presented to the Nursing faculty for review and comment. Specifically, changes were proposed to admission GPA and SAT scores, the number of science courses which can be repeat/deleted for a passing grade (minimum "C"), the number of times a student may withdraw from a nursing course without receiving a grade, and the "advanced placement" for transfer students who hold a LPN license. Additionally, a recommendation was made that the university no longer distinguish between "Nursing" and "Pre-Nursing" students (the latter group being those who had some marginal qualifications related to high school GPA or SAT/ACT scores during the admission process), but rather, categorize all students initially admitted to the Nursing program as "Pre-Nursing" until they have successfully completed the foundational science courses prior to beginning the first required nursing course. Faculty input resulted in some minor changes to the initial proposal after which the plan was endorsed by consensus and moved along for further approval through faculty governance.

**Results:** Over the course of a semester, the proposed changes to nursing student admission and progression guidelines received approval from all necessary individuals and committees and are scheduled for implementation beginning in Academic Year 2015-2016. The impact of the changes on overall nursing student retention and successful program completion will not be able to be assessed for several years. However, on-going research will track the data on admission, retention, and successful program completion for students in the traditional pre-licensure BSN Program in order to document the outcomes of this change project.

**Conclusions:** Leading change is challenging in most situations, but in the environment of higher education, nursing faculty and leaders may be particularly challenged by institutional structures and processes over which they do not have much control. Building relationships with colleagues outside of the Nursing Department is necessary to persuade others in positions of authority why proposed changes are necessary to support nursing student success. Understanding the perspectives of Admissions Department staff, the Registrar, the Marketing Department, and faculty from other disciplines who sit on key committees is an essential step when trying to influence others to support changes to student recruiting/admissions and academic eligibility for progression. This change project represents an important shift in the manner in which student success is supported at this university, by interceding at the initial step of student admission and then more strictly controlling progression, so that those students who reach the upper levels of the Nursing curriculum will have the optimal chance to be successful in BSN completion and passing the NCLEX-RN.

## An Innovative Approach to Mentoring Newly Hired Nurse Educators

---

*Greta I. Marek, DNP, MSN, BSN, RN, CNE, USA*

### Purpose

The purpose of this presentation is to describe a sustainable mentoring program used to promote successful assimilation of newly hired nurse educators into the academic environment.

### Target Audience

The target audience of this presentation is nurse educators that practice in academia.

### Abstract

Introduction: Newly hired nurse educators face multiple challenges in today's rapidly changing academic environment. Transitioning from clinical practice into academia without the benefit of effective mentoring may lead to dissatisfaction, frustration, and attrition. Newly hired nurse educators may find difficulty in understanding academic areas of teaching, scholarship, and service, especially if they are transitioning from clinical practice. An effective mentoring program for nurse educators provides guidance, support, resources and assistance, as well as an opportunity for experienced faculty mentoring team members to guide newly hired nurse educators through the complex world of academia. The purpose of this project was to create a sustainable mentoring program to promote successful assimilation of newly hired nurse educators into the academic environment.

Methods: The method was a Plan-Do-Study-Act (PDSA) project to create an effective mentoring program for newly hired nurse educators. The project leader (scholar) guided the Faculty Mentoring Program Committee (FMPC) through the creation and progression of the faculty-mentoring program. The triad that consisted of the scholar Greta Marek, DNP, RN, CNE, her mentor M. Peggy Hays, DSN, RN, COI, and faculty Cynthia Clark, PhD, RN, ANEF, FAAN regularly discussed the project's progress. The Experienced Nurse Faculty Leadership Academy (ENFLA), sponsored by Sigma Theta Tau International/Chamberlain College of Nursing Center for Excellence in Nursing Education, provided an evidence-based program that encouraged learning and growth for the scholar.

A review of the literature included searches in PubMed, CINAHL, ERIC, Ovid, Google Scholar and EBSCO host using the search terms: academic mentoring, nursing faculty mentoring, mentoring programs, nurse educator mentoring. Limitations placed on the search were English language, peer reviewed, and a timeframe of 2000 to the present. Scholar reviewed 29 full-text articles and 20 university websites; used Watson's Theory of Human Caring and Benner's Novice to Expert models in relation to nurse educator mentoring programs. The scholar formed the FMPC at their college of nursing secondary to the need to develop a formalized faculty-mentoring program. Information from the literature review guided planning, actions and recommendations from the committee.

Results: The ENFLA scholar endeavors to continue to work with the FMPC towards the mentoring program's growth and sustainability. The committee developed the program's mission, vision, goals, outcomes, logo, and a semester-by-semester structure. The FMPC created two different tracks for newly hired nurse educators: a three-semester program for experienced nurse educators and a five-semester program for novice nurse educators. The first semester of each track focuses on orientation to the university, the college, and assigned courses. Newly hired nurse educators remain a cohort, instead of the traditional dyad mentoring model. Experienced nurse educators serve as a resource person and share their expertise in teaching, scholarship, or service. The goal of remaining in a cohort would be to help newly hired nurse educators develop team-building skills, enhance collegiality, provide support, adapt to the local culture, and provide consistency.

The new nursing faculty, hired during the 2014-2015 academic year, serendipitously decided to form an ad hoc committee to the FMPC, to ensure input. The ad hoc committee will collaborate with the FMPC to determine the mentoring program's effectiveness each semester through formative and summative evaluations.

Conclusion: Members of the FMPC expressed a sense of renewed purpose and pride while collaborating on creating a sustainable mentoring program. Ad hoc committee members expressed optimism and excitement about working with the FMPC towards evaluating the mentoring program's effectiveness.

### Launch of an Interdisciplinary Poverty Simulation

---

*Terry Delpier, DNP, RN, CPNP, USA*  
*Karen H. Morin, PhD, RN, ANEF, FAAN, USA*  
*Karen L. Carlson, PhD, RN, USA*

#### Purpose

The purpose of this project was to cultivate new leadership skills in an experienced nurse educator through the process of establishing an interdisciplinary Poverty Simulation program at a medium sized public university in the upper Midwest.

#### Target Audience

The target audience of this presentation is nurse educators interested in the Poverty simulation or interested in developing leadership skills.

#### Abstract

**Background:** Poverty is a significant issue in the United States. According to the U.S. Census Bureau, the 2013 poverty rate was 14.5%, with a 19.9% poverty rate for children. Living in poverty is associated with significant long-term consequences, especially for children. Children are more likely to have lower levels of cognitive development with lower levels of educational achievements, and are also more likely to develop behavior problems and mental health issues that may continue into adulthood (Edin & Kissane, 2010). For people of all ages, living in poverty has been associated with negative health consequences, which, in turn, can worsen the family's poverty (Braveman et al., 2011; World Health Organization, WHO, 2008).

Although causes of poverty are not well understood, most of the causes of poverty are outside of the control of people who are poor. Additionally, persons living in poverty often experience stigmatization. Research suggests that when service professionals have negative perceptions of people living in poverty, levels of care provided by those professionals are less adequate (Castillo & Becerra, 2012; Reingold & Liu, 2009; Weaver & Duongtran, 2010). It is therefore important that everyone, especially students in professional service industries, are educated about the causes of poverty, and that efforts are made to influence attitudes toward the poor positively. Reutter, Sword, Meagher-Stewart, and Rideout (2004) identified that, in general, students with more positive attitudes toward people living in poverty were likely to believe that poor health within that population was primarily a result of limited access to resources. In contrast, students with more negative attitudes were likely to attribute poor health to poor health choices of individuals living in poverty, thus "blaming" the poor for being poor.

One way to encourage change in attitudes is through experiential learning followed by reflection. In the proposed Poverty Simulation (Missouri Association for Community Action, n.d.), students from many disciplines are able to experience the difficulties and challenges faced by "being" poor. The simulation is conducted with participants being assigned family identities. The families work to navigate the demands and challenges associated with being poor in 15 minute weeks; this is done by prioritizing challenges and interacting with community resources to resolve those challenges. The guided reflection at the end of the experience helps students to process the information and their feelings. This process increases students' awareness and understanding, potentially leading to changes in attitudes towards the poor.

**Purpose:** The purpose of this project was to cultivate new leadership skills in an experienced nurse educator through the process of establishing an interdisciplinary Poverty Simulation program at a medium sized public university in the upper Midwest.

**Methods:** Over a 12 month period, this scholar engaged in the Experienced Nurse Faculty Leadership Academy (ENFLA) program sponsored by Sigma Theta Tau International (STTI) and Chamberlain College of Nursing Center for Excellence in Nursing Education. Through workshops, study and reflection and with the generous support of her triad team, Faculty, Karen L. Carlson, PhD, RN and Mentor, Karen H. Morin, PhD, RN, ANEF, FAAN, this scholar has expanded her leadership skills to the university level through the process of launching an interdisciplinary Poverty Simulation Program. This process involved developing support from other disciplines and developing links with community agencies.

**Results:** Due to the time required to mobilize support from an interdisciplinary group and the challenges of securing funding, the Poverty Simulation program will not be completed within the time frame of the ENFLA program, but the work is ongoing. Using the framework of Kouzes and Posner (2012) and reflecting on the process of change (Quinn, 1996), the scholar has been able to develop strong support for the project from faculty and administrators in four different disciplines: nursing, social work, education and speech, hearing, and language. Funding from a grant application is currently pending. The project is designed to provide a meaningful experience to students and community members. Though not the main focus of the project, there is also a potential to develop an opportunity for interdisciplinary faculty scholarship. This would be done by securing IRB approval to survey student attitudes toward poverty, before and after the simulation experience.

**Conclusions:** Participation in the ENFLA program, with the guidance and support of Faculty and Mentor, has greatly helped expand the scholar's personal and professional leadership skills, as well as develop confidence in those skills. These skills have enabled the beginning development of an interdisciplinary Poverty Simulation experience. But these skills have also enabled the ENFLA scholar to successfully apply for and be chosen to fill the two-year term of the Teaching Learning scholar. This is a university-wide position to promote faculty development. Thus, lessons from the ENFLA program will be used to provide leadership for faculty from all disciplines at the university.

### Development of a Women's Health Nurse Practitioner Major at Duke University School of Nursing

---

*Kathryn Trotter, DNP, MSN, BSN, RN, CNM, FNP-C, FAANP, USA*

*Anne Moore, DNP, WHNP/ANP, FAANP, USA*

*Clarann Weinert, SC, PhD, MA, MS, BSN, RN, FAAN, USA*

#### Purpose

to review a faculty leadership project which introduced a new women health NP major to a University's MSN program.

#### Target Audience

faculty and students interested in women's health NP programs as well as faculty who are interested in developing a new major at their school.

#### Abstract

Introduction/background: The focus on women's health, including improved understanding of the unique health needs of women, has increased over the past few decades. Further, the demand for women's providers is escalating with many new women enrollees seeking primary care services via the Affordable Care Act legislation. (Report on Activities Related to "Improving Women's Health" As Required by the Affordable Care Act (P.L. 111-148, Section 3509), 2013). Specialized knowledge of women's health care is heightened when women also have multiple chronic conditions. (Weisman and Chuang, 2010; NIH Office of Research on Women's Health, 2010).

Purpose: To develop and initiate a women's health nurse practitioner (WHNP) major within the MSN program at Duke University School of Nursing. This requires leadership and organizational skills on many levels as well as curriculum design and economic planning. The ultimate goal is a sustainable program.

#### Methods:

1. Conducted an internal and external needs assessment for the WHNP major within the MSN program. HRSA ANE grant application submitted early 2014.
2. Through the Experienced Nurse Faculty Leadership Academy (ENFLA) sponsored by Sigma Theta Tau International/Chamberlain College of Nursing Center for Excellence in Nursing Education, the scholar participated in a triad team of Scholar/Mentor/Faculty. The 12-month leadership program helped to sharpen leadership and administrative skills.
3. Created a business plan, to include internal marketing of the program to DUSON administration, faculty, as well as to current and potential students.
4. Led a Team-Based Project focused on initiating the WHNP major. Included multiple stakeholders, which will contribute to an improved overall product.
5. Measured impact and outcomes in ongoing fashion.

#### Plan:

1. Enroll 8 in the 01 Year, 10 in the 02 Year, and 12 in the 03 year.
2. Develop and implement innovative and sustainable IPE didactic and clinical experiences for students in the WHNP, PA and DPT graduate programs that define and validate the essential competencies necessary to provide high-quality, evidenced-based care to women.
3. Evaluate knowledge and attitudes of scholars and graduates, skill development, and postgraduate board certification and employment.

#### Results

1. Received HRSA grant approval: July 2015-Celebration event for stakeholders, Project coordinator hired.
2. Faculty voted approval of new courses x 4. First course (Gender and Women's Health) completed August 2014. Next new course is slated for January 2015.
3. Marketing: Launched online AANP SmartBrief Ads, and regional and national professional meeting exhibits.
4. Students: Well over target with 20 enrolled in the Spring 2015 cohort, and 12 in the Fall 2015 cohort.
5. Evaluate student/faculty impact. Pre-test on knowledge and IPE interaction completed with first cohort, May 2015. 13/17 completed surveys. Post graduation, a repeat survey is planned.
6. HRSA ANE Refunded for year 2.
7. Key leadership strategies: Quarterly faculty meetings-check in, creation of welcome video by faculty to new students. PI has observed and participated in Physician Assistant teaching events in order to foster the relationship between schools and plan future IPE events.

Conclusion: This was successful and an ideal leadership project for an experienced faculty member/leader candidate. It required many skills including: vision for the WHNP role within the school and within the profession, organizational skills, relationship building and networking with administrators, preceptors, and students, building a marketing and economic plan, and curriculum design. Full program outcomes will be determined in year 2 and 3.

## ENFLA - Experienced Nurse Faculty Leadership Academy Invited Posters

### Interprofessional Education and Collaboration from the Students' Points of View

---

*Pennie Sessler Branden, PhD, APRN, CNM, RN, USA*

#### Purpose

The purpose of this activity is to begin the discussion of Interprofessional Education (IPE) and Interprofessional Collaboration (IPC) from the students' vantage point at Sacred Heart University (SHU), College of Health Professions (CHP).

#### Target Audience

Students of the SHU CHP from multiple disciplines including: Nursing, include Physical Therapy (PT), Occupational Therapy (OT), Speech-Language Pathology, Athletic Training, Exercise Science, Healthcare Informatics, and Health Sciences.

#### Abstract

**INTRODUCTION/BACKGROUND:** Healthcare providers can no longer work in silos and neither can health professions' educators. Health care professionals must work together to provide the best possible care for individuals and communities and reduce redundancy. Opportunities for Interprofessional Education (IPE) have not been utilized to their full potential even when the health professions schools/programs share a building or exist on a university campus. Those lost opportunities reduce the extensive and worthwhile possibilities for interprofessional awareness, education and collaboration across the health professions.

Interprofessional education is a pedagogical approach for preparing health professions' students to provide patient care in a collaborative team environment. The premise of IPE is that once health care professionals begin to work together in a collaborative manner, patient care will improve (Buring, Bhushan, Broeseker, Conway, Duncan-Hewitt, Hansen & Westberg, 2009) and collaboration will continue. In an effort to support and encourage Interprofessional Collaboration (IPC) and education, the IPE Committee of the Sacred Heart University (SHU) College of Health Professions (CHP) was established to spearhead and identify opportunities for IPE integration across the curriculum into each professional track. The ENFLA Scholar recognized the opportunity to begin this process by having an IPC activity with students from different CHP departments/schools to come together and learn about IPE leading to IPC.

Over the past year, the IPE Committee at the SHU CHP has been leading an effort to have the faculty better understand the IPE and the opportunities it affords for collaboration in education and care across the health professions. Initially the committee was formed by the Dean of the CHP and the committee members attended the IPEC Faculty development in the spring of 2014. The Experience Nurse Faculty Leadership Academy (ENFLA) Scholar was appointed to this group in September of 2014. At that time the committee was tasked with the job of getting faculty members of the CHP to submit proposals for IPE activities. Since then two workshops for the CHP faculty have been held and a call for proposals has been done. The committee decided to support three projects that were proposed. Since the work of the IPE Committee has addressed activities by and for the faculty, the ENFLA Scholar has decided to have an activity for and IPE group of students from the CHP to build support for IPE from the ground up. IPE research has supported this type of activity.

**PURPOSE:** The purpose of this activity is to begin the discussion of Inter-professional Education (IPE) and Inter-professional Collaboration (IPC) from the students' vantage point at Sacred Heart University (SHU), College of Health Professions (CHP).

**OBJECTIVES:**

1. Introduce IPE and IPC to the students of at least three different CHP professions.
2. Increase mutual understanding of the roles and responsibilities of at least three disciplines in SHU CHP.
3. Relate IPE competencies to each discipline's professional standards.
4. Encourage interprofessional collaboration and dialogue across the CHP majors.

**METHODS:** The proposed activity will be a single, 4 hour workshop for CHP student volunteers in the early fall 2015 semester. These students will include those from the School of Nursing, and at least two other departments in the CHP. The other disciplines in the College include Physical Therapy (PT), Occupational Therapy (OT), Speech-Language Pathology, Athletic Training, Exercise Science, Healthcare Informatics, and Health Sciences. The workshop will address at least two of the IPEC Core Competencies for Interprofessional Collaborative Practice. These IPC Practice Competency Domains include:

1. Values/Ethics for Interprofessional Practice
2. Roles/Responsibilities
3. Interprofessional Communication
4. Teams and Teamwork

**ACTIVITY:**

1. The ENFLA Scholar will form an IPC group of educators from at least three professions within the CHP.
2. This faculty committee will identify the group of students to include in this activity. The students will be notified and asked to participate with approximately an ultimate number of 8-12 from each professional track. The students will volunteer for this activity/workshop.
3. This IPC activity/workshop will include:
  1. Evaluation of the student participants for:
    1. their understanding of IPE and IPC before and after the activity
    2. their ideas related to when IPE can be done across the professions at SHU CHP
    3. their level of communication across professions before and after the activity
  4. Introduction of the IPE/IPC topic.
  5. IPC student groups reviewing and discussing their discipline's professional standards and where they are congruent.
  6. Case study with interprofessional student groups evaluating the opportunities for IPC and patient care.
  7. Students will offer suggestions on how they believe IPE and IPC can be integrated into the CHP professions curricula.
  8. Evaluation of the information gathered during the activity including student pre and post tests and suggestions with cross over from the faculty suggestions.
  9. After the workshop and based on student feedback, the IPC faculty will identify what course(s) and learning opportunities may have the potential for IPE in the SHU CHP.

**RESULTS:** In order to evaluate this Program's Outcomes, the Objectives will be measured as stated below:

1. The student participants will look at the professional standards of each of the disciplines represented and compare and contrast them as an activity of the workshop. These results will be reported by and to the interdisciplinary groups during the workshop. Written sheets from each group will be collected by the ENFLA Scholar and tabulated.
2. Questionnaires before and after the workshop will be answered by the student participants to evaluate and compare their understanding of what IPE, IPC, and professional roles and responsibilities are for each discipline represented by the student participants.

**CONCLUSIONS:** To be determined after execution of workshop.

## GNLA - Geriatric Nursing Leadership Academy Invited Posters

### A Nurse Leaders Journey to Improve Geriatric Outcomes in the Acute Care Setting

---

*Rhonda R. Davis, MSN, BSN, RN, F-GNLA, USA*

*Claudia J. Beverly, PhD, MSN, RN, FAAN, USA*

*Tina M. Savdoval, MBA, BSN, RN, USA*

#### Purpose

The purpose of this presentation is to expand geriatric knowledge and experience to enhance the care of the geriatric population throughout the organization.

#### Target Audience

The target audience of this presentation is healthcare professionals and nurse leaders interested in advancing the nursing practice as it relates to the older adult

#### Abstract

The Geriatric Nurse Leadership Academy (GNLA) is an 18 month mentored leadership experience that is designed to operationalize learned leadership behaviors by assisting and supporting the fellow in developing and implementing a project that is centered on improving geriatric outcomes. Methodist Le Bonheur Healthcare has a culture of continuous quality improvement and leadership development and therefore chose to participate in the 2014-2015 GNLA cohort recognizing that as an organization the advancement of nursing practice in the care of older adults deserves attention in the community and the profession. A team was assembled to develop needed tools and provide education about the benefits of improving geriatric competence. Metrics to evaluate the program and its impact were agreed upon and systems were put into place to monitor and share the results. Involvement in GNLA fostered a partnership of a variety of disciplines and the interprofessional project identified and addressed several geriatric initiatives: enhance the geriatric knowledge of 100% of the bedside nurses on the medical surgical unit, implement geriatric training of new graduates in facility orientation and weekly team conferences with the pharmacist, case manager, social worker, patient care coordinator and nurse of geriatric patients on the unit. The expectation of this collaborative effort is to develop a team that is equipped with the clinical competencies to meet the needs of the older adult and focus on a plan using multiple strategies to decrease length of stay, increase patient satisfaction, and ultimately improve clinical outcomes of older patients. Over time the goal is to expand this geriatric knowledge and experience to enhance the care of this specialized population throughout the organization. Participation GNLA allowed the fellow to address professional and personal challenges that will be encountered as a leader uses an interprofessional project to implement organizational change.

## Preparing the Workforce to Care for Older Adults

---

*Jennifer L. DeClercq, MSN, RN-BC, FGnLA, USA*

*Lisa A. Imlay, MSN, RN, USA*

*Nelma B. Crawford Shearer, PhD, USA*

### Purpose

The purpose of this presentation is to identify knowledge gaps among current health care providers in respect to the older adult population and the effort to improve competence and comfort in care provisions.

### Target Audience

The target audience of this presentation is direct care providers and those leading and managing the care providers.

### Abstract

The Geriatric Nursing Leadership Academy (GNLA) is founded on the three learning domains of leadership: Individual Leadership Development, Advancing Nursing Practice through Leadership of an Interprofessional Team Project, and Expanding Scope of Influence within the organization, community, and profession. The GNLA utilizes the Kouzes-Posner Leadership Challenge model for the purpose of developing leaders through a mentorship to advance practice and the care continuum for the older adult.

My individual leadership plan focuses on clarifying my values and setting an example by modeling the way for the interprofessional team as well as colleagues in the community. In order to model the way and inspire a shared vision, I focused on developing my public speaking skills and pursued new leadership opportunities and collaborations within and outside of my organization.

I have expanded my professional scope of influence by accepting an executive leadership position of Director of the Medical & Surgical Units at the hospital where I was employed as a clinical manager. I also accepted the responsibility to facilitate the long term care and post-acute care quarterly meetings within our community. I took the initiative to contact the local Senior Services Center and will be assisting in the organization of a Senior Health Fair for our community. I have been invited to the transitions of care team within our organization and serve as a key member to improve the quality of patient transitions of care. I now have a voice for leadership within the organizational Nurse Executive Council, Department Head meetings and was nominated to be a Baldrige examiner. Our organization is beginning the journey to receive the Malcolm Baldrige Quality Award. As an active member of the core team, I share my voice regarding the changing health care environment.

Advancing nursing practice and leadership was achieved by leading an interprofessional team project. As a GNLA fellow, I have learned the importance of inspiring a shared vision and enabling others to act on improving care provider's knowledge and skills in needs of hospitalized older adults. Through a multidisciplinary team approach and collaboration with a local university, assessment of caregiver knowledge within an acute care setting will be evaluated, knowledge gaps will be identified, and education will be created and dispersed with the intent to create a higher level of competence and comfort among those providing direct care to the older adults. Findings for the project will be presented at the Sigma Theta Tau International Biennial Convention.

### GNLA Leadership Journey: Community Resource Group Project: A Mississippi (MS) Community Initiative

---

*Christie J. Robbins, FNP-C, RN, AANP, FGnLA, USA*

#### Purpose

The purpose of the presentation is to describe my GNLA leadership journey.

#### Target Audience

The target audience of the presentation is health care providers.

#### Abstract

**Introduction:** The Geriatric Nursing Leadership Academy (GNLA) is designed to assist and support the development leadership of advance practice nurses (APRNs). It focuses on individual leadership development, advancing nursing practice through leading through an interprofessional team project, and advancing the scope of influence of APRNs at the community, state and national levels. As a GNLA Fellow, I was able to implement an interprofessional project centered on improving geriatric health outcomes. This leadership development journey has been supported by my employer, Matrix Medical Network, a community health industry founder and leader. What began as a project; led to a journey to my heart, thus defining me as a person and nurse. The two will forever define my life.

**Individual Leadership Development:** My journey is best defined through the lens of the three domains of leadership as postulated by the Kouzes-Posner (K-P) model. As a GNLA fellow, the K-P model served as a guide in expanding my scope of influence by encouraging the hearts of those around me, and, by modeling the way for others. Multiple modalities were used to develop my leadership such as developing a mentor-mentee relationship, leadership training, observed behavior development with formal feedback, and purposeful self-reflection.

**The Interprofessional Team Project Initiative:** Matrix Medical Network is a visionary in the field of community medicine. The Mississippi (MS) Community Resource Group Project Initiative was developed to create an electronic tool to link health care providers with available community resources for older adults, bridging the gap between them, promoting efficient and comprehensive care at the highest level for all.

**Advancing Scope of Influence:** Expanding my scope of influence began by identifying key stakeholders interested in the care and well-being of older adults in Mississippi (MS). What began at the community level eventually led to my influence at the national level with federal lawmakers. These experiences enhanced my ability to enable others to act. For example, one of the collaborating physicians has become involved in Mississippi government affairs for the care of older adults, and one of the nurse practitioners has started a community work group in her town for the self-development of women. A second nurse practitioner is seeking a doctoral degree.

**Conclusion:** The Geriatric Nursing Leadership Academy provides development opportunities to nurses and encourages them to expand their scope of influence to a global level. As a GNLA Fellow, I recognize the role nurse leaders play in the future of healthcare. The development of strong community engagement with available resources is the key to the future of the care of older adults in Mississippi, and the subsequent possible world impact.

## GNLA - Geriatric Nursing Leadership Academy Invited Posters

### A Changed Approach in the Management of Chronic Non-Cancer Pain in Older Adults

---

*Lisa R. Binns-Emerick, MSN, RN, CS, GNP-C, USA*

*Mary Beth Lepczyk, MSN, ACNS-BC, ANP-C, USA*

*Claudia J. Beverly, PhD, MSN, RN, FAAN, USA*

#### Purpose

The purpose of this presentation is to provide effective and appropriate opiate alternatives to manage chronic non cancer pain in the older adult, using an interprofessional team, in order to implement a practice model change. The journey of the Geriatric Nurse Leadership Fellow will also be showcased.

#### Target Audience

The target audience of this presentation will be nurses who are interested in alternative pain management strategies for the older adult and those interested in implementing a practice change model utilizing an interprofessional team. Those interested in providing leadership in the geriatric arena will also be targeted.

#### Abstract

Inappropriate use of opiate medication for the management of chronic pain by older adults is fraught with challenges for the patient as well as healthcare providers. The Drug Enforcement Agency (DEA) recently changed the scheduling of hydrocodone combination products which created an opportunity to change pain management prescribing patterns and use for our elderly patients. The number of older adults, with their ever more complex needs, will continue to increase as the baby boomers age in our country thus having nurse leaders poised to address these needs within a climate of change is necessary. Furthermore, in the current health care climate and in the midst of the current Affordable Care Act, effective interprofessional leadership is needed in order to facilitate effective change. The Geriatric Nurse Leadership Academy (GNLA) sponsored by Sigma Theta Tau International in partnership with Hill Rom and the Hearst Foundation, provides an excellent opportunity for the community based geriatric nurse practitioner to develop their leadership knowledge and skills in order to provide effective leadership through this changing healthcare climate. The purpose of the GNLA is to prepare and support a group of nurses to develop and implement an interprofessional project centered on improving geriatric health outcomes. Using multiple methodologies in order to develop leadership knowledge and competence, the Fellow develops their skills in three domains throughout their GNLA Fellowship: individual leadership, advance nursing practice through leadership of an interprofessional team project and expand their scope of influence in their organization, community and profession. The GNLA utilizes the Kouzes and Posner leadership model in order to build on existing skills as well as to learn new leadership strategies. Utilizing these leadership strategies, the Fellow was instrumental in developing and leading an interprofessional team (pharmacists, pain experts, addiction medicine, physicians, nurses and social work) to develop a protocol for opiate use in the Rosa Parks Geriatric Wellness Institute for Senior Health (RP-WISH) patient. The purpose of the study was to provide effective and appropriate opiate alternatives to manage chronic pain in the older adult after determining the current opiate utilization rates of the RP-WISH patient and in so doing implement a practice model change. Provider and patient education modules were developed with subsequent standardization in the RP-WISH procedures used with an opiate using patient, such as utilization of a pain contract, urine drug screening as appropriate, patient and pain assessment tools, etc. Furthermore, the Pain Management Model was used to guide the project and give it a theoretical underpinning in order to maintain our focus of providing care to the older adult in such a way as to keep them functional and as independent as possible while promoting their overall quality of life, reducing their pain by addressing their pain from a biopsychosocial perspective and utilizing medications and other procedures in a judicious manner. Utilizing the leadership of an interprofessional team as a vehicle, the Fellow was able to use these newly acquired leadership skills to position herself in order to impact her organization by changing policy and procedures with regards to the care of the older adult opiate using patient, her community by participating with the DEA on a task force regarding opiate

use/abuse and her profession by disseminating learned information in the effective and efficient care of the older adult patient in chronic pain.

## Leadership with Intention and Impact

---

*Heidi K. Holmes, RN, BA, BScN, MScN, RN, GNC(C), FGnLA, Canada*

*Veronique Boscart, RN, MScN, MEd, PhD, Canada*

*Deborah Cleeter, EdD, MSN, RN, USA*

### Purpose

The purpose of this presentation is to convey the knowledge and capabilities gained as an emerging leader in the care of older adults. The presentation will demonstrate how I have transitioned into someone now dedicated to integrating leadership into my everyday life as a person and as a professional.

### Target Audience

Nurses and Health Care Providers, Health Care Agencies, Post-Secondary Health Care Education

### Abstract

Introduction: The Geriatric Nursing Leadership Academy (GNLA), “prepares nurses to lead multidisciplinary teams to improve health care to older adults...” (STTI, 2015). In addition to scopes of influence that are assessed and developed, the GNLA also, “assists and supports each participant to develop and implement an interprofessional project centered on improving geriatric health outcomes” (STTI, 2015). The measurement of success as a Fellow in the GNLA is not based on awareness and knowledge, but on behavioral changes and impact on care. My development and transition as a leader in gerontological nursing occurred over the last 18 months. These changes in behavior were accomplished with the support and guidance of a Faculty Advisor (Dr. Deborah Cleeter) and Leadership Mentor (Dr. Veronique Boscart), who constituted a triad. Support via funding was also provided by Sigma Theta Tau International (STTI), The Hearst Foundations and Hill Rom Inc. The Fellow’s employer, Conestoga College, was also in support of the GNLA Fellowship and project as it is in line with Conestoga College’s mandate to advance healthy communities. An interprofessional team, which I led, worked together to develop a continuing education module focused on the aging population and the care of older adults.

Background: Using Kouzes and Posner’s Leadership Challenge text (2012) as a foundation, I developed an Individual Leadership Development Plan (ILDP), which outlined strategies to achieve behavioral changes as a leader. The ILDP was also a means to measure outcomes and impact of my leadership related to the care of older adults. Formal feedback was solicited from colleagues who served as Leadership Observers (LOs), as well as from people in my personal and professional life. In addition to leadership related changes assessed within the organizational setting, scopes of influence were also determined, considered, and tracked, to evaluate progress in professional and community leadership. Meeting every 2 weeks by phone with my Faculty Advisor and Leadership Mentor, the pathway for leadership was planned, assessed, and modified, and progress was quickly identified by noting changes in behavior and reactions of others.

One of the components of the GNLA Fellowship is a project, serving as one of the means with which to develop and measure my leadership capabilities. I led an interprofessional team to develop an educational module focused on depression in older adults, and how to better prepare health care professionals to understand, assess and treat depression in this age group.

Aim: The GNLA’s purpose is to, “prepare and position nurses in leadership roles in various health care settings...” (GNLA, 2014). Specific behavioral based goals I developed to meet this vision included

1. Being an inspiration to those I work with as a leader, by inspiring a shared vision and encouraging the heart.
2. Communicating with those in my personal and professional life in a manner that is seen to be mutually beneficial, effective and positive
3. Demonstrating and being known by others for my brand of perseverance, idea generating, honest and forthcoming, and enthusiastic.

The aim of the project within my Fellowship was to develop an educational module to be used to improve competencies and influence the behaviors of health care professionals, who care for older adults at risk for or living with depression, in all settings. It is imperative that health care professionals become more aware of this issue, how to assess depression using best practices and more importantly what to do with their findings; communication, documentation and advocacy.

Methods: My progress was assessed through a variety of methods. As mentioned, an ILDP was drafted, edited, and finalized as a working document to guide me as a Fellow. It was often revisited in triad meetings, as well as discussed at GNLA milestones, such as workshops and site visits. The ILDP served as a plan for action to change my behaviors in measurable ways, and was tracked regularly. Changes in behavior that demonstrated strength in leadership included:

- Committing to spending regular time to future oriented thinking and planning
- Inviting and being open to discussions and input versus reporting
- Becoming aware of and using positive and purposeful language, both verbal and nonverbal
- Demonstrating appreciation for those I lead, by getting to know them personally and showing gratitude via small but meaningful gestures
- Living out my brand of perseverance, idea generation, honesty/forthrightness, and enthusiasm

Changes in behavior were noted and measured by 4 LOs, who completed surveys and sit down discussions both 1:1 with me, as well as in small groups with the triad. These discussions focused on assessing and providing data regarding communication styles (verbal and nonverbal) as well as reactions of others to the Fellow as a leader. Regular group GNLA Fellow teleconferencing calls were attended (once a month) to learn more about leadership behaviors and methods to achieve leadership goals. As well, individual methods to learn more about leadership styles were brainstormed and trialed, such as Lunch with Leaders. Regular meetings with organizational management were also scheduled, which centered on the project, but also on leadership development and progress. I also made a commitment to more actively engage as a leader in professional and community organizations and events. I became actively involved with professional nursing organizations (CGNA, GNAO, RNAO) and political forums, such as those facilitated by Ministers of Federal Parliament. After attending GNLA Workshop II, and following a Fellow's teleconference on the use of Social Media, I also began a Twitter account, engaging others in recognizing the issues facing the health of older adults and what can be done to resolve these.

The topic of depression as the focus for the educational module was decided upon after an extensive gap analysis of accredited continuing education programs in Canada, consultations with community health care agency partners, and a literature review. A letter of permission was received from the Research Ethics Board at Conestoga College, in recognition of this project as program evaluation. The educational module was piloted at a professional development conference at Conestoga College in June 2015, with faculty and professionals in attendance providing data. The educational module will also be assessed by curriculum experts, community partner agencies, and community experts in this field. Feedback was collected via online survey and focus group comments, to assess participant's recall of content, module evaluation methods, and frequency of use of similar methods and content within their practice/teaching. Early on however, it was evident that the educational module is being considered by community partner agencies, with great potential being recognized for meeting needs, not previously considered, such as with adults with developmental disabilities. Outcomes include:

- Enhanced awareness of depression in older adults and the risks
- Increased screening for depression in older adults
- Improved interprofessional communication regarding risks and diagnosis of depression

All of this occurred as a result of the changes I have made in my behavior as a leader, impacting my organization, community, profession and most importantly older adults. It is very exciting that these outcomes are occurring in a variety of settings (LTC, acute care, community), which is a new way of addressing depression and its impact on the overall health of individuals and systems.

Results: I have achieved many of my leadership goals. I have received improved ratings and data in my leadership abilities to encourage the heart and inspire a shared vision, and have improved the way with which I consistently communicate with others as a leader. I have also begun to market my brand of persevering, generating ideas, being honest and forthcoming, and always enthusiastic.

These results were tabulated from survey data and verbal feedback I solicited from peers/family members, Leadership Observers, management at Conestoga College, community partners, as well as professional organization associates. In addition, the GNLA Scope of Influence portfolio evidences growth in many areas, such as:

- New roles obtained in professional organizations
- Conferences attended related to gerontology
- Consulting
- Policy work
- Professional Networks
- Impact numbers

Following the pilot presentation of the module, the plans for assessing data, refining the educational module and presenting formally to more community partners and health care professionals will occur in the next few months. The project team will analyze data gathered during June and October sessions, and assess how participants have utilized the module. These results will then be correlated with care of older adults via current education programs that are offered. The team will also assess in Fall 2015/Winter 2016 if the educational module is taken up as part of post graduate certificate in gerontology.

As mentioned, development and change has been measured and will continue to be, both from project data as well as data related to my leadership goals. What is most exciting however is the transition that has been noted by all those involved with this Fellowship and by myself. Most recently I was nominated and accepted as a cohort representative to present at a Symposium at the STTI convention in Fall 2015. For me this summed up and evidenced how I have committed to making effective leadership a part of me and what I do; making the impact and integration of my experiences correlate with the care of older adults.

### Global Nursing Professional Migration: Addressing the Issue of Communication and Transition through Utilization of On-Line Education and Virtual Internships

---

*Klaudia J. Lewis, MSN, RN, USA*

*Brandon H. Parkyn, MSN, RN, CCRN, USA*

#### Purpose

This seminar will present the option of on-line education and virtual internships as an opportunity to close the gap in education and aid in better transition into the new healthcare culture, professional expectations and social culture.

#### Target Audience

The target audience of this presentation is for foreign born health care nursing professionals that have either decided or have migrated to the United States to work within the health care system.

#### Abstract

The global nursing professional migration: addressing the issue of communication and transition through utilization of on-line education and virtual internships

Each year many nurses migrate to the United States for better working conditions, career changes, enhanced development, a better life, safety for themselves or family, or sometimes just to experience something new. Research has shown that migrating healthcare professionals face many obstacles during the transition process to the new culture and healthcare system. Some of those obstacles include: lack of understanding of United States Health Care System, lack of education about appropriate communication techniques, and lack of support from the sponsoring corporation during the transition period into a new and unfamiliar setting. Many nurses and their families have high levels of stress and disappointment when experiencing cultural shock from the immersion into a new culture. Those obstacles, on many occasions, prohibit new nurses from becoming successful as healthcare professionals within United States healthcare system. Many of them return to their country of origin or decide to change their career and remain within the USA border. Corporations and healthcare systems then are faced with all the migration costs, training and still are faced with a nursing shortage. This seminar will present the option of on-line education and virtual internships as an opportunity to close the gap in education and aid in better transition into the new healthcare culture, professional expectations and social culture. By closing the gap and supporting migrating nurses through providing them with the needed education, professional development and support we will make the process of transition and cultural shock less overwhelming, thus, raising the chances of keeping the, much needed, nursing work force within the USA borders.

## LDR PST 1 - Leadership Poster Session 1

### Innovation in Action: How to Design a New Graduate Float Pool

---

*Kristen Jean Brown, MSN, BSN, BA, RN, CPN, USA*

#### Purpose

To share the progress, successes and lessons learned of an innovative hiring strategy that utilizes new graduate nurses in a way they have rarely been used in the past – in a float pool designed strictly for newly licensed RNs.

#### Target Audience

Nurse Managers and administration that are struggling to meet strict and ever changing staffing requirements with cost effective and out of the box strategies. New nurses in the float pool are a resource now as well in the future as permanent openings become available with seamless transitions on to units.

#### Abstract

Introduction: Nurse staffing is a challenge. Float pools have been used effectively to staff units with hospital employees. Experienced nurses have almost solely made up the float pool workforce until now.

Purpose/Objects: To improve staffing resources through the implementation of a New Graduate Nurse Float Pool (NGNFP) and provide new grads a means of employment in a competitive market predominately hiring experienced nurses.

Methods: Implemented in 2013, nurses apply to the NGNFP and interview with nurse managers and the Residency Coordinator. They are oriented to the six adult units they will be working. They spend four weeks on a medical/surgical unit and one week on each of the remaining units for a total of 12 weeks in addition to participating in a yearlong RN Residency program.

Results: Of the original six NGNFP nurses, three have taken permanent positions and three remain in the float pool. An additional 19 nurses have been hired into the float pool and an Assistant Clinical Manager has been added to focus on its daily operations. Twenty more nurses will be hired in first quarter, 2015.

Discussion: As a result of the NGNFP, on-boarding and orientation to the units has been enhanced by developing unit specific orientation binders, mentoring by NGNFP nurses, streamlined reporting processes and regular NGNFP staff meetings with the off-shift supervisor.

Implications for Practice: The NGNFP has the potential to change how nurses are hired and is a win-win for the organization and nurse. To further evaluate the NGNFP nurse's satisfaction, stress, organization/prioritization, communication and support, the Casey-Fink survey is being implemented.

# LDR PST 1 - Leadership Poster Session 1

## Bringing the Theory of Leadership and Research into Practice

---

*Shannon Lanctot-Shah, DHS, MSN, BSN, RN, Canada*  
*Susan P. Hackett, MN, BSN, RN, Canada*

### Purpose

The purpose of this presentation is to share the integration of theory and practice by showcasing a semester of student work in a Nursing Student Leadership Conference. A variety of learning opportunities provide students with the means to meet the competencies of nursing leadership and research at the BSN level

### Target Audience

The target audience of this presentation is primarily nurse educators. The teaching and learning methods and integration of education and practice across the continuum of nursing interests will be applicable to all members of the healthcare team and advocates for community development in rural communities.

### Abstract

Leadership is a complex, multifaceted phenomenon that has been defined in numerous ways (Grossman and Valiga, 2013). Students graduating with a BSN are required to step into leadership roles in health care systems that are complex, fast paced and stretched for resources. In order to prepare students to step onto these leadership roles they need to develop competencies in nursing leadership and nursing research.

Senior nursing students in a small rural college in southern British Columbia (Canada) engage in a semester of theory and practice to further develop their competencies in the areas of leadership, influencing and managing change, and the utilization of research for the purpose of promoting the health of individuals, families, communities and society, within the context of the Canadian health care system. The nursing practice experience focuses on participants' growth in their practice as professional nurses. They have opportunities to explore interprofessional practice and nursing leadership in the context of emerging Canadian and global health issues and trends.

These practice experiences provides nursing students with opportunities to explore concepts studied in their theory courses, such as influence, power, change, health policy strategies, funding and resources allocation, and citizen participation, scholarship and research. Students have an opportunity to engage in change on a specific health or nursing practice issue in a wide variety of nursing practice settings.

Participants learn about professional nursing practice, critical thinking, and critical reflection. Practice experiences are supported by seminars, which provide opportunities to examine theories and concepts for discussion, exploration, and integration. Praxis involves the examination of the dynamic interplay between theory and practice. Praxis is actualized by critical reflection, journaling, and active participation in nursing practice seminars.

## LDR PST 1 - Leadership Poster Session 1

### Forensic Psychiatric Nursing: Promoting Collaboration between Psychiatric Mental Health Nursing and Forensic Psychiatry

---

*Liberty Olive Macias, MSN, RN-BC, CFN, USA*

#### Purpose

The purpose of this presentation is to share with clinical and administrator attendees an initiative that can promote and strengthen the collaborative relationship between forensic psychiatrists, psychologists, and psychiatric mental health nurses.

#### Target Audience

The target audience of this presentation includes clinicians, administrators, nurse practitioners and nurses in the forensic mental health setting.

#### Abstract

Literature has substantiated that lack of collaboration in the health care system compromises quality of care that results in increased human and financial losses. Conversely, a collaborative partnership among health care providers improves communication, delineates roles, enhances professional competence, and improves overall delivery of quality care.

Interprofessional collaboration is an essential practice element in the forensic psychiatric mental health field. There is an increasing number of nurses employed in the forensic setting, working with psychiatrists, physicians, psychologists, social workers, and rehabilitation therapists. Forensic nursing texts describe the role of nurses working in prisons, jails, and forensic psychiatric hospitals as specialized practice due to the use and application of clinical nursing skills to patients who have had interactions with the legal system. The International Association of Forensic Nurses (IAFN) and the American Nurses Association (ANA) have published the scope and standards of forensic nursing practice and yet nurses are underutilized resources in terms of what the scope of practice entails.

This presentation will introduce an initiative to promote collaboration among psychiatrists, other clinicians, and nurses in the forensic psychiatric field based on the Institute of Medicine's recommendations. The proposal for quality improvement will expand nurses' role through training and education and provide opportunities for nurses and psychiatric mental health nurse practitioners to expand their professional roles. The presentation will endorse the utilization of advanced practice nurses in the psychiatric mental health field to become key players in the practice of forensic psychiatry.

## LDR PST 1 - Leadership Poster Session 1

### Nurses' Faith and Its Impact on the Provision of the Spiritual Component of Holistic Care to Patients in Oncology

---

*Sarah M. Miller, EdD, MSN, RN, USA*

#### Purpose

The purpose of this presentation is to understand how does faith play a role in nursing care that is provided to patients in oncology? How does nurses' awareness of their personal faith play a role in their ability to provide the spiritual component of holistic care to patients in oncology?

#### Target Audience

The target audience of this poster is nurses who work in the oncology specialty, nursing leaders, or nursing educators specifically those who believe the spiritual component of holistic care is vital to address for each patient.

#### Abstract

This poster presentation will include data from a research study conducted as part of doctoral work. Ten registered nurses who have worked in oncology and have attended MidAmerica Nazarene University in Olathe, KS, and who have attended the post-licensure programs (RN-BSN or MSN) were interviewed regarding their personal faith and how they provide spiritual care to patients. The majority of the research participants have indicated there is a need for spiritual care in oncology and that in order to provide this component of holistic care, nurses must have faith. These nurses also shared the need for spiritual care specifically in the oncology setting, as patients in oncology often need spiritual care throughout their diagnosis and treatment. The information gathered from this study will be used to inform nursing leaders and educators of the need to incorporate faith-based information into nursing curriculum and continuing education offerings. There is no direct benefit to the participants in this study.

Nurses' faith and its impact on the ability to provide the spiritual component of holistic care is important for each and every one of us! Whether we are nurse educators, nurse leaders, or nurses working within healthcare facilities, we must address the topic of our faith and how it impacts the spiritual care we provide to our patients. Furthermore, as nurse educators and leaders, how do we address these topics with our students and staff? Come and dialogue with me as we work to understand the topic of faith in nursing and how it impacts spiritual care.

### Nurse Executives and Leaders: A Customized Advanced Nursing Leader Model for Professional Development

---

*Roberta P. Pawlak, PhD, RN, NEA-BC, USA*

*Barb Pinekenstein, DNP, MSN, BSN, RN-BC, CPHIMS, USA*

#### Purpose

The purpose of this presentation is to outline an organizing framework for a customized professional development model for nurse leaders, acknowledging various standards and experience levels.

#### Target Audience

The target audience of this presentation includes emerging and seasoned nurse leaders (including executives), as well as academic faculty in graduate nursing programs.

#### Abstract

Nurse Executives and Leaders: A customized advanced nursing leader model for professional development

Development of nurse leaders requires an organizing framework that integrates standards from professional nursing organizations (AONE, CGEAN, ANA), and broader systems organizations (AHA). Formal education for nurse leaders has been guided by the organizing framework of AACN Essentials for Master's and Doctoral Education for Advanced Nursing Practice within the indirect care role. However, strategizing professional and mentored experiences for the emerging and seasoned nurse leader has been a challenge. Customization is crucial, as individuals present different needs at varying points in one's career. This presentation introduces a model for integrating professional leadership standards and competencies as advanced career planning in nursing leadership is explored. The model includes a gap analysis and development of a strategic leadership plan that links to a customized vision of future advanced leadership goals. This model promotes transformational leadership outcomes supportive of next stage career growth.

One case example will outline a former Chief Nursing Officer's further development in regional community organizations serving at-risk populations, State and National Workforce Centers, grant writing and leadership and Health Information Management consulting. A model and tools for identifying a customized foundation, professional development and mentored experiences will be introduced.

## LDR PST 1 - Leadership Poster Session 1

### Leading in Education, Practice and Research: DNP and PhD Teams

---

*Elizabeth A. Carlson, PhD, RN, USA*

#### Purpose

to discuss and give examples of the benefits of having teams of nurses prepared at the DNP and PhD levels working together to improve education, practice and research.

#### Target Audience

educators, administrators, practitioners, researchers and those interested in doctoral education for nurses.

#### Abstract

It is incumbent on educators to create synergy and collaboration among the Doctor of Nursing Practice (DNP) and PhD scholars. Collaboration among doctoral-prepared nurses is important because of the: 1) rapid growth of DNP programs and graduates, 2) ability for shared resources, and 3) opportunities for research and scholarship. Furthermore, the rapidly evolving healthcare environment requires strong leaders that can collaborate to drive changes to improve quality, access, costs, and address the needs of the public. However, at this point collaborative efforts are in an infancy stage with few reportable outcomes cited in the literature. In accordance with the Institute of Medicine recommendations and essentials put forth by the American Association of Colleges of Nursing, collaborative relationships between DNP and PhD-prepared nurses are developing. Therefore, a comprehensive review of challenges and benefits of collaborative efforts may influence strategies to promote mutual goal setting and scholarship. Importantly, collaboration offers a synergistic approach for knowledge generation and transformation to clinical practice.

One area to promote doctoral collaboration is through education. Doctoral curricula are reformulating to facilitate intraprofessional education and practice by offering DNP and PhD combined courses. Such opportunities can strengthen partnerships among students that will transcend into practice, research, and scholarly endeavors. Given the expansion of doctoral programs, both DNP and PhD-prepared graduates need to collaborate to meet the needs of the public, especially since the enactment of the Affordable Care Act. Offering combined courses for DNP and PhD students provides students opportunities to learn from one another and gain insight into varying perspectives. This can also be a benefit for the educational organization as it reduces overhead cost by eliminating redundancy and maximizing faculty expertise. Using the divergent perspectives and frameworks of DNP and PhD prepared nurses, along with their respective skills and expertise provides opportunities and resources to advance clinical and translational research. For example, DNP and PhD prepared nurses collaborated on an initiative to improve the cardiovascular health of underserved populations among older adults in the community. This combined effort resulted in an improvement in clinical outcomes and scholarly dissemination which serves as a positive example of DNP-PhD collaborative efforts. Collaboration at all levels is the hallmark for nursing to lead diverse teams, promote synergy, and redesign complex systems to improve patient outcomes.

# LDR PST 1 - Leadership Poster Session 1

## From Patient Advocacy to Political Advocacy

---

*Dale M. Mueller, EdD, MSN, MS, RN, USA*

### Purpose

disseminate findings from a multi-stage study of political astuteness of BSN students on how nurses can participate more fully as advocates beyond the clinical relationships in the workplace to benefit the profession, current and future patients, communities and the nation as a whole.

### Target Audience

all nurses in whatever role they fulfill in the spectrum of health care services.

### Abstract

Nurses identify themselves as patient advocates, but fewer nurses identify themselves as political advocates. Using the Political Astuteness Inventory (PAI) in a health policy course across three years, pre and post scores were gathered to identify students' basic understanding of political astuteness, how their understanding may have changed by the end of the course and how skill development in the political arena increased by introducing "hands-on" advocacy activities within the course. A total of 436 nurses have participated with 78% between 20 and 39 years of age, 58% having practiced <5 years, and 84% registered to vote. Only 49% were aware of health care issues at the state or national level, only 21% knew who to contact among elected officials regarding input on local, state or national issues and only 4% knew on which committees their elected federal officials were serving. While student awareness did increase in post-course scores, the voting age in the USA is 18 and most voters do not take an additional course at the university level to become aware of national issues concerning issues of interest to them. Improvements to the course curriculum were made in year #2 and post-course scores do show an even greater level of awareness once these course changes were made. A concern remains that not all nurses who vote are able to enrich their knowledge through a senior level health policy course, so building awareness among all nurses regardless of academic preparation or area of service about potential positive impacts in the policy arena continues to be an area ripe for professional growth.

## LDR PST 1 - Leadership Poster Session 1

### Scaling Up Nurse Education: An Evaluation of a National PhD Capacity Development Programme in South Africa

---

*Judith C. Bruce, PhD, RN, RM, South Africa*  
*F. Mavis Mulaudzi, DLittetPhil, RN, RM, South Africa*  
*Catherine Comiskey, PhD, Ireland*  
*Anne Matthews, PhD, RN, RM, Ireland*  
*Charmaine Williamson, PhD, South Africa*  
*Hester C. Klopper, PhD, RN, RM, South Africa*

#### Purpose

The purpose of the presentation is to consider the outcomes of a study that evaluated a national PhD capacity development programme in South Africa to scale up nurse education in the context its National Strategic Plan for Nurse Education and Training 2013-2017.

#### Target Audience

The target audience for this presentation is nurse educators and nurse leaders, PhD scholars, administrators, philanthropists

#### Abstract

**Background:** The global shortage of nursing professionals educated at baccalaureate level and beyond has been highlighted and the impact of this shortage is apparent in each continent. The consequence of this is a substantial shortfall in nurses with postgraduate research degrees to meet the demands of academia, advanced nursing roles and knowledge generation. Within South Africa nursing education outputs do not meet demands, reflecting the global statistic of less than 1% of nurses having a doctoral degree. A national PhD capacity development programme was introduced to scale up nurse education and to address these nursing shortages.

**Objective:** To evaluate a national PhD programme within the context of a nurse education strategy and a national health insurance plan in South Africa.

**Design:** A comparative effectiveness research (CER) design was employed.

**Setting:** The setting was in South Africa between 2012 and 2014, a country with 51.7 million inhabitants and approximately 130,000 registered nurses.

**Participants:** Participants included three cohorts of PhD candidates, programme facilitators, supervisors and key stakeholders.

**Methods:** Data from a one day consultative workshop were analysed using an inductive thematic analysis. Data from evaluation reports, compiled over a three year period, were analysed using descriptive statistics. A mapping of the alignment of the PhD topics with healthcare priorities, and a comparison of the development of nurse education, of the national and international funder were conducted.

**Results:** The evaluation reports rated the programme highly. Three themes were identified from the workshop. These were, "support" with the sub-themes of burden, leveraging and a physical supportive place; "planning" with the sub-themes of the national context and practice, and "quality" with the sub-themes of processes and monitoring and evaluation. The mapping of PhD topics revealed that research was in line with development priorities. However, further investment and infrastructural changes were necessary to sustain the programme and its impact.

Conclusions: To address sustainability and capacity in nations scaling up nurse education and healthcare insurance, it was recommended that top-up degrees for diploma educated nurses be developed along with, the implementation of a national nursing strategy for PhD and post-doctoral training encompassing clinical practice implementation and collaboration.

## LDR PST 1 - Leadership Poster Session 1

### Promoting Interprofessional Collaboration, Global Health Awareness and Leadership Skills through International Service-Learning

---

*Janice E. Hawkins, MSN, BSN, RN, USA*

*Christine A. Sump, MSN, BSN, RN, CNE, USA*

#### Purpose

The purpose of this presentation is to provide nurse educators with the tools to build a multidisciplinary study abroad global health course that fosters interprofessional collaboration and leadership skills in health science students while promoting global health awareness.

#### Target Audience

The target audience of this presentation is nurse educators and program directors interested in developing study abroad programs that cultivate interprofessional competencies and global health awareness.

#### Abstract

International service-learning programs offer a unique opportunity to incorporate interprofessional education and global health awareness into health science curriculums. Through service activities, students develop leadership skills and collaborative team approaches to promote the health of diverse populations. Appreciation, respect, integration of knowledge, and communication between multiple disciplines are crucial components of international health care teams and desired outcomes for health science students. Graduates of health science programs must have the knowledge, skills, attitudes, and values that prepare them to be “collaborative practice-ready” for the healthcare workforce. According to the Interprofessional Education Collaborative (IPEC), interprofessional service-learning experiences and global health knowledge prepares students for collaborative practice environments and population focused health promotion. Since effective global health initiatives rely on partnerships and the collaboration of diverse healthcare team members, it is prudent to implement a multidisciplinary approach to global health education and international service-learning experiences.

International service learning programs increase awareness of disparities in healthcare and prepare providers to improve the health of vulnerable populations both at home and abroad. Successful study abroad programs require thoughtful preparation and planning to ensure best practices in service-learning, maximize attainment of program outcomes, and minimize potential risks to students and international partners. Development of a global health study abroad service-learning course for health science students requires careful consideration of interprofessional competencies, learning activities, and evaluative criteria that are relevant to all majors. In addition to formulating appropriate didactic content, course developers must overcome logistical obstacles of multiple schedules and multiple levels of students. Universal topics such as cultural sensitivity, health disparities, ethics, values, communication, and teamwork can all be incorporated into the course framework.

Nurse educators will leave the presentation with the tools to build an international study abroad program that incorporates interprofessional competencies, global health awareness and leadership promotion into didactic content, cultural immersion experiences, and service learning projects. Nursing faculty will share their perspectives on overcoming the challenges of developing a single program for multiple disciplines at both the undergraduate and graduate level. The faculty will provide a blueprint of an international service-learning study abroad program designed to meet core competencies of nursing, dental hygiene, physical therapy and community health students. Tips for multidisciplinary integration in course development, including assessing and encouraging faculty buy-in, will be built into the presentation.

# LDR PST 1 - Leadership Poster Session 1

## Outcomes of Participation in a Nurse Externship Program

---

*Lourdes Maria Casao, PhD, RN-BC, FNP, USA*

### Purpose

The purpose of this presentation is to provide evidence resulting from a recent research study and published dissertation along with guidelines in the development and implementation of a sustainable pre-licensure student nurse externship program.

### Target Audience

The target audience of this presentation include professional developers responsible for building and sustaining a strong RN workforce pipeline, nursing faculty, and nurse leaders.

### Abstract

**Introduction.** Nurse externship programs were initially developed by healthcare institutions as a recruitment tool for new nurses. Literature has demonstrated the positive outcomes of the program on the participants and healthcare institutions but during times of economic difficulties, health care institutions discontinue the program. A literature review revealed the studies that demonstrate the value of the program are limited to the recruitment phase and the 2-year retention of the newly graduated nurses. A recent research study demonstrated the long-term outcomes of the program relative to RN retention over 5 years and adherence to quality indicators. More importantly the research found a negative correlation between participation in a nurse externship program and extension of unit based orientation. The average number of hours of extension was also identified thereby leading to the development of a return on investment formula for the program.

**Purpose.** The purpose of this learning activity is to present the results of the recent study along with practical ways to utilize the findings in developing, implementing, sustaining, evaluating the outcomes and improving nurse externship programs.

### **Outline.**

1. The research study presentation
  - a. Background
  - b. Research questions
  - c. Research aims
  - d. Study methodology
  - e. Findings
  - f. Practical use of the findings
2. How to establish a nurse externship program presentation
  - a. Identify and getting the buy in of key stake holders
    - i. Healthcare institutions
      1. Leaders
      2. Preceptors
      3. Patients
    - ii. Academic institutions
      1. Faculty
      2. Nursing students
    - iii. Community
  - b. Collaboration between healthcare institutions and academic institutions
  - c. How to choose your nurse externs
  - d. Implementation
  - e. Monitoring the success of the participants
  - f. Tips for success
3. Discussion on how to measure the outcomes of an externship program

#### 4. Conclusion

**Conclusion.** The findings of the research study can be utilized in developing, implementing, sustaining, evaluating, and improving programs designed to assist newly graduate nurses transition into their roles as a licensed, professional nurse. Programs that may benefit from these findings include both pre and post-licensure internship programs such as residency programs.

### Policy and Practice: Rapid Health Impact Assessment (HIA) as a Leadership Tool

*Roberta P. Pawlak, PhD, RN, NEA-BC, USA*

*Barb Pinekenstein, DNP, MSN, BSN, RN-BC, CPHIMS, USA*

#### Purpose

The purpose of this presentation is to demonstrate the application of a Rapid Health Assessment (HIA) to a proposed policy and model of care change at the State level.

#### Target Audience

The target audience of this presentation includes community and public health nurse leaders, and nurses involved in public policy.

#### Abstract

DNP students at the Henry Predolin School of Nursing completed a Rapid Health Impact Assessment (HIA) on a proposed policy and model of care change for the Wisconsin Well Woman Program as part of the Population Health and Public Policy class. The results and recommendations were disseminated to key stakeholders to inform and impact policy decisions and mitigate unintended consequences of proposed policy changes. A rapid Health Impact Assessment (HIA) uses structured data, stakeholder feedback, professional expertise, and analytic methods to analyze complex effects of policy, practice, and programs on health. Use of HIA's been increasing in the public health sector. This tool provides a comprehensive and systematic approach to the analysis of complex health data sets to drive informed policy and practice decisions. The HIA process was applied to a current state policy decision resulting in active learning and recommendations for policy, practice, and program configuration. The use of a rapid HIA links to the Doctor of Nursing Practice (DNP) Essentials, and is an effective leadership tool used to support decision making and policy. The HIA provides a comprehensive and systematic approach to the assessment of health and illness parameters. It is an effective tool to evaluate the impact of decisions on health and wellness.

### Collaborative Practice Revisited: Compassion as the Missing Antecedent

---

*Kathryn A. Pfaff, PhD, MSc, BScN, RN, Canada*

*Ada Markaki, PhD, APRN-BC, Greece*

*Jean Echlin, MSc, BSN, RN, Canada*

*Lisa A. Hamilton, Canada*

#### Purpose

To revisit collaborative practice within a compassionate care focus. It will define a new concept, 'compassionate collaborative practice', present a revised practice model, and introduce strategies to promote and engage care partners in compassionate collaborative practice.

#### Target Audience

All nurses (those involved in clinical practice, leadership, education and research) who have an interest in understanding and promoting compassionate collaborative practice

#### Abstract

Interprofessional collaboration or collaborative practice is an evidence-based practice model that can improve health outcomes in and across all care sectors and settings. It is linked with increased access to care, improvements in chronic disease management, patient safety and healthy workplaces (Canadian Interprofessional Health Collaborative, 2009; World Health Organization, 2010). Although numerous policy statements promote interprofessional collaboration, and organizations attempt to integrate its concepts, it remains elusive in many health care institutions. One of the few exceptions is demonstrated in hospice and palliative care, a setting in which collaborative practice thrives. This presentation will argue an important missing antecedent in operationalizing collaborative practice - This is compassion.

Compassion is the heart of hospice and palliative care, and key to its success in achieving the benefits associated with interprofessional collaboration. In this setting, health care providers come together to advocate, and provide supportive care for the whole person and his or her family. The presentation will revisit collaborative practice within a hospice-driven focus on compassionate care. It will define a new concept, 'compassionate collaborative practice', present a revised practice model, and introduce strategies to promote and engage care partners in compassionate collaborative practice.

### Implementing a Capstone Course as a Means for Assessing Program Outcomes

---

*Nancy C. Falvo, PhD, MSN, BSN, RN, USA*  
*Laurie Bladen, PhD, MBA/HCM, RN, USA*

#### Purpose

to present initial findings on the assessment of program outcomes through a capstone research course. During this course, students in an online RN BSN program carry out research projects designed the previous semester. In addition, students assess the outcomes of the RN BSN program through reflection journal assignments.

#### Target Audience

The target audience for this presentation include educators, researchers, and other interested participants

#### Abstract

The purpose of this presentation is to describe the capstone course of an online RN BSN program. The capstone should provide a culminating experience requiring students to use the knowledge and skills learned throughout the program. Prior to the current curriculum, students developed hypothetical research proposal without data collection or analysis. The curriculum lacked a method for translating evidence into practical knowledge for our students. Moving to an evidence-based model for nursing education, an undergraduate research project is now required as part of the capstone course. Research studies are designed in the previous semester and evolve from the strategic plan priorities of the National Institute of Nursing Research (NINR). Working in small groups, students receive IRB approval; complete their studies, and present finding to an online forum of students and faculty. The goal of this curriculum innovation is to create learning opportunities in research, which builds students' professional knowledge and skills so that BSN nurses will practice nursing research competently in a changing health environment. This curriculum innovation contributes to the health and quality of life of the clients served by BSN students.

The capstone course also serves as a means of assessing the RN BSN program outcomes. Through the use of reflection journals, students assess the outcomes of the RN to BSN program. Reflection journals encourages the student to consider their learning experiences for the curricular threads and comment on what they learned, how they learned it, and how they can apply the knowledge in their current position. At the same time, students reflect on their discoveries and growth as a BSN nurse, which helps the students to identify successful principles to use again. Participants will learn about the teaching strategies to assist students in performing a pilot study. Participants will also learn creative solutions to assist students in reflecting upon what they have learned in the BSN program as well as how to use this knowledge in their future practice.

### Doctoral Education in Nursing: A Polish Perspective

---

*Lena Serafin, MSN, BSN, RN, Poland*  
*Anna Doboszynska, MD, PhD, MD, Poland*  
*Ewa Kadalska, PhD, MSN, BSN, RN, Poland*

#### Purpose

The purpose of this presentation is showing the Polish doctoral education in nursing.

#### Target Audience

The target audience of this presentation are nurses who are interested in educational system in other countries.

#### Abstract

Background: Becoming a registered nurse in Poland requires a completing of a three-year bachelor's degree. Afterwards nurses have an opportunity to continue their education at master's degree level or start a two-year clinical nurse specialist course. Doctoral education can be attended by nurses who have successfully completed their master's degree. The main law which regulates nursing practice in Poland is an act from 15<sup>th</sup> July 2011. According to this document Polish registered nurses are obligated to continuously develop their skills and competences. This is the reason why so many nurses improve their skills by attending a postgraduate courses (around 7,5% of them have obtained a title of specialist at some clinical field) (Main Chamber of Nurses and Midwifery, 2012).

Discussion: First Polish nurses obtained they doctoral degrees in early 80s. The dissertations focused mainly on human sciences, natural sciences or medical sciences, nevertheless it were not focused strictly on nursing, as it was not recognized as a field of science back then. According to Polish Nursing Association, since 2006; 51 polish nurses became doctoral of science.. Gaworska-Krzemińska (2009), head of Nursing Management Department of Medical University of Gdańsk, claims that only 0,5-1% nurses, who graduated a master's degree, continued their education at doctoral level. Today, in the Polish education system there are still no doctoral studies specifically in nursing - it is not possible to obtain a doctor of nursing science degree. Currently majority of nurses start studies at faculty of health sciences and they obtain a doctor of health science title. Each faculty which conducts a doctoral education is obligated to create their own curriculum.

The course of doctoral studies is regulated by Directive of Minister of Science and Higher Education from 24<sup>th</sup> October 2014 regarding the doctoral studies and doctoral scholarship. This act defines organizational aspects of courses and duties of directors of the studies. For example, according to the Faculty of Health Sciences (The Medical University of Warsaw) doctoral education program, the curriculum takes four years and contains 1205 study hours. The most part (360 hours) of the degree is focused on teaching skills. Doctoral candidate has to conduct classes with students. Then, 326 hour is a self study – mainly to prepare for the classes. Furthermore, students have to complete the following courses: biostatistics, history of medicine, bioethics, psychosomatic medicine and humanistic basics of medicine. There are two options of studying: paid and free of charge. The first one is chosen definitely more often than the second. Furthermore if doctoral candidate completes a program of study on time (verified once a year), during four years of education he receives a monthly scholarship. Additionally, students have an opportunity to receive money from external facilities.

Conclusions: For many years Polish nurses have been putting their efforts into being able to obtain a doctoral degree specifically in nursing science. The opportunity of education at doctoral level has shown new perspectives for Polish nurses They can willingly improve their skills. Scientific work is an important aspect of developing nursing profession in Poland as it helps to progress evidence-based practice what is essential for improving the quality of care.

### How Nurses and Engineers May Contribute to Improved Global Nutrition

---

*Daniel Oerther, PhD, PE, BCEE, USA*

*Sarah E. Oerther, MSN, MEd, BSN, RN, USA*

#### Purpose

The purpose of this presentation is to motivate nurses to take action locally to improve nutrition through their understanding of the global threats to food security and nutrition arising from population growth, environmental constraints, and climate change.

#### Target Audience

The target audience of this presentation is nurses who want to have a positive impact in the nutritional status of their local community through discussion of case studies from local and global examples.

#### Abstract

Despite the efforts of the United States and other nations, more than 800 million people remained food insecure in 2014. Within the United States, more than 50 million people reported food insecurity at some point in 2014, defined as unable to provide adequate food for one or more of its members, due to lack of resources. This presentation will highlight collaborative efforts by the presenters to develop local nutrition interventions based upon evidence-based approaches using a conceptual framework that takes into account global development goals. In particular, the recently completed negotiations that were part of the Second International Conference on Nutrition will be highlighted as well as the recently released, inaugural Global Nutrition Report. Important partnerships with awareness raising advocacy campaigns such as the 1,000 Days Partnership as well as the value of country-led plans that are part of the Scaling Up Nutrition Network will be described. With case studies of local community gardens, international school lunch programs, and global, intergovernmental negotiations, this presentation will provide a framework for nurses to engage their local communities with evidence based practice to improve nutrition through effective interventions.

## LDR PST 1 - Leadership Poster Session 1

### Workforce Planning: Developing and Maintaining for National Health Security

---

*Konstance I. Cook-Withers, PhD (Hon), MSN-ED (Informatics), PHN, USA*

#### Purpose

The purpose of this presentation is to provide and sustain a tiered, scalable system approach with an "All Hazards Scalable Medical Surge Model" reducing the response time to reach capacity and capability during the threat of Mass Casualty Incidents.

#### Target Audience

The target audience of this presentation is geared towards transformational nursing leaders, health providers, administrators, emergency planners, and specialist who collaborate together in building a sustainable workforce for daily surge activities and for national health security.

#### Abstract

**Background:** Hospitals day to day staffing needs are tremendously compromised in the care of patients compounded by a disaster. An All Hazards Scalable Medical Surge Model provides a competent skilled workforce in a timely manner to survive a medical surge at the federal, state, and local capacity and capability for National Health Security.

**Objective:** To provide an innovative approach to reduce the time necessary to activate designated medical personnel in response to a public health emergency meeting surge capacity and capability.

**PICOT Question:** For the patient population and mass influx of disaster related patients, does an All Hazards Scalable Medical Surge Model compared to day to day practice provide the appropriate and timely clinical level of care; reducing the risk of morbidity and mortality in response to a catastrophic incident?

**Implementation Process:** A comprehensive literature review was conducted of databases: Medline, CINAHL, PubMed, using key words "disasters, preparedness, response, medical surge". A thorough review of real world examples, after action reports, training of tabletop, functional, full scale exercises, and the use of the All Hazards Scalable Medical Surge Model was examined.

**Result:** Progress has been made although Ready or Not Scores provided by Trust for America's Health and the Robert Wood Johnson Foundation, CDC, and WHO continue to fluctuate.

**Implications:** The Healthcare workforce must be able to scale up to surge capacity and capability for all hazards and conditions requiring a medical surge.

**Recommendations/Conclusions:** Additional research and emergency preparedness is needed to contribute to a community's resilience by incorporating an All Hazards Scalable Medical Surge Model.

## LDR PST 1 - Leadership Poster Session 1

### Evaluation of a Psychoeducation Practitioner Training Program (PPTP): A One-Group, Pre-Test/Post-Test Study

---

*M. Matsuda, PhD, RN, Japan*

*A. Kono, PhD, RN, Japan*

#### Purpose

The objective of this study was to evaluate the usefulness of a psychoeducation practitioner training program (PPTP) with regard to nursing competency (Defloor et al., 2006) with the exclusion of skill.

#### Target Audience

The target audience for this study is psychiatric nurses and psychiatric nursing researchers. „«

#### Abstract

**Background:** In Japan, mental health care is currently undergoing a transformation, in accordance with new government policies under the slogan: “from inpatient to community health care”. Nevertheless, the mean period of hospitalization is longer and the number of beds for psychiatric patients in Japan is greater than in other countries, and symptoms recur and lead to readmission in many patients. Recurrence of mental diseases is likely to be prevented by improvement of medication adherence on the part of psychiatric patients (Kissling, 1991). Xia, Merinder, and Belgamwar (2011) reported in a literature review related to randomized controlled trials focusing on psychoeducation for patients with schizophrenia that psychoeducation reduced relapse, readmission, and encouraged medication adherence.

In Japan, mental health care institutions have paid attention to psychoeducation as psychosocial treatment. However, in Japan, only approximately 30% of psychiatric care facilities have adopted psychoeducation so far. Consequently, we considered that it was extremely important to evaluate a training program of psychoeducational practice developed by Matsuda and Kono (2013).

**Objective:** The objective of this study was to evaluate the usefulness of a psychoeducation practitioner training program (PPTP) with regard to nursing competency (Defloor et al., 2006) with the exclusion of skill.

**Methods:** Research design was applied to a one-group, pre-test/post-test study. The participants were recruited from among nurses working in all psychiatric hospitals in A Prefecture, Japan. The PPTP was developed based on the survey results, literature associated with psychoeducation, and the principles of NPE developed by Matsuda (2008). The program was conducted over two consecutive days. A questionnaire survey consisted of their Characteristics, the Knowledge of Illness and Drugs Inventory (KIDI; Maeda, Mukasa, & Ogoh, 1992), the General Self-Efficacy Scale (GSES; Sakano, 1986), the Japanese Version of the Evidence-Based Practice Attitude Scale (EBPAS-J; Okumura, Fujita, Noda, & Ito, 2010), the Work Motivation Measurement Scale for Nurses (WMMSN; Sano & Yamaguchi, 2005) and Nurses' perception of psychoeducation practice. Statistical differences were detected by non-parametric Wilcoxon rank sum test. Prior to its commencement, this study was approved by the Institutional Review Board.

**Results:** Forty nurses participated in the PPTP, of whom 38 (17 men and 21 women) completed a two consecutive days curriculum (dropout rate: 5 %). The mean KIDI total score after intervention was significantly higher than that before intervention ( $Z(38) = 2.094, p < .05$ ). Furthermore, between pre and post intervention, the 'knowledge of drugs' subscale score had a significant difference ( $Z = 3.902, p < .05$ ), but the 'knowledge of illness' subscale score had no significant difference. The total GSES scores showed no significant differences between pre and post the intervention, whereas there was significant difference in the 'social positioning of one's ability' subscale score. The EBPAS total scores and the 'openness' ( $Z = 3.295, p < .001$ ), 'appeal' ( $Z = 3.080, p < .05$ ) and 'requirements' ( $Z = 1.981, p < .05$ ) of its

subscale scores after intervention were significantly higher than those before intervention, but the 'divergence' subscale showed no significant change.

On the other hand, the WMMSN fell short of statistical significance ( $p=n.s$ ). Nurses' perception of psychoeducation questionnaire scores showed significant differences in the 'I have an understanding of psychoeducation' ( $Z=5.245$ ,  $p<.001$ ) and 'Psychoeducation should be provided by other professions' items score ( $Z=2.707$ ,  $p<.05$ ). However, the other items' score showed no significant change.

**Discussion:** The PPTP was considered to help participants develop an extensive knowledge of psychoeducation in a short period of time. The 'social positioning of one's ability' subscale score of the GSES indicated a statistically-significant difference. If the nurses who participated in the PPTP have a successful experience of conducting psychoeducation, this may improve their self-efficacy.

Especially, improving subscales of the EBPAS showed that the PPTP provided not only satisfaction with the contents of the program but also interest in psychoeducation for the participants.

The PPTP was not able to directly support the acquisition of particular skills of psychoeducation for psychiatric nurses; however, the result of this study indicated that the program generally improved those nursing competencies required to provide psychoeducation. Thus, in a future study, it will be necessary to consider the methodology of the program to reinforce these skills.

## LDR PST 1 - Leadership Poster Session 1

### From MDG's to SDG's: Nursing's Role in Development through 2030

---

*Daniel Oerther, PhD, PE, BCEE, USA*

#### Purpose

The purpose of this presentation is to share outcomes of the United Nations negotiations on the Sustainable Development Goals and to highlight the role that nursing will play in development through 2030.

#### Target Audience

The target audience of this presentation is nurses without borders including nurse leaders, nurse educators, and nurse practitioners who want to use an understanding of global development to motivate their local influence.

#### Abstract

From 2000 through 2015, the Millennium Development Goals (MDGs) have served as time bound, quantifiable objectives to measure progress towards development. The first seven MDGs focus upon specific areas of action including hunger, education, gender, children, maternal, HIV, and environment; and the eighth goal focused on the importance of global partnerships. Throughout 2015, the world is taking stock in our collective efforts towards achieving these eight goals. In September of 2015, the United Nations will convene a summit to adopt the post-2015 development agenda. Known as the Sustainable Development Goals (SDGs), from 2015 through 2030 a set of up to 17 goals will be considered and finally adopted. Among these new goals, nurses must identify where they can most successfully contribute towards the global development agenda. While the SDGs will be set before the STTI biennium conference convenes, the 2015 meeting of STTI represents the first opportunity for nurses to collectively consider how to integrate into the ongoing development agenda. This presentation will highlight the final form of the SDGs including specific opportunities for nurse leaders, researchers, and practitioners to align their global vision with their local influence. The presenter is uniquely able to offer this opportunity to reflect on the SDGs because of his unique position as a science and technology policy advisor to the Honorable John Kerry, Secretary of State of the United States.

# LDR PST 1 - Leadership Poster Session 1

## Faculty Attitudes toward Interprofessional Education and Teamwork

---

*Jodie C. Gary, PhD, RN, USA*

*Regina Bentley, EdD, MSN, RN, USA*

### Purpose

The purpose of this presentation is to: 1) Describe the development interprofessional education (IPE) at a health science center (HSC). 2) Examine barriers and solutions to IPE within health professions education. 3) Report on a study conducted to evaluate attitudes towards IPE and teamwork among a population of HSC faculty.

### Target Audience

The target audience of this presentation is: •Health professions educators and clinicians to include: nursing, medicine, pharmacy, dentistry, and public health faculty •Those interested in interprofessional education (IPE) and teamwork implementation in a health science center (HSC) setting

### Abstract

The purpose of this presentation is to describe a journey for interprofessional education (IPE) at a health science center (HSC). Barriers for IPE and solutions will be examined. As attitudes of faculty towards IPE and teamwork impacts health professions education students, report on data from a study conducted to evaluate these attitudes will be shared.

Purpose: Needed is the understanding of HSC faculty attitudes toward interprofessional education and teamwork in order to develop targeted faculty development in order to support interprofessional education amongst the health professions.

Problem, Background & Significance: Team-based collaborative care is essential in today's healthcare environment. While healthcare delivery is a team effort and not a collection of individual efforts, most healthcare professionals are educated in silos. Key to facilitating interprofessional collaboration may to provide targeted faculty development for HSC faculty. It is logical that interprofessional training should occur during the education of healthcare professionals, but the attitudes of the faculty responsible for training healthcare professionals be better understood.

Accrediting bodies across the health professions are requiring interprofessional education (IPE) (Zorek & Raehl, 2013) and the core competencies for interprofessional collaborative practice have been developed to guide implementation by the Interprofessional Education Collaborative Expert Panel (ICEP, 2011).

As the attitudes of faculty towards IPE and teamwork impacts health professions education students, the presentation would report on data from a study conducted to evaluate these attitudes. The professions from the HSC perspective include the nursing, medicine, pharmacy, dentistry, and public health.

### Research Questions:

RQ1. What linear combination of independent variables predicts health science center faculty attitudes towards interprofessional learning in the healthcare setting?

RQ2. What linear combination of independent variables predicts health science center faculty attitudes towards interprofessional health care teams?

RQ3. What linear combination of independent variables predicts health science center faculty attitudes towards interprofessional education?

### References

## LDR PST 1 - Leadership Poster Session 1

### The Value of the DNP (Doctorate of Nursing Practice) in Nursing Education

---

*Cari S. Simpson, DNP, MSN, BA, RN, CNE, USA*

*Diane A. Anderson, DNP, MSN, BSN, RN, CNE, USA*

#### Purpose

The purpose of this presentation is to discuss the value of the DNP (Doctorate of Nursing Practice) in nursing education. Many consider the DNP a practice degree and not as present in the education realm.

#### Target Audience

The target audience of this presentation is for faculty, educators and clinical practitioners.

#### Abstract

The Doctorate of Nursing Practice (DNP) is a newer degree endorsed by the American Nurses Association (ANA) in 2004 as the practice doctorate degree. There continues to be confusion as to the benefits of the DNP in academia. The counterpart PhD focuses on research based strategies and is the chosen degree for tenure in university settings. Controversy surrounding “academic rigor” of the DNP presents a barrier for not offering tenure to DNP prepared faculty. Unfortunately, there have been negative viewpoints that ultimately impact the tenure potential for the DNP prepared nurse educator in an academic setting.

Many university settings don't consider the DNP candidate for classroom instruction; however, the rationale for this practice is not clearly defined. It is advantageous for both the PhD and DNP to collaborate in the classroom setting, sharing both clinical and research experiences, which will aid in strengthening the nursing profession overall. This has resulted some conflict with regard to the value of the DNP in the academic setting, and also a lack of support in the evidence that is necessary to demonstrate the credibility of the DNP degree. It is necessary to demonstrate credibility of the DNP degree and to debunk preconceived impressions by doctoral prepared colleagues.

The contributions of the DNP prepared nurse educator cannot be overlooked, regardless of whether they are being considered for research based publications, or for tenure track. Graduates of either a PhD or DNP programs have not specifically prepared for a faculty teaching role, and upon graduation both still require mentoring and preparation in teaching methodologies, program development, and curriculum design.

Exploring the value of the DNP degree in nursing education, and how it compliments other terminal nursing degrees must be explored, and ultimately the best of what each has to offer for the benefit and success of nursing students and the profession of nursing.

## LDR PST 1 - Leadership Poster Session 1

### Academic Integrity: It's More Than Not Cheating

---

*Deborah A. Raines, PhD, EdS, MSN, BSN, RN, ANEF, USA*

#### Purpose

The purpose of this presentation is to discuss the difference between a culture that focuses on promoting academic integrity and one focused on catching cheaters. The implications on learning, behavior and professionalism will be discussed. Specific strategies for initiating a culture change will be shared.

#### Target Audience

The target audience for this presentation is nurse educator and academic administrators.

#### Abstract

The introduction of the internet and web-based resources have made it easier to cheat and easier to get caught. As a result many programs and universities have developed academic integrity policies. However, on closer inspection the focus of many of these policies is to stop cheating (and other academic irregularities), by listing what is considered cheating and the possible punishments. But does today's student know the meaning of academic integrity? Do faculty and educational administrator's role model academic integrity in the teaching/learning environment? Academic integrity is more than not cheating it encompasses values of honesty, trust, fairness, responsibility and respect. As healthcare professionals integrity is foundational to the nurses' role and responsibility. This presentation will explore the significance of changing the culture in our academic institutions to promoting integrity instead of focusing on catching and punishing the cheater. A focus on academic integrity has an impact on learning, behavior and professionalism. Seven strategies to promote academic integrity in your course or program will be shared as well as assessment strategies used in both large and small class settings, clinical education and even online learning environments.

## LDR PST 1 - Leadership Poster Session 1

### Post Doctoral Career Pathway through Collaboration across Continents

---

*Katri Vehviläinen-Julkunen, PhD, RN, RM, Finland*

*Tarja Kvist, Docent, PhD, MSN, RN, Finland*

*Paula R. Sherwood, PhD, MSN, BSN, RN, CNRN, FAAN, USA*

#### Purpose

The purpose of this talk is to give an overview of a systematic project in advancing post-postdoctoral education between Finland, other European countries and USA.

#### Target Audience

The target audience of this presentation is researchers and clinicians as well as leaders in Nursing, interested in career development

#### Abstract

Since the latter part of 20<sup>th</sup> century, doctoral programs began in nursing in different parts of the world. It has been stated that innovative doctoral programs should be connected to units' research programs and must involve international collaboration and multidisciplinary expertise (AACN 2010, Kim et al. 2015). Doctorally prepared nursing experts are crucial to the development of societies and health services as well as to advancement of the discipline of Nursing. Still, the development of post doctoral career pathways is extremely important. Unfortunately, systematic, well-organized post-doctoral training programs have been missing in many countries in Europe, including Finland. This has been noted by many professional organizations such as European Academy of Nursing Science (EANS), Sigma Theta Tau International (STTI) and the International Network for Doctoral Education in Nursing (INDEN). The purpose of this talk is to give an overview of a systematic project in advancing post-postdoctoral education between Finland, other European countries and USA.

In 2013, an urgent need was recognized in Finland to develop a post-doctoral education program by strong collaboration between Finnish and US nursing experts in academia. This program was supported by Finland's over 30-year history in doctoral education in nursing. Doctoral education has been organized in nursing and health sciences since 1979 and the first doctoral degree in the country was awarded in 1984 in Kuopio. Since 1984, a total over 100 students have completed their doctoral degree at the University of Eastern Finland (UEF, Kuopio).

European and Finnish higher education and research strategies called for more systematic researcher's career development after doctoral degree (Research Careers 2010, Report on Mapping Exercise 2011). Our aim was to develop a two-year post-doctoral training program in Nursing Science at the University of Eastern Finland to expand the research skills and have guided experiences related to the research programs of the department. The post doctoral program was designed to be an individualized experience, meaning it takes into consideration the interests, background, and competencies of the fellow and the aims and objectives of the research program. The fellow meets regularly with the mentor who provides ongoing guidance to her/him. The aims of the program were: 1) to expand knowledge and skills relevant to the trainee's research interests, 2) conduct preliminary studies and prepare a research proposal to be submitted for extramural funding, 3) produce manuscripts for submission, 4) expand skills relevant to interdisciplinary and international collaboration in research and scholarship, 5) be knowledgeable about the tenure track positions at the department as well as, various other future employment opportunities and 6) promote skills to lead a research project.

A preliminary plan was completed in 2013 by favorable funding from the university (UEF) and support from a US colleague. Preliminary post doctoral program planning was fruitful and opened possibilities for strong funding from European Union program Horizon 2020 with partners from Europe and University of Pittsburgh, USA. The four year research and innovation program including career training will start in 2015.

## LDR PST 2 - Leadership Poster Session 2

### Clinical Nurse Specialist Designed Certification Preparation Course

---

*Jennifer L. Kitchens, MSN, BSN, RN, ACNS-BC, CVRN, USA*  
*Margie A. Hull, MEd, MSN, ACNS-BC, CDE, RN, USA*

#### Purpose

The purpose of this presentation is to implement and evaluate a Clinical Nurse Specialist led medical-surgical certification preparation course for medical-surgical nurses.

#### Target Audience

The target audience is medical-surgical nurses seeking certification and the leaders at their institution especially if they are seeking Magnet status.

#### Abstract

**Purpose:** The purpose was to implement and evaluate an institutionally-based CNS-led medical-surgical preparation course in order to prepare its medical-surgical nurses to become certified. **Significance:** The CNS competencies provide a basis for a CNS-led medical-surgical preparation course. Nursing certification may have many benefits to organizations including improved nursing competence; confidence; patient care; promotion of professional growth; and reflection of knowledge and expertise in a specialty. **Background:** There is no formal medical-surgical certification preparation course at the institution. This course was requested by practicing medical-surgical nurses and organizational leadership. The approach to certification preparation was innovative by being institutionally-based for its own nurses eliminating cost of tuition and travel. Magnet recognition and career ladders elevate the importance of attaining nursing certifications. CNS facilitation of certification preparation courses has received little attention in the literature. **Description:** Two CNSs collaborated to implement and evaluate the medical-surgical certification preparation course by: planning each preparation session; advertising; developing novel instructional materials; acquiring study resources; fostering a safe learning environment; analyzing evaluation data; disseminating findings. Topics included in the review course were: navigating certification websites; identifying testable material; cultivating study skills; deciphering test questions; identifying perceived barriers to studying/learning; addressing known areas of weakness; decreasing test anxiety; test taking and study tips. Participants' knowledge was assessed by administering a 10-question pre- and post-test covering certification test content. The CNS-led medical-surgical certification preparation review course was evaluated by administering a CNS-designed Certification Preparation Course Survey consisting of a pre-(12 item) and post-survey(16 item) to assess overall course effectiveness. **Outcomes:** The medical-surgical certification preparation course included five sessions(1.5 hours each) over a six-week period(n=6 nurses). Pre-test results were 38%; post-test results were 84%. The Certification Preparation Course Survey results were positive. For the survey item, "I plan to take the medical-surgical nursing certification exam", results were yes(n=5) and maybe(n=1). Perceived degree of anxiousness when taking a test was measured using a 4-point Likert Scale(higher scores equaling more anxiety). Mean perceived anxiety scores were pre-(3.0) and post-survey(1.7). All participants reported learning additional content; content presented was valuable; presenters and teaching methods were effective; practice questions were beneficial; personal goals were attained; course expectations were met; the environment was conducive for learning. **Interpretations:** Results indicate a CNS-led medical-surgical certification preparation course was an effective approach to enhance knowledge about medical-surgical content. Longitudinal evaluation strategies should assess overall cost-effectiveness and participants' retention and use of knowledge.

### Nursing Students' Clinical Training Experiences that Motivated Them to Study

---

*Hisako Kobayashi, MSN, RN,, Japan*

#### Purpose

The purpose of this presentation is we clarified nursing student's experiences that had promoted their motivation to study during acute-phase adult training, in order to improve such training . In addition, students motivation and effort will be able to lead them to land a better job.

#### Target Audience

The target audience of this presentation is hospital's administrative staffs, lecturers, college professors, student's nursing advisers and college students.

#### Abstract

**Purpose:** If a nursing student becomes interested in their clinical training, and it motivates them to study more, their future self-image and effort to search for a job may be promoted. In this study, we clarified nursing students' experiences that had promoted their motivation to study during acute-phase adult training, in order to improve such training.

**Methods:** The study subjects comprised third-year college nursing students. On the last day of each subject's training, they were asked to freely write down their experiences that had promoted their motivation to study in college. The subjects' accounts were classified according to meaningful sentences, which were subjected to qualitative and inductive analyses as well as categorization. This anonymous questionnaire survey was conducted with the approval of the ethical review board of an institution that the researchers belonged to.

**Results:** A total of 93 subjects participated in our study, with a mean age of 21.0 ( $\pm 0.87$ ) years. The subjects' accounts regarding their experiences that had motivated them to study were classified into 167 codes and 10 subcategories, from which the following 5 categories were extracted: 1) pleasure of deepening knowledge, 2) increased motivation after being praised, 3) satisfaction with thorough instructions, 4) nursing practice in which one's efforts can pay off, and 5) desire to become a nurse. Some subjects were praised by their patients, teachers, or instructors during their training, and such an experience promoted their motivation to study.

**Discussion:** Our findings suggest that trainees' motivation to study may be nurtured through their relationship with other people and their own positive feelings, and that their self-esteem may increase through receiving one-to-one instructions or praise.

## LDR PST 2 - Leadership Poster Session 2

### Bringing World Class Nursing Care to a World Class Eye Institute through Transdisciplinary Collaboration

---

*Robert J. Dorman, MSN, RN-BC, CCRN, C-NPT, USA*

#### Purpose

The purpose of this presentation is to demonstrate how an American school of nursing collaborated with a world class eye institute in India to improve the education of the nursing staff, and expand the institute mission of preventing blindness in India.

#### Target Audience

The target audience of this presentation is nurses who have an interest in making a global difference by sharing expertise, educational program development, and interprofessional collaboration.

#### Abstract

A compelling example of interprofessional collaboration that has been identified came from a study of “the psychological and sociocultural factors that influence the risk of Human Immunodeficiency Virus (HIV)/Sexually Transmitted Disease (STD) for married men in urban poor communities of India” (Schensul, Nastasi, and Verma, 2006, p. 96). This interprofessional team consisted of an American anthropologist, an American psychologist, an Indian psychologist, demographers, STD epidemiologists, public health physicians, allopathic physicians, microbiologists, educators, and traditional healers and activists from the study communities. This collaboration of both medical and social scientists is called for in a paper by Rosenfield in 1992 where she defines three different levels of disciplinary collaboration:

Multidisciplinary – in which researchers work in parallel or sequentially from a disciplinary-specific base to address common problems...

Interdisciplinary – in which researchers work jointly but still from a disciplinary-specific basis to address a common problem...

Transdisciplinary – in which researchers work jointly using a shared conceptual framework drawing together disciplinary specific theories, concepts and approaches to address a common problem. (p. 1351)

By collaborating on development of this research in a transdisciplinary method, the team used a combination of methods in forming and evaluating the project, and ultimately developing the intervention tool, which “addressed medical, psychological, and cultural factors related to men’s sexual risk” (Schensul et al, 2006, p. 102). This team was diverse not only in terms of professional background, but also in terms of their nationality, type of institution, religion, work experience, age, gender, and socioeconomic and educational background. Although there were several factors that were viewed as challenges (language, hierarchy, funding, common misunderstandings), other factors played into the success of the study (development of personal relationships over time, central lodging, dedication and commitment to the project, electronic communication over distances, open dialogue, professional benefits, replicability of the study components). An intervention that will take place at the LV Prasad Eye Institute (LVPEI) illustrating the effectiveness of transdisciplinary work is a continuing education project to increase the knowledge base of the current staff, while improving the training of new staff; building collaborative relationships through joint continuing education, and allowing each discipline to through its own concepts and approaches while using the shared pyramid of care concept that has driven LVPEI to the top of the eye care world. Surveying the staff prior to instituting this intervention, to determine their current level of transdisciplinary collaboration will be vital, as will be an exit survey at the end of the clinical teaching period. Additional surveys regarding the transdisciplinary approach will be useful when conducted at 1 year marks for the next 3-5 years. This will measure impact at the team level.

An additional theory that will show benefit to the transdisciplinary approach at LVPEI in India is situated learning theory. Situated learning is a social learning approach and views learning “as a social activity situated within a particular environment or context” (Sargeant, 2009). It was first described by Jean Lave, a social anthropologist, in 1988. The key concept that this theory introduced was that in a situational environment, learning would be more successful. Anderson, Reder, and Simon (1996) state that the four key concepts of situated learning are that (1) action is grounded in the situation where it occurs, (2) knowledge does not transfer between tasks, (3) abstract training is not useful, and (4) instruction must be done in a complex, social environment. Through the construction of a simulation lab that is mocked up to be both environments common to LVPEI (operating theatre and patient care ward), practitioners of all levels will be able to practice not only clinical and technical skills, but communication and teaching skills. Outcomes of this intervention can again be measured by surveying the staff involved prior to and following the simulation exercise, and tracking the success of their work during the actual simulation. This will measure the impact of situated learning at the individual level.

### Capturing Faculty Practice Data: Examining the Interdisciplinary Student Opportunities in a Multi-Site Faculty Practice Setting

---

*Raechel Ferry-Rooney, MSN, RN, APRN-BC, USA*

*Alice Geis, DNP, RN, APN, USA*

*Angela M. Moss, MSN, BSN, APN-BC, RN, USA*

#### Purpose

The purpose of this poster is to describe the interdisciplinary efforts of the clinicians in Faculty Practice sites. We will examine these efforts in relation to recommendations for successful interdisciplinary education. Recommendations will be made regarding specific needs to support interdisciplinary student opportunities in the clinical areas.

#### Target Audience

The Target audience of this poster is nursing educators, persons involved in faculty practice sites, preceptors, and leaders in interdisciplinary education and practice.

#### Abstract

Since the 1980s, the Rush University College of Nursing Office of Faculty Practice has maintained multiple Chicagoland community partnerships for the provision of nurse-managed, faculty-led access to healthcare. Community partners and faculty collaborate to develop programs and services based on community and population needs. Currently, Rush University College of Nursing Faculty Practice encompasses over 20 direct care clinical sites and employs 30 Registered Nurses and APRNs. Over 16,000 hours of direct patient care are provided annually to populations traditionally classified as medically underserved, such as minority, immigrant, low-income, and women and children. Clinical services include direct patient care in the following areas: primary care, women's health, mental health, occupational health, school-based health, and pediatrics.

Due to the diversity of services provided and populations served, it is difficult to accurately and consistently capture practice and outcome data, including student clinical activities. Therefore, the Office of Faculty Practice has created a Faculty Practice supported position dedicated to the collection and analysis of outcome data and quality improvement efforts of the practice. An initial step in outcome analysis was conducting a cross sectional descriptive survey directed to each Rush University College of Nursing Faculty Practice clinician.

An illuminating result from the survey is the higher than expected number of health disciplines represented among the students at the faculty practice sites. Of the clinicians reporting, 75% currently have at least one student in clinic. Clinicians most frequently report nursing students- both Baccalaureate students and Doctoral students, many of which are Advanced Practice students. Also reported are Medical, Social work, Pharmacy, Physical Therapy, Occupational Therapy, Psychology, and Respiratory Therapy students. Additionally, while Rush University is the most common university represented, the Faculty Practice sites also precept and teach students from eleven other regional colleges and universities.

The importance of interdisciplinary education and health care has been expressed frequently by professional organizations of both education and healthcare as well as by the federal government. In 2013 a Health Resources and Service Administration (HRSA) advisory committee recommended for the inclusion of "population health and interprofessional competencies" into program funding opportunities for public health (HRSA, 2013, p9). The American Association of Colleges of Nursing and Sigma Theta Tau International recognize the importance of interdisciplinary health education as well as health care in white papers and position statements (AACN, 2015; STTI, 2003).

These organizations and others have recognized the benefits of interdisciplinary learning, which have been described in several scopes. Some authors have pointed to financial benefits. Problems with interdisciplinary communication and collaboration have been shown to be costly in terms of patient outcomes in health care systems (Sargeant, 2009), resulting in as much as 70% of adverse events being related to problems in collaboration and communication between providers (Fewster-Thuente & Velsor-Friedrich, 2008). Beyond the economic advantages, participants in IPE report improved interprofessional communication (Kilminster et.al, 2004) and increased familiarity with the viewpoints of disciplines other than their own (Robben et. al, 2012).

The purpose of this poster is to describe the existing interdisciplinary efforts of the clinicians in Rush University College of Nursing Faculty Practice sites. We will examine these efforts in relation to current recommendations for successful interdisciplinary education. Finally recommendations will be made to the Office of Faculty Practice regarding specific needs to support interdisciplinary student opportunities in the clinical areas.

Method: Three to four of the most professionally diverse Rush University College of Nursing Faculty Practice sites will be selected. Faculty Practice clinicians responsible for the clinical experiences of students will be interviewed to discern the various ways that interdisciplinary experiences for students occur. Themes will be sought, conceptually organized to assess the following areas: Interprofessional presence; Intersection of patient and interdisciplinary student collaboration; Community partner commitment to interdisciplinary education; Interprofessional communication (role clarification and debriefing are key to ongoing experience).

Results: It is expected that each site will have strengths as well as areas in which the Office of Faculty Practice can provide improved support. After interviewing the clinicians, it may be possible that the information gathered can be generalized across Faculty Practice sites to enhance interdisciplinary student clinical interactions within the diversity of Faculty Practice sites. This information may also inform the overall academic practice partnership models in use, and assist in efforts to create rubrics for effective interdisciplinary student collaboration which supports the strategic goals and missions of both the academic and practice organizations. An example might be interdisciplinary student collaboration on projects could provide data for grant applications, build new structures for student orientations or clinical rotations, and support other agency initiatives, giving the students "real world" experience in effective collaboration.

Implications and Next Steps: As noted in STTI's Arista 3, interdisciplinary health delivery is a key prerogative in a changing health environment (STTI, 2003). Interdisciplinary education in the clinical setting aligns with the goals of the Rush University College of Nursing Office of Faculty Practice, fostering student learning of innovative care models in diverse learning opportunities.

### Intersectoral Collaboration to Promote Interprofessional Education

---

*Sue Coffey, PhD, RN, Canada*

*Hilde Zitzelsberger, BScN, MSc, PhD, RN, Canada*

*Leslie L. M. Graham, RN, BScN, MN, Canada*

#### Purpose

The purpose of this presentation is to share experiences and outcomes related to university-hospital collaboration to promote interprofessional education. Through discussion of student, faculty, and hospital partner experiences, benefits and challenges to collaboration will be discussed.

#### Target Audience

The target audience for this presentation would include nursing and health sciences educators.

#### Abstract

Interprofessional education (IPE) is becoming increasingly significant in nursing and health care curricula, now widely recognized as a precursor to patient safety and quality of care mandates across North American and internationally. IPE provides health care students with the opportunity to learn with, from, and about each other to both promote effective collaboration and improve health outcomes (Meakim et al., 2013). Historically, nursing and health care students have typically learned in “professional silos”, a model known to contribute to poor communication skills, teamwork failures, and compromised patient safety (Palaganas, 2014). Although there has been movement toward integrating IPE into curricula, there is as of yet not enough data to draw definitive conclusions about IPEs effectiveness. Nevertheless, there is some indication, albeit limited, that IPE has a positive impact on the interprofessional practice (IPP) agenda (Coffey & Anyinam, 2014). Within the Canadian context, few opportunities exist for students to engage in IPP. This reality results in gaps in student preparation for the real-world practice environment and may negatively impact nursing care and patient outcomes. This presentation will provide an overview of the early results of an educational initiative that builds upon strong collaborative ties between a university and a community teaching hospital. By teaching about interprofessional practice, in a setting which promotes and supports interprofessional practice, students were invited into both real-world and simulated learning that extended theoretical knowledge into the practice setting. Student perceptions of learning through large-group simulations will be discussed. Lessons learned from the student experience will be shared. Faculty perceptions of barriers and facilitators to large group interprofessional, simulation-based education for nursing and health sciences students will be explored. Finally, discussion of the benefits and challenges of intersectoral collaboration between the post-secondary education and health care sectors to provide opportunities for IPE and IPP will be discussed.

## LDR PST 2 - Leadership Poster Session 2

### Interprofessional Education through Community Service

---

*Denise B. Isibel, MSN, RN, RN, USA*

*Linda Bennington, PhD, RN, USA*

#### Purpose

To educate nurses to participate in inter-professional teams with both a leadership and service learning objectives. The presentation will promote how to develop an inter-professional team that includes both faculty and students from various health care specialties.

#### Target Audience

The target audience of this presentation are Nurse educators, Public health/Community health Nurses interested in population health.

#### Abstract

**Introduction:** The Virginia Academy of Nutrition and Dietetics (VAND) conference is designed to address the essential knowledge requirements of professionals and paraprofessionals who work with vulnerable populations in the Hampton Roads area. Specifically, the objective of this project is to facilitate a creative learning environment that will provide a foundation for these attendees to take back to their smaller communities as health promotion improved maternal child healthcare with an emphasis on oral healthcare.

**Background:** Health promotion involves the process of enabling people to increase control over, and to improve their health. It not only embraces actions directed at strengthening the skills and capabilities of individuals, but also action directed towards changing social, environmental and economic conditions so as to alleviate their impact on public and individual health (Public Health Agency of Canada, 2007). The measure of a community's needs can often be determined through the infant mortality rate as it reflects the quality of prenatal and birth care available to both children and mothers and is a critical indicator of the overall health and welfare of a nation. Virginia's infant mortality rate is higher than the national average at 6.8/1000 and the highest rate is in Hampton Roads at 9.1/1000 (Virginia.gov, 2014a). Oral healthcare has been identified as one of the top three barriers to health access in Hampton Roads (Hampton Roads Community Health Assessment, 2004)

The World Health Organization asserts that interprofessional education (IPE) of healthcare students is essential to positively impacting population-based health outcomes, disease prevention, social advocacy and elimination of health disparities to include maternal-child health indices (Chavez, 2013). Maternal child health has the greatest impact on the outcomes of adult health by virtue of establishing the potential genetic environment of the developing fetus, which will, in turn, set the stage for a healthy, productive citizenry. Additionally, IPE affords students with an understanding of the importance of each discipline's role in meeting a community's health needs.

This service learning project will address these needs through the development of a faculty facilitated student-led educational forum to be presented at the Spring 2015 Virginia Academy of Nutrition and Dietetics (VAND) conference. Service learning has been used successfully in both Nursing and Dental Hygiene to increase awareness of health disparities for vulnerable populations (Bentley & Ellison, 2005).

**The Project:** This innovative project supports the development of a new service learning opportunity with a community partner: Virginia Academy of Nutrition and Dietetics. Our goal is to connect interdisciplinary teams of students from four departments (Dental Hygiene, Nursing, Environmental Health, and Public Health) within the College of Health Sciences to develop this educational forum by (1) students will assess basic learning needs within existing programs in the Hampton Roads area. For example, Resource Mothers and Loving Steps are two programs that train lay healthcare workers to mentor pregnant teens through a community driven initiative to not only eliminate significant disparities in

perinatal health experienced by African-American women and their families but to prevent infant mortality and low weight births within a population that has this risk, (2) students will meet and collaborate with VAND representatives to assess their basic learning needs based on their input to develop an educational program that is specifically designed and packaged for use in their field of training. (3) students will be exposed to programs within the community and likewise expose the facilitators of these programs for their potential to be expansion of service learning opportunities, (4) students will learn the value of health promotion interdisciplinary team advocacy to increase positive health outcomes, (5) students will use measureable criteria in the evaluation of outcomes and solicit feedback from paraprofessionals and stakeholders regarding results of conference.

#### **Student Learning Outcomes:**

- Apply disciplinary specific knowledge and skills to an inter-professional service learning opportunity.
- Assess the community's perspectives on health.
- Collaborate with VAND, each other, and faculty members to facilitate community-based health promotion for individuals and communities.
- Identify additional community needs and resources relevant to the communities paraprofessionals serve.
- Incorporate the principles of health literacy into the design and implementation of health promotion programming.
- Evaluate through measureable criteria conference outcomes from solicited feedback.

**Community Needs and Outcomes:** The Virginia Academy of Nutrition and Dietetics (VAND) is a professional, not-for-profit organization of food and nutrition experts affiliated with the Academy of Nutrition and Dietetics. Nearly 1600 members serve the citizens of our Commonwealth through the promotion of optimal nutrition, health and well-being. This Interdisciplinary service learning project directly impacts the organizations goals and objectives by:

- Supporting community partners in their efforts to improve the public's health
- Decrease infant mortality and malnourishment through nutritional programs in the community
- Decrease oral health disease and influencing the risk factors that cause oral diseases
- Strengthen professional/paraprofessionals' abilities to improve health through strategies that focus on community development and sustainable programs.

**Evaluation:** Critical reflection (Bringle & Hatcher, 1999) is essential to assisting the students to achieve a meaningful service learning experience which bridges coursework with critical community health needs. Thus, students will be asked to reflect on their own attitudes, beliefs and values regarding health promotion. Blogs, free writing exercises, and post-event round table discussions will be used as teaching-learning strategies for facilitating student reflection, achievement of learning outcomes, and evaluation. Student will also prepare a poster to be presented at the College of Health Science Interprofessional Education (IPE) day Spring, 2015.

## LDR PST 2 - Leadership Poster Session 2

### Using Wikis to Stimulate Collaborative Learning in Interprofessional Nursing Education

---

*Hilde Zitzelsberger, BScN, MSc, PhD, RN, Canada*

*Karen Campbell, BScN, RN, Canada*

*Dorothea Service, BScN, MScN, RN, Canada*

*Otto Sanchez, MD, MSc, PhD, Canada*

#### Purpose

The purpose of this presentation is to discuss the use of wikis to support undergraduate nursing students to develop the collaborative skills needed in their future professional roles in communities of practice by sharing our experiences of the implementation of wikis for group assignments in two interprofessional health sciences courses.

#### Target Audience

The target audience of this presentation is nursing and health sciences educators interested in technology-enhanced collaborative learning in nursing education.

#### Abstract

The use of wiki technology fits well in courses that encourage constructive knowledge building and social learning by a community of learners. Pedagogically, wikis have attracted interest in higher education environments as they facilitate the collaborative processes required for developing student group assignments (Carroll, Diaz, Meiklejohn, Newcomb & Adkins, 2013; Collier, 2010; Rasmussen, Lewis & White, 2013; Thompson Martin, 2012). Collaborative group projects within a wiki environment closely mimic community of practice settings that nursing students will face as future health professionals. Furthermore, the impetus towards interprofessional communication in contemporary healthcare education and practice environments strongly lends to the rationale of employing robust tools, such as wikis, within undergraduate nursing education. Technologically-enabled collaboration integral to wikis may be ideal for modeling and training effective interprofessional communication within interdisciplinary courses focused on interprofessional health care teams (Stephens, Robinson & McGrath, 2013). In this presentation, we describe our pilot project to assess the implementation of wikis in two online small- and mid-sized elective courses comprised of nursing students in third or fourth year undergraduate levels within interdisciplinary health sciences courses. Despite a number of challenges in the implementation and use of wiki for teachers and learners, our experiences clearly indicated a number of potential advantages. However, there is a need to further develop the pedagogical use of wiki environments before they can be expected to support collaboration among undergraduate nursing students. A key insight gleaned from our project is the fundamental need to invest in the process of creating an effective wiki learning environment in order to facilitate meaningful educational student experiences. Adapting wiki implementation to suitable well-matched courses will make adaptation of wikis into nursing curricula more effective and may increase the chances that nursing students will hone the collaborative abilities that are essential in their future professional roles in interprofessional communities of practice. The STOLEN approach (Foord, 2007) is a systematic approach to wiki implementation, and will be discussed to more effectively facilitate the use of wikis into nursing curricula and increase the chances that students will engage positively in ways that will make them consider using wikis in future virtual collaborative endeavors as health professionals.

### Strategies to Increase Nursing Student Diversity

---

*Asako T. Katsumata, PhD, ME, BA, RN, USA*

*Victoria McCoy, BSN, RN, ONC, USA*

*Andrea Doughty, PhD, USA*

*Terese Burch, PhD, RN, USA*

#### Purpose

The purpose of this presentation is to identify barriers to enrollment for the under-represented groups, i.e. African Americans, Hispanics and males, and to form action plans to recruit well qualified students to increase student diversity in nursing programs

#### Target Audience

Anyone who is interested in having diversified nursing work workforce to meet the health care needs of diverse population

#### Abstract

**Background:** The US population is becoming more and more diversified. According to the year 2010 national census, the population was distributed as 72.6% white, 16.3% Hispanic, 12.6% African American, and 4.8% Asian. The most recent national figures on registered nurses indicate that 83.2% are white, 3.6% Hispanic, 5.4% African American, and 5.5% Asian. To provide socially and culturally competent patient care, it is necessary for nursing programs to produce diversified graduates.

**The objective** of the project is to identify barriers to enrollment for the under-represented groups, i.e. African Americans, Hispanics and males, and to form action plans to recruit well qualified students to increase student diversity in nursing programs.

**Method:** This is a qualitative study utilizing interviews with members of the target groups and nursing program recruiters. The project was done in three phases: 1). A literature review to determine successful recruitment strategies currently being used by nursing programs; 2) interviews with members of the target groups and nursing program recruiters; and 3). Development of a recruitment plan to help guide nursing colleges in diversifying the student body.

**Result:** The major themes of barriers for the under-represented groups include lack of media image, role models, educational resources, money for tuition, guidance, opportunities, math and science academic foundation, confidence, and perseverance. The actions plans for recruiting diversified students include 1.) introduce nursing as a profession by utilizing multimedia, TV, radio, newspaper, pamphlet, internet and live presentation at middle schools, high schools, junior colleges, churches, shopping centers, community centers that have higher Hispanic, African American and/or male populations; 2). promote the importance and the reward of nursing as a profession by relating case scenarios and retelling positive stories from patients and nurses; 3). establish role models of Hispanic, African American and/or male nurses and/or nursing students in the communities by inviting members of these groups to meet with and talk to prospective nursing students at various nursing promotions, such middle and high school career days, college career fairs and community job fairs; 4). provide counseling on financial resources available to potential nursing students by detailing the financial obligations for nursing programs, the federal and state financial funding, the private sect loans, the scholarships available, and most importantly let the prospective students know that they will have guidance for the financial planning through the whole nursing program; 5). mentor potential nursing students to set up goals for their professional growth, to prioritize their goals and to persevere in achieving their goal to enroll in nursing program

## LDR PST 2 - Leadership Poster Session 2

### Nursing Leadership and the Relation with Management Models Adopted in Healthcare

---

*Andrea Bernardes, PhD, RN, Brazil*

*Daniele Éllen Grivol, Brazil*

*Carmen Sílvia Gabriel, PhD, RN, Brazil*

*Gisleangela Lima Rodrigues Carrara, RN, Brazil*

*Priscila Lapaz Baldo, RN, Brazil*

#### Purpose

The purpose of this presentation is to transfer the knowledge generated from the analysis of the contributions of the produced research on nursing leadership and management models adopted in the health services, published in national and international journals from 2003 to 2014.

#### Target Audience

The target audience of this presentation is all health professionals, managers, leaders, teachers and students who are interested in the theme of leadership and its correlation to the adopted management models.

#### Abstract

**Introduction:** The importance of leadership can be measured through the strength at which this theme has been shown in the academic literature. The professionals of nursing who are health teams' leaders, develop not only a function of influence, but also collaborate on accomplishment of mutual goals of their teams<sup>(1)</sup>.

**Objective:** The study aims to analyze the contributions of the produced research on nursing leadership and management models adopted in the health services, published in national and international journals from 2003 to 2014.

**Methods:** It was used Integrative Literature Review which is a research method that allows the search, critical evaluation and synthesis of available evidence about the researched theme<sup>(2)</sup>. In this methodology were covered six distinct stages: issue identification, literature search, categorization of primary studies, assessment of studies included in the integrative review, interpretation of results and synthesis of knowledge evidenced<sup>(3)</sup>. The main question of the research was developed through the PICO strategy, which represents the acronym Patient, Intervention, Comparison and Outcomes: what are the leadership styles used in health services when they adopt vertical management model or participatory management model? A form was used to collect bibliographic data, in which information was drawn on the identification of the authors, database where the paper was found, the study objective, methodology, type of research, findings, conclusions and level of evidence. The level of evidence was classified using the evaluation criteria established between one and seven, where level 1 is systematic review, with randomized controlled trials to level 7, which shows authorities of opinion articles or experts committees report<sup>(4)</sup>. For the selection of articles the following databases were used: Latin American and Caribbean Health Sciences (LILACS), Medical Literature Analysis and Retrieval Systems Online (MEDLINE), SciVerse Scopus and CINAHL, published from 2003 to 2014. Were included primary articles extracted from the databases. Theses, dissertations, monographs, books and revisions of any style were excluded. The sample consisted of scientific articles found in the selected databases, published in Portuguese, English and Spanish, in national and international journals, located by controlled descriptors "leadership", "hospital management", "hospital management" and "nursing" beyond the uncontrolled descriptor "health management model."

**Results and Discussion:** The searching resulted in a total of 220 potential references; 168 excluded for being inadequate to the theme, 14 because they are not available online and 15 for being literature review. The study was then composed of 13 indexed articles dealing with the leadership styles used by

nurses and the relationship with the management model adopted which met the criteria proposed in this study. In order to facilitate the interpretation of data, publications were grouped into three categories: "Contemporary leadership and participatory management model" which 07 papers stood out with key features to keep professionals in an atmosphere of partnership and trust, thus providing a healthy workplace and facilitator of the care process. The second category entitled "Contemporary leadership and vertical management model" highlighted 04 papers. This category seems paradoxical, since to adopt a more participatory leadership style, as the authentic and transformational, it is expected that the institution has established teamwork, collective decision and dialogical communication, contradictory to the assumptions of hierarchical management model. The third category called "Autocratic leadership and vertical management model" emphasized 02 papers that aimed to know the leadership styles developed by nurses and their influence on interpersonal relationships established between the nursing staff. Among the surveyed studies, three leadership styles stood out as the most used by nurses: transformational, democratic and authentic. These three styles have characteristics in common as all point out that in a nursing team there are people with different personalities and different technical level, and also emphasize that nurses should have a group vision, recognizing in each member the technical skills and simultaneously, helping them to overcome their difficulties. These styles also give more autonomy to the led about the decisions to be taken, and the nurse assumes a role of encouraging the development of his team activities. Besides the attention to contemporary styles of leadership, it emphasizes the autocratic style, also evidenced by the study. This style, although has some advantages, is targeted to inhibit employees' potential, since it ends up hindering creativity, participation and motivation. This style is characterized as non-dialogic, authoritative, and should be avoided as far as possible. However, the adopted leadership style is usually linked to the management model implemented in the institution. More innovative management models induce the use of more participative and transformational leadership styles. On the other hand, more vertical and hierarchical models suggest a more authoritarian leadership.

**Conclusions:** In this study, it is observed that there is not a unique style which may be previously practiced by the leader, unless he knows the personal characteristics of his team. Thus, effective leadership demands knowledge by the leader about the management philosophy of the institution, as well as the virtues and difficulties faced by his subordinates. The study showed the need for further research with larger level of evidence, that enable the improvement of the quality of care through the use of more innovative leadership practices which encourage professionals to work more motivated and satisfied, and to be more collaborative and co-responsible with the results provided to patients. On the subject, the authors intend to continue the study through the development of field research with professionals working in services which adopt different management models and leadership styles.

## LDR PST 2 - Leadership Poster Session 2

### A Measure of Perceived Fatigue among Nurses in Western North Carolina

---

*Karen R. Cochran, MSN, RN, CNOR, USA*

#### Purpose

The purpose is to present a study of reported fatigue among nurses in a large hospital system including 5 facilities. The study compared differences among varying demographic groups within the study. The level of fatigue, acute versus chronic, and the ability to recover from fatigue between shifts was also measured.

#### Target Audience

The target audience of this presentation includes hospital leaders who make decisions about staffing and staffing models as well as nurses involved in patient care.

#### Abstract

**Background/ Significance:** Managed health care and reduced reimbursement together with the nursing shortage is leading hospitals to rely on nursing overtime to meet staffing needs. We are anticipating a heightened shortage of nurses as our aging population retires. Other industries such as airline, trucking, and railroads have put policies into place to limit the hours employees can work in a week to circumvent fatigue in workers because fatigue contributes to worker errors. Previous research has demonstrated a link between working long hours, fatigue, and decreased performance among nurses. Fatigue has specifically been linked to on the job injuries and poorer patient outcomes. The current trend in nursing is working 12-hour shifts. This shift is popular among nurses and most think they fully recover from the long day on subsequent days off; however, research shows fatigue has more impact on a nurse working a 12-hour shift than one working an eight hour shift. Evidence shows numerous negative effects of nurse fatigue on work performance. It is well established that fatigue leads to decreased alertness, slowed reaction time, impaired communication, reduced motivation, lower productivity, lapses of attention to detail, compromised problem solving, increased risk of injury, and loss of empathy.

**Purpose:** This research study examined perceived fatigue among nurses. The objectives were to measure the level of fatigue present, distinguish acute from chronic fatigue, determine the nurses' ability to recover between worked shifts, and compare differences in fatigue across the various demographic groups within the study.

**Study Design/Methodology:** An anonymous survey was conducted to measure fatigue following a descriptive, correlational study design. The survey instrument used in this study incorporated both the Fatigue Assessment Scale and the Occupational Fatigue Exhaustion Recovery Scale. These two survey instruments have proven reliability and validity and were combined to capture a more comprehensive depiction of fatigue than use of just one survey instrument may have offered. The survey was distributed through email to nurses in direct patient care roles. It was explained that participation was voluntary. The email contained a link to an online survey where nurses could anonymously complete the survey. There was no contact between the participants and the researcher. Surveys were de-identified; IP addresses were not tracked.

**Setting/Sample:** The study was conducted in a large hospital system comprising five acute care facilities. The hospitals are located in both urban and rural settings. A convenience sampling method was utilized. The total number of nurses in the study population was 2,764. Study participants totaled 610 and represented a widely heterogeneous group of nurses. All registered nurses who provide direct patient care in the hospitals were included in the study. Nurses not working in direct patient care roles were excluded from the study. All five hospitals were represented among the participants.

**Results:** When looking at the entire group of study participants, results from the Fatigue Assessment Scale indicated an overall presence of fatigue with a mean score of 23.5 utilizing descriptive statistics in SPSS. When analyzing the Occupational Fatigue Exhaustion Recovery Scale, the study participants

indicated an overall high level of acute fatigue with a mean score of 67.2. The Occupational Fatigue Exhaustion Recovery Scale also revealed that participants, as a group, reported a medium or moderate amount of chronic fatigue with the mean score of 47.1 and a moderate ability to recover between worked shifts represented by a mean of 52.1. A comparison of shift lengths revealed that nurses working a 12-hour shift reported a statistically significant higher level of acute fatigue with a mean score of 68.8, ( $p < .001$ ), than nurses working  $\leq 9$  hours and nurses working 10 hours. This is consistent with other studies of fatigue among nurses. When comparing day, evening and night shift nurses, nurses working night shift scored statistically significant higher on the Fatigue Assessment Scale with a mean of 24.9, ( $p < .001$ ), than nurses' working day or evening shifts. Additionally, nurses in the study working night shift report the least ability to recover between shifts. These results raise concerns regarding safe, high quality patient care since so many nurses are working 12-hour shifts in hospitals today. There was not a statistically significant difference in reported fatigue between nurses who are required to take call and those who are not required to take call. Moreover, there was no difference between nurses working in a trauma center and nurses working in community hospitals. Although nurses working greater than 40 hours per week reported more chronic fatigue, mean 52.1, than nurses working less than 40 hours per week, mean 46.7, when compared there was not a statistically significant difference between the two groups ( $p = 0.08$ ). There was also no difference in reported fatigue among the various age groups. . The departments reporting statistically significant higher levels of acute fatigue compared to the other departments were labor and delivery and medical surgical inpatient units with mean scores of 72.9 and 72.3 respectively, ( $p < 0.5$ ). These mean scores represent a high level of acute fatigue. The behavioral health department reported a statistically significant low capability of inter-shift recovery with a mean score of 37.9 ( $p < .05$ ).

**Conclusion:** Considering the increased acuity of patients today, the desire for quality patient care and the growing nursing shortage, the retention of experienced nurses should be a top priority. This study and many others illustrate that 12-hour shifts result in a fatigued workforce. Fatigue leads to exhaustion and burnout, which has shown to be a factor in nurses deciding to leave the profession. Such a scheduling pattern is incompatible with goals for safe, high quality patient care; therefore the use of 12-hour shifts should be limited. Healthcare leaders must provide healthy work environments to retain experienced nurses and to provide patients with safe experiences. Shorter work shifts should be implemented in efforts to reduce the incidence of fatigue and burnout among nurses. Hospital leaders must recognize that fatigued nurses present a risk to patients. The number of hours that are required between worked shifts should also be well-defined to allow for adequate recovery. Lastly, hospital leadership should change staffing patterns as well as their expectations of overtime and call duties, and view a fatigued nurse as incongruent with goals of patient safety.

### Empowering Nurses to Partner in the Care of Children with Developmental Disabilities

---

*Angela Chlebowski, BSN, RN, EFM-RNC, USA*

*Sally O'Toole Gerard, DNP, MSN, BSN, RN, CNL, USA*

#### Purpose

The purpose of this presentation is to describe the value of the multi-dimensional LEND program for graduate nursing students and a description of dissemination of this specialized knowledge to upgrade undergraduate and graduate curriculum.

#### Target Audience

The target audience of this presentation is nursing professors and administrative individuals in revising nursing curriculum. Clinical nurses will benefit from the importance of increasing knowledge on this specialized population.

#### Abstract

The CDC and HRSA have published that the prevalence of Developmental/Intellectual Disabilities has increased by 17.1 % in nearly 10 years, calculating that about 1.8 million children currently live with Developmental and Intellectual Disabilities in the United States. During a nurse's careers they will come into contact with infants, children, adults, and families that are affected by intellectual/developmental disabilities throughout the lifespan. Caring for such a specialized community can be challenging for the healthcare provider. Are nursing students in an undergraduate and graduate degree programs being exposed to proper training and enrichment programs? Numerous studies have looked at this question. The results from many studies suggest that nursing students at both the undergraduate and graduate level are not receiving the education and clinical experiences needed in working with this specialized population. Limited disability curricula can be attributed to lack of faculty expertise and limited time in an already packed curriculum. However this has attributed to negative attitudes by nursing students and providers of individuals with disabilities. Through the revision of a generic Master's of Nursing Leadership Curriculum at Fairfield University there is a comprehensive and interprofessional opportunity for nursing graduate students who have a passion for this specialty area. This clinical/educational experience is known as LEND (Leadership, Education in Neurodevelopmental Disabilities). LEND programs are a nationwide initiative for graduate and post graduate students to take part in a training program to develop skills in advocacy/policy, clinical, research, and teaching; with the goal of taking on a leadership role in a career specialized in children and families with disabilities and special healthcare needs. The program is a unique opportunity for nursing students to work in a multidisiplinary setting for the common goal of helping and assisting children and families with disabilities and special healthcare needs. In many instances graduate nursing students are inhibited from participating in rich academic experiences due to restrictive curricular plans. This poster/presentation will describe the value of the multi-dimensional LEND program for graduate nursing students and a description of dissemination of this specialized knowledge to upgrade undergraduate and graduate curriculum.

## LDR PST 2 - Leadership Poster Session 2

### Breakthrough Leadership – A Window into the Boardroom: A Descriptive Phenomenology Pilot Study about the Experiences of Nurses Serving on Interprofessional Healthcare Governing Boards

---

*Lisa J. Sundean, MSN, MHA, RN, USA*

#### Purpose

The purpose of this presentation is to share the results of a first time study about experiences of nurses on interprofessional healthcare governing boards, to raise awareness about the importance of the engagement of nurses on boards, and to inspire nurses to seek board placements to improve the healthcare system.

#### Target Audience

The target audience for this presentation is nurses who aspire to use their knowledge, skills, and expertise to improve health and healthcare through high-level decision-making and leadership in the interprofessional healthcare governance boardroom.

#### Abstract

Nurse engagement on healthcare governing boards in the United States is low between two and six percent. The 2010 Institute of Medicine report, *The Future of Nursing; Leading Change, Advancing Health*, recommends nurses engage as board members and become equal partners with other healthcare leaders to make critical decisions about healthcare design and reform. The Robert Wood Johnson Foundation (RWJF) recently launched an initiative to place 10,000 nurses on boards by 2020. Nursing organizations like Sigma Theta Tau International, the American Academy of Nursing, and the American Nurses Association have partnered with RWJF to bring the initiative to fruition. Considering nurses are at the nexus of patient care, quality, and costs, nursing leadership at the board level is critical. Few research studies examine the issue of nurses on boards. **PURPOSE:** The purpose of the pilot study was to describe the experiences of nurses on interprofessional healthcare governing boards and to begin a trajectory of research evidence about this topic. **METHOD:** The research design used was descriptive phenomenology. A purposive sample of three nurse board members from New England participated in the study. The interview statement was, "Please describe to me your experiences as a nurse serving on an interprofessional healthcare governing board. Please describe all your thoughts, perceptions, feelings, and specific examples you can recall and wish to share." Data were analyzed using Colaizzi's method of phenomenological data analysis. **RESULTS:** Data analysis yielded seven themes: 1. Role on the Board: Pusher and Prodder, 2. Nursing Skill Sets: Innovator, Implementer, Evaluator, 3. Composition of the Board: Hats Off to the Person Who Brought Me onto the Board, 4. Voice and Influence: By the Way, I Happen to be a Nurse, 5. Culture of the Board: It was an Old Boys Network, 6. Board Work: Let's Get Down to Business, and 7. Personal Outcomes: A Fantastic Learning Opportunity. The fundamental structure of the experience is one of breakthrough leadership described in terms of influence, contribution, respect, pride, and personal development. **DISCUSSION:** Even though challenges were described, serving on healthcare boards allowed the nurse participants to effectively use their voice, knowledge, skills, and expertise to contribute to high-level leadership and decision-making about healthcare. The experiences of the nurse board leaders in this study demonstrated their ability to engage in board level discussions and decision-making as recommended in the IOM report. The experiences of the nurses in the study provide a window into the boardroom. The boardroom is one that few nurses enter. To effectively contribute to the transformation of the healthcare system, it is critical for nurses to engage as leaders in healthcare boardrooms.

## LDR PST 2 - Leadership Poster Session 2

### A Global Resource for Nurses: Work Team Empowerment

---

*Christina Leibold Sieloff, PhD, RN, CNA, BC, USA*  
*Mary Louanne Friend, PhD, MN, BSN, RN, USA*

#### Purpose

to review the current status of empowerment research in health care with a focus for identifying nursing work team strategies that can assist those work teams to further improve their workplace empowerment.

#### Target Audience

any nurse, who is a member of a work team, within any practice setting and any location globally.

#### Abstract

The purpose of this presentation is to review the current status of empowerment research in health care with a focus for identifying strategies that nursing work teams can implement to further improve their workplace empowerment. The target audience for this presentation is any nurse, who functions as a member of a work team, within any practice setting and any location globally.

Empowerment is a perspective with global implications for nurses in all practice settings. In terms of the health care environment, the literature has identified there are many benefits that result from empowerment within the work place. These include: increased satisfaction, increased retention, etc. The empirical literature supports the relationship between structural and psychological empowerment to: 1) job satisfaction, and the 2) Magnet hospital characteristics of autonomy, control over practice environment and positive nurse-physician relationships.

Research also suggests that team membership and power are associated with student empowerment. The ability to empower nursing students as teams may enable them to create transformative, collaborative working environments globally.

However, there are two aspects of the current literature that are problematic when attempting to assist healthcare work teams to fully benefit from work team empowerment. First, the majority of health systems research is focused on the empowerment of individuals rather than work teams. This perspective is problematic as it conflicts with the fact that nurses routinely practice as members of healthcare work teams, regardless of their practice setting or global location. An additional problem is presented by research that originates from a paternalistic view of empowerment where the work team's empowerment depends upon either the environment or other individuals within that environment rather than on the efforts of the work team.

In this presentation, a view of empowerment will be presented that focuses on 1) practical empowering nursing work team strategies that 2) use established mechanisms in innovative combinations to assist nursing work teams to enhance their forward thinking skills, particularly in terms of addressing environmental forces that effect health care. The Sieloff-King theory of work team empowerment within organizations, and the related instrument (Sieloff-King Assessment of Group Empowerment within Organizations) focuses on: 1) healthcare work teams, and 2) the team's ability to autonomously empower themselves. This theory has demonstrated its global applicability through research in a variety of practice environments and global (Finland, Israel, Korea, United States). This theory and the reliable and valid instrument provides all nursing work teams with practical and innovative strategies

Through the use of the reliable and valid instrument, any nursing work team should be able to both assess and further improve its level of empowerment. The ability to achieve transformative nursing practice, and enhance nursing teams' talents in a variety of professional situations, depends upon individuals who believe empowerment is an active process as opposed to a passive process that leaders

perform for their followers. Likewise, team empowerment supports group cohesiveness that has also been correlated to nurse retention and increased satisfaction.

Over the past 40 years, nursing has been described in the literature as behaving as an oppressed group. The time for forward thinking is now where nurses believe they are responsible for their own ability to achieve goals and to empower themselves and their work teams. Quality nursing education, practice and research to support transformative nursing practice and safe and quality patient outcomes depends upon effective, empowered, nurse work teams.

### Constant Chaos: Utilizing Change Theory in Baccalaureate Nursing Leadership Education

---

*Tanya R. Sanders, MSN, BScN, RN, Canada*

*Tara Lyster, MN, BScN, RN, Canada*

#### Purpose

To share with participants how we utilized the concept of change in the development of student knowledge and skills in change management and leadership.

#### Target Audience

Educators and nurse leaders

#### Abstract

The need for leadership education in undergraduate nursing has been established (CASN & CNA, 2014) and is essential for the progression of the profession (Duncan, Rodney & Thorne, 2014). As a part of learning on leadership the concept of change was utilized with fourth year nursing students to solidify their understanding of leadership concepts and their effects on change. It is essential that nurses develop the skills required to be involved in successful change. Beginning the exploration of change within nursing education provides nurses with the foundation needed to become leaders of change and effective followers.

Change is inevitable in health care and is something that nurses are a part of continually. This presentation will explore how the concept of change was introduced in a leadership course in the fourth year of an undergraduate degree program in Canada. Using identified change theories students were asked to examine a change being implemented in health care and were asked to explore the role of the nurse and connection to change theory. Through this examination students were able to see the influence they as new RN graduates can have on change initiatives and gain insight into surviving and thriving in change.

In this presentation participants will be presented with information on the education program, curriculum, place of learning, and influencing literature and policy driving leadership education in this school of nursing. There will be an opportunity to discuss key leadership concepts used in undergraduate education and explore possibilities for future development. From the broad concept of leadership participants will focus on the concept of change and identify how a specific assignment was utilized to consolidate student learning on leadership. The goal of the assignment was to foster an understanding in students of their potential roles in ensuring change is positive and effective. By understanding the complexity and dynamics of planned change fourth year undergraduate students have the opportunity to explore their role in change and how they can contribute and develop their leadership skills, knowledge, and abilities.

### Effective Nursing Leadership and Emotional Intelligence

---

*Kirsi Toivanen-Atilla, MSN, BSN, RN, USA*

#### Purpose

The purpose of this presentation is to share nurse leaders' perceptions of effective nursing leadership, to discover the elements of effective nursing leadership, and to discuss about the role of emotional intelligence in nursing leadership.

#### Target Audience

The target audience of this presentation is educators and nurse leaders. In order to emphasise the role of emotional intelligence in nursing, key players need to be aware of the subject.

#### Abstract

Current issues in healthcare such as nursing shortage and turnover, health reform, and quality of care have turned the focus to nursing leadership. Research has shown that the concept of emotional intelligence, as integrated in nursing, has positive effects on staff, patient and organizational outcomes. Nurse leaders are in a crucial position to promote positive staff outcomes, positive patient care outcomes, and eventually, positive organizational outcomes. It is important to research what makes effective nursing leadership, and perhaps even more importantly, how nurse leaders perceive effectiveness. The purpose of this study was to describe nurse leaders' perceptions of effective nursing leadership, to discover the elements of effective nursing leadership, and to determine the role of emotional intelligence in nursing leadership as perceived by nurse leaders.

The study used a qualitative research design. Data were collected by using a secured online questionnaire during September and October 2010. Data collected were analyzed by using Colaizzi's Method of Data Analysis. The findings were examined through Goleman's framework of emotional intelligence competencies.

The study group (N=20) consisted of female registered nurses in formal nursing leadership positions. Participants were recruited through a national organization for nurse leaders. Participants were members of the organization and they were located throughout the country.

This study found that emotional intelligence is considered as an element of effective nursing leadership. Moreover, it was found that effective nursing leadership is relationship-centered, and can be demonstrated through qualities such as communication and attentive listening. Also, an organization and its culture have a role in effective nursing leadership.

However, more nurse leader-focused research is needed since it can promote the establishment of evidence-based nursing leadership. Further, it would be beneficial for the future of nursing leadership to include formal emotional intelligence education in both BSN and MSN programs, and to emphasize emotional intelligence qualities already when selecting and hiring nurses and nurse leaders.

The study could be replicated by using triangulation with a more diverse study group. More detailed research regarding the needs of the target group should be conducted in order to design curriculum regarding emotional intelligence education. Furthermore, it would be good to continue researching reliable ways to measure the impact of effective nursing leadership on staff outcomes, patient outcomes and organizational outcomes, as well as the effects of organizational culture on nursing leadership performance.

## LDR PST 2 - Leadership Poster Session 2

### Educating Nurses as Leaders Who Promote Health Equity through Social Change

*Catherine Y. Read, PhD, RN, USA*

*Debra M. Pino Betancourt, MA, BS, USA*

#### Purpose

The purpose of this presentation is to describe the implementation of high impact practices for preparing baccalaureate nursing students to be leaders who promote health equity through social change. The Social Change Model of leadership development is presented as a framework for program planning.

#### Target Audience

The target audience of this presentation is nurse educators interested in student leadership development with a focus on promotion of health equity.

#### Abstract

Nurse educators have a responsibility to prepare graduates as leaders whose actions will contribute to the achievement of health equity. The Social Change Model (SCM) can provide a framework for a lifelong developmental process of leadership identity that is congruent with nursing's social policy agenda. The SCM asserts that leadership is a collaborative, service-oriented, values-based process that is about effecting change on behalf of society. It posits that leadership includes people in positional and non-positional roles, views leadership as a process rather than a position, and promotes equity, social justice, self-knowledge, service and collaboration. The seven values of the SCM cluster across individual (consciousness of self and others, congruence, commitment), group (collaboration, common purpose, controversy with civility), and societal (citizenship) domains.

When societal health equity is at stake, participation of underrepresented and underresourced students is a key to the ultimate effectiveness of leadership development initiatives. A climate of inclusivity within the university and a broad definition of diversity are essential components of meaningful programs. At the program level, best practices should include open discussions about definitions of labels and the underlying assumptions about student aptitudes. The seeds of leadership for social change need to be planted early and cultivated throughout a nurse's education. Activities need to be sequenced to meet student's developmental needs over time and consider specific influences that may vary by race, ethnicity, gender, sexual orientation, age, and socio-economic status. It is important to recognize that a student's leadership self-efficacy can be nurtured through activities beyond those of "positional leadership." Equally important is the notion that leadership is important for all nurses- not just those in formal leadership roles.

Leadership development initiatives should extend into co-curricular and extracurricular activities that are supervised or mentored by faculty and nurse leaders. Evidence suggests that high-impact practices that can shape college students' capacities for socially responsible leadership fall into four categories: sociocultural conversations, mentoring relationships, community services and membership in off-campus organizations. These categories, grounded in the tenets of the Social Change Model, provided guidance for the activities in our nursing student leadership development program. Specific examples include:

- 1) Sociocultural conversations: small group meetings where nurse leader, faculty, alumnae/i and staff facilitators address how all nurses can advocate for the vulnerable and underserved to influence health and social policy agendas and facilitate dialogue around socio-cultural issues in the clinical settings; required written reflections and blogposts about program activities; opportunities for language and cultural immersion; student participation in the school's diversity advisory activities; open classroom and clinical discussions on sociocultural issues; alliances with multicultural organizations on campus.
- 2) Mentoring relationships: required meetings with assigned faculty mentor with follow up written reflection; developmental mentoring experience whereby upperclassmen are guided as they provide

mentorship for underclassmen; leverage other mentoring opportunities on campus, such as research fellowships and student organization involvement.

3) Community service: involve students in local health fairs/flu clinics; encourage participation in service immersion opportunities; seek clinical placements in nontraditional clinical settings within the community.

4) Membership in off-campus organizations: State and National Student Nurses Association and local chapters of the National Black Nurses Association, National Association of Hispanic Nurses, Asian American and Pacific Islander Nurses Association, et al. are eager to engage students and provide opportunities for networking, professional growth, and sociocultural reflection. Other organizations receptive to student involvement include the Institute for Healthcare Improvement, Peer Health Exchange, American Red Cross, etc.

Social change is an active, long term process that begins with insight and is realized through skills that can be taught and developed in a nursing program and carried forward in one's career and as a citizen of society. Nurse educators are in a prime position to cultivate leadership for social change through intentional student programs that recognize the developmental nature and need for inclusivity in student formation. The next challenge will be to define and track specific outcomes that would demonstrate the long-term effectiveness of socially responsible leadership development programs; those outcomes should reflect the participants' activities that are aimed at reducing health disparities, promoting social justice, and contributing to the betterment of society.

## LDR PST 2 - Leadership Poster Session 2

### Global Service Learning Aboard the U.S. Navy's Pacific Partnership Mission

---

*Gary Glauberman, MS, RN, APHN-BC, USA*

#### Purpose

The purpose of this presentation is to describe a Global Service Learning partnership between the UH Mānoa Nursing program and the U.S. Navy's Pacific Partnership mission with the aim of developing skills to address global health challenges as part of an international, interdisciplinary team of providers and health educators.

#### Target Audience

The target audience for this presentation is nursing educators, undergraduate and graduate nursing students interested in engaging in global health.

#### Abstract

Nursing around the world is facing complex challenges to individual, community and global health. To be prepared to face these challenges, nursing students need to develop a global perspective on local health issues. Academic institutions that educate nurses must establish creative partnerships to provide innovative learning environments for nursing students to improve their skills while working together with professionals from multiple disciplines to address the broad range of social determinants that influence health. Global Service Learning (GSL) offers a model for promoting culturally compassionate learning and collaborative leadership skills while addressing global health issues. GLS is based on seven core principles with an aim of immersing students in service-learning experiences that are mutually beneficial to the learner as well as the population they serve.

The collaboration between the University of Hawaii at Mānoa (UHM) School of Nursing and Dental Hygiene and the U.S. Navy's Pacific Partnership mission demonstrates this kind of engagement. The Pacific Partnership mission is an annual humanitarian assistance exercise to Asia and Pacific Island countries. Together with participants multiple countries and multiple disciplines, UHM nursing faculty and graduate students conduct training and educational exchanges with international participants, where they exchange best practices for on nursing care, disaster preparedness and public health.

The purpose of this presentation is to describe this GSL partnership between the UHM Nursing program and the U.S. Navy's Pacific Partnership mission, and its influence on UHM Nursing participant's ability to provide health services and education as part of an international, interdisciplinary team of providers and health educators. The target audience for this presentation is nursing educators, undergraduate and graduate nursing students interested in engaging in global health. Through shared efforts in health promotion, students improve their capacity to work side-by-side with people of diverse cultural backgrounds and professional training; they develop a deeper understanding of how improvements in global health are accomplished; and they build confidence in identifying themselves as global health nurse leaders.

## LDR PST 2 - Leadership Poster Session 2

### Evaluating the Outcomes and Impact of Five (5) Projects Using the Case Study Method

---

*K. Elizabeth Mokoka, PhD, RN, South Africa*

*Hester C. Klopper, PhD, MBA, RN, RM, FANSA, South Africa*

#### Purpose

To describe the use of the case study methods in evaluating the outcomes and impact of projects

#### Target Audience

Project and Programme managers, nurse researchers and evaluators

#### Abstract

**BACKGROUND:** Between 2006 and 2012, Atlantic Philanthropies (AP) invested 32.8 million USD to strengthen the nursing sector in South Africa. Of the work that has been done, through nineteen projects, five projects were identified and selected by Atlantic to be documented as case studies to be shared with a wider audience of the nursing and other relevant sectors and interest groups. The Forum for University Nursing Deans of SA (FUNDISA) was contracted to construct the case studies.

**OBJECTIVE:** To develop case studies on selected projects to describe what was achieved, the projects' outcomes and impact it made in the lives of the beneficiaries; and to document lessons and best practices in order to share and replicate these best practices.

**METHODS:** Each of the five case studies were described, using the appreciative enquiry approach, where achievements, assets, innovations, strengths, as well as lessons learnt and opportunities for sustainability, high points and success stories were described from data collected from multiple data sources using methods such as interviews, observation and document reviews.

**RESULTS:** In all 5 case studies, replicable best practices were identified and described. In collaboration with Atlantic Philanthropies, the case studies are disseminated to all the relevant audiences through publications and presentations. The specific case study method used will also be shared with other project implementers as it can be used during the conclusion of projects.

**CONCLUSION:** Case studies are suitable for answering questions that funders might have regarding their investments. They are also useful in evaluating the outcomes and deliver evidence that the project is having an impact on the lives of beneficiaries.

### Novice Nurse Mentorship Programs to Transform Professional Development

---

*Alicia Glassco, MSN, RN, CNL, CNML, USA*

*Bernadette M. Longo, MSN, PhD, RN, CNL, APHN, USA*

#### Purpose

The purpose of this presentation is to present pilot findings that support inclusion of mentoring within new nurse residency programs. The authors present a successful program of mentoring that decreased attrition rate of new nurses and had an associated cost savings for the institution.

#### Target Audience

The target audience of this presentation are nursing professionals in leadership positions within hospital settings that employ newly-graduated (novice) nurses.

#### Abstract

Globally, the shortage of nurses continues despite increases in graduation rates. Nurses continue to leave the profession due to overall job dissatisfaction involving workload, stress, pay, and lack of advancement opportunities and interpersonal relationships (Chan et al., 2013). Alarming, newly-graduated novice nurses are especially vulnerable to leaving the profession. This workforce pattern challenges healthcare systems to implement innovative programs to retain their nurses.

Nurse Residency Programs have become common in modern healthcare systems (Rush, Gordon, Lilly, & Janke, 2013). These residency programs usually occur from 3 months to 1 year and utilize preceptors whose role is to supervise, tutor and teach the novice nurse. Thus, residency programs are helpful for role development and for building technical and organizational skills to perform the daily work, but lack support for the mental well-being of the novice and fail to address their career development. Therefore, additional mentoring can meet these needs and likely improve overall satisfaction and retention of novice nurses. In contrast to preceptors, mentors are non-judgmental seasoned peers who counsel the novice and offer career guidance and support. The concept of nurse mentoring is common in academia and upper nursing management in hospital settings. However, only a few hospital systems have implemented nurse mentoring programs for their novice nurses (Rush, et al., 2013).

A Novice Nurse Mentor (NNM) Program was piloted at a Level II Regional Trauma Hospital during 2013-14. The NNM Program was offered concurrent with the standard year-long New Nurse Residency Program. The NNM Program focused on developing and supporting nurse mentors to successfully mentor novice nurses. Mentors were recruited who met qualifications of being a registered or advanced degree nurse,  $\geq 2$  years experience, willingness to support a mentee without compensation, a self-defined positive personality, and were not employed in a management position. Pairing of mentors with potential mentees ( $n = 64$ ) occurred at two mingle events resulting in a pilot cohort of 15 pairs. After a formal meeting with the project coordinator, the pairs met weekly for the first month, then bi-weekly or as needed. Mentorship development workshops were offered monthly on issues such as work-life balance, adult learning theory, and networking. In addition, the mentors were facilitated with group processing to share about the role and any emerging issues. This pilot project followed the 15 mentor/mentee pairs over a period of 4 months. The institution's baseline novice nurse retention rate was 74% per year. There was an estimated financial loss of \$64,000 per novice nurse who would leave the institution. A pre/post survey of all nurses in the New Nurse Residency Program was used to assess differences between the 15 mentoring-exposed novice nurses and 49 reference novice nurses.

Novice nurse retention rates improved from 74% to 79% per year, an institutional cost savings of \$192,000. Significantly more mentor-exposed novice nurses (85%) rated having peer support as a satisfying aspect of their work environment compared with (70%) of the reference novice nurses ( $p = .018$ ). Although not significantly different ( $p = .20$ ), 60% of the mentor-exposed novice nurses rated ongoing learning as one of the most satisfying aspects of their work environment compared to 50% of the

reference novice nurses. Positive qualitative feedback was received from mentors and mentees for continuation of the program. As a result, the institution incorporated the mentoring program into the existing residency program and will continue to develop and monitor effectiveness.

Voluntarily NNM Programs, offered within standardized nurse residency programs, can transform healthcare environments and enhance the professional development of nurses. This pilot project demonstrated the cost effectiveness of incorporating mentoring for those novice nurses seeking more support and guidance from seasoned nursing role models. Likewise, experienced nurses had the opportunity to provide service to the discipline by mentoring new nurses thru their first years. Future structured and institutionally-supported mentoring programs need to measure effectiveness in order to create an evidence base for retaining novice nurses and transform professional development for all.

## LDR PST 2 - Leadership Poster Session 2

### Engaging Students in the Classroom Using Active, Team-Based Learning Strategies

---

*Paula Baumann, PhD, MBA, BSN, RN, CNE, USA*  
*Cindy L. Farris, PhD, MSN, MPH, BSN, CNE, USA*

#### Purpose

The purpose of this presentation is to discuss strategies to create a learner-centered classroom environment that engages students while focusing on teamwork and collaboration. Team-based learning activities, technology use in the classroom, peer review, collaborative testing, formative evaluation methods, and an environment based on respect and authentic learning are addressed.

#### Target Audience

The target audience of this presentation is educators in nursing programs or in staff development who are interested in utilizing active learning strategies to engage learners and improve learning outcomes while teaching teamwork, collaboration, and fostering an environment based on respect.

#### Abstract

As students enter into nursing school faculty are charged with socializing students into the professional role of nurses while helping students develop a sound knowledge base of critical nursing concepts. Along with teaching students critical nursing concepts, faculty must also assist students to develop skills in communication, professionalism, teamwork, and collaboration in order to be a safe and effective member of the interprofessional health care team. Research has shown that a transformation to learner-centered, active learning strategies must be incorporated into nursing curriculums for students to meet future demands required of new nurses to provide safe, quality patient care. By providing students with the opportunities to consistently practice communication skills, giving constructive peer feedback, and dealing with conflict in a safe environment, students are better able to transition to practice already possessing some of these crucial skills. This session will discuss strategies implemented in a beginning level nursing course to create a learner-centered classroom environment that engages students while focusing on communication, teamwork, and collaboration. Strategies that will be discussed include: Team-based learning activities, use of various technologies-including Socratic in the classroom to address different learning styles, constructive peer review, collaborative testing, formative evaluation methods, and creating a classroom environment based on respect and authentic learning. This session will provide examples of active learning strategies and how to modify existing assignments for more engaged students. Sharing of strategies, evaluation tools, grading rubrics, and a discussion of modified team-based learning will be addressed. In addition, a detailed discussion of the use of collaborative testing and how it can be utilized in nursing courses along with data related to student outcomes will be provided. The educational technologies used in the classroom, along with strategies implemented to create a classroom environment based on mutual respect supportive of deep learning will also be addressed.

## LDR PST 2 - Leadership Poster Session 2

### Implementing the Clinical Nurse Leader (CNL) Role in Japan

---

*Asako Katsumata, PhD, ME, BA, RN, CNL, USA*

*Shannon K. Lizer, PhD, FNP-BC, USA*

*Gordana Dermody, MSN, RN, CNL, USA*

#### Purpose

The purpose of this presentation is to discuss how collaborative partnerships were formed with Japanese nursing leaders to advance nursing roles, improve nursing practice to promote better nursing work environments, and quality nursing care.

#### Target Audience

The target audience of this presentation include clinical and academic nursing leaders.

#### Abstract

**Background:** The provision of high quality, efficient, and cost-effective healthcare care is a complex process in health systems across the globe (Lindberg, et al., 2008). Care delivery models, supply and demand of human and fiscal resources, and population specific health care needs within various sociocultural contexts are complicated issues. These issues require individuals with expert knowledge and skills in order to be solved. Therefore the CNL role could be a catalyst to improve healthcare outcomes in other countries through systems expertise, advanced clinical skills that optimize interdisciplinary collaboration and the development of partnerships as a leader across the healthcare delivery system (Harris, et al., 2014).

**Program:** To promote the implementation of the CNL role in Japan a multifaceted approach was used. First, over three years (2012, 2013, and 2014) the assumptions of the CNL role were disseminated in major medical centers, universities, and professional nursing organizations across Japan. In particular, the intersection of care, health, and cost known as the triple aim, was a topic of priority. In addition, examples of CNL successes were shared as exemplars. Through this process of dissemination 14 institutional partnerships in Japan were developed. In response to these partnerships a special agreement was requested from the Commission on Nurse Certification (CNC) and AACN to promote qualified Japanese Nursing leaders in achieving the faculty CNL certification. Subsequently in 2014 a 7-day CNL seminar was delivered at Saint Anthony College of Nursing comprised of theory, case studies and a clinical immersion experience to prepare qualified Japanese nursing leaders to achieve CNL certification. After successful certification the goal is to partner with certified faculty and universities to develop a socio-culturally congruent CNL curriculum meeting the AACN (2013) competencies and curricular expectations for CNL education and practice.

**Outcomes:** 1) Finalized a collaborative agreement with CNC and AACN to promote CNL faculty certification for qualified nursing leaders in Japan. 2) Presentations in 2012, 2013, and 2014 totaling 40 presentations delivered about the CNL role to a variety of universities and medical centers, and professional nursing associations. 3) Developed formal institutional partnership agreements with 2 major Japanese universities. 4) Delivered the first bilingual comprehensive CNL seminar with clinical immersion component to 7 qualified Japanese nursing faculties. **Work in progress:** 1) Grant submission by a Japanese partner institution to facilitate the implementation of CNL programs across Japan. 2) Japanese partners are currently preparing for certification on 2015. 3) CNL seminars are planned in Japan and in the U.S. in 2015.

**Recommendations:** Successful introduction of new nursing roles is possible through careful strategic planning, consensus building, and developing strong personal partnerships with leaders, and between key organizations.

## LDR PST 2 - Leadership Poster Session 2

### Nursing Simulation: It's Not Just for Skills Anymore

---

*William T. Campbell, EdD, MS, RN, USA*

#### Purpose

to introduce to nursing educators/faculty that the use of simulation for nursing education is not limited to teaching, practicing, and/or testing of skills. Rather, simulation may be used for teaching collaboration, interdisciplinary approaches, medication knowledge, priority setting, communications, leadership, team work, delegation, and critical thinking.

#### Target Audience

nurse educators/faculty who are interested in using simulation for the education of nursing students at various levels or even in the hospital with staff development and/or continuing education.

#### Abstract

Ever since Mrs. Chase in 1911 nursing education has utilized the mannequin for skills. The earliest mannequins in nursing were used for transfers, positioning, and other non-invasive skills & learning activities. Following the lead of medicine, especially anesthesiology, they were now being used for the training of nurses instead of doctors. The mannequins used were very low fidelity and were literally dolls, but quickly became useful for skills demonstrations, practice, and testing while maintaining the important patient safety. They were often just skills trainers or partial torsos with an orifice or lumen to accommodate a tube's insertion.

Computers and simulation changed that. This time following the lead of the airline industry, aeronautics, and the military computerized nursing simulation moved away from the screen and would begin to incorporate the mannequin in the role of the patient. Again, with patient safety as the ultimate goal, education of nurses was the desired outcome. The fidelity level of the mannequins began to increase, but the activities were still basic skills instruction.

Even with the higher fidelity mannequins and the technological advancement of simulation many nursing instructors remain at the skills level of simulation because that is how they learned and where they are comfortable. Tradition is ingrained and often difficult to overcome. Simulation must move beyond Mrs. Chase.

My Nursing Care of Children & Adolescents course utilizes 3 days of simulation in a 12 day clinical rotation. Twenty-five percent (and up to 50%) of clinical being simulation maintains a consistent level of clinical education & preparation and maintains competency for the licensure exam & for employment (Hayden, Smiley, Alexander, Kardong-Edgren, & Jeffries, 2014). The simulations increase in complexity as the semester progresses. The simulations have basic skills, but go far beyond. The simulations, scenarios, nurse's reports, and physician's orders are designed to introduce questions and situations that will demand interdisciplinary collaboration, reinforcement of the knowledge of medications using available resources, setting priorities, developing leadership skills, building team work, delegating interventions, and the application of critical thinking. The simulations are designed to be a learning experience and not an assessment of the student. By removing instructor grading the stress level is diminished and learning increases in a more positive environment.

This session will describe tasks & orders inserted into the simulation scenarios to encourage a higher level of learning. It will also report the students' comments and reactions.

## LDR PST 2 - Leadership Poster Session 2

### The Development of a Formal Mentoring Model and Program in a Faith-Based School of Nursing

---

*Kathryn A. Osteen, PhD, MSN, BSN, RN, USA*  
*Barbara Devitt, MSN, BSN, RN, USA*  
*Lisa Otto, MSN, BSN, RN, CMSRN, USA*  
*Cheryl Riley, DNP, MSN, BSN, RN, NNP-BC, USA*  
*Julie Millenbruch, PhD, MSN, RN, CCRN, USA*  
*Cathy Miller, PhD, MSN, RN, USA*

#### Purpose

The purpose of this poster presentation is to present the Formal Mentoring Model and Program developed by the Mentoring Task Force at Baylor University Louise Herrington School of Nursing (BULHSON).

#### Target Audience

The target audience of this presentation is nurse researchers, educators, and administrators.

#### Abstract

Mentoring is a leadership initiative and a strategy that promotes collaboration, net-working, and inter-professional relationships. The purpose of this poster presentation is to present the Formal Mentoring Model and Program developed by the Mentoring Task Force at Baylor University Louise Herrington School of Nursing (BULHSON).

Mentoring is the foundation of self-development and launching of a professional career trajectory (Hunt & Ellison, 2010; Meier, 2013). Mentoring is a dynamic, evolving, ever changing relationship between individuals (Grossman, 2013). The mentoring process involves one individual guiding another to develop both personally and professionally (Grossman, 2013). Mentoring within a workplace setting is helpful to increase employee attitudes, motivation, and career outcomes (Meier, 2013).

The mentorship model developed by the BULHSON Mentoring Task Force, was designed to incorporate seven concepts identified by the Task Force as important to a successful faculty mentoring program. The seven concepts include the BULHSON mission and vision, the mentor, the mentee, Baylor University Pro Futuris (2012), and visionary leadership within the context of a Christian academic community. Finally, elements of the nursing process, ongoing assessment and evaluation, are incorporated. The goal of the mentoring program is transformational mentorship, culminating in the outcomes of Christian excellence in teaching, leadership, service, professional practice, scholarship, and research.

The conceptualization of the Mentorship Model centers on the tenets of the strategic vision of Baylor University Pro Futuris (2012), and the vision and mission of the school of nursing "to prepare baccalaureate and graduate level nurses, within a Christian Community, for professional practice, health care leadership, and world-wide service" as well as the nursing school's motto "Learn. Lead. Serve." The theoretical framework for the Model is based on the System Theory of input, throughput, and output (Kelly, 2011), and consists of interdependent entities, communication, and interactive processes for the development of predetermined outcomes. Input information of the model consists of the Mentor-Mentee Agreement, the foundation of the mentoring relationship. Other pertinent input data includes SMART Goals, (Specific, Measureable, Achievable, Results-oriented, and Time-based) to focus on faculty development and career trajectory for non-tenured and tenured faculty, as well as an organizing scheme of policies and procedures of the structure and organization for the mentoring program.

The input melds into the throughput of contiguous interacting circles of entities with continual assessment and evaluation, while encased in the foundation of a Christian community. These entities include the Baylor University Pro Futuris (2012), the mission, values and vision of BULHSON and the dynamics of the

mentor and mentee relationship, interactions, and processes interconnected by a visionary relationship that is the underpinning of the transformational mentorship. The desired outcomes of the transformational mentorship are teaching, leadership, service, professional practice, scholarship, and research. At the heart of these outcomes are the priorities of the enactment of BULHSON motto “Learn. Lead. Serve” with professional practice as the fundamental foundation of the nursing profession. These outcomes of the mentoring program, promote excellence in the profession, the school of nursing, and above all, increased evidence-based quality patient care.

## LDR PST 2 - Leadership Poster Session 2

### Job Satisfaction as Experienced by Generation Y Nurses: A Phenomenological Study

---

*Sonia Anselmo-Witzel, PhD, MEd, RN, SNT, USA*

#### Purpose

The purpose in this presentation is to describe the lived experiences of job satisfaction among Generation Y registered nurses in the workplace. The results from this study will potentially allow nursing leaders to develop strategies in retaining and recruiting this generation of nurses

#### Target Audience

The target audience of this presentation is nurse leaders interested in retaining and recruiting Generation Y nurses by identifying satisfiers Generation Y nurses identified in the workplace. Exploring job satisfaction from the perception of Generation Y nurses will assist nurse leaders in developing strategies to retain this generation of nurses

#### Abstract

Job satisfaction in nursing has been reported to be at an all-time low, which has posed a challenge for healthcare organizations (Chung & Fitzsimons, 2013). With an increasing shortage of nurses, awareness needs to be directed toward understanding job satisfaction among nurses. When nurses are dissatisfied with their job, healthcare organizations can spend millions of dollars per year on orientating and recruiting new nurses, as well as employing traveling or contract nurses (Morgan & Lynn, 2009).

Efforts by healthcare organizations and nurse leaders are necessary to address job satisfaction among Generation Y nurses to maintain and recruit this generation to mitigate the nursing shortage in the United States. According to Zinn, Guglielmi, Davis, and Moses (2012), the nursing shortage affects all aspects of healthcare, which threatens patient safety, quality of patient care, and the ability of healthcare organizations to meet the healthcare needs of Americans. A worsening shortage of nurses can be lessened by promoting retention of younger nurses, members of Generation Y, entering the nursing profession (Tourangeau, Cummings, Cranley, Ferron, & Harvey, 2009). Focus should be on job satisfaction for Generation Y nurses, because they are the future generation of nurses of our society and world.

Job satisfaction is important to assess in Generation Y nurses because this generation is just starting their careers. Job satisfaction has been identified as one of the most significant reasons affecting nurses' choices to continue at their place of employment (Tourangeau et al., 2009). Since job satisfaction has been shown to predict retention of employees, it is an area of concern within Generation Y nurses because this generation is more likely to leave their organization if they are not satisfied with their job (Morgan & Lynn, 2009).

Job satisfaction is the major contributor on intent to remain employed (Tourangeau et al., 2009). According to Tourangeau et al. (2009), previous research studies have had little success in explaining what components of job satisfaction cause nurses to remain employed. Understanding the lived experiences of job satisfaction among Generation Y nurses is needed in the retention of younger nurses to make sure an adequate supply of registered nurses remain in the workforce. The results from this present study, which identify job satisfiers for Generation Y nurses, will potentially allow nursing leaders to develop strategies in retaining and recruiting this generation of nurses (Morgan & Lynn, 2009).

According to Wieck, Dols, and Northam (2009), research indicated high levels of stress and low levels of occupational fulfillment are being reported among new graduate Generation Y nurses. Job dissatisfaction is a concern to healthcare organizations, which could amount to spending millions of dollars per year on orienting and recruiting new nurses (Morgan & Lynn, 2009). Wieck et al. (2009) reported estimated costs to replace a registered nurse range from \$10,000 to \$60,000, and \$42,000 to \$64,000 to replace a

specialty nurse. Generational differences, personnel shortages, and an aging population are causes for healthcare organizations to think about reasons that influence job satisfaction among Generation Y nurses.

The purpose of this descriptive phenomenological study was to explore the lived experiences of job satisfaction among Generation Y nurses in the workplace in an urban hospital located in Upstate New York. The research design involved in-depth semi-structured interviews with 10 Generation Y registered nurses. The central research question that guided the study was: What is the lived experience of job satisfaction for Generation Y nurses at an acute-care facility? Herzberg's dual-factor theory of job satisfaction and motivation formed the theoretical framework for this study. Colaizzi's seven-step method was used to guide the analysis of the study to identify four main themes and six sub-themes in the data generated from the participants. The four themes and six sub-themes were as follows: (a) experiences of feeling good, (b) relationships, (c) job strain, and (d) having choices. The sub-themes making a difference, feelings of value, and I found my calling emerged from the theme experiences of feeling good. The sub-themes connections, balancing life, and feeling devalued emerged from the theme relationships.

This study may bring awareness to nurse administrators and managers if they wish to retain Generation Y nurses by addressing the importance of understanding satisfiers Generation Y nurses identified. Exploring the lived experiences of job satisfaction and the meaning Generation Y nurses attach to those experiences may potentially increase understanding about generation-specific retention within healthcare organizations. Nurses can benefit from the recognition that job satisfaction within the profession may lead to decreased turnover rates in Generation Y nurses.

### Constructing the Role of Global Health Nursing

---

*Michele J. Upvall, PhD, MS, BS, RN, CRNP, USA*

*Jeanne M. Leffers, PhD, MSN, MA, BA, RN, USA*

#### Purpose

The purpose of this presentation is to explore a definition of global health nursing grounded in a framework of global ethics and sustainability of global health nursing partnerships.

#### Target Audience

The target audience of this presentation is nurses interested in developing global health partnerships for clinical practice, study abroad, consulting, or volunteering and service opportunities.

#### Abstract

There is a need for a definition of global health nursing and exploration of nursing roles for global health to ensure ethical, responsible and effective practice. This presentation will offer a formal definition of global health nursing developed from an extensive review of the literature. This definition of global health nursing focuses upon essentials such as social determinants of health, cultural humility, deliberate and reflective practice, and full partnership with individuals and/or communities. Implications for global health nursing will be explored through Crigger's (2008) framework of global nursing ethics. Essential characteristics of global nursing ethics include listening to the voices of those who are marginalized, balancing both community and individual interests, using reflexivity, understanding the required human capacities for human flourishing, and utilizing business and technology to further social justice rather than exploitation. Building upon the definition of global health nursing, recommendations for the ethical implementation of global health nursing practice roles that build and sustain partnerships will be discussed.

### Nursing Management of Head Nurses Receiving the Outstanding Award

---

*Jiraporn Rattikarnsuka, MSN, RN, Thailand*  
*Areewan Oumtanee, PhD, RN, Thailand*

#### Purpose

The objective of this research is to describe the management experiences of the head nurses who received the outstanding award for following the Hermeneutic phenomenology research methodology.

#### Target Audience

Understanding experiences of the head nurses who won the outstanding award

#### Abstract

The objective of this research is to describe the management experiences of the head nurses who received the outstanding award for following the Hermeneutic phenomenology research methodology. Information was provided by the fourteen head nurses who received the outstanding award from the department of nursing of one tertiary hospital. The information was obtained by in-depth interviews. An exact transcription of the interviews was analyzed following the Diekelman's method, and the results are as follows:

- 1) Self-development: Head nurses take the initiative to learn from the senior head nurses, who they believe are excellent role models. The head nurses enthusiastically focus on personal development, gaining up-to-date knowledge and learning to use it as they improve their ability to supervise in their work areas. Learning to have balance in their lives is considered very important. To achieve this balance, they finish a day's work and leave it behind as they go home. At home they focus on family and relax the body and soul.
- 2) Human development, head nurses have the human management and create the good environment for working, support the staff to generate the work for learning and self-development, provide the training or higher education for supporting the ability in various sides, giving the job follow the staffs' skill, knowledge and ability, open the opportunity for making the decisions by them own, more develop the staffs' ability, Head nurses will be the consultant and solving both working problems or personal problems for the staffs, in addition to attempt to build up the working environment as the second house of staffs, warmth, good relation, helping each other and would like to work.
- 3) Work development: Head nurses are assigned very important tasks. Work planning, creating projects that benefit patients and the wards, standardization of work methods and practices, and the coordination of interdisciplinary teams for patient care are some of the major responsibilities. Additionally, the head nurses must be sincere in their intentions when they encourage hard work and achievement. They must be able to justify their management techniques and work planning. Head nurses feel a sense of responsibility for the happiness in the lives of their staff members. Although the head nurses have these responsibilities, they also must understand the division between the work force and management as it relates to the organization. Finally, they feel very proud to be nurses and they love their work. This helps to keep good relations within the organization.

Understanding the results of the head nurses experiences who won the outstanding award, the nurse administrations are better able to plan for the development of other head nurses.

### Building Mexico-U.S. Academic Partnerships: Bridging Cultures and Breaking Barriers

---

*Carolina Huerta, EdD, MSN, BSN, RN, FAAN, USA*  
*Juana Mercedes Gutierrez Valverde, DSN, MSN, RN, Mexico*

#### Purpose

to: 1.) Describe a partnership between Universidad Autónoma de Nuevo Leon School of Nursing and University of Texas-Pan American Nursing Department; 2.) Discuss school similarities and benefits/challenges encountered in establishing this partnership; 3.) Demonstrate success of a global academic partnership, and 4.) Discuss strategic alliances that enrich learning.

#### Target Audience

individuals interested in establishing a global/international academic partnership; nursing educators with an interest in study-abroad programs; academicians interested in learning how to establish international linkages among nursing schools.

#### Abstract

Knowledge of global health care is considered an essential component of nursing in the 21<sup>st</sup> century. One avenue to impart this knowledge to nursing students is the creation of international partnerships. These international partnerships promote educational experiences that provide nursing students with an opportunity to learn the different country-specific educational systems, develop cultural awareness necessary when providing health care, and become more sensitive to the importance of making global connections in a technologically driven world. This presentation focuses on one such partnership between a public University in Texas and Universidad Autónoma de Nuevo Leon, Mexico (UANL). Geographically, the two universities are separated by the Rio Grande River. The university in Texas is located in the lower Rio Grande Valley and is approximately 12 miles from the Texas-Mexico border. The student population is approximately 88% Mexican-American. UANL is located in Monterrey, Mexico, approximately 160 miles from the border that divides the Rio Grande Valley and Mexico. Although many of the students share a common heritage and only a river separates the two areas, culturally these students are not the same. This presentation describes the development of an international collaboration between two nursing programs, one in Mexico and the other in the United States. The two speakers, one from the United States and the other from Mexico, will each present their unique viewpoint of this evolving experience.

The purposes of this presentation are to: 1.) Describe the development of a partnership between Universidad Autónoma de Nuevo Leon School of Nursing and a university in Texas' Nursing Department and programs; 2.) Discuss the similarities between the two schools and the benefits and challenges encountered in establishing the partnership; 3.) Demonstrate the success of an international academic partnership, and 4.) Discuss potential strategic alliances that will enrich student and faculty learning in both countries.

## LDR PST 2 - Leadership Poster Session 2

### Promoting Retention and NCLEX-RN Success on the First Attempt: Roles of Remediation, Self-Confidence and Salutogenesis

---

*Ernestine Hunter Cuellar, PhD, MSN, BSN, RN, PMHCNS-BC, USA*

#### Purpose

to explore coping strategies and resources that faculty may employ to assist nursing students who are dealing with stress, (2) to investigate the relationship between salutogenic factors (those facilitating adaptive coping) and perceived self-confidence among nursing students and, (3) to invite a call to action for research addressing these issues.

#### Target Audience

Nursing Faculty and graduate students.

#### Abstract

Schools of nursing and nursing faculty are struggling with high attrition rates and low NCLEX-RN first time pass rates. At the same time students are struggling with progressing and completing nursing programs while maintaining their own sense of self-worth. There is limited research addressing the association of positive factors that sustain nursing students in stressful situations, i.e., preparing for success on NCLEX. Student nurses who manage stress as a component of maturity and development become nurses who are able to monitor and moderate stress in their careers.

Salutogenesis is framed as a range of emotional responses occurring from health to disease (pathogenesis) throughout an individual's lifespan. The theory of salutogenesis has been explicated as the capacity to survive stressful events while gaining enhanced psychological strength to face future stressful events. A sense of coherence (SOC) is one of the essential influences identified in individuals who managed to sustain a positive world view in spite of encountering extreme life stressors. In addition to the SOC the positive world model encompasses three main elements: (1) comprehensibility, (2) manageability, and (3) meaningfulness.

Comprehensibility, the core element of salutogenesis, is indicative of the mutual relationship an individual has in gaining a coherent understanding of structure within the individual's environment, e.g., nursing school. The second element, manageability, encompasses implementing positive mechanisms and other coping resources to control that environment. Meaningfulness, the third element, addresses the emotional and spiritual element that an individual may identify as valuable and worthy, for example the desire to become a nurse.

The aims of this presentation are: (1) to explore coping strategies and resources that faculty may employ to assist nursing students who are dealing with stress, (2) to investigate the relationship between salutogenic factors (those facilitating adaptive coping) and perceived self-confidence among nursing students and, (3) to invite a call to action for research addressing these issues. This presentation is a synthesis of the educational literature addressing Salutogenesis and identifying methods suitable to enhance remediation and promote self-confidence among nursing students preparing for NCLEX.

### Factors Influencing Professional Behavior of Staff Nurses

---

*Sopida Lorjai, BSN, RN, Thailand*  
*Areewan Oumtanee, RN, PhD, Thailand*  
*Duanphen Konlakit, MSN, RN, Thailand*

#### Purpose

analyze selected factors affecting professional behavior

#### Target Audience

professional nurses, staff nurses, nurse manager and nurse who concern about professional behavior.

#### Abstract

The purpose of this research is to analyze selected factors affecting professional behavior. The selected factors composed of psychological empowerment, Achievement Motive and personal factor including age and marital status. A sample of 386 staff nurses at working in government university hospitals, Thailand with 1 year working experience were selected by using multi-stage sampling. Psychological empowerment of Spreitzer, Achievement Motive of McClelland were used as a conceptual framework and developed study questionnaires. Those questionnaires were tested for content validity and reliability with alpha of .90, .92, .96, and .96 respectively. Results from statistical analysis revealed the followings:

1. Model 1: The variables that explain professional behavior are **psychological empowerment and Achievement Motive**. They are accounted for 57.1% of the variance.
2. Model 2: The variable that explain Achievement Motive is **education of bachelor degree**. It is accounted for 2.4% of the variance.
3. Model 3: The variables that explain **psychological empowerment** are **education of Master degree and age**. They are accounted for 9.8% of the variance.
4. According to path analysis, professional behavior is affected by psychological empowerment (direct effects), Achievement Motive (direct effect) and age and education (indirect effects).

## LDR PST 2 - Leadership Poster Session 2

### The Virtual Nursing Symposium: A Transforming Undergraduate Nursing Student Conference

---

*Nancyruth Leibold, EdD, MSN, RN, PHN, LSN, CNE, USA*  
*Laura Marie Schwarz, DNP, RN, CNE, USA*

#### Purpose

The purpose of this presentation is to disseminate information about the Virtual Nursing Symposium, an undergraduate nursing student conference. Students present their evidence-based projects to share their innovative and creative ideas with others at a virtual conference, via the online Learning Management System.

#### Target Audience

The target audience is faculty interested in a similar experience for online/distance students at their school or those interested in virtual nursing conferences.

#### Abstract

Undergraduate research conferences are common events in higher education that allow students to present their research and evidence-based projects. However, this is impractical for nursing learners in an online program to be able to attend. Some learners live a long distance from the campus location for the undergraduate research conference. Students may also have an established career with working hours, or family obligations so attending would be a hardship.

The Virtual Nursing Symposium, a two-day online nursing conference is a solution for RNs who are completing their BS in nursing in an online learning program. The location of the Virtual Nursing Symposium is the online Learning Management System. The learning platform is a convenient, easy to use approach for online nursing students to be able to attend and/or present at an undergraduate conference. The poster presentation includes the vision, and planning, including the call for abstracts, abstract reviews, web site development, implementation, and evaluation of the Virtual Nursing Symposium.

Dissemination of information is an important aspect of advancing the discipline of nursing. Based on this strong belief, nursing faculty in the RN to BS in nursing completion program mentored learners about the dissemination of information in courses and specific to the Virtual Nursing Symposium. Faculty coached learners on how to write an abstract, how to use the online abstract submission program (created by the authors for Symposium abstract submissions), and how to author creative and interesting electronic posters and PowerPoint presentations.

Learners submitted the abstracts of their evidence-based projects for review by the Planning Committee. Learners received notice of submission results and specific instructions for when to post their electronic posters and PowerPoint presentations in the Virtual Nursing Symposium that was set up in the online Learning Management System. Twenty-seven online nursing learners presented their electronic posters or PowerPoint presentations via the Learning Management System at the first Virtual Nursing Symposium. Symposium brochures with the presenter's names, credentials, presentation titles, and presentation abstracts and were distributed at the entrance to the Virtual Nursing Symposium forum by way of an electronic PDF file. Invitees include all faculty and students in the RN to BS program. Each presenter started a new discussion thread in the Virtual Nursing Symposium where their presentation was posted, along with their abstract. Each presenter visited their presentation thread frequently during the two-day period to answer any questions and dialogue with attendees. Attendee evaluation of the Virtual Nursing Symposium is quite favorable. This poster includes color images of the Virtual Nursing Symposium, along with informational narratives.

### Informatics for Nurse Leaders: Technology Impacting the Care of the Older Adult

---

*Johnanna Hernandez, PhD, MSN, RN, APRN, FNP-BC, USA*  
*Julie Millenbruch, PhD, MSN, RN, CCRN, USA*

#### Purpose

The purpose of this presentation is to identify informatics technologies, nurse leaders must be aware of to lead the charge of caring for the explosive growth in older adults in the United States.

#### Target Audience

The target audience for this presentation are registered nurses, advance practice nurses, and health care leaders.

#### Abstract

The purpose of this presentation is to identify informatics technologies, nurse leaders must be aware of to lead the charge of caring for the explosive growth in older adults in the United States. The use of tele-health, social media, and home-based information technology can enhance care of the older adult with chronic health issues. Health related smart phone applications are found in abundance and used by many healthcare providers, patients, and care givers. Social media has the potential to both promote healthcare outcomes, provide educational resources and influence healthcare decision-making. Access to technology also provides new opportunities for ethical breaches of patient privacy. Nurse leaders must be up-to-date on current technology focusing on care of the older adult influencing healthcare providers and patients to formulate proactive and reactive policy for compliance in practice. The American Organization of Nurse Executives (AONE) note technology is changing the way healthcare is delivered. As providers and patients are incorporating the use of handheld devices and social media in to everyday life, nurse leaders must evolve and adapt informatics policies and procedures. Furthermore, the global impact of social media moves implications from microscopic to macroscopic, affecting humankind and societal norms.

### Exploring the Impact of a Medical Mission Trip on Graduate Nurse Practice Perceptions, Ideals and Practice Implementation

---

*Cindy Ford, PhD, MSN, BSN, RN, CNE, USA*

*Brenda Kinning, BSN, RN, USA*

*Amanda C. Raymundo, BSN, RN, USA*

*Charalene Ruble, MSN, BSN, RN, USA*

#### Purpose

The purpose of this presentation is to share the outcomes of a recent qualitative study involving graduate nursing students medical mission trip to Honduras.

#### Target Audience

The target audience of this presentation is faculty/nurses interested to learn about the learning outcomes of a travel abroad trip, and interested to hear the personal practice impact of a out of country trip experience.

#### Abstract

There is little debate about the significance of nursing educational experiences to promote cultural understanding as the population requiring care becomes increasingly diverse. Faculty are aware of the study abroad research results yielding positive learning outcomes such as participants reporting increased understanding of other cultures and a commitment to being a positive force for improvement of healthcare abroad and in their own community (Saenz & Holcomb, 2009); gains in substantive knowledge, changes in values and communication skills (Carpenter & Garcia, 2012) and increased understanding as well as uncomfortable, lingering, unsettled feelings resulting from awareness of inequities in resources (Evanson & Zust, 2006). Study abroad is one way to broaden American nursing students' worldview, but accommodating a study abroad course into a nursing curriculum can prove challenging.

One graduate nursing program faculty group felt so strongly about the importance/outcomes of some type cultural immersion trip, the faculty placed a global culture and health course within the required graduate curriculum. A recent medical mission trip to Honduras was the setting for this exploratory/qualitative study. After university exempted IRB approval (educational research), the collection of data included formative narrative journaling throughout the trip, a summative qualitative evaluation of the trip experiences and completion of the Go Culture Assessment (Dodd, 2013). The assessment tool is an online selection tool forecasting cultural performance, relationships, cultural adaptation, leadership development in relocation and personal development. The tool identifies 16 cultural engagement factors to help determine strengths and areas of need.

Data analysis from all data collected sources will contribute to the understanding of graduate nurse outcomes from the lived experience of the medical mission trip to Honduras. Results can be utilized for pre-trip educational planning and student participant preparation for cultural immersion in a country outside the United States. Further, it is believed the study outcomes will support nursing faculty to persist in the provision of cultural experiences for students in the face of challenges and barriers for implementation of international cultural immersion trips.

## LDR PST 2 - Leadership Poster Session 2

### Walking the Walk: Designing a 10-Week Research Course and Integrating an EBP Model

---

*Milena P. Staykova, EdD, APRN, FNP-BC, USA*  
*Daniele I. Staykov, student, None, USA*

#### Purpose

To discuss how nursing students develop EBP knowledge, skills, and attitudes over a 10-week class period To show the relevance of an EBP project. To share the course outline and expanded syllabus of a 10-week preparatory research course for baccalaureate nursing students

#### Target Audience

Academic educators preparing the next generation of professional nurses. Administrators looking for competent graduates

#### Abstract

In the 21<sup>st</sup> century's healthcare, behind every clinical decision making, there should be evidence to support it. Using Evidence-Based Practice (EBP) is not any more in the realm of opportunities but it has become an expectation for daily professional practice in any healthcare field including nursing. Professional organizations such as the American Association College of Nursing and National League of Nursing have drafted the future of professional nursing practice that should be based on evidence. Sigma Theta Tau International is one of the first international organizations that are supporting the development of nursing scholarship and clinical practice that is based on evidence. The public and employers expect the new graduate nurses entering clinical settings to integrate a high-quality level of evidence into their clinical decision-making and lead the delivery of safe, cost effective but quality, patient-centered care. However, at the academic institutions, the nursing research courses often put greater emphasis on learning research concepts rather than using the evidence to make clinical decision for a specific clinical condition and in a specific clinical situation. The limited EBP exposure leaves the students unprepared for the transition to the professional nursing practice. Furthermore, the fast-paced nature of the contemporary education demands from the faculty to deliver condensable information and quickly prepare clinicians using technology, engaging teaching strategies and student-centered education. Nursing faculty members face the challenge to select key content and meet course objectives in a short time period. The purposes of this project are to discuss how nursing students develop evidence-based practice knowledge, skills, and attitudes over a 10-week course and to share the design of a student project that is based on EBP model for clinical decision making.

**Method:** A pedagogical procedure to teaching nursing research and integrate an EBP model for clinical decision-making. Population: 27 traditional track and 27 accelerated (2<sup>nd</sup> baccalaureate degree) track BSN students from diverse backgrounds, age, and gender completed the 10-week course. Design: 10-week course that included educational modules integrating animated lectures, practice sessions, innovative and engaging in-class activities, exams, and poster and power point project presentations.

**Results:** 3 students posters were invited for presentation at the Week of the Nurse by the Sr. Director of Research and EBP of a Magnet-designated organization. The topic ranged from Catheter Associated Central Line Infections and Ventilator Associated Pneumonia to Violence at Workplace. Two posters were presented at the College Research Day; 1 abstract was invited for a poster presentation at a professional conference; 3 student abstracts were submitted for poster presentations at the 43<sup>rd</sup> STTI biannual convention. One team was invited to present at the local hospital's Evidence-Based Council. One team presented the group project to oncology nurses who were starting a new central-line-infection-prevention product that the students have researched during their project.

**Discussions:** The culture for EBP and clinical inquiry for best evidence can be ignited in a classroom at a baccalaureate degree level when students experience its close relevance to future professional

practice. A 10-week course is a demanding but rewarding experience for baccalaureate-prepared nursing students. Engaging students in active learning instead of attending lectures only can have the benefit of producing lifelong outcomes for future workforce that will embrace research and EBP.

### Lead: Empowering Clinical Leaders at the Bedside

---

*Joyce J. Fitzpatrick, PhD, RN, FAAN, USA*

*Kelly Hancock, MSN, RN, USA*

*Mary Beth Modic, DNP, RN, USA*

*Jennifer Van Dyk, DNP, RN, USA*

#### Purpose

The purpose of this presentation is to describe the process and outcomes of a formal program, LEAD, designed to transform the professional development of clinical nurses.

#### Target Audience

The target audience of this presentation is clinical nurses at all levels, nurse leaders, and nurse educators.

#### Abstract

The LEAD Program, Leadership Education and Development was designed to transform care at the bedside by empowering clinical nurses and assistant nurse managers in their roles as clinical unit-based leaders. The heart of the LEAD program is enhancing communication skills of clinical nurses. Participants are taught new communication skills, emphasizing their leadership role, with clinical colleagues, particularly physicians, nurse colleagues, and most importantly, patients and families. Key concepts of leadership/management were core to the program to empower the clinical nurses. Concepts addressed included: personal awareness and personal leadership skills and abilities, leading change, leading others individually and in teams, leading to enhance the patient and provider experience, and the leadership role in outcomes management. Objectives included: orient nurses to their leadership potential for affecting change at all levels of care; introduce ways nurses can include elements of leadership in day-to-day management and patient care activities; describe real and perceived barriers to nurse leadership from bedside to boardroom; and capture the nurses voices regarding leadership in clinical care through vignettes about nurse caring and the patient experiences. Participants submitted reflections on leadership, powerful descriptions of the program impact. Also, participants' leadership practices were charted prior to program implementation and at program conclusion, with significant differences noted collectively and individually. Program outcomes will be presented including key behavior changes and perceptions of the unleashed potential for affecting change in day-to-day clinical practice. Key program outcomes from the assistant nurse manager group have been initiated, including a virtual journal club, a caring for the caregiver program, and a professional mentoring program to assist nurses to develop professional success. The presentation will also focus on lessons learned and plans for future program development, including the publication of nurse participants' reflections on leadership and profiles of significant changes in care delivery as a result of the LEAD experience.

## LDR PST 2 - Leadership Poster Session 2

### Does Preceptor Training Improve New Graduate Performance?

---

*Michelle D'Alessandro, DNP, MS, RN, NEA-BC, USA*

*Nancy S. Goldstein, DNP, MS, BSN, RNC-OB, ANP-BC, USA*

*Jeremy Brown, MBA, BS, CNA, GNA, USA*

*Alexandra Sussman, BS, USA*

#### Purpose

The purpose of this study is to examine the new graduate nurses' perception of competence in comparison to the nurse leadership's perception (nurse managers & preceptors) of preparedness after orientation.

#### Target Audience

The target audience of this presentation is graduate nurses' and preceptors, charge nurses and nurse managers in leadership roles.

#### Abstract

The new graduate nurse faces stress and many challenges as they acclimate to the roll of a nurse during their first year of clinical practice. Health care organizations and academic institutions have an important role in training competent and prepared novice entry to practice nurses. Communication at the academic institution and health care organization level is crucial to ensure that all clinical expectations are understood for novice entry to practice nurses. The purpose of this study is to examine the new graduate nurses' perception of competence in comparison to the nurse leadership's perception (nurse managers & preceptors) of preparedness. There are two question of focus. Will there be a significant difference between the perceptions of new grad nurses and nursing leadership? Does preceptor training improve new graduate performance? Web-based questionnaires will be utilized to collect data. As part of the statistical data, a population size of minimum 150 participants (75 new grad nurses and 75 nursing managers along with preceptors) will be collected by March 15, 2015. Data analysis will incorporate recommendations for healthcare organizations and academic institutions. The proposed outcomes will include recommendations on strategies for preceptor role modeling and training, as well as preparation for nursing students in clinical experiences for entry into practice at the nursing program level. The results of this study will clarify the expectations and actual competencies of the new graduate nurse (as defined by the nurse managers and preceptors) to ensure their success in beginning clinical practice.

## LDR PST 2 - Leadership Poster Session 2

### The Effectiveness and Use of Mentors in Nursing Leadership in Healthcare Practice Settings

---

*Barb Pinekenstein, DNP, MSN, BSN, RN-BC, CPHIMS, USA*

#### Purpose

The purpose of this presentation is to examine the use and perceptions of formal and informal mentors in the leadership development of nursing leaders, specifically nursing directors and nurse executives within healthcare settings

#### Target Audience

The target audience of this presentation is nursing and staff development leaders that are interested in mentoring as a leadership development process.

#### Abstract

There has been increased focus in utilizing mentoring to facilitate the leadership and professional development of nursing leaders. Mentoring is used both formally and informally to support leadership development, succession planning, retention, role transition, and skill development. Benefits of mentoring include enhanced productivity, career satisfaction, lower levels of job stress, psychosocial support and professional development. The reported experience of nursing leaders' use of mentors at the director and nurse executive level in healthcare system settings is limited.

The purpose of this presentation is to describe mentoring best practices and share the results of a capstone study that examines the use and perceptions of formal and informal mentors in the leadership development of nursing leaders, specifically nursing directors and nurse executives within healthcare settings. The study is a mixed methods, cross sectional, descriptive design with a convenience sample of nursing leaders in Wisconsin who are members of the Wisconsin Organization of Nurse Executives and a Wisconsin Center of Nursing leadership resource list.

Understanding the experiences, barriers, and outcomes of mentoring will assist in the development of mentoring programs and will generate new knowledge about nurse leaders' use of mentors originating outside of the discipline of nursing.

## LDR PST 2 - Leadership Poster Session 2

### Nebraska Chapter Collaboration Enhances Continuing Nursing Education

---

*Judi Dunn, MS, CPP, RN-BC, USA*

#### Purpose

The purpose of this presentation is to identify how collaboration between STTI chapters can enhance continuing nursing education for members and impact nursing practice.

#### Target Audience

All nurses and nursing students.

#### Abstract

The purpose of this presentation is to demonstrate the importance of collaboration between chapters of STTI to enhance continuing nursing education. The Nebraska Collaborative, consisting of five STTI chapters, have planned together for five years to provide a continuing nursing educational event that brought together nurses and nursing students in the pursuit of clinical and educational excellence. Through collaboration we have been able to not only reach all portions of our state, but have been able to engage nurses and nursing students in the pursuit of continuing education. Assisting nursing students to engage in professional development prior to licensure impacts their ability to associate continuing education with life-long learning goals.

We will discuss completing an appropriate needs assessment, determining learner needs, and how best to address those needs across the state (and/or region). A variety of teaching-learning strategies will be discussed. Best practices will be shared.

The presenter will be able to discuss the criteria needed to adhere to ANCC continuing nursing education.

## LDR PST 2 - Leadership Poster Session 2

### Nursing Management Competencies of Nurse Managers after Attending the Nursing Management Training Program Organized by Faculty of Nursing, Khon Kaen University, Thailand

---

*Marisa Krairiksh, PhD, MSN, BSc, RN, Thailand*

#### Purpose

The purpose of this presentation is to present a research result related to nursing management and professional development.

#### Target Audience

The target audience of this presentation is nurse manager and faculty staff who involved in management training programs.

#### Abstract

The aim of this study was to describe nurse managers' management competencies, comparing them with their employers' perceptions of their management competencies. This descriptive study involved 190 nurse managers who had attended five programs of the 4-month nursing management training program organized by Faculty of Nursing, Khon Kaen University, and 194 employers' perceptions of the nurse managers' competencies. The questionnaire measuring opinions of trained nurse managers and their employers related to trained nurse managers' characteristics and management abilities was developed by the researchers. Reliability of the questionnaire derived from the nurse managers' data of this study was .97. The study revealed that trained nurse managers perceived high levels of their overall characteristics and management abilities (mean=4.28, S.D=.41; mean=4.10, S.D=.44, respectively). The characteristics of trained nurse managers' responsibility had the highest mean value (mean=4.45, S.D=.52) and creative thinking had the lowest mean value (mean=4.11, S.D=.58) as perceived by nurse managers. The mean value of trained nurse managers' ability of providing good nursing service was the highest (mean=4.37, S.D=.52) and the ability of communication was the lowest (mean=3.99, S.D=.57) as perceived by nurse managers. Trained nurse managers' employers perceived high levels of trained nurse managers' overall characteristics and management abilities (mean=4.00, S.D=.51; mean=3.84, S.D=.54, respectively). Perceptions of the employers regarding trained nurse managers' characteristic of responsibility had the highest mean value (mean=4.26, S.D=.65) and the characteristic of visionary had the lowest mean value (mean=3.79, S.D=.70). The same as trained nurse managers' perceptions, perceptions of the employers regarding trained nurse managers' ability of providing good nursing service had the highest mean value (mean=4.23, S.D=.66) and the ability of communication had the lowest mean value (mean=3.64, S.D=.70). Perceptions of trained nurse managers and their employers both in characteristics and management abilities were statistically significant different ( $p<.05$ ).

## LDR PST 2 - Leadership Poster Session 2

### Wanted! Leaders to Advance Excellence, not Mediocrity, in Nursing Education

---

*Theresa M. Valiga, EdD, RN, CNE, ANEF, FAAN, USA*  
*Beth Phillips, MSN, RN, CNE, USA*

#### Purpose

Challenge nurse educators to reflect on ways our current programs and policies promote mediocrity and how they, as nursing education leaders, can promote excellence instead.

#### Target Audience

Faculty teaching in schools of nursing, regardless of program type (pre-licensure or graduate), and educational administrators

#### Abstract

Chances are good that if you ask faculty teaching in almost any nursing program about the quality of their program, you will get a response that it's a great program. After all, nearly every program that seeks national accreditation receives it. Nearly every program that undergoes a review by its State Board of Nursing has a positive outcome. And the vast majority of graduates of pre-licensure programs pass the licensing exam, while graduates of graduate programs are successful on certification exams.

But are these indicators of excellence? Or are they indicators of being merely satisfactory? Have our schools become victims of the Mediocrity Principle, which asserts that there is nothing really special about who we are or what we do? Measures such as those noted above may say that a program meets minimal standards. Are we willing to accept that? Are we willing to work as hard as we do merely to be average?

This session is designed to challenge participants to think about the concept of excellence ... what it is, what it "looks like" in an academic environment, and how it can be measured. Once this foundation has been laid, we will explore the "sacred cows" that often stand in the way of achieving excellence in nursing education, the "hidden curricula" that contribute to mediocrity, and the work life of faculty that prevents us from investing the time and energy needed to be innovative, creative and excellent ... regardless of program type, the student population served, or faculty qualifications. Excellence, after all, is not about resources ... it's about values, attitudes, and expectations.

Participants will be asked to respond to questions posed, engage in think-pair-share exercises, and outline strategies to use "back home" to lead the drive toward excellence. Do we, as presenters, have THE answers to this challenge? Not at all. But do we have ideas to share about what excellence in nursing education might look like and how we might get there? Absolutely! Please join us for a stimulating, engaging dialogue.

## LDR PST 2 - Leadership Poster Session 2

### Enhancing Nurses' Engagement in Health Policy: From the Classroom to the Statehouse

---

*Sharron J. Crowder, PhD, MN, BSN, RN, USA*  
*Pam Ironside, PhD, MS, BA, RN, ANEF, FAAN, USA*

#### Purpose

The purpose of this presentation is to discuss strategies that foster student engagement in health policy through active learning activities and experiential learning opportunities. Tips for building student engagement and creating experiential learning opportunities such as Statehouse legislative fellowships will be presented.

#### Target Audience

The target audience of this presentation is nurse educators, clinicians, researchers, and attendees interested in health policy leadership and advocacy.

#### Abstract

The Institute of Medicine's Future of Nursing report calls on nurses to assume leadership roles in the redesign of the health care system and policies that impact health outcomes and nursing practice. Professional nursing organizations, such as Sigma Theta Tau International, support efforts to prepare nurses to participate in the policy level at all levels of government, including the state level. Many faculty emphasize teaching students about health policy, however classroom delivery of health policy content and engagement can be enhanced through active learning strategies. Nurse educators are also positioned to prepare future state health policy leaders by expanding student engagement beyond the classroom into "real world" settings. State legislative fellowships provide opportunities for students to actively engage in the legislative process. Yet for many nursing faculty, developing effective learning strategies and experiential learning opportunities for several settings can be challenging. This session will provide strategies nurse educators can use to enhance health policy learning outcomes. Specific strategies to build student engagement in health policy leadership and advocacy will be explored. Efforts to provide experiential learning opportunities to further engage students will be supported through exemplars of state legislative fellowships. Kolb's experiential learning theory provides the framework for engaging students in legislative fellowships. Through experiential learning, legislative fellowships enable nursing students to examine the role state government plays in various aspects of policy including access to health care policy, workforce development, nursing practice, and nursing education. The implications for future innovation and research will also be explored.

### Professionalism in the Clinical Setting: How Do We Uphold the Values of Our Professions?

---

*Elizabeth Hammond-Ritschard, MSN, RN, USA*

*Joanne Farley Serembus, EdD, RN, CCRN, CNE, USA*

#### Purpose

The purpose of this presentation will discuss the role of professionalism in the clinical setting as seen through the eyes of the student nurse. A discussion on faculty strategies aimed at helping students implement leadership styles to foster civility in the clinical setting.

#### Target Audience

The target audience of this presentation is nursing faculty, nurses in the clinical setting, student nurses, and nurse leaders.

#### Abstract

As we move forward with new and innovated technology, we are meeting the needs of our patients, but there is one area which has not progressed; role modeling of professionalism in the clinical setting. The primary purpose for clinical is to provide hands on opportunities to nursing students. This enables them to develop patient care skills under the guidance of well experienced nurses. During this time they are also exposed to accepted behavior and values of the profession. Sadly, students report that their clinical rotations do not foster growth as a result of incivility imposed by professional nurses. We all have taken the Nightingale Pledge, but do we truly uphold this pledge when it comes to profession and shaping the future generation of nurses? Has nursing become so desensitized to acts of incivility that students have become victims during what is thought to be a learning environment? This presentation will detail an assignment in a BSN leadership course in which students described a personal incident involving incivility in the clinical setting. The purpose of the assignment was to have the students reflect on such an incident, identify a leadership style, change theory, and communication style that could be used by them in future situations. The first-hand accounts described by students were unexpected and eye-opening. Faculty took this rich qualitative data and decided to look for relevant themes. The main themes as well as sub-themes discovered will be discussed in addition to faculty strategies aimed at helping students end the cycle of incivility.

## LDR PST 2 - Leadership Poster Session 2

### Opening a New Nursing Education Program: Lessons Learned

---

*Betsy M. McDowell, PhD, MSN, BSN, RN, CNE, USA*

#### Purpose

The purpose of this presentation is to identify best practices when opening a new undergraduate nursing education program.

#### Target Audience

The target audience of this presentation is faculty and administration of new and established nursing education programs, as well as those exploring the feasibility of opening or expanding a nursing program.

#### Abstract

In the Future of Nursing report (IOM, 2010), one of the key recommendations was to increase the proportion of baccalaureate and higher degree-prepared nurses in the nation's workforce to 80% by 2020. One of the barriers to preparing more baccalaureate-prepared nurses is a dearth of open seats in existing nursing education programs. Many established nursing education programs would like to expand but lack the fiscal, faculty, and/or clinical resources required to accomplish this. In 2006, a private, church-affiliated, liberal arts college in the southeastern US partnered with a nearby medical center to open a new generic baccalaureate nursing program. An experienced nurse educator, the presenter, was hired initially as a consultant and then as the inaugural chair of the nursing department to implement the generic BSN program. Approval to open the prelicensure program was obtained from the State Board of Nursing in spring of 2009 and the first nursing courses were taught at the junior level in the fall of that year. Subsequently, initial national accreditation by the Commission on Collegiate Nursing Education was obtained by the program in the next year. The first class of BSN-prepared students graduated from this program in May 2011 and all graduates were licensed and employed in nursing by the end of that year. The program continues to admit one class of 24 new students to the junior NUR courses each fall semester and graduates one class of baccalaureate-prepared nurses each May. Alumni of the program have gone on to graduate school to become nurse practitioners, have served as preceptors for nursing students, have taken travelling nurse assignments across the US, and/or have earned Nurse of the Month recognition. The program will be expanding this year by adding an RN to BSN Completion track in the fall. The purpose of this session is to explore the lessons learned through this journey so as to delineate several best practices when opening a new undergraduate nursing education program. These lessons also could be helpful to nursing education programs seeking to expand existing capacity. Observations from faculty, administrators, students, alumni, and clinical partners are incorporated in the presentation to illustrate this journey.

### **Mama Care: An Innovative Care Model for Pregnant Women with a Prenatally Diagnosed Birth Defect**

---

*Jessica Schwarz, MSN, RN, CNM, USA*  
*Elizabeth Froh, PhD, RN, RN, USA*  
*Billie Bitowski, MSN, BSN, RN, USA*

#### Purpose

The purpose of this presentation is to describe how Centering Pregnancy, an established care model, was adapted for use in the Center for Fetal Diagnosis and Treatment (CFDT). The CFDT is a referral center that cares exclusively for women whose pregnancies have been complicated by a prenatally diagnosed fetal anomaly.

#### Target Audience

The target audience of this presentation is women's health care providers, hospital and practice administrators, health policy makers and childbirth educators.

#### Abstract

The purpose of this project is to demonstrate how an adaptation of the Centering Pregnancy Model of group prenatal care, Mama Care, is being implemented in a population of patients with prenatally-diagnosed fetal congenital anomalies who are receiving care in a specialty referral center. Centering Pregnancy is an innovative approach to care delivery that integrates the three major components of prenatal care: health assessment, education and support into a unified program within a group setting. This project was supported by the Sigma Theta Tau Maternal Child Health Leadership Academy in partnership with Johnson and Johnson and the Children's Hospital of Philadelphia. The leadership team, Jessica Schwarz CNM, MSN (scholar), Elizabeth Froh PhD, RN (mentor) and Billie Bitowski MSN (faculty), aimed to demonstrate that an existing care model (Centering Pregnancy) can be adapted for novel use in a unique patient population. The setting of the project is the Center for Fetal Diagnosis and Treatment at the Children's Hospital of Philadelphia where patients with prenatally-diagnosed fetal anomalies come for prenatal evaluation, care and birth.

Following an initial pilot program, the leadership team began a multi-disciplinary continuous quality improvement project. Mama Care represents a significant modification of the established Centering Pregnancy Model including reducing the number of sessions per cohort from 10 to 4 in order to accommodate the 2<sup>nd</sup> and 3<sup>rd</sup> trimester assumption of care which is typical in this setting. While Centering Pregnancy groups as described in the literature typically comprise 8-10 pregnant women, Mama Care groups ranged from 3 to 6 pregnant women and their support people. In adapting the model, the team prioritized adherence to the 13 Essential Elements of Centering including the use of a facilitative leadership style, stability of the group membership, and completion of health assessment within the group space. During the sessions each patient has a brief, one on one visit with the midwife in a semi-private, screened off section of the room. This encounter encompasses a blood pressure check, fetal heart rate check, fundal height measurement and weight and urine assessment and is documented in the patient's chart. Any additional testing that is needed by individual patients is scheduled before or after the group session. Mama Care sessions are co-facilitated by a midwife and an RN. Specific educational content addressed includes normal discomforts of pregnancy and comfort measures, labor and delivery preparation and expectations for the postpartum period.

Using a multi-method assessment including survey tools and focus groups, quantitative and qualitative data were collected to evaluate the participants' reflections of Mama Care on their pregnancy experiences and overall satisfaction. The quantitative tool used is the 20-item Pregnancy Experience Scale. This scale is validated to measure pregnancy-specific factors related to the maternal psychological state. Qualitative

data was collected at the end of the last session of each cohort in a semi-structured focus group format facilitated by the leadership mentor. A total of 15 women have participated in Mama Care during the period of data collection. Three major themes emerged from the qualitative data: (1) Connectivity and inclusiveness, (2) Enhanced learning through group process, and (3) Increased comfort with the health care team and setting.

In conclusion, implementing an innovation in a care delivery model poses challenges to the health care team and requires ongoing commitment to the change process. A significant limitation of this project includes a high attrition rate (related to earlier than anticipated delivery) in some of the cohorts which undermined the utility of the quantitative data collection tool and posed challenges within the group itself. However, focus group data continued to demonstrate a high level of satisfaction with the model. Many of the Mama Care participants have continued their relationships for weeks and even months after the closing session, enhancing support in the postpartum period. In conclusion, Mama Care offers an example of care model innovation in a uniquely challenging setting that provides enhanced value to patients and families.

### Increasing Exclusive Breastfeeding Rates in a Predominantly African-American Patient Population

---

*Michelle L. Harrison, MSN, MBAHCM, RNC-OB, USA*

*Diane L. Spatz, PhD, RN-BC, FAAN, USA*

*Florence Jones, DNP, RN, NEA-BC, FACHE, USA*

#### Purpose

The purpose of this presentation is to describe my leadership journey in leading a multidisciplinary change team in developing processes to increase exclusive breastfeeding rates in a predominantly African American community.

#### Target Audience

The target audience of this presentation is clinicians that are interested in leading a change initiative and improving exclusive breastfeeding rates.

#### Abstract

**Background:** Exclusive breastfeeding provides infants with ideal nutrition as well as optimal health and developmental outcomes. Human milk protects children from certain illness and childhood conditions. Research demonstrates that breastfed infants are at lower risk for Sudden Infant Death Syndrome (SIDS), gastrointestinal infections, respiratory illnesses, ear infections, allergies, childhood obesity and diabetes. African American babies consistently have lower breastfeeding rates from birth to a year old compared to White and Hispanic babies (Centers for Disease Control, 2013). The CDC identified that African American women are the least likely to have the support network to breastfeed and have identified that hospitals in neighborhoods with mostly African American residents do less to promote breastfeeding than those in areas with more White residents. To increase breastfeeding rates, one must increase community awareness of the benefits of human milk and the importance of family support of the breastfeeding mom. Developing hospital routines and policies that support the breastfeeding mom and infant bonding will facilitate an increase in breastfeeding rates.

**Aim:** Through the Maternal Child Health Nurse Leadership Academy (MCH) sponsored by Sigma Theta Tau International and Johnson & Johnson I embarked on an 18 month leadership journey that included a triad of faculty mentor, leadership mentor and fellow. By utilizing the support, expertise, and practical wisdom of my faculty mentor, Diane Spatz, PhD, RN-BC, FAAN, my leadership mentor, Florence Jones, DNP, RN, NEA-BC, FACHE and the following the Kouzes and Posner approach to leadership I was able to reenergize my leadership with new knowledge and skills. This leadership journey through MCH has centered on becoming successful in leading a change team by recognizing strengths and weaknesses and cultivating decision-making capabilities. In our exclusive breastfeeding project our team's aim was to increase exclusive breastfeeding rates in a predominately African American patient population. The goal was to increase exclusive breastfeeding rates from 4% to 15% by September 2015.

**Methods:** A two-step approach was used to educate, encourage and support this clientele with breastfeeding. The first step to meeting the goal was to provide awareness and education to childbearing women and their supporting families on the benefits and importance of human milk. Newborn admission processes after vaginal deliveries were modified to minimize separation of the mother and infant allowing time for the promotion of skin to skin and the initiation of breastfeeding in the first hour of life.

**Results:** Community activities included two focus groups with 6 pregnant women in the community to understand cultural barriers that impact their success. Our team participated in two community health fairs, which focused on family and family support of breastfeeding women and one health fair at a community college in which the emphasis was on the benefits of breastfeeding. We had three

appearances, August 2014, February 2015 and April 2015 on two different local radio talk shows with an estimated listening audience of 75,000 to 100,000 families. We set up informational booths at a local mall, apartment complex, and physician office in which 200 pieces of educational literature was distributed. We spoke to 34 different women individually about the benefits of breastfeeding at these locations. The second step focused on the hospital setting. At the beginning of the project a 4 hour mandatory class was completed by 47 RNs and 9 obstetrical technicians to ensure that they had the knowledge and resources to encourage and support mothers who wished to exclusively breastfeed.

Observing 411 new mothers from July 2014 through December 2014 exclusive breastfeeding rates ranged from 9% to 16% with an average of 13.4%. In the next 5 months from January 2015 to May 2015 observing 332 new mothers, exclusive breast feeding rates ranged from 0% to 13% with an average of 9.2%. The overall average for the 9 month period from July 2014 to May 2015 was 11.2%. In trying to determine a possible reason for the decrease in exclusive breast feeding rates, mode of delivery was examined for the two time periods. There was an average of 18.3 cesarean sections per month in the first time period, July 2014 to December 2014 which accounted for 26% of the total deliveries. In the second time period, January 2015 to May 2015 there was an average of 20.2 cesarean sections per month which accounted for 29.7% of the total deliveries. There was a 10% increase in cesarean rates in the second time period. Not having well established processes for decreasing separation of mother and infant after surgical deliveries impacted our ability to promote skin to skin and the initiation of breastfeeding in the first hour of life. This could explain the decrease in exclusive breastfeeding rates during the second period.

**Conclusion:** Changing community culture through education on the benefits of human milk combined with shaping our hospital culture to decrease separation of mother and infant after delivery will help us reach our goal of increasing exclusive breastfeeding rates to 15% by September of 2015.

### Implementation and Evaluation of Transitioning Newborns at the Bedside Maternal-Child Leadership Project

---

*Sonya L. Clayton, MSN, RN, IBCLC, CCE, USA*  
*Shakira Henderson, DNP, MS, MPH, RNC-NIC, IBCLC, USA*  
*Katheryn B. Arterberry, DNP, MSN, RN, APRN, FNP-BC, USA*

#### Purpose

The purpose of this presentation is to increase the knowledge of Perinatal and Maternal-Newborn nurses regarding the positive impact transitioning newborns at the bedside has on skin-to-skin initiation rates, patient satisfaction, and exclusive breastfeeding rates.

#### Target Audience

The target audience for this presentation is Perinatal and Maternal-Newborn Nurses.

#### Abstract

Background: Traditionally, mothers and babies are separated after birth. However, strong evidence exists that immediate skin-to-skin contact after birth between mother and baby has positive outcomes for both mother and baby. Babies who transition with their mothers have better breastfeeding rates and mothers who transition with their babies are more satisfied with the birthing process. Nonetheless, nurses are challenged daily with promoting skin-to-skin, especially after a cesarean delivery. West Kendall Baptist Hospital embarked on a journey to implement a change process of transitioning all eligible newborns at the bedside. The project was facilitated through the STTI Maternal-Child Health Leadership Academy.

Purpose: To implement and evaluate a Bedside Newborn Transition Initiative emphasizing Skin-to-Skin after Birth Maternal-Child Leadership Project

#### Specific Aims

- To utilize leadership strategies to implement Bedside Newborn Transition emphasizing Skin-to-Skin after Birth Maternal-Child Leadership Project
  - To train all Labor and Delivery nurses to transition newborns at the bedside
  - To transition all eligible newborns at the bedside
  - To decrease separation time of couplets ( i.e. the mother/baby dyad)
  - To increase skin-to-skin initiation rates
  - To maintain patient satisfaction scores at or above 95%
  - To increase exclusive breastfeeding rates

#### Project Activities

- A unit-specific taskforce made of key stakeholders was developed and lead by the STTI Maternal-Child Leadership Academy Fellow.
- The taskforce over a 6-month period:
  - Met monthly
  - Completed training for all Labor and Delivery nurses on transitioning at the bedside
  - Performed patient chart audits to monitor skin-to skin initiation rates, breastfeeding exclusivity rates, and separation times
  - Tracked Satisfaction surveys of transitioning mothers

#### Evaluation Methods

- Staff Education Training data
- Monthly tracking of skin-to-skin initiation of all eligible newborns data
- Monthly tracking of transitions of all eligible newborns data

- Monthly Press Ganey patient satisfaction survey results
- Monthly tracking of exclusive breastfeeding rates

Results: Twenty-six Labor and Delivery nurses were trained and 338 patients were cared for during the 6-month period. The number of infants transitioned at the bedside increased by 70%. The separation time of couplets decreased by 90%. The skin-to-skin initiation rates increased by 75%. Exclusive breastfeeding rates increased by 55%. Mother satisfaction with bedside transition remained at the 95<sup>th</sup> percentile.

Conclusion: Transitioning newborns at the bedside has a positive impact on skin-to-skin initiation rates, patient satisfaction, and exclusive breastfeeding rates. Skin-to-Skin after Birth Maternal-Child Leadership Project may be a promising approach to accomplishing newborn bedside transitioning.

### Bereavement Program for the Perinatal Loss Patient and Family

---

*Sabre Ann Knaust, ADN, RN, USA*

*Meredith Laine Green, MSN, BSN, AGCNS-BC, RN, APRN, USA*

*Julia Snethen, PhD, MSN, BSN, RN, USA*

#### Purpose

To examine the impact of a standardized bereavement training program on the staff nurse's perception of their ability to provide effective care for patients experiencing perinatal loss.

#### Target Audience

Healthcare employers, obstetricians, labor and delivery nurses, Nursery/NICU nurses, clinical nurse educators, chaplains, case management, and social workers.

#### Abstract

Background: Nurses in maternal-child nursing practice are periodically faced with the challenging situation of providing care for patients' experiencing perinatal loss. Unfortunately, the preparation nurses receive in their basic academic programs may be limited or non-existent on the topic of effectively caring for patients and family members experiencing perinatal loss. Additionally, due to the infrequent exposure to perinatal losses, staff nurses may perceive that they are not adequately prepared to effectively provide care during such potentially sensitive and emotionally charged situations. Therefore, a standardized bereavement training program was implemented in this study to prepare staff nurses to provide effective care to patients and family members during perinatal loss.

Purpose Statement: To examine the impact of a standardized bereavement training program on the staff nurse's perception of their ability to provide effective care for patients experiencing perinatal loss.

Methods: Participants for this quasi-experimental investigation were staff nurses at a Southern Midwestern women's health hospital. Staff nurses completed a survey prior to receiving the bereavement training, and following the intervention the same survey was given to participants to complete. The 17 item survey was developed by the investigator and was comprised of two different sections. The initial 9 items focused on nurse's perceptions of knowledge related to perinatal loss. The second section included 8 items, which focused on the staff nurses perceptions of their ability to provide care to patients and family members experiencing a perinatal loss.

Results: Data collection is currently in progress, with 18 staff nurses having completed bereavement training, as well as the pre and post-test surveys.

Conclusion: By identifying the staff nurses perceptions of the bereavement program for patient and family members experiencing a perinatal loss, it is hoped that this will increase the nursing staff's confidence and competence. Additionally, the long-term goals include improved patient outcomes and patient satisfaction.

### A Novel Approach to Reduce Non-Emergent Visits through a Mentored Postnatal Education Program

---

*Susan A. Hoffman, BSN, BA, RNC-MNN, USA*

*Leigh Small, PhD, RN, CPNP-PC, FNAP, FAANP, FAAN, USA*

*Barbara L. Buchko, DNP, MS, BSN, RNC-MNN, USA*

#### Purpose

The purpose of this project was to identify the most common reasons mothers access emergent care services for their newborns for non-emergent reasons, and then develop and implement a postpartum educational program provided by trained laypersons at a local pregnancy help center to address these health concerns.

#### Target Audience

The target audience for this presentation are those interested in maternal-child healthcare and education. This includes professionals such as maternity and emergency nurses, Pediatric and Women's Health Nurse Practitioners, Obstetricians, and Pediatricians. Additionally, laypersons who provide perinatal education to mothers may be interested in the findings of this project.

#### Abstract

**Purpose:** Anecdotal information from nurses at two local hospitals suggested that mothers seemed to be accessing emergency services unnecessarily for their newborns after discharge from the hospital also. The purpose of this project was threefold. The first step was to identify the most common non-emergent reasons that mothers bring their newborns (age birth to 9 months) to a local emergency department. Given these common reasons, two face-to-face postpartum classes were developed to provide educational information that would address the commonly occurring health issues (step two). The classes were offered at a local non-profit pregnancy help center at no charge. The third aspect of this project was to develop the leadership skills needed to work with the interdisciplinary team enacting the project as one way to bridge the local hospital and a community-based to improve maternal-child care and reduce unnecessary costs. Understanding the principle reasons that motivate mothers to bring newborns for emergent care has allowed us to "work as one to improve health through exceptional care."

**Methods:** This project was conducted in a 76-bed Pathway to Excellence community hospital in northeastern United States; an organization that is but one member of a larger health care system. A hospital chart audit revealed that 378 newborns from age birth to 9 months were seen in the emergency department for diagnoses deemed to be non-emergent during calendar year 2013. The most common reasons the newborns were brought for health care to the emergency room were fever, vomiting, upper respiratory infections, bronchiolitis, and suspected otitis media. As a result of this finding, two postpartum face-to-face classes were developed for new mothers by a team of maternity nurses, laypersons and a local pediatrician using evidence based information. These educational sessions were offered by trained laypersons and adult learning principles were applied while using multi-modal learning materials. The effects of the program were assessed using a pre-/post-test design through the use of a knowledge questionnaire.

**Results:** Demographic data was collected to appreciate general characteristics about the participants at baseline. The effects of the intervention were assessed by determining the change in mothers' knowledge following their participation in the educational classes. Additionally, the mothers' perceived ability to determine the urgency of health issues and know what steps to take were assessed .

**Conclusion:** By identifying common non-emergent reasons mothers access emergency services, postpartum education can be provided through one on one mentoring programs to improve newborn health and reduce unnecessary medical costs. As my leadership skills have developed, I am more able to facilitate the collaboration of hospital and community-based organizations to 'work as one' and provide exceptional evidence-based health care, and thus improve the maternal-child health outcomes in our community.

### Improving Oxygen Management in Very Low Birth Weight Neonates

---

Vania Blanc, MSN, FNP-C, RNC-NIC, USA  
Colleen Rodriguez, BSN, MHSA, RN, RNC-NIC, USA  
M. Sharon Harris, MSN, RN, NEA-BC, USA

#### Purpose

to assess the impact of implementing evidence-based oxygen weaning guidelines in a NICU.

#### Target Audience

Pediatricians, Neonatologists, NICU Respiratory Therapists, NICU Nurses

#### Abstract

**Background:** Oxygen toxicity in preterm neonates contributes to the development of Retinopathy of Prematurity (ROP) and Chronic Lung Disease (CLD). A proactive approach to reducing the levels and time of oxygen exposure in this population is an important step in the management of preterm infants and likely to impact their health outcomes. The healthcare professionals at the bedside play a key role in optimal oxygenation of the preterm neonate because ongoing adjustments are crucial to adequate management. The focus of this project was to incorporate evidence-based research findings into daily nursing practice in a 49-bed Level III Neonatal Intensive Care Unit (NICU) to improve neonatal outcomes associated with oxygen toxicity. The target group in this study includes infants that are less than 32 weeks or less than 1500 grams at birth.

**Purpose:** Therefore, the purpose of this project was to assess the impact of implementing evidence-based oxygen weaning guidelines and its effects in a NICU.

**Methods:** A two-dimensional baseline assessment revealed that clinical alarms related to oxygen saturation monitoring at the bedside were not consistently being set according to recommended parameters. In addition, the clinical alerts received on the nurses' phones were not consistently being acknowledged due to the increased number of alarms that do not always require a nursing intervention leading to alarm fatigue. Following IRB approval, a multidisciplinary team convened to conduct a literature review using terms such as 'standardized care for infants on oxygen', 'oxygen saturation targets', and 'chronic lung disease'. Following this review the team worked to develop oxygen weaning guidelines to standardize care across the unit. The team developed a pre-/post-test design to appreciate compliance with the new guidelines, changes in the number of alerts nurses receive for oxygen saturation alarms, a nurse change readiness assessment, and the number of days the premature infant required oxygen. The project involved approximately 123 premature infants who were less than 32 weeks gestation or 1500 grams at birth who were oxygen dependent in the NICU from June 2014 to February 2015. Weekly rounds were initiated during the time this protocol was implemented to monitor nurse compliance with the new guidelines and review the oxygen saturation limits set on each monitor; which when triggered alert nurses to assess their neonatal patients' status.

**Results:** As a result, there was a significant increase in the compliance with time spent within the recommended oxygen saturation parameters for prematurity program patients from 3% to 95%. In addition, there was a 50% reduction in the amount of alerts received on nurses' phones in a 12 hour shift. Furthermore, in the four month period post implementation of the oxygen weaning guidelines, there was a decreased amount of oxygen days and an increase in the amount of time premature infants remained within the set oxygen saturation parameters. The average time the neonates required oxygen was reduced from 25.98 oxygen dependent days pre study to an average of 24.74 oxygen dependent days post study following the protocol implementation. In addition, as a result of an alarm assessment

conducted at the beginning of this project, practice changes were implemented resulting in a reduction in the amount of alarms nurses received by more than 50%.

**Conclusions:** These immediate post implementation findings suggest that the infants who experienced the new protocol and received less oxygen will less likely suffer the results of oxygen toxicity and therefore have lower risk of developing the chronic comorbid consequences of oxygen toxicity such as Retinopathy of Prematurity and Chronic Lung Disease. Oxygen is a drug. Therefore, it is important to implement appropriate strategies and protocols surrounding its use in the NICU to impact the management of the preterm neonates on oxygen.

## MCH - Maternal-Child Health Nurse Leadership Academy Invited Posters

### The Golden Hour: Early Initiation of Breastfeeding

---

*Brooke N. Swails, BSN, RN, USA*

*Becky Palmer, RN, CNM, CEC, PCC, PNC (C), PhD, Canada*

*Robyn K. Hale, PhD, RN, USA*

#### Purpose

The purpose of this presentation is describe our experience developing a quality improvement project using evidence based practices to increase and improve the early initiation of breastfeeding while increasing nurse education and comfort with lactation support.

#### Target Audience

The target audience of this presentation is all nurses and physicians practicing within the Maternal-Newborn setting.

#### Abstract

Background: Breastfeeding in the first hour of life is recommended by the World Health Organization (WHO) and is listed as step four of the Baby-Friendly Hospital Initiative (BFHI). The United States Surgeon General has identified the steps listed in the BFHI as an approach that leads to better breastfeeding outcomes. Outdated hospital policies/protocols, lack of education for labor and delivery staff, and decreased knowledge on the World Health Organization Baby Friendly Standards are barriers to mother-child bonding and initiation of breastfeeding. The first hour of life is referred to as “The Golden Hour” and many hospitals recognize this period as a special time for bonding between parents and newborns. Through the Maternal-Child Health Nurse Leadership Academy (MCH) sponsored by Sigma Theta Tau International (STTI) and Johnson & Johnson, this scholar participated in a mentor-guided leadership program using Kouzes and Posner’s leadership practices. The triad team, consisting of a faculty mentor, leadership mentor and scholar, developed and implemented a quality improvement project using evidence-based practice to increase and improve the early initiation of breastfeeding while increasing nurse education and comfort with lactation support.

Purpose: The purpose of this project is to increase and improve the early initiation of breastfeeding while increasing nurse education and comfort with lactation support.

Methods: This project involves a cross-sectional survey of labor and delivery nurses within a midsize community hospital in Glendale, Arizona. The pre/post survey evaluates nurses’ knowledge regarding breast feeding support and internal or external barriers preventing initiation within the first hours of life. Early breastfeeding initiation rates were collected prior to staff education and will be re-evaluated at project completion. Staff education consisted of the empirical evidence supporting early initiation, patient education material and use of the Golden Hour Data sheet used by nurses at each delivery. Additional education was created for physician offices to distribute to patients.

Results: Results from the nurse survey demonstrated that 65% of nursing staff felt comfortable with assisting patients with breastfeeding. Sixty-eight percent of staff would like more education and training on latching and positioning infants. However, a sample of deliveries reviewed before implementation of the Golden hour revealed only 48% of mothers initiated breastfeeding within the first hour of life. Preliminary results (January through May) reveal 88% of mothers have initiated breastfeeding within the first hour of life. A post-assessment survey of nurses is scheduled for July 2015.

Conclusions: Using the MCH Academy to implement a quality improvement project using evidence-based practice to increase and improve the early initiation of breastfeeding while increasing nurse education and comfort with lactation support has demonstrated promising results promoting the special bond between

patients and newborns. Continued work is warranted to sustain the nursing practice change, as well as, future research evaluating patient response measuring neonatal stress and transition vital signs.

### Improving Exclusive Breastfeeding by Changing Hospital Practices

---

*Gwendolen Wheeler, MSN, BSN, RNC-OB, C-EFM, USA*

*Brittney M. Baird, MSN, RN, RNC-OB, C-EFM, USA*

*Carla E. Rider, MBA, MSN, RNC-LRN, USA*

#### Purpose

The purpose of this presentation is to show how to improve exclusive breastfeeding by placing efforts on the Baby Friendly ten steps of successful breastfeeding and leadership skills in order to promote optimal health benefits for mothers and newborns.

#### Target Audience

The target audience of this project is the maternal child healthcare team including the nurse, lactation support, obstetricians, and pediatricians.

#### Abstract

Introduction/Background: Hospital practices interfere with successful breastfeeding in the hospital setting. The Baby Friendly ten steps to successful breastfeeding can improve breastfeeding and provide multiple health benefits for the mother and newborn, yet nurses do not consistently implement these practices. Through the Maternal-Child Health Nurse Leadership Academy (MCH) sponsored by Sigma Theta Tau International (STTI) and the program sponsor Johnson & Johnson a triad team consisting of Carla Rider, the Faculty Mentor, Brittney Baird, the Leadership Mentor, and Gwendolen Wheeler, the Scholar embarked on an 18-month project. The project allowed the Scholar to facilitate teams to improve exclusive breastmilk feedings at discharge with ongoing mentorship to obtain, practice, and polish leadership skills guided by Kouzes and Posners Leadership Challenge concepts.

Aim/Goal/Purpose Sentence: The purpose of this presentation is describe a journey to improve exclusive breastfeeding rates by implementing the ten steps of successful breastfeeding and improve patient satisfaction to support optimal maternal child health.

Method: The objective to improve exclusive breastfeeding in the hospital setting started by educating over 300 nurses on the Baby Friendly ten steps to successful breastfeeding and evidenced-based policy and guidelines to coach women to exclusively breastfeed and support mothers feeding preference. Focus groups identified three of the ten steps to strive for improvements. Monthly audits converted to metrics were disseminated to team members who set goals and used PDSA cycles for practice improvements. Audits for step four revealed the number of newborns who had skin-to-skin contact and breastfeed in the first hour of life. Audits for step seven revealed the number of newborns who had initial newborn assessments and baths at the mother's bedside reflecting a change in location of the newborn from birth to allow rooming in and allowing the mother and newborn to stay together. Audits for step six revealed the number of newborns discharged from the well-baby setting who had exclusive breastmilk feedings, and based on mother's desires to breast milk feed, those that accomplished this at discharge and medically indications for not accomplishing this goal.

The objective to improve the patient experience was measured through the Hospital Consumer Assessment of Healthcare providers and Systems (HCAHPS) score, Press Ganey patient satisfaction survey scores, patient testimonies, and though online patient comments.

Results: The hospital deliveries 4,800 babies a year. After a 10 month study period, the overall range of breastfeeding rate increased from 50% to 58%. The ten month top performance month showed 29 more mothers exclusively breastfeed their babies from birth to hospital discharge from the well baby nursery. During the first hour of life, 139 more mothers and newborns benefited from skin to skin and 220

mother's breastfed considering her feeding preference. This reflects a 22% over baseline rate. To promote rooming-in and allowing the mothers and newborn to stay together, 294 (83%) newborns had the initial nursing assessment at the mother's bedside and 267 (75%) newborns had the newborn bath at the mother's bedside. These results reflect the majority of the initial assessments and baths are now being done as rooming in. The patient satisfaction scores remained consistently high and patient comments reflected high remarks for the changes in hospital practices supporting their care.

Conclusions: Leadership skills were enhanced by introducing an evidenced-based, quality improvement project using Lewin's Theory of Change and the Maternal Role Attainment Theory. Skills were gained in metric measurement, goal setting with teams, and creating outcome graphs. Collaboration and team building with multi-disciplinary team members including more than 300 maternal child nurses, management and administrative leaders, physicians, marketing, and informatics was achieved. Building high performing teams, enhancing other's leadership abilities, and increasing employee pride provided patient safety. Patient-centered care was enhanced by increasing maternal confidence and skills to bond, feed, and comfort the newborn. In addition, patient centeredness added to the increase in patient satisfaction and accomplishment when caring for their newborn.

Future hospital goals may be decided on to gain accreditation for a center of excellence in breastfeeding by obtaining the Baby-Friendly Hospital status for successfully implementing the ten steps to successful breastfeeding. This project will assist the hospital in the process to achieve this goal for improvement.

### **Improving Developmental Care Provided by Patient Care Assistants to Prevent Developmental Regression during Acute Hospital Admission**

---

*Ashley N. Davis, BSN, RN, USA*

#### Purpose

The purpose of this project is to develop a new educational offering for PCAs focusing on developmentally appropriate pediatric care. The new offering was developed, and will be taught by a multidisciplinary team. Success of the new offering will be measured by results of competence and confidence questionnaires.

#### Target Audience

The target audience of this project is the PCA in the acute pediatric care setting. The number of PCAs impacted by this project is approximately 15. The sub audience includes RNs, educators, and managers. This project is expected to touch approximately 150 children and family members during this initial phase.

#### Abstract

Background: As healthcare rapidly changes, organizations large and small are adapting the structure of their inpatient and outpatient service areas in order to provide quality care in a more efficient manner while maintaining high levels of patient/family satisfaction. A change in the care delivery model in a children's hospital incorporated the use of PCAs in partnership with a registered nurse to ensure all staff were working to their highest capabilities. Subsequently a gap was identified in the PCAs orientation and educational preparation. There was a lack of knowledge and application of developmentally appropriate pediatric care. This project was a quality and safety improvement project concentrated on developing a new educational offering for PCAs centering on developmentally appropriate pediatric care. The new offering was developed by a multidisciplinary team including a Pediatric Nurse Practitioner, Clinical Nurse Specialist, Clinical Educator, Clinical Manager, Registered Nurse, PCA, Child Life Specialist, and a Patient and Family Experience Coordinator. The offering was presented in small segments, over a two (2) hour time frame using a variety of teaching methods.

Methods: Through the Maternal Child Health Nurse Leadership Academy (MCHLA) sponsored by Sigma Theta Tau International and program sponsor Johnson & Johnson, I participated in a triad team guided leadership academy and mentorship program over an 18 month period to procure and refine leadership skills in a maternal child healthcare setting. Guided by the Faculty Mentor; the Leadership Mentor and Scholar shadowed the Kouzes and Posner's leadership practices to form and guide a multidisciplinary team in the development of a new educational offering for patient care assistants (PCAs) focusing on developmentally appropriate pediatric care. Delivery of the content will be carried out through electronic learning modules and classroom setting education which includes case studies and hands on competencies. Success of the new educational offering will be measured through methods of competence and confidence questionnaires which will be administered in a pre-test and post-test fashion.

Results: Results thus far in the project consist of creation of an updated developmentally appropriate pediatric care educational offering. This included a thorough assessment of the existing electronic learning modules accompanied by updating of content and literacy levels; the creation and validation of pre and post confidence and competence scales used to measure the success of the curriculum; and administration of the pre confidence and competence scales to 15 PCAs. The project timeline includes plans to present the educational offering in July, 2015. Post questionnaire administration and evaluation will occur in September and October, 2015. It is anticipated that by November, 2015, 15 PCAs will have completed the new educational offering and the post-test on confidence and competence. Following data

analysis any needed changes will be made to the presentation and it then will be assimilated into the orientation curriculum of all future PCAs.

Conclusions: Regressive developmental behaviors frequently accompany the hospitalization of children. To minimize these regressions, or lack of attainment of appropriate developmental milestones, all care givers must be knowledgeable about anticipated "normal" development in children. Since the PCA has become an integral part of the nursing care delivery team they must be provided with adequate information and guidance to provide such care and/or seek additional assistance. This project presented information deemed essential by a team of experienced child health care providers, presented the material using dynamic and diverse methods, and anticipates changes to be documented in the analysis of pre/post testing and improved patient satisfaction.

### A Pilot Exploring Integration of a Home Visiting Public Health Nurse into a Pediatric Medical Home Team

---

*Katharine Joy Besch, BSN, MBA, RN, USA*  
*Lea Ann Miyagawa, MN, BSN, RN, USA*

#### Purpose

Enhance the Pediatric Medical Home team by incorporating a home visiting Public Health Nurse (PHN). The goal is to provide improved continuity of care between the clinic and the home environment thereby enhancing the health care of clients and families as well as job satisfaction of the medical team.

#### Target Audience

The target audience of this presentation is Sigma Theta Tau Biennial Convention participants, nurse leaders, policy makers, and health care professionals interested in reviewing and discussing ways to improve services to high risk pediatric patients.

#### Abstract

Introduction/Background: Mounting evidence shows that home visiting programs can decrease health disparities; reduce hospitalizations and emergency care visits; and increase access to health care services. Furthermore, experts in pediatrics, public health and early childhood development have discussed the integration of home visiting nurses and the medical home and how the new model of care can optimize communication, and collaboration improving continuity of care for pediatric clients and their families.

Public Health Seattle and King County (PHSKC) has a robust Public Health Nurse (PHN) home visiting service as well as pediatric clinics that have achieved medical home designation. PHSKC serves a diverse population with over 100 languages spoken in the area which increases the complexity of providing comprehensive patient care. Formalizing the relationship between home visiting PHN's and the Pediatric Medical Home team could serve to strengthen the care coordination and health resources available to the pediatric clients.

Aim/Goal/Purpose Sentence: The aim of the pilot project is to explore a new model of care that enhances the Pediatric Medical Home model by incorporating a home visiting Public Health Nurse (PHN) into the existing medical home team. The goal is to improve client access to medical care and the continuity of care between the clinic and the home.

Methods: A Public Health Center site, Columbia Public Health Center, was identified as having a Pediatric Medical Home team as well as a home visiting PHN department, which operated separately. The leadership fellow facilitated the formation of the pilot project team consisting of an MD, office RN, MA, PHN, and nurse supervisor. The team identified a pilot group of seven clients to follow over 9 months who met the criteria of being under 6 months of age and a high risk client. The newly developed team met for regular team meetings for case conferencing and evaluation of pilot strategies and problems with communication. Team guidelines were set regarding preferred methods of communication for care coordination activities and patient education strategies. Family interviews and a medical home staff focus group were conducted after the pilot's completion. Chart reviews provide additional descriptive data for activities and family data.

Results: Themes from interviews of the Medical Home team are presented exploring the benefits and barriers for the communication, timing and health care encounters of patients involved in the pilot. Care perceptions of family members and recommendations for future team care will be analyzed and reported.

Impact of the project, next steps and recommendations for continuation and/or expansion of the project will be presented.

Conclusion: This pilot project explores an enhanced model of care incorporating a home visiting Public Health Nurse (PHN) into the existing Medical Home team. This project provides data about the viability and impact of expanding the Pediatric Medical Home team to provide improved services and access to care for high risk children in the community.

### Early Skin-to-Skin in the Operating Room Following Cesarean Birth

---

*Tonia Squires, BSN, RN, IBCLC, USA*  
*Julia Snethen, PhD, MSN, BSN, RN, USA*  
*Meredith Laine Green, MSN, BSN, AGCNS-BC, RN, APRN, USA*

#### Purpose

To examine the effectiveness of the implementation of an early skin-to-skin intervention program for mothers and babies following a cesarean birth. A secondary aim was to examine the association between mothers whose baby was placed skin-to-skin after cesarean birth, and exclusivity of breastfeeding at time of discharge.

#### Target Audience

Any hospital or birth center looking to implement skin-to-skin contact following a cesarean birth.

#### Abstract

Background: World Health Organization (WHO) and The United Nations International Children's Fund (UNICEF) have identified "Ten Steps to Successful Breastfeeding". The "Ten Steps" use evidenced-based care to optimize breastfeeding outcomes and ultimately improve health outcomes, both short and long-term, for both mother and infant. Many hospitals in the United States, are working toward the implementation of all ten steps and ultimately the title of "baby friendly" through the organization Baby Friendly Hospital Initiative (BFHI).

For this project, the fourth step, to "initiate breastfeeding in the first hour of life", was identified as a quality improvement project, with cesarean births having the greatest need. In order to accomplish this goal, it was decided that an early skin-to-skin program was needed for mothers and babies immediately following cesarean birth, to encourage the initiation of breastfeeding in the first hour of life.

Purpose Statement: To examine the effectiveness of the implementation of an early skin-to-skin intervention program for mothers and babies following a cesarean birth. A secondary aim was to examine the association between mothers whose baby was placed skin-to-skin after cesarean birth, and exclusivity of breastfeeding at time of discharge.

Methods: An early skin-to-skin program for mothers and babies following cesarean birth was developed by a team of healthcare providers at a women's healthcare center in the Southern Midwest. Preparation for implementation of the new skin-to-skin program was completed through meetings, educational in-services and competencies with nursing staff, physicians and operating room staff.

Data was collected by conducting retrospective chart reviews to obtain rates of cesarean born infants going skin to skin in the operating room and exclusivity of breastfeeding at discharge. Exclusions for skin to skin were given for medically unstable infants and mothers and if the mothers declined to participate in the skin-to-skin program. Ongoing results of the monthly rates of skin-to-skin and exclusivity of breastfeeding were posted in the staff break room, with individual staff recognition for complete documentation and consistency of implementation.

Results: The early skin-to-skin program for mothers and babies following cesarean birth was initiated in October 2014, and data collection on the project was begun in November 2014. Currently, the preliminary data for the rates of early skin-to-skin contact for eligible mothers and babies following cesarean birth has risen from 0% at the initiation of the program to 76%. Data collection is currently ongoing for both the early skin-to-skin program as well as exclusivity of breastfeeding at discharge.

Conclusion: Through the implementation of the new standard of care, education, documentation changes, encouraging the heart and data collection, we had an increase of 76% for eligible mothers and babies experiencing skin to skin in the operating room from implementation of the program.

It was recognized early in the implementation of the project that this was one step in the journey to becoming a baby friendly hospital. The ease and swiftness to which the early skin-to-skin program for mothers and babies following cesarean birth was implemented was unexpected. The success is thought to be due to both the education of the nursing staff on the importance of early breastfeeding, and an ongoing gradual change in the women's health center towards a breastfeeding friendly culture.

### Field Birth: A Video Program and Resource Website for Care Providers of Newborns Delivered Outside of the Hospital

---

*Karen Lynne Wright, PhD, MSN, NNP-BC, RN, USA*

#### Purpose

The purpose of this project is to improve the clinical outcome of newborns delivered outside of the hospital by providing prehospital care providers with video resources, an educational program, and website for newborn care immediately following delivery.

#### Target Audience

Prehospital care providers including first responders, paramedics, emergency medical technicians, midwives, and doulas.

#### Abstract

**Introduction:** Despite the rise in planned and unplanned home and field births, the opportunities and resources for pre-hospital care providers to participate in visual demonstration and to gain fundamental information regarding critical concepts of newborn care are limited. The purpose of this program is to provide pre-hospital care providers with a video resource education program and website with resources for newborn care immediately following delivery.

**Method:** The program Field Birth was created for providers to learn about and visualize newborn care and resuscitation techniques following delivery. The website and course modules were content validated and evaluated for usability by 5 content experts including 2 nurse midwives, 2 paramedics and 1 emergency medical technician. Ten 30 minute video modules demonstrating newborn care following delivery were created: preparing for Baby, assisting Baby at birth, well Baby, every Baby, sick Baby, early Baby, warming and transporting Baby, communication about Baby, and putting it all together about Baby. A pre and post-test was created to test learning. Prior to the live launch of the website, the modules were piloted using a paramedic and EMT class enrolled at a nearby university.

**Results/Beneficiaries:** The target beneficiary audience is infants delivered outside of the hospital. The target program audience is pre-hospital care providers.

It is anticipated that 30 participants will complete the pre and post-test and 10 learning modules. Pre and post-test comparison scoring \_\_\_\_\_. As part of the evaluation, participants were also asked for commentary about the program and website. Based on feedback, changes can be made for the program to continue.

**Activities:** Use of the website and links as resources for pre-hospital care providers. Ten video modules discussing and demonstrating newborn care and birth resuscitation methods were developed.

**Limitations:** The pilot and launch of Field Birth was initially directed towards emergency medical technicians and paramedics. Further marketing of the program to the midwifery and doulas is forthcoming.

## MCH - Maternal-Child Health Nurse Leadership Academy Invited Posters

### Preterm Labor: Enhancing Assessment Competency and Reducing Variation among Telephonic Maternity Care Managers in a Managed Care Organization

---

*Kimberly C. Hite, MSN, RN, RNC-MNN, USA*

*Laura A. Fennimore, DNP, RN, USA*

*Catherine Burns, PhD, RN, CPNP-PC ret., FAAN, USA*

#### Purpose

The purpose of this presentation is to describe a project designed to enhance the assessment of pregnant women involved in a telephonic maternity care management program offered by a managed care organization.

#### Target Audience

The target audience of this presentation is Registered Nurses interested in Maternal Child Health and care management programs offered by managed care organizations.

#### Abstract

**Introduction/ Background:** Preterm labor is a major public health issue that has substantial direct and indirect costs including staggering health care costs from prolonged neonatal intensive care unit (NICU) hospitalization; potential long-term health consequences such as cerebral palsy, mental retardation and blindness that can impact overall quality of life; and significant emotional costs for the family from increased levels of stress and potential loss of income. More than 50% of preterm births occur among women with no identifiable risk factors. It is essential that pregnant women be assessed for actual and potential risk factors and educated about their risk status, signs and symptoms of preterm labor, and the importance of early medical intervention. The UPMC Health Plan, a part of the UPMC Health System, is a regional managed care organization located in Pittsburgh, PA. The UPMC Health Plan shares a common set of values with the rest of the system to create a consistent UPMC experience across the continuum for the patients, health plan members, employees, and the communities it serves. A telephonic maternity care management program is available for pregnant members with commercial health insurance, as well as members enrolled in government programs such as Medical Assistance. The program is staffed by thirteen registered nurses with extensive obstetrical nursing experience functioning in the role of maternity care managers. The maternity care manager contacts the member by telephone, completes a comprehensive assessment, and offers prenatal and postpartum education. The average caseload per nurse is 185 members.

**Purpose:** The purposes of this project were to develop a preterm labor competency assessment to identify gaps in existing knowledge and assess the comfort level of thirteen registered nurses in the maternity program working telephonically with pregnant women whom may experience preterm labor during their pregnancy, to develop a preterm labor learning module using current evidence-based research and practice guidelines, and to devise a standardized care pathway to ensure consistency of risk assessment and education provided to UPMC Health Plan members enrolled in the telephonic maternity care management program.

**Methods:** Through the Sigma Theta Tau International (STTI) Maternal-Child Health (MCH) Nurse Leadership Academy, sponsored by Johnson & Johnson, this fellow ; Laura Fennimore, the leadership mentor; and Catherine Burns, the STTI MCH faculty advisor, participated in a faculty guided leadership and mentorship program to acquire and enhance leadership skills necessary to facilitate a quality improvement project focused on improving maternal-child outcomes. The Fellow used a team of nine healthcare professionals that consisted of maternity nurse case managers, hospital-based nurses, physicians, and project analysts to help develop the project using a Logic Model framework. Team members conducted a review of literature and current practice guidelines for preterm labor related to risk

factors, diagnosis, treatment and pertinent patient education to develop staff education content. A PowerPoint presentation was developed and presented to maternity staff along with a preterm labor resource packet. In addition, the team is developing a standardized preterm labor care pathway to be utilized by all maternity care managers to help reduce variation in assessment of risk and improve pregnancy outcomes.

A number of evaluation strategies were used to evaluate the success of the project. A pre/post-education survey using a five point Likert scale was developed and provided to all maternity care managers to assess their overall comfort level related to preterm labor management and caring for women experiencing this pregnancy complication. Since all calls with members are recorded, a call and chart audit tool was developed to evaluate change in care manager behavior related to risk assessment of preterm labor and the consistency of patient education provided pre-education and post-education. Audits are planned for 3 month intervals to determine the extent of nurse behavior change and if change was sustained over time. Constructive feedback and coaching is provided to staff members as needed. The data analysis will include individual and group results. Maternity assessments utilized by the maternity care managers will be revised to improve assessment of risk and identify opportunities for patient education.

**Results:** The pre and post education surveys of the nurse case managers showed improvement in their overall comfort level of nursing care for pregnant women experiencing preterm labor. The mean overall comfort level on the pre-education survey of 4 increased to 4.6 on the post-education survey and an increase of 24% indicating feeling extremely comfortable. All of the nurse case managers indicated that they were extremely likely to incorporate the information provided into nursing practice and 70% rated their comfort level regarding their role as case manager caring for this population as extremely comfortable. The pre- education and post- education call and chart audits results are still being collected and evaluated. Findings will be reported at a later date. Calls and charts audited at the following intervals; pre-education and post-education. Constructive feedback is provided to maternity case managers as individuals and as a group on an ongoing basis to ensure staff remains competent. The electronic medical record template for maternity assessments has been redesigned to enhance risk assessment.

**Conclusions:** The project found that prior to the intervention there was significant variation among the care managers in the assessment of preterm labor risk and patient education provided. In addition, the information provided to members was not consistent with current evidence based practice guidelines. Following the education program, utilization of the written module, use of the improved EMR template, feedback from call and chart audits, and development of a standardized care pathway, the expectation is improved consistency of risk assessment and education provided by the maternity case managers to pregnant women enrolled in the telephonic maternity care management program at UPMC Health Plan. Additionally, the project provided a vehicle for discussions with a variety of obstetrical providers including private and outpatient clinic obstetric practices and the inpatient hospital staff to look at provision of system wide best practices to educate pregnant patients about preterm labor risk factors, reduction and prevention of risks, and early identification of preterm labor to minimize risks and enhance pregnancy outcomes.

As a fellow in the STTI MCH Nurse Leadership Academy, the fellow has learned to apply the five Kouzes and Posner leadership principles to her role as manager of the UPMC Health Plan Maternity Program. The fellow models the way through her commitment to the highest standards for professionalism and personal integrity in her daily work with her team and makes exceeding expectations a priority. In the past few months, she has worked closely with her director to inspire a shared vision and challenge the process for changes within the maternity program as the team strives to improve efficiency and effectiveness, and improve member engagement levels. The fellow has enabled others to act by engaging staff in various aspects of this project by involving them in the research for current evidence based practices and the development of preterm labor course content. Staff were also included in the decision making process which helped to facilitate the successful adoption of program changes by the team. The fellow encourages the heart of her team members by actively listening to the personal concerns of her staff,

celebrating their personal and professional milestones, and by promoting the maternity program to medical directors, other departments, and to the OB provider community.

### Keeping Skin in the Game: Bringing Awareness to Neonatal Skin Injuries

---

Media S. Esser, MSN, BSN, RN, APNP, NNP-BC, USA  
Christine A. Schindler, PhD, RN, CPNP-AC/PC, WCC, USA  
Patricia Clinton, PhD, MSN, BSN, IA, ARNP, CPNP, USA

#### Purpose

The purpose of this presentation is to bring an increased awareness to the incidence of neonatal skin injuries, the ongoing work related to strengthening, quality interventions, and preventative measures at the bedside.

#### Target Audience

The target audience of the presentation is nursing and medical professionals including those in leadership positions.

#### Abstract

**Purpose:** The purpose of this project is to increase awareness of the broad range of neonatal skin injuries and to improve documentation of those injuries in a level 4 Neonatal Intensive Care Unit (NICU).

**Background:** Skin injury is a significant problem in the neonatal population. Skin injuries in the neonatal population are suspected to be under reported and often overwhelming for healthcare professionals. Neonatal skin is very thin compared to adult skin, taking days to weeks to mature, thus predisposed to injury. Injuries are most commonly caused by daily bedside care and procedures performed during the neonate's hospitalization. The advancement of technology in improving morbidity and mortality over the last 10 years has continued to result in the occurrence of skin injuries.

The most common skin injuries found in the neonatal population are skin tears, IV infiltrates, device related pressure injuries, diaper dermatitis, irritant dermatitis, and adhesive injuries. Every neonate in the NICU is considered high risk and several preventative measures are performed based on clinical triggers in daily care. As many as 4% of patients from the NICU may be discharged with significant scarring. Those infants of lower gestational age have had rates of unintentional skin injuries at 57% compared to their term counterparts with rates of 3%. Describing the scope of skin injuries seen in neonates is a first step in developing interventions to improve outcomes.

**Methods:** This QI project began in January 2015 following successful IRB approval. All infants admitted to the NICU were assessed and data were included on all infants except those with pre-existing incision sites, Gtubes, trachs, and other surgical sites that would be under the management of a specialty service.

Data collection included: basic demographics, description of injury, site of injury, date of resolution, and interventions. Nurses documented skin injuries in a specific section within the electronic health record providing a date of start/end and description.

**Results:** Process measures included: the creation of a data collection tool, the provision of education for interdisciplinary teams, and improved documentation. Outcome measures included: the identification and characterization of skin injuries other than pressure ulcers.

**Leadership Journey:** This journey started with the idea of promoting increased awareness related to neonatal skin injuries and the need for consistent standardized documentation related to those injuries. The project grew to become the compilation of many meaningful experiences leading to the generation of a stronger NICU presence in the conversations surrounding skin care initiatives within the organization.

The KP model served to guide the work with each of the five steps exemplifying key points in this skin care journey. The five steps including modeling the way, inspiring a shared vision, challenging the process, enabling others to act, and encouraging the heart served as guides for the project.

### Building an Interprofessional Collaborative Education and Practice Model (ICEPM)

---

*Terry L. Eggenberger, PhD, RN, NEA-BC, CNL, CNE, USA*

#### Purpose

The purpose of this presentation is to demonstrate how a team leadership project led to a method of aligning education and practice to support interprofessional collaboration by faculty, students and front line providers.

#### Target Audience

The target audience of this presentation is clinically focused academic faculty and nurses from practice settings.

#### Abstract

Background: A new Internal Medicine residency program in a community hospital challenged the existing team structure and how providers (e.g., nursing, pharmacists, and current medical staff) interacted and collaborated. To achieve the goals of the Nursing Faculty Leadership Academy (NFLA), a leadership project was developed to address team communication and collaboration to develop effective working relationships among frontline health care providers at the point of care. An interprofessional (IP) team from academia was formed to partner with this practice setting to improve IP competencies.

Purpose: The focus of this project was to conduct a mixed method assessment of team culture to develop interventions that foster living the IP competencies in practice by faculty, students and front line providers and build a sustainable Interprofessional Collaborative Education and Practice Model (ICEPM).

Methods: The initial baseline assessment was completed in two phases using a mixed methods approach. In Phase I, focus group and individual interviews over eight months examined perceptions about the organization's culture, beliefs about existing attitudes towards team concepts, and communication patterns as a prelude to promoting this ICPM. The interviews were audio recorded and transcribed. The IP research team independently read the transcripts using conventional content analysis to code the data and identify themes. In Phase II, a pre and post-test design is being implemented to evaluate strategies to strengthen working relationships, communication, and team collaboration. Gittel's Relational Coordination Scale, a validated and reliable instrument has measured team work pre implementation of ICEPM interventions, and will be administered post interventions. Relational Coordination (RC) is a mutually reinforcing process of communicating and relating for the purpose of task integration measured between workgroups and/or individuals.

Results: Analysis of Phase I focus groups (N=19) and individual interviews (N=26) provided insights from pharmacists, nurses, case managers, new residents, hospitalists and community physicians. Emerged themes included Disjointed Communication, Desire for a Shared Mental Model, Impact of Residency Presence and Call for Mechanisms that Foster Interprofessional Collaboration. These findings were shared with the hospital leadership and university faculty followed by brainstorming how to promote IP practice. As a result the project team chose to structure the 7 domains of Relational Coordination (RC) on patient needs for discharge. Pre interventional RC Scores were reviewed by the project team for their reflection on patterns of behavior that impact the patient discharge process. Overall, RC among the discharge process team was moderate, driven by strong Frequent Communication ties and weak Timely Communication and Shared Knowledge ties. Frequent communication among team members was identified as a strength the team can leverage as they embark on their effort to improve the patient discharge process. Weak timely communication and shared knowledge among team members currently limits the effectiveness of the patient discharge process. Similar patterns were also borne out at the role level.

Conclusions: Results of the organizational assessment are guiding the team as they integrate and hardwire IP communication. In turn, the team plans to produce a discharge video featuring IP perspectives, implement IP discharge rounds, and develop Faculty and Practice Champions to create a sustainable IP environment that impacts patient outcomes.

## Shattering the Glass Ceiling for a Junior Nurse Leader

---

*Trisha Leann Horsley, PhD, RN, CHSE, CNE, USA*  
*Suzan Kardong-Edgren, PhD, RN, ANEF, CHSE, USA*  
*Elizabeth Peter, PhD, RN, Canada*

### Purpose

The purpose of this presentation is to share the journey of a junior nurse scholar through the Nurse Faculty Leadership Academy.

### Target Audience

The target audience of this presentation is junior nurse faculty who have the passion to improve nursing education and desire to be a change agent for the future as well as seasoned nurse faculty who are interested in serving as a mentor.

### Abstract

**Background:** In academia, junior faculty have more experience in following their seasoned colleagues than leading change in nursing education even if the junior faculty member is doctorally prepared. At this point in time, our seasoned colleagues remain among us to serve as leaders and mentors but the time will quickly approach when they will no longer be with us to share their wisdom. The time has come and it is essential for junior nurse faculty to develop and sharpen their leadership skills under the formal guidance and mentoring of seasoned colleagues to ultimately become nursing leaders.

**Aim:** The overall aim was to foster the Scholar's leadership development utilizing the Kouzes and Posner's Five Practices of Exemplary Leadership model as well as formal mentoring through the triad team; the Scholar, Leadership Mentor, and Faculty Advisor.

**Methods:** The Nurse Faculty Leadership Academy (NFLA) is an 18 month leadership development program for junior nurse faculty created and supported by Sigma Theta Tau International in partnership with the Elsevier Foundation. A project, to increase the quantity of high quality simulations and change the simulation scheduling model within the Scholar's School of Nursing, served as the vehicle to work through and display leadership development.

**Results:** The Scholar lead a simulation team which successfully executed a 175% growth in the amount of simulations across six clinical courses and changed the simulation scheduling model for undergraduate nursing students. During the NFLA, the Scholar met and exceeded all Individual Leadership Development Plan objectives. The Scholar's leadership growth within all five areas of Kouzes and Posner's model was documented through both quantitative and qualitative measures.

**Conclusions:** The NFLA provided the supportive environment, mentoring, and opportunities for the Scholar to emerge as a leader within academia, the community, and her chosen specialty area of simulation. The Scholar pushed through a perceived glass ceiling in regards to her future potential as a change agent in nursing education. The Scholar is now equipped with strategies and resources for ongoing leadership development and has the passion to assist others in their leadership development as well.

### Faculty Mentoring of DNP Students

---

*Nancy N. Manister, DNS, CNS, FNP-BC, USA*  
*Keville C. Frederickson, EdD, RN, FAAN, USA*  
*D. Anthony (Tony) Forrester, PhD, RN, ANEF, FAAN, USA*

#### Purpose

to highlight this scholar's individual leadership development experience and expanded scope of influence, which was facilitated through development of a team project. The team project was designed to increase knowledge regarding the process and experiences of mentors and mentees in the DNP program setting.

#### Target Audience

nursing faculty involved in leadership development, nursing faculty who are developing, revising or teaching in DNP programs, and DNP students.

#### Abstract

**Background:** The Sigma Theta Tau International Nurse Faculty Leadership (NFLA) Academy experience, which is supported in partnership with the Elsevier Foundation, provided an opportunity to develop faculty leadership skills and expand my scope of influence through identification and development of a team leadership project. The first step in this process was the formation of a triad, consisting of a Leadership Mentor - Keville Frederickson EdD, RN, FAAN, NFLA; a Faculty Advisor - D. Anthony Forrester PhD, RN, ANEF, FAAN; FAAN, and Scholar – Nancy N. Manister DNS, CNS, FNP-BC. The triad relationship provided critical support throughout the NFLA experience.

The NFLA team leadership project - Faculty Mentoring of DNP Students – was developed to advance nursing education by providing needed information about the mentoring relationship between DNP student and faculty mentor. Information is needed about this relationship as most DNP programs are new, and best practices for mentoring have not been established.

**Purpose:** The purpose of this experience was to promote leadership development for junior nursing faculty through varied educational strategies focused on knowledge, competence, and outcomes.

**Methods:** The NFLA 21-month program utilized a curriculum based upon leadership development of the scholar across three domains: individual leadership development; advancing nursing education through a team leadership project; and expanding the scholar's scope of influence within the academic institution, the community, and the nursing profession. Two 3-day intensive workshops and continued support by the leadership mentor and faculty advisor served to guide the scholar through this experience. Kouzes and Posner's Five Practices of Exemplary Leadership were utilized as a basis to assess the scholar's strengths and weaknesses, and provided a framework for leadership development. As well, Kouzes and Posner's leadership practices were used to develop a team leadership project aimed at advancing nursing education through assessment of needs and expectations of DNP student mentees and DNP faculty mentors, development of a four hour mentoring workshop, and workshop evaluation. Opportunities were identified for increasing the scholar's scope of influence throughout the program experience.

**Results:** The NFLA scholar utilized self-assessment tools, self-reflection, as well as feedback from the leadership mentor and faculty advisor to determine two areas of focus for individual leadership development: model the way; and enable others to act. A team was formed to develop, implement, and evaluate a team project at Fairfield University. The project team consisted of two nursing faculty members, a university administrator, and the NFLA scholar. The NFLA leadership mentor and faculty advisor provided valued input and support throughout this process. The team project - Faculty Mentoring of DNP Students - was successful in determining mentoring needs and expectations of DNP students, and expectations and beliefs of DNP faculty mentors. A positive mentoring workshop experience was provided to a group of DNP faculty mentors and student mentees, and evaluations of this workshop will

be used to develop and plan for future workshops and inform mentoring practices for DNP programs. The experience of participating in the NFLA served as a spring board for the scholar to increase scope of influence within the university (organization), the community, and the nursing profession.

Conclusions: The intensive NFLA experience provides an invaluable opportunity for the junior nurse faculty member to develop key leadership skills. Supported by the triad relationship and continued self-assessment and reflection, this program demonstrates a successful strategy for developing nurse faculty leaders of the future.

### Preparing for Program Changes: Fostering Faculty and Staff Leadership Development Using a Business Case Model

---

*Jennifer L. Embree, DNP, MSN, BSN, RN, NE-BC, CCNS, USA*

*Nancy C. Sharts-Hopko, PhD, RN, FAAN, USA*

*Ainslie Nibert, PhD, RN, FAAN, USA*

#### Purpose

To describe the NFLA project: a template for nursing leadership program change and a framework for staff and faculty leadership development using the Kouzes and Posner Model and the Style Code.

#### Target Audience

The target audience for this presentation is nursing faculty.

#### Abstract

Nurses represent the largest human resource across the continuum of care. Developing nurses who can lead health care is critical. The Nurse Faculty Leadership Academy through Sigma Theta Tau and sponsored by Elsevier provides novice faculty opportunities to enhance leadership talents for nurse scholars and leadership team members. This academy affords the scholar opportunities for additional growth and leadership through a triad team of a Faculty Mentor-Nancy Sharts-Hopko PhD, RN, FAAN, and Faculty Advisor-Ainslie Nibert PhD, RN, FAAN, and the Scholar.

Graduate nursing leadership programs can provide a bridge to build new leaders by offering practical experience related to core leadership concepts, translating knowledge into practice and creating relationship skills. Leadership development helps new nurse leaders generate authentic dialogue, collaboration, and mutual decision-making. Nursing leadership integrates nursing, science, leadership, human, financial and other disciplines that prepare nurses to lead health care systems. Nurse leaders' unique contributions to health care center around evidence-based care delivery, outcomes research synthesis, patient safety strategies, creative leadership and evaluation of healthcare systems. It is important to identify gaps between current conditions and desired conditions in an organization. The Master's in Nursing Leadership in Health Systems (MSN NLHS) program is one of nine masters in nursing leadership programs in our state. In light of a newly re-vamped Doctor of Nursing Practice program for Nurse Executives, the MSN NLHS program needs to provide foundational leadership for those students seeking a Masters in Nursing Leadership who might later seek a terminal degree. The current MSN NLHS program was identified as a one weekend per month hybrid program in which to complete ten problem-based case reviews, develop a nursing unit budget, assess a nursing informatics hospital system, and assess hospital systems. The MSN NLHS program underwent a program review over six years ago, so program review is necessary. Delivery of programs and courses are dependent upon students attending, staff support, such as instructional designers and video conferencing specialists. Including these important stakeholders in the NFLA team provided an opportunity for team input into course and program enhancements as well as leadership development.

The future of nursing schools, the campus, and programs must be distinctive, effective, efficient, transformative, and nimble in response to change, stakeholder needs, and emerging opportunities. The school's strategic initiative to increase graduate education capacity's goal with clear and nimble structures fits well with this MSN NLHS program review.

Ongoing changes at the school of nursing include leadership transition at a variety of levels. Updating faculty, curriculum chairs, and new explanations of the work of the NFLA team was accomplished. The university chose a new learning management system to replace the homegrown system and system implementation is in process. A new ePortfolio system is also under implementation by the university and integration with the learning management system will occur. Continuing relationships with instructional

designers, videoconferencing specialists and students afford additional opportunities for course improvement and address important stakeholder needs.

### Faculty Leadership Development: Mentoring, Team Leadership, and Community

---

*Alison H. Edie, DNP, MSN, BSN, FNP-BC, USA*

*Bette A. Mariani, PhD, RN, USA*

*Carol E. Winters, PhD, RN, CNE, USA*

*Elaine S. Marshall, RN, USA*

#### Purpose

The purpose of this poster presentation is to share the experience of a novice faculty member in the Sigma Theta Tau International Nurse Faculty Leadership Academy (NFLA).

#### Target Audience

The target audience of the presentation is nurses new to the faculty role, expert faculty considering mentoring, and administrators responsible for faculty development.

#### Abstract

Introduction/Background: Clinicians new to school of nursing faculties are expert practitioners but novice to the faculty role. Development of new faculty into leaders in nursing education promotes career success and faculty retention, encourages positive academic environments, and ultimately, advances nursing education. Sigma Theta Tau International (STTI) Nurse Faculty Leadership Academy (NFLA) sponsored by the Elsevier Foundation is designed to develop leadership knowledge and practices in non-tenured or tenure-track full time faculty with less than 5 years of experience in schools of nursing. Scholars advance their leadership in three domains; individual leadership development, nursing education through a team project, and expansion of their scope of influence in their organization, community, and profession. For each of these domains, scholars set priorities, goals, strategies, and outcomes for their own growth as nurse leaders in education.

Purpose: The purpose of this scholar's participation in the NFLA was to develop personal leadership practices, successfully lead a team project, and advance her impact in the organization, community, profession, and nursing education.

Methods: Through the STTI Nurse Faculty Leadership Academy (NFLA), this scholar led a team project that facilitated leadership growth. This 18-month intense leadership academy promoted leadership development through the use of a triad model of mentorship consisting of a faculty advisor, (Dr. Carol Winters), two mentors, (Drs. Elaine Marshall and Bette Mariani), and a scholar. Kouzes' and Posner's leadership model of Five Practices of Exemplary Leadership (2012) was used to guide the scholar on this leadership journey. Using this model and with the relationship of the triad, the scholar developed an Individual Leadership Plan.

Results: By leading a team in the development of a web-based clinical scenario, this scholar demonstrated growth in the Kouzes' and Posner's leadership practices of "Modeling the Way," "Enabling Others to Act," and "Encouraging Others." The scholar shared and affirmed her values by setting an example of expectations through her personal commitment to the team project. When obstacles occurred, priorities were realigned and goals were adjusted to meet new outcomes. This helped to keep the team cohesive and despite setbacks, the work continued. The scholar fostered collaboration, encouraged members to contribute their own ideas, and supported the decisions of the team members. The team successfully presented the work of the project at a national conference giving recognition to all.

The NFLA scholar expanded her scope of influence in nursing education at the institutional and national level. At the university, she serves on graduate program committees and is a board member of the local STTI chapter. In the community, she serves on a homeless shelter board. Nationally, she is a co-chair of a special interest group for a national nurse practitioner organization.

Conclusion: The NFLA fostered the leadership development of a novice faculty member and expanded the scope of influence of the scholar through mentorship, leadership development planning, and a team leadership project.

### Am I There Yet? My Journey to Becoming a Nurse Faculty Leader

---

*Elaine C. Hardy, PhD, RN, USA*

*Barbara Manz Friesth, PhD, RN, USA*

*Norma Martinez Rogers, PhD, RN, USA*

#### Purpose

The purpose of this presentation is to describe my involvement in the NFLA and to illustrate my improvement in leadership skills as a nurse educator and scholar, working to improve minority student and faculty outcomes in nursing education.

#### Target Audience

The target audience of this presentation is early career nursing faculty, and administrators interested in providing leadership development opportunities for their early career nursing faculty.

#### Abstract

Introduction: Early in my career as nursing faculty I thought that I knew what I wanted. I aspired to be a nurse faculty leader. However, I quickly realized that I had no idea what it took to become a leader. This is why the Sigma Theta Tau International Nurse Faculty Leadership Academy (NFLA) was so intriguing to me. When the opportunity to apply to this program arose, I inquired immediately to my institution for support in this endeavor. The NFLA, sponsored by the Elsevier foundation, recruits early career nurse faculty for the purpose of developing them as leaders in nursing education. The 18-month program is based upon Kouzes and Posners' (K&P) five practices of exemplary leadership: model the way, inspire a shared vision, challenge the process, enable others to act, and encourage the heart. A leadership mentor and faculty advisor supports the scholar. The scholar's personal leadership growth is fostered through developing individual leadership, leading a team project, and expanding the scholar's scope of influence in their institution, community, and profession.

Purpose: The purpose for my involvement in the NFLA is to improve leadership skills as a nurse educator and ultimately to impact minority student outcomes in nursing education.

Methods: In order to develop as a leader, the scholar used a variety of measures of growth and self-development. One such measure, the K&P Leadership Profile Inventory (LPI), was used to construct an Individual Leadership Development Plan (ILDLP). Self-reflection, input from the mentor, and faculty advisor, helped the scholar to identify behaviors, action strategies and desired outcomes conducive to becoming a leader. To monitor the scholar's progress, the scholar identified two faculty members to observe displayed behaviors in a variety of settings and to give feedback.

The team-project was to increase perception of growth and leadership development in diverse undergraduate nursing students. While leading the project team, the scholar further practiced personal leadership behaviors. The students' perception of their leadership was measured with a pre-and post programming Student-Leadership Profile Inventory (S-LPI). For comparison of the students' perception and that of others, the students selected two observers to complete the Observer S-LPI. Data from pre-and post-programming S-LPI and the Observer S-LPI were analyzed using Wilcoxon test.

To further develop the scholar's leadership growth, the mentor and faculty advisor together with the scholar identified leadership possibilities within the scholar's institution, community, and profession. Opportunities suggested to the scholar were to join the curriculum committee, resolve disagreements with faculty using dialogue, disseminate NFLA experience at conferences, and work with the team on disseminating project and leadership experience in manuscript form. Professionally, the scholar was encouraged to continue with the local chapter of the National Black Nurses Association and to run for a board of director's position of the National Black Nurses Association.

Results: The scholar's identified goals and associated behaviors identified through the ILDP were in the areas of effective communication, delegation, encouraging others, and enabling others to act. The faculty observers reported a positive change in the scholar's behaviors. However, some improvements were still needed in effective communication.

Results from the team-led project with 10 students: 5 male, 5 female, 30% ethnic/racial minority, ranging in ages from 19-41, were statistically significant in all 5 practices of exemplary leadership for pre-and post-programming. While the comparison between students and observers' measures were not statistically significant, the observers perceived students ratings higher than students perceived themselves.

By practicing the associated behaviors identified through the ILDP the scholar's scope of influence in the institution increased. Exemplars of this influence are: joined the curriculum committee, worked on several subcommittees, served as consultant to a university interdisciplinary grant to develop an educational pipeline for minority students, and mentored faculty and students in writing and submitting abstracts. The scholar has had several peer-reviewed abstracts submitted and accepted for national conferences and a podium presentation at the 2<sup>nd</sup> Annual Cultural Inclusion Institute.

Conclusion: This journey as an NFLA scholar has taught me that by being self-reflective and taking advantage of opportunities that the NFLA has provided, I can develop into the nurse faculty leader that I aspire to become.

## Inspiring a Shared Vision for Interprofessional Education

---

*Karma Cassidy, PhD, MSN, RN, USA*

*Laura C. Dzurec, PhD, MS, BS, RN, PMHCNS-BC, ANEF, USA*

*Carolyn A. Williams, BSN, MSN, PhD, FAAN, USA*

### Purpose

The purpose of this presentation is to describe scholar leadership development and scope of influence in team projects to advance nursing education. An assessment of faculty knowledge, attitudes and practices in Interprofessional education (IPE) was conducted.

### Target Audience

The target audience of this presentation are participants of the 43rd Sigma Theta Tau International (STTI) Biennial Conference including but not limited to nursing students, faculty and STTI Academy Scholars

### Abstract

**Background:** Leaders in health care quality and safety recommend adoption of collaborative practice models to improve health outcomes and development of a workforce skilled in Interprofessional collaboration. Interprofessional education (IPE) for collaboration occurs when students from two or more professions learn about, from and with each other to improve health outcomes. Effective integration of IPE into curricula depends upon leadership with focused resolve to impact attitudes toward collaboration and a willingness to revise and/or develop curricula to support IPE. For the most part, nursing and allied health faculty received their education and practiced in traditional fragmented health care models and may lack an awareness of the need for or the skills to integrate IPE into existing curricula. A necessary first step toward development of curricula with integrated IPE is assessment of faculty attitudes, knowledge and existing practices. The focus of this project was to foster progression of individual leadership practices and expansion of scope of influence through team project leadership in an academic setting.

**Purpose:** The purpose of this presentation is to describe scholar leadership development and scope of influence in team projects to advance nursing education. An assessment of faculty knowledge, attitudes and practices in Interprofessional education (IPE) was conducted.

**Methods:** The Sigma Theta Tau International Nurse Faculty Leadership Academy provided support and mentorship for the scholar's individual leadership development demonstrated by team projects to advance nursing education in the area of Interprofessional education (IPE). A multidisciplinary team consisting of faculty representing public health, health administration, occupational sciences, sport and physical education sciences and dietary sciences was recruited to develop a consensus statement for IPE and conduct a faculty assessment of knowledge and attitudes toward and practices in IPE.

**Results:** Key findings from the assessment of IPE knowledge attitudes and practices (N=77, 61%) were that faculty were familiar with IPE (87%), felt it should be prioritized (80%) and that faculty participation should be encouraged (87%). But confidence in IPE skills was low (42%). Faculty were also concerned that it would increase workload (50%) and (45%) did not perceive support for IPE by administration.

**Conclusions:** Faculty highly value IPE and believe it should be a curriculum priority but need administrative support to develop IPE skills and integrate content. The scholar transitioned mid-academy to another university setting where new Master's program curricula in nursing administration and education are being developed. As a result of growth in leadership skills and confidence provided through the NFLA experience, the scholar now has the opportunity to lead curriculum development in a new setting.

### Addressing Pain in Older Adults through an Interprofessional Lens

---

*Sharon R. Rainer, PhD, APRN-BC, USA*

#### Purpose

highlight the development of an interprofessional team and findings of the team's leadership project that evaluated the effectiveness of a pain education intervention on health care provider knowledge and attitudes regarding older adult pain management.

#### Target Audience

Health care educators and clinicians including Registered Nurses and Advanced Practice Nurses.

#### Abstract

The basis of this project was individual leadership development and the creation of an interprofessional team to address quality of pain management of older adults in ambulatory health care settings. Leadership development based on the Kouzes and Posner model was used to focus on identifying aspects of leadership within five domains (model the way, inspire a shared vision, challenge the process, enable others to act, encourage the heart) that enhanced individual leadership and also allowed the team to function at its highest level. While all domains of leadership development were important to the project plan and implementation, emphasis was on inspiring a shared vision, challenging the process, and modeling the way as top domain areas. The relationship of three (mentor, scholar and advisor), a unique feature of Sigma Theta Tau's Nurse Faculty Leadership Academy, was a major catalyst in moving the project forward. The overall approach to the project was to focus on team building within the relationship of three and within the larger team assembled to create and implement the team's project. What evolved was an interprofessional, innovative, and sustainable learning opportunity for clinicians across several disciplines within the university.

Pain care of older adults is challenging across many clinical settings. Pain is highly subjective and deeply personal experience, yet its management necessitates an objective standard of care. Pain is a worldwide public health epidemic in spite of years of dedicated research. Pain negatively affects physical, psychological, social and financial well-being yet is not adequately recognized and treated by health care providers. Research shows that unrelieved pain interferes with sleep and increases anxiety, depression, morbidity and mortality among older adults. Poorly managed pain can have numerous deleterious effects such as difficulty concentrating, lack of energy, lost productivity, decreased quality of life and inability to complete everyday tasks. In addition untreated pain in older adults decreases physical function and increases risk of deadly falls and injuries. Few educational opportunities exist for health care professionals to enhance their knowledge and skills in the area of pain management of older adults.

A half day program for clinicians from nursing, medicine, pharmacy, physical and occupational therapy was established to address the need for education in pain management of older adults. Participants completed a pre and post survey using the "Knowledge and Attitudes Survey Regarding Pain" tool. Teams addressed four areas of pain care: taking the pain history, the physical exam, deciding on treatment and evaluations and outcomes. A simulation session with a standardized patient with multiple comorbidities and chronic back pain was part of the learning experience. Outcomes from the survey and course evaluations were presented and future programs and curriculum enhancements have been recommended.

The project was used to enhance scope of influence within and beyond the university setting. More educational opportunities for students and experienced clinicians are needed. Within the organization the team that came together to develop the project will disperse and become part of other teams and committees throughout the learning community. An important aspect of the interprofessional team and goals for expanding the scope of influence of nursing was realized as a result of this project. Nurses are the pivotal professional who can prioritize pain for patients across all health care settings yet their ability

to adequately address pain in the ambulatory setting is not fully realized. Continued efforts at the education, research and policy levels to effect change in this area will continue

# NFLA - Nurse Faculty Leadership Academy Invited Posters

## From Clinical Practice to Leadership in Academia

---

*Bimbola Fola Akintade, PhD, MBA, MHA, ACNP-BC, CCRN, USA*

### Purpose

The purpose of this presentation is to share my NFLA scholar experience through the 18 month faculty guided mentorship and leadership program which focused on leadership development, a scholar led team project and expanding the scope of influence.

### Target Audience

Other NFLA Scholars, Leadership Mentors, Faculty Advisors and STTi members.

### Abstract

**Background:** As an expert clinician, making the transition from clinical practice to a leadership position in an academic setting has presented many challenges. The Nurse Faculty Leadership Academy (NFLA) Scholar Program sponsored by Sigma Theta Tau International and Elsevier has helped mitigate these challenges for myself and other novice nursing faculty leaders. This is an 18 month faculty guided mentorship and leadership program which focused on three domains; leadership development, a scholar led team project and expanding the scope of influence.

**Methods:** Several leadership tools were utilized to accomplish the goals of the NFLA Scholar Program based on the aforementioned domains. These included an Individual Leadership Development Plan (ILDLP), a scholar led project involving the development and implementation of a simulation based initiative at the University of Maryland School of Nursing to increase access to Acute Care Nurse Practitioner (ACNP) clinical sites and developing a network to expand the scholars scope of influence under the mentorship and guidance of my Leadership Mentor and Faculty Advisor.

**Results:** Through the mentorship process, the scholar was able to create a goal focused leadership plan including becoming a more effective leader, vocalizing thoughts, expanding sphere of influence and managing time effectively. The scholar led simulation project has led to an increase in access to high acuity clinical units by first semester ACNP students at the University of Maryland Medical Center, Baltimore Maryland. In terms of expanding scope of influence, the scholar has been more active in clinical practice, scholarship (presenting and publishing), and currently serve on more than one national organization.

**Conclusions:** The NFLA provides multiple avenues to emerging nurse leaders in academia through structured essential leadership skills and mentorship opportunities. This 18 month faculty guided mentorship and leadership program provides the scholars with a community network to develop individualized quality leadership styles and resources, and to positively promote much needed change in academia and clinical practice.

### Facilitating Individual Leadership Development and Advancing Communication through a Multidisciplinary Team Leadership Project

---

Wyona M. Freysteinson, PhD, MN, BSN, RN, USA

#### Purpose

The purpose of this presentation is to describe how the Sigma Theta Tau International Nurse Faculty Leadership Academy guided an emerging academic nurse leader in developing a personal leadership plan and a multidisciplinary team project aimed at improving student's and nurse's communication skills.

#### Target Audience

The target audience of this presentation is 1) junior nurse faculty, 2) administrative staff interested in fostering the academic career success of emerging nurse leaders, and 3) faculty and healthcare leaders interested in improving the communication skills of students and/or nurses.

#### Abstract

Background: The Texas Medical Center (TMC), the largest medical center in the world, has a healthcare workforce comprised of individuals from over 150 countries. Texas Woman's University is situated within the heart of the TMC. There are healthcare students enrolled in this university who have regional and/or foreign accents that act as barriers to intelligible language and effective safe communication.

Goal: The focus of this project was to enhance the personal leadership development of an emerging academic nurse leader through guiding a university-wide team that focused on improving the oral communication skills of healthcare students.

Methods: The 18 month Nurse Faculty Leadership Academy (NFLA) Scholar Program is sponsored by Sigma Theta Tau International (STTI) and Elsevier. Kouzes and Posner's leadership practices were used throughout the program and allowed the scholar to refine her own leadership style. Through frequent communications in a triad relationship the scholar was mentored in building a comprehensive individualized leadership plan and career development map. The triad consisted of STTI Faculty Mentor: Dr. Ainslee Nibert, Leadership Mentor: Dr. Karen Morin, and Faculty Scholar: Dr. Wyona M. Freysteinson.

Results: The NFLA scholar discovered the value of self-reflection, gained inner strength in challenging the status quo, and acquired increased sensitivity to others. A multi-disciplinary team developed and implemented the Language of Scholarship: Accent Modification Program for University Students. Initial significant findings of the Language of Scholarship research study have resulted in a large health care system in the TMC requesting that the program be implemented and researched within their hospitals which will allow for the collection of staff and patient indicators.

Conclusions: The NFLA leadership program and mentoring triads provide opportunities for junior nurse faculty to develop their leadership skills, cultivate a supportive multidisciplinary environment, expand their scope of influence, and ultimately find satisfaction in being an academic nurse leader.

## NFLA - Nurse Faculty Leadership Academy Invited Posters

### Evaluation of Clinical Adjunct Faculty, Clinical Teaching Partners (CTPs), and Internship Preceptors Educational Needs, Challenges, and Barriers

---

*Jennifer Titzer, DNP, RN, USA*

*Rose O. Sherman, EdD, RN, NEA-BC, FAAN, USA*

*Barbara Manz Friesth, PhD, RN, USA*

#### Purpose

The purposes of this presentation is to highlight the leadership behaviors enhanced through the Sigma Theta Tau International Nurse Faculty Leadership Academy by leading a team of nursing faculty in the evaluation of supplemental clinical nursing faculty.

#### Target Audience

Nurse educators The target audience of this presentation is nurse educators, nursing academic leaders, clinical faculty, nurse leaders and staff development experts.

#### Abstract

Purpose: Due to the shortage of nurse faculty, employment of clinical experts as supplemental clinical faculty is essential. Ensuring the nursing programs' objectives and desired learning outcomes are met requires strategic development and evaluation methods addressing the unique needs of the supplemental clinical faculty. As part of the Nurse Faculty Leadership Academy (NFLA) sponsored by Sigma Theta Tau International and Elsevier, a nurse scholar led a group of five nursing faculty in the design and implementation of a program evaluating the challenges and needs of supplemental nursing clinical faculty. The scholar was charged with leading the team and engaging stakeholders. Stakeholders included nursing leaders from local healthcare facilities and University leaders, which expanded the scholar's scope of influence.

Methods: The NFLA scholar participated in an 18 month program that included a personal Leadership Practices Inventory (LPI) evaluation and an individualized leadership development plan (ILDLP). The ILDP focused on improving the scholar's leadership behaviors centering on Kouzes and Posner's five leadership practices. To successfully implement the project the scholar had to lead the team and focus on each member's strengths. This required the leader to assess each member's individual strengths and inspire a shared vision while enabling the team to act to ensure the program was implemented and completed within the allotted timeframe. The team developed focus group and survey questions to identify the challenges and educational needs of supplemental clinical faculty. The supplemental clinical faculty included adjunct clinical faculty, clinical teaching partners assigned to dedicated education units, and clinical teaching associates used in a senior nursing internship course. The focus group narrative was recorded and dictated by the University's outreach department. Common themes were identified within the three focus group reports. The online survey results were analyzed and those questions that were scored the lowest on the Likert scale, indicating a lack of confidence in that competency, were identified.

Results: The team collaboratively organized three focus groups for each of the supplemental clinical faculty groups. Fifteen supplemental clinical faculty attended the focus groups and 18 supplemental clinical faculty completed the online surveys. Focus group responses suggested supplemental clinical faculty need a better understanding of the expectations and objectives so they could more effectively evaluate students. Online survey responses indicated supplemental clinical faculty feel they need more training and education to more effectively meet the needs of the nursing students. The areas scored the lowest on the surveys coincided with the focus group responses and designated workshops are needed to help supplemental faculty recognize the appropriate knowledge, skills, and attitudes of nursing students varying from novice, advance beginner, and competent. In addition, clarification of the clinical evaluation form is needed to help supplemental faculty use it to assess students' performance.

The scholar expanded her scope of practice by engaging project stakeholders and being appointed to positions on the University's Alumni Council and the Foundation Board. These appointments provided the scholar additional avenues to work on her ILDP and improve leadership behaviors. Results from the team led project are actively being disseminated. The evaluation model used in the project was presented at one national and one international conference. In addition, a manuscript describing the evaluation method, results, and subsequent workshops is pending.

Conclusions: Common practice in many undergraduate nursing programs is to utilize supplemental clinical faculty; however, to ensure successful attainment of program and student outcomes, ongoing development of these individuals is essential. This pilot study is an initial step in identifying and addressing the unique needs of clinical experts placed in the role of supplemental clinical faculty. The NFLA scholar was able to improve leadership behaviors by inspiring a shared vision and enabling others to act. In addition, her scope of influence was increased through the project by engaging both University and community stakeholders, which will provide further avenues for future leadership roles and meet the goals of her IDLP.

## Promoting Leadership: The NFLA Experience

---

*Erin E. Killingsworth, PhD, MSN, BSN, RN, USA*

*Marilyn Oermann, PhD, MSN, BSN, FAAN, USA*

*Carol Winters, PhD, RN, CNE, USA*

### Purpose

The purpose of this presentation is to present the leadership journey of one scholar through the 18 month Nurse Faculty Leadership Academy.

### Target Audience

The target audience of this presentation are nursing faculty.

### Abstract

To meet the challenges in higher education and healthcare, nursing education needs leaders who are dedicated to providing quality education, finding creative solutions, and working collaboratively with multidisciplinary teams. The purpose of Sigma Theta Tau International's Nurse Faculty Leadership Academy (NFLA), sponsored by Elsevier, is to mentor junior nursing faculty to promote leadership development and individual career success in addition to supporting nursing academia through faculty retention and fostering productive work environments.

**Methods:** The NFLA uses the Triad relationship between the Scholar, Leadership Mentor, and Faculty Advisor to meet the purpose of the academy. Through the Triad relationship, this Scholar, participated in the 18-month leadership program by completing an individual leadership plan, leading a team project, and expanding her personal scope of influence.

**Results:** The individual leadership plan, based upon Kouzes and Posner's leadership model, specifically focused on promoting the scholar's leadership in her academic environment and reflecting on her leadership practices and experiences. From this plan, the scholar engaged in leadership activities at her institution such as mentoring a new faculty member, leading committees at the school level related to quality improvement and program accreditation, serving as the keynote speaker at school and college level functions, and representing the school on a university level committee. The team leadership project focused on creating a comprehensive evaluation plan to support the development and evaluation of BSN nursing student progression toward safe nursing practice in regard to targeted student outcomes identified from the AACN's (2008) Baccalaureate Essentials. The team developed a curriculum assessment template to serve as a guide to identify gaps in the curriculum, map out where in the curriculum the student outcomes were being taught, and identify how those outcomes were evaluated. The outcome evaluation included the specific assessment method and level of Bloom's cognitive taxonomy. During the NFLA, the scholar's scope of influence increased in the school of nursing and at the college level: this can be seen through increased recognition for her expertise by school and college administration. Examples include being asked to participate in curriculum development at the school level and to teach a multidisciplinary course with students from nursing, pharmacy, public health, and dietetics at the college level.

**Conclusions:** The NFLA experience allowed one junior faculty member to be mentored by leaders in nursing education to promote her personal leadership and career development.

### Leadership Development through the Nurse Faculty Leadership Academy (NFLA) and a Nurse Practitioner (NP) Education Project

---

*Amita Avadhani, DNP, MSN, MA (Psych), BSN, DCC, ACNP, ANP, CCRN, USA*  
*RuthAnne Kuiper, PhD, MN, BSN, RN, CNE, ANEF, USA*  
*Barbara J. Patterson, PhD, RN, ANEF, USA*

#### Purpose

The purpose of this presentation is to highlight the individual leadership development of a nurse faculty scholar through the team leadership of a NP education project under the guidance of a NFLA Mentor and Adviser.

#### Target Audience

Nurse Practitioners, Nurse Practitioner Faculty

#### Abstract

**Background:** Advancement of nursing education as well as its sustainability rests on the leadership skills of the nursing faculty. Therefore leadership development of novice nurse faculty is critical to the future of nursing education. Sigma Theta Tau International (STTI) and Elsevier sponsored Nurse Faculty Leadership Academy (NFLA) is a structured leadership-mentoring program designed to develop upcoming nursing faculty. The program encompasses expert guidance from a leadership mentor and the direction from a faculty advisor to facilitate the success of the faculty scholar through successful implementation of a nursing education project. The purpose of this 18-month long program was to facilitate individual leadership development, completion of a team led project, and expansion of the scope of influence of the NFLA scholar.

**Methods:** Individual leadership development, the first domain of the program was supported through guidance provided by the leadership mentor and faculty advisor. Further, the ability to understand and govern leadership practices was polished based on the five exemplary practices of Kouzes and Posner's (K&P) model that included the ability to model the way, share an inspired vision, challenge the process, encourage the heart, and enable others to act. The second domain rested on the creation of a leadership project to advance nurse practitioner (NP) education. The project included a design of a simulation program to teach Adult Gerontology Acute Care NPs central venous catheter (CVC) insertion under ultrasound guidance. The third domain, which draws support from the first two domains, broadened the scholar's scope of influence, increased collaborations, and encouraged looking beyond the school and venturing into the University, statewide and nationwide resources and initiatives.

**Results:** Through the leadership of a team in implementing this simulation project and following the exemplary leadership practices from the K&P model, the leadership mentor and faculty advisor supported the individual leadership development of the scholar. The team led project to establish the above referenced simulation project was successfully completed as well. Further, the scope of influence of the faculty scholar was expanded via participation in School, University, State and National level committees. Publications in peer reviewed journals and presentations at national conferences have also occurred.

**Conclusions:** STTI and Elsevier's joint venture of NFLA has supported aspiring nursing faculty to develop as leaders in academic settings. Support from a leadership mentor and a faculty advisor facilitated and enhanced leadership abilities of this NFLA scholar through support of nursing education evidence, theory, and philosophy.

### Developing an Honors Program in Nursing through the NFLA Experience

---

*Larry Slater, PhD, RN-BC, CCRN, USA*

*Ellen B. Buckner, PhD, RN, CNE, USA*

*D. Anthony (Tony) Forrester, PhD, RN, ANEF, FAAN, USA*

#### Purpose

The purpose of this presentation is to explore the scholar's leadership development and expanded scope of influence through the NFLA experience and to discuss the scholar's team leadership project focused on developing an honors program in nursing for traditional baccalaureate students.

#### Target Audience

The target audience for this presentation includes: (1) nursing faculty wishing develop leadership and expand their scope of influence within their institution; and (2) nursing faculty and/or schools of nursing exploring development or revision of an honors program in nursing for high-achieving students.

#### Abstract

**Background:** As the wave of nursing retirements rises over the next decade, the profession will begin to lose its most cherished leaders in clinical practice and nursing education. It is imperative that the profession actively engage new nurse faculty to become leaders and change agents not only within their academic institutions, but in their communities and the nursing profession. The Nurse Faculty Leadership Academy (NFLA) was created by The Honor Society of Nursing, Sigma Theta Tau International and The Elsevier Foundation to develop junior faculty scholars (those with 2 to 5 years in the faculty role). Upon completion of the Academy, the scholars will possess the leadership skills necessary to help prepare our next generation of clinical and faculty nurse leaders.

**Purpose:** The purpose of the NFLA is to develop junior nurse faculty scholars through engagement in three domains: individual leadership development; design and implementation of a team leadership project improving nursing education and benefiting the scholar's organization; and expanding scope of influence in the organization, community, and profession. The focus of the scholar's leadership project was to develop an honors program for high-achieving, traditional baccalaureate nursing students. The program aims to cultivate the high-achieving nursing student's quest for scholarship in practice, research, teaching, and service through innovative programming and instructional excellence, preparing these future nurses to serve populations locally and globally through the advancement of nursing science.

**Methods:** The NFLA is an 18-month intensive experience in which the scholar participates in two in-person workshops, monthly leadership calls with other scholars, and two site visits at the scholar's academic institution. Throughout the program, the scholar works hand in hand with a dedicated leadership mentor and a faculty adviser (relationship of three) to develop and evaluate the scholar's growth in the three academy domains. Using the Kouzes and Posner's exemplary leadership practices as a guide (The Leadership Challenge, 2012), the scholar's leadership growth occurs through action, with the development and implementation of a team leadership project.

The scholar enlisted a team of four faculty to design an honors program for 4-year, traditional baccalaureate students. The team conducted an extensive literature review on honors education in nursing, completed an in depth organizational history on honors education at the academic institution, and developed a comprehensive stakeholder analysis in order to lay the foundation for program development. The team is also conducting an IRB-approved faculty and student needs survey to guide program development. The team has continued to engage key stakeholders including admissions, advising, development, marketing, and administration, allowing project team members to expand their own scopes of influence within the academic institution as the program continues to develop. In addition, team meetings also include leadership development activities, promoting individual team members' growth and exemplifying NFLA's call to develop faculty within the scholar's academic institution.

Results: With assistance from the leadership mentor, faculty adviser, and local leadership observers, the scholar created an extensive individual leadership development plan (ILDLP) that addressed 4 of the 5 Kouzes and Posner practices. The ILDP aided the scholar in developing positive verbal and non-verbal communication patterns for fostering team building and promoting collaborative and constructive change within the scholar's academic institution. In addition, the ILDP guided the scholar in identifying personal leadership styles, values, and philosophies that have facilitated leadership growth. The scholar's growth has enabled him to expand his scope of influence within the academic institution, with committee leadership at the departmental, college, and university levels, as well as the profession, serving on boards and taskforces at the local, state, and international levels.

The NFLA project team at the scholar's institution has continued to position themselves to become leaders in honors education in nursing. The team has published an encyclopedia entry on nursing honors programs and has an article in press detailing the history of nursing honors and providing perspectives on the implementation of nursing honors programs to develop future nursing leaders. The team has developed the program's mission, vision, and outcomes and is currently completing curriculum development modeled on interprofessional education. In addition, the team has finalized the application and admission process, which will be instituted in the Fall of 2015 to admit the first cohort of students in the Fall of 2016.

Conclusions: The NFLA is an exciting, innovative program to facilitate junior nurse faculty scholars in developing key leadership skills for personal and career growth. It also provides a framework for sustainable advancement of leadership growth within the scholar's organization and community to expand the cadre of clinical and faculty nurse leaders for years to come.

## RSG STR - Rising Stars of Research and Scholarship Invited Student Poster Session

### A Rural Medically Underserved Community Breastfeeding Intervention in Pediatric Primary Care

---

*Deborah A Dumphy, DNP, MS, BSN, AS, APRN, NP-C, USA*

*Myra L. Clark, PhD, MS, BSN, APRN, NP-C, USA*

*Julie A. Thompson, PhD, RN, USA*

#### Purpose

The purpose of this presentation is to discuss and disseminate the findings of an intervention aimed at improving breastfeeding rates in a rural medically underserved community.

#### Target Audience

The target audience for this presentation is Registered Nurses, Nurse Practitioners and Certified Nurse Midwives.

#### Abstract

**Objectives:** The overall aim of this quality improvement (QI) project was to increase breastfeeding rates through a Nurse Practitioner (NP)-led breastfeeding intervention refining the care provided in a rural, medically underserved community with breastfeeding rates lower than state and national averages. Specific goals were to increase breastfeeding initiation (as measured at the newborn visit) and continuation rates (as measured at the 1-month, 2-month and 4-month well child visits) of “exclusive,” “partial” (breastfeeding families also supplementing with formula) and “any” breastfeeding by at least 10% after implementation of a comprehensive evidence-based practice breastfeeding clinical protocol. The Academy of Breastfeeding Medicine’s (2013) “Clinical Protocol #14: Breastfeeding Friendly Physician’s Office: Optimizing Care for Infants and Children” was the evidence-based practice (EBP) guideline chosen for implementation in the rural, low income, medically underserved pediatric primary care clinic.

**Methods:** A before-and-after design with two independent groups of mother-infant couplets, one pre-intervention (N=43) and a one post-intervention (N=45) were longitudinally evaluated on breastfeeding rates at four time intervals. The four time intervals were the newborn visit, 1-month, 2-month and 4-month well child visits for exclusive, partial and any breastfeeding rates. Recruitment for the pre-implementation group included the first 43 healthy newborns presenting for the newborn visit from November 2013 through the 4-month visit of the final enrolled infant, which occurred in June 2014. Recruitment for the post-implementation group included the first 45 healthy newborns presenting for the initial newborn visit from July 2014 through the 4-month visit of the final enrolled infant, which occurred in February 2015. Relationships for the two groups were compared using two sample t-tests Chi square, and Fisher’s exact tests. Statistical analysis was done using SPSS 22.0 with the level of significance set at  $p = .05$ .

**Results:** Post-implementation rates for any breastfeeding progressively increased for each time point and achieved >10% increases at the 2-month (13.86%) and 4-month (47.25%) visits. Exclusive breastfeeding rates increased by 40.98% at the 1-month visit, 27.4% at the 2-month visit, and 139% at the 4-month visit.

**Conclusions:** Implementing an NP-led evidence-based breastfeeding-friendly office protocol in a rural pediatric primary care setting with low breastfeeding rates is associated with increased breastfeeding rates.

## RSG STR - Rising Stars of Research and Scholarship Invited Student Poster Session

### Got Stress? A Wellness Neuman Model Approach: Teambuilding between Upper and Underclassmen

---

*Amy Jo Barnes, USA*

*Whitney Beiswanger, USA*

*Zoey Dressel, USA*

*Mariah McMillen-Feasel, USA*

*Abigail Pfaff, USA*

*Allissa Smith, USA*

#### Purpose

The purpose of this presentation is to share a Little/Big project developed by senior leadership students that promoted an environment of civility for teambuilding and collegial relations between under and upper classmen nursing students as well as nursing faculty in an undergraduate pre licensure nursing program.

#### Target Audience

The target audience of this presentation is nursing students, nursing faculty, clinical preceptors, and advisors. Nursing staff and managers could benefit from these strategies used to build collegial relationships.

#### Abstract

Stress is commonly experienced by college students; the pressure to maintain good grades while balancing family, work, and social responsibilities can either hinder or aid in a student's academic success. The challenge students often face is in obtaining adequate resources that will aid in maintaining a balance between the beneficial and the excessive and often debilitating amounts of stress. Nursing students have reported that stress is associated with a fear of making mistakes in clinical experiences that may result in patient harm, committing medication errors, feelings of inadequacy when interacting with nurses and other members of the healthcare team, meeting high testing standards, the loss of leisure time, and the pressures of paying for school (Alzayyat & Al-Gamal, 2014).

During a 400 level Bachelor of Science Program leadership course, six pre licensure nursing students were assigned with clinical faculty preceptors for a 90 hour clinical. The clinical faculty were in charge of 100, 200, and 300 level students in clinical settings. Nursing student stressors reported in a literature review informed the project. The Neuman Systems Model (Neuman & Fawcett, 2011) provided the framework and guided the nursing process. Stressors identified by current underclassmen were similar to those reported in the literature; therefore stressors were prioritized with student input leading to six prioritized stressors.

During phase one of this project, each leadership student targeted their small group of seven to nine students to develop learner-centered (Weimer, 2013) teaching and learning resources under the guidance of clinical preceptors and course professor. A resource board was constructed that contains resource cards for the identified stressors: APA, Medication Math, Surviving Nursing School, Reducing Stress, Your Health, and Test Taking Skills. A resource book, three ring binder with sleeves, was developed and served as a hardcopy presentation method which can be easily transported to the clinical setting as needed. The resource board and book were placed in the student nurses lounge for easy student access. Targeting millennial students, informatics skills were applied creatively to construct a Facebook page, Blackboard discussion groups, and webpage. These social media resources contained tutorials, videos and additional resources offering online asynchronous access to the information anytime, or anyplace with a computer or mobile device. Phase two of the project intentionally united the six leadership students into a "group" to develop the Little/Big project. The leadership students advanced the project beyond the teaching and learning resources to include opportunities to build collegial relationships

between under and upperclassmen. Underclassmen (Littles) can seek assistance from upperclassmen (Bigs) regarding topics such as class assignments, class schedules, specific study tips, emotional support, etc. Phase three involved a report to the faculty, intended to secure buy-in for future application of the teaching learning resources within courses as faculty deemed appropriate. Following the presentation, success was experienced as permission was granted for the student created resources to be made accessible for faculty use. Phase four, here at the STTI convention, allows for professional networking of the project for application and replication beyond our university. Outcomes of the Little/Big program, student testimonials, and handoff strategies for sustainability will be reported.

### Guideline Adherence among Kenyan Healthcare Providers in Peri-Urban For-Profit Clinic

---

*Brittney J. Sullivan, MS, BS, RN, CPNP, USA*

#### Purpose

to engage learners about the importance of healthcare provider guideline adherence in Kenya in order to better understand development of future interventions to retain healthcare providers during the scale-up of a private for-profit health organization.

#### Target Audience

healthcare professionals and allied health workers interested in improving guideline adherence for healthcare professionals including nurses, physicians, NPs, and PAs, as well as individuals interested in global health, health resources and capacity building, and social entrepreneurship.

#### Abstract

**Background:** Penda Health is a chain of private, for-profit outpatient clinics that delivers comprehensive primary care to low and middle income Kenyans using midlevel care providers (certified nurse practitioners and clinical officers), caring for approximately 2,000 patients per month. Penda's aim is to provide high quality, low cost services, and empathetic and caring healthcare to patients through innovative standardized protocols, qualified right-skilled providers<sup>1</sup>, and strong supplier partnerships.<sup>2</sup> In low and middle-income settings, healthcare provider adherence to guidelines has shown mixed results – with many studies showing public sectors having more adherence to guidelines<sup>3</sup>; however, after implementing organizational and educational interventions, Penda has nearly doubled adherence rates surrounding four diagnoses although adherence rates varied significantly per diagnosis (urinary tract infection, vaginal discharge, tonsillitis, and childhood diarrhea).<sup>4</sup> Adherence to guidelines has been shown to be lower in private sector healthcare systems in low and middle income countries, although Penda has show great success in improving adherence rates through targeted interventions.<sup>3</sup> Specifically in childhood diarrhea, both in public and private clinics dehydration guideline adherence ranged between 0% and 84% across 23 countries with a median of 20% correct treatment.<sup>5</sup> Penda has goals of scaling and replicating quickly in Kenya and has had a focus on provider guideline adherence. However, as an organization, it is still working to identify core components that enhance provider adherence and operationalize a systematized provider development plan. Thus, gaining leadership understanding of provider barriers and facilitators to guideline adherence will aid in understanding and developing a systemized provider development plan in the future.

**Purpose:** To gain an understanding of organizational leadership understanding of healthcare providers' barriers and facilitators in guideline adherence in order to develop interventions to retain healthcare providers.

**Setting:** Penda Health clinics surrounding Nairobi, Kenya in East Africa.

**Methods:** In May and June 2015 we will conduct contextual qualitative interviews with Penda organizational leadership (N=3). This will allow for further interpretation of quantitative data based on healthcare providers' adherence to guidelines related to urinary tract infections, vaginal discharge, childhood diarrhea, and tonsillitis.

**Findings:** We believe a comprehensive understanding of healthcare provider rationale for guideline adherence will benefit Penda in their future scaling and replication plans to open 100 clinics by 2020 across East Africa, seeing over 2 million patients per year.<sup>2</sup> Barriers and facilitators to guideline adherence will allow for creation of low-cost, high-impact organization level interventions to improve

healthcare provider adherence now, as well as during Penda's rapid scale-up. Not only will Penda be able to increase consistent healthcare provider guideline adherence between all providers and sites, but they may also improve patient safety and quality of care due to improved provider guideline adherence quality improvement and evaluation projects.<sup>6</sup>

### Peer Tutor Support of Diverse Learning Styles for Pre-Licensure Nursing Students in a Simulation Center Environment

---

*Caitlin Michele Camp, USA*

#### Purpose

The purpose of the presentation is to demonstrate increased student satisfaction and self-reported outcomes following the support of individual learning styles aided by SIMCARE Center peer tutors.

#### Target Audience

The targeted audience for this presentation is professional nurses, vendors, and student nurses attending the 2015 STTI Conference.

#### Abstract

Pre-licensure BSN students show a preference for multiple learning styles. The SIMCARE Center, simulation lab offers students the opportunity to learn based off of their own learning styles. This is facilitated by peer tutoring using visual aids, simulation, and matching activities.

Pre-licensure BSN students at Chamberlain College of Nursing have the opportunity to identify their learning styles. These learning styles include visual, auditory, reading, and kinesthetic (Fleming & Baume, 2006). Visual learners prefer observation, PowerPoint presentations, or graphics to enhance learning while aural learners prefer to listen, discuss, and participate in study groups (Blevins 2014). Reading learners prefer textbooks, essays, and manuals while kinesthetic learners prefer to be hands-on, participate in role playing, and manipulate equipment. Students who work as a team can incorporate all three learning styles in simulation. Learning can be acquired through discussion during pre and post conference and watching or role playing during the simulation. Peer tutors can assist with this process by being an active team member. This can include, but not limited to assisting in the simulation room, enhancing their knowledge of the simulation topic pre and post, and providing evaluations to enhance further simulations. Multiple activities created by peer tutors have been implemented in addition to simulation to support learning styles such as handouts, matching activities, and hands-on assessments. It is the job of a peer tutor to reinforce the material in a way that supports each learning style.

According to Benner (1982), there are five different levels of proficiency in nursing. The novice nurse is the beginning level of proficiency during which he or she has no experience in tasks they are expected to perform. The second level of nursing is the advanced beginner who is acceptable in the tasks he or she is expected to perform. The competent nurse is the third level of proficiency in which he or she worked for two to three years and has been able to set long-term goals for themselves. The proficient nurse is the fourth level where more perspectives come into play and less labored decision making occurs. The last level of proficiency in nursing is the expert who has a large background and is able to care out duties with intuition. When Chamberlain College of Nursing pre-licensure students assist in simulation, they are also starting as novice nurses. Simulation gives students the ability to role play as registered nurses and act out multiple scenarios before going into the clinical setting. Novice nursing in the SIMCARE Center gives students background knowledge before being hired which can put them ahead of any other school who does not participate in simulation.

Unsolicited student comments suggest a majority of pre-licensure students prefer hands-on learning. Survey results confirm increased student satisfaction following kinesthetic, or hands on learning as compared to lecture alone. Inter-professional Education (IPE) is integrated into the SIMCARE Center approach and supports students in collaborative practice. IPE enables students to work in teams, ensure consistency with care for patients, and generate new roles (Barr 1988).

Identifying how each pre-licensure student at Chamberlain College of Nursing learns to improve student success. Peer tutoring is important to these students because it provides them with positive reinforcement of material learned in class while also supporting their individual learning style.

## The Relationship between Nurse Education and Stroke Protocol Knowledge

---

Melissa Dianne Mitchell, MSN, BSN, ASN, RN, Sane-A, USA

### Purpose

The purpose of this presentation is to present the findings on the effectiveness of a directed educational curricula as it relates to the identified gaps in stroke protocol knowledge levels of nurses within the ED and ICU of a critical access research facility.

### Target Audience

Nurse educators in clinical roles that are responsible for the design and presentation of learning curricula for Registered Nurses within their institution.

### Abstract

**Purpose:** The purpose of this presentation is to reveal the findings on the effectiveness of a directed educational curricula as it relates to the identified gaps in stroke protocol knowledge levels of nurses within the Emergency Department and Intensive Care Unit of a critical access research facility.

**Method:** Pre-Post Survey Methodology was used to assess clinical nurse knowledge as it pertains to the facility's established stroke protocol. Participants included nurses from the Emergency Department and the Intensive Care Units of a critical access hospital. A single data collection tool was used in the pre and post education timeframes to distinguish gain or lack of gained knowledge following the provision of education. The data collection tool was a test that consisted of 20 questions related to stroke protocol knowledge that nurses in the Emergency Department and Intensive Care Units should be both familiar with and comfortable following. These questions were derived directly from the existing stroke protocol informational binder and charting flowsheets that nurses use to guide them through acute care of the stroke patient. The data collection tool consisted of 5 true/false questions, 10 multiple choice questions, and 5 fill in the blank type questions. The same data collection tool was administered in both the pre-education and post-education timeframes. A comparison of the results will be made to determine the effectiveness of the directed educational curriculum. The directed educational curriculum was developed based off of the pre-education test scores. Those items that were most frequently missed in testing were identified as areas of high importance and the curriculum was developed around those educational gaps. The education was delivered using both an online electronic learning management system, known as eLMS, and a 2 hour classroom participation event. The eLMS module was a powerpoint presentation that was completed by participants prior to class attendance. The class session involved review of key points of stroke protocol and 2015 Core Measure Standards, instruction and return demonstration of proper calculation of tPA drug dosing, hands-on experience with set up and administration of tPA using an IV pump, an interactive quiz board game, and a question and answer open discussion regarding the documentation piece of stroke protocol, prior experience, and helpful tips for attaining timely adherence to the protocol. Following completion of the online learning module and attending the classroom segment of the directed educational curriculum, the same data collection tool was re-administered to the ED and ICU nurses participating in the study. A comparison of the pre and post-education test results will be made to determine the effectiveness, or lack thereof, of the directed education that was provided to the participants.

**Results:** The results of this study are not yet complete, as the project is ongoing at the present time.

**Conclusion:** The project is ongoing at the present time and data collection continues. The results of the study may provide suggestions about the development of future educational curriculum for nurses within the research facility who are responsible for direct patient care, adherence to policy, and compliance with regulatory standards, such as those in the Emergency Department and Intensive Care Unit.

### Autism Spectrum Disorder and the Emergency Department: A Quality Improvement Project

---

Heather A. Krinock, MSN, MS, RN, CEN, ATC, USA

#### Purpose

The purpose of this presentation is to present the results of the quality improvement project on educating emergency department staff nurses concerning the patient care for individuals with Autism Spectrum Disorder.

#### Target Audience

The target audience of this presentation is the emergency department's registered nurses, including staff nurses, clinical educators and nurse managers.

#### Abstract

**Background:** Autism Spectrum Disorder (ASD) includes classical Autism, Asperger's, and Pervasive Developmental Disorder. ASD is a life-long neurodevelopmental and neurobehavioral disorder afflicting one out of every 68 eight-year-old children in the U.S. The CDC reported that of these 1-68 children, 1-42 are boys and 1-189 are girls. The CDC surveillance summary found that 31% of these children had IQ scores in the disabled range (<70), 23% were in the borderline range of 71-85, and 46% were of average or above average. Autism Spectrum Disorder occurs in all races, ethnic and socioeconomic groups. This is a patient population that will be permanently present in our practices. This increase in patients with Autism Spectrum Disorder (ASD) will require an improvement in the understanding of the disorder and methods for providing care to these patients. An increased prevalence in the last six years highlights the importance of ED staff awareness to effectively identify the disorder and associated behaviors when assessing and treating these patients. Several common psychological and medical comorbidities to ASD impact patient care in the emergency department. Comorbidities include Attention Deficit Hyperactivity Disorder, anxiety, depression, obsessive-compulsive disorder, learning disabilities, seizures and epilepsy, sleep disorders, gastrointestinal disorders, and catatonia.

**Purpose:** Understanding the underlying disorder and comorbidities would facilitate timely implementation of effective nursing interventions that decrease stimuli, provide comfort, and enhance communication with the patients. Therefore, increasing professional nurse awareness of Autism Spectrum Disorder in the Emergency Department (ED) was essential to achieve quality patient outcomes.

**EBP Project:** To enhance ED nursing staff awareness, an evidence-based quality improvement project was developed and implemented. There are two main domains concerning diagnosis criteria of Autism Spectrum Disorder which are; deficits in social communication and social interaction and restricted or repetitive behaviors or interests. The deficits in social communication and social interaction are significant and impact daily life. Frequently seen symptoms with this diagnosis are the following: impairments in social interaction, fixation on objects, pronoun reversal, hyperactivity, low frustration tolerance, concrete thinking, repetitive actions and/or words, over-stimulation, hypersensitivity and hyposensitivity. The hypersensitivity and hyposensitivity symptoms of this disorder are significant challenges for these individuals. Their responses to stimuli are jumbled. They may be significantly oversensitive to sound, touch, sight, smells and taste. They may not recognize a typically painful injury. There has been some research that suggests those with ASD and ADD/ADHD have higher rates of injuries requiring medical attention. Another study found that patients with ASD had a significant increase in requiring an emergency department visit due to a psychiatric reason versus a non ASD pediatric patient. The difficulties that individuals with Autism Spectrum Disorder face are staggering. These difficulties are increased in an emergency department. Emergency departments are loud, chaotic, hurried and bright environments. The individual with ASD presenting to the emergency department is injured or ill. This

special patient population may have significant issues with communicating with the healthcare providers in the emergency department. Currently there is limited training or awareness concerning this patient population. In addition, there is a limit to strong evidence concerning the best practices for providing patient care to individuals with ASD in the emergency department or concerning educational programs on best practices for ASD patients in the emergency department. It is critical to begin educating emergency department staff concerning Autism Disorder Spectrum and that further research will continue concerning best practice for patient care for individuals with ASD. The research for the educational presentation was obtained from various professional journals. I utilized research concerning visual cue cards, desensitizing techniques and transition planning from pediatric nursing, behavioral pediatrics, and medical journals. Successful implementation of the quality improvement project required the engagement of key stakeholders. Key stakeholders included resource staff at the South Carolina Autism Society, the ED nurse manager, the ED nurse educator and the ED nurses. Stakeholders aided in the development and implementation of an education presentation to enhance staff awareness of ASD. This presentation included visual cue cards, appropriate computer applications, and tools for communication and sensory overload.

**Methods:** The educational presentation was presented to staff members of the emergency department during mandatory staff meetings to ensure maximum exposure. The program content included definition of the disorder, incidence statistics, signs and symptoms of the disorder, and evidence based practices for the care of diagnosed patients. The presentation included pictures of staff members and their children with ASD to increase the impact of the presentation. Staff members requested to have pictures of their children and families included in the presentation.

The educational presentation included innovative learning strategies such as power point presentations, discussions, and follow up feedback. These strategies were utilized to ensure maximum effectiveness by addressing the various learning styles and the needs of the adult learner. These learning strategies addressed the visual, auditory and kinetic learner in a concise format. ED nursing staff was instructed on the importance of querying patients and family members concerning Autism Spectrum Disorder during the triage and assessment phases of the ED visit. This ensured that appropriate nursing interventions could be implemented for this specific patient population.

**Outcome:** Based on subjective post-implementation follow up resulted in a change in practice due to an increase awareness of Autism Spectrum Disorder in emergency department patients. The emergency department nurses state improved awareness of the disorder and techniques for providing patient care. The program outcome, to implement evidence-based quality improvement practices and improve efficacy of assessment and treatment of patients diagnosed with Autism Spectrum Disorder was achieved. The statistics and the personal impact of staff members with ASD children assist in long term sustainability of the quality improvement project. The quality improvement project is nearly budget neutral. The education presentation is delivered during mandatory staff meetings, which are budgeted. Maintaining a concise, informative presentation will minimize the disruption in the agenda for staff meetings and preserve the time constraint. The educational presentations will be presented by volunteers.

### Bedside Clinical Nurse Perceived Barriers to Participation in Research Activities

---

*Diane M. Swintek, MSN, RN, CPAN, USA*

#### Purpose

The purpose of this presentation is to present the findings on the perceived barriers of the bedside clinical nurse about participation in research activities.

#### Target Audience

The target audience of this presentation is Registered Nurses in clinical settings, Clinical Nurse Educators, Nurse Leaders in clinical settings, Nurse Research Facilitators interested in increasing the participation of the bedside clinical nurse in research activities.

#### Abstract

**Purpose:** The increasing complexity of wellness issues presented by the patient accessing healthcare services demands that the bedside clinical nurse have critical thinking and analysis skills. In the acute care setting, the bedside clinical nurse most often gains knowledge through practice and discussion with nursing colleagues. Moving to a practice model that has, as a cornerstone, evidence-based practice has been difficult to achieve. Discovering the perceived barriers identified by the bedside clinical nurse to participation in research activities will assist with creating appropriate interventions to increase research participation. Utilizing research findings in the care at the bedside is an important tool to decrease the severity of illness and the length of stay.

**Methods:** This is a quantitative descriptive design research study. Data will be collected through a questionnaire administered by an online survey platform, preserving anonymity and confidentiality. There will be seven demographic questions and fifteen informational Likert style questions. The collected ordinal data will be analyzed for frequency distribution and central tendency.

**Results:** Project in progress.

**Conclusions:** Project in progress.

## RSG STR - Rising Stars of Research and Scholarship Invited Student Poster Session

### Identifying the Perceptions of Nurses Regarding Care and Management of Central Lines

---

*Joy Michelle Selchow, BSN, MSN, RN, USA*

#### Purpose

The purpose of this presentation is to present the nurses perceptions of the care and management of central lines.

#### Target Audience

The target audience of the presentation are Nurse leaders in practice settings, Registered Nurses in acute care and long-term care facility, Infusion Nurses, Infection Control Nurses.

#### Abstract

**INTRODUCTION:** Every day nurses are asked to care for patients to the best of their ability and prevent harm. There are many different infections nurses try to prevent on a daily basis and one of them is central line associated bloodstream infections (CLABSIs). Nurses can help prevent CLABSIs through the care and management of central lines.

**PURPOSE:** The purpose of this study was to understand the nurse's perceptions of the care and management of central lines.

**METHOD:** A simple descriptive design was used with nonprobability and snowball sampling. An anonymous and confidential survey was distributed to the inpatient nurses in the acute care, critical care and intravenous therapy departments at the research facility. The survey was made up of 19 questions consisting of 4 demographic, 7 likert scale and 8 true or false questions. There were 98 respondents.

**RESULTS:** The nurse's agreed and strongly agreed they received orientation as a new hire along with ongoing education and training around the care and management of central lines, 73% and 71%, respectively. As the literature stated education and training is key to reducing central line associated bloodstream infections. The perceptions of the actual standards from the true or false questions varied in agreeing and disagreeing with the literature. Overall there was a greater than 80% agreement with the nurse's perception of the care and management of central lines when compared to the standard in the literature.

**CONCLUSION:** Nurse education around care and management of central lines should be ongoing from new hire to new policy rollouts and updated policies. Evidence-based research to show the reason behind why a facility cares for and manages central lines should be available. Nurses learn in multiple ways from doing it, seeing it and hearing it thus multiple ways should be available when teaching. Ongoing follow-up of the nurses' perception of the care and management of central lines is recommended.

## RSG STR - Rising Stars of Research and Scholarship Invited Student Poster Session

### Mindfulness-Based Interventions and Homework Interference with Cancer Patients

---

*Jacquelyn Tracy Krug, MA, BSN, BA, RN, USA*

#### Purpose

to show how a mindfulness-based intervention can be presented to cancer patients on an individual basis (eliminated the group effect) and to provide information on homework interference.

#### Target Audience

involved in clinical and educational healthcare.

#### Abstract

A wealth of studies exist to the efficacy of mindfulness-based interventions with cancer patients but few reflect homework behaviors. The aim of this study was to add to the literature by examining the pre-post intervention scores with the group membership variable eliminated and to explore interfering homework variables.

**Research Problem:** The need exist in further understanding the impact a mindfulness-based intervention has on the psychological and physical symptoms of a cancer patient. Research has shown that two mindfulness-based approaches have been implemented with cancer patients, namely mindfulness-based stressed reduction (MBSR) and mindfulness-based cognitive therapy (MBCT). Research maintains each intervention employs a positive influence on the cancer patient's symptoms. Further study is needed to rule out the influences of group membership as a positive influence on the patient's outcomes and to further understand what variables interfere with the patient's completion of their homework. This study looked to explore the patient's personal experience with a mindfulness-based intervention and the factors that interfered with the completion of weekly homework as part of the intervention.

**Research Method:** The methodological approach used for this research study was quasi experimental. Three instruments were utilized for the study comprising two Likert scales and a survey. The participants were nine cancer patients recruited for a six-week mindfulness-based program consisting of both MBSR (Mindfulness-based Stress Reduction) and MBCT (Mindfulness-based Cognitive Therapy). Each week the subjects were introduced to a new daily mindfulness exercise and were asked to monitor six variables before and after each exercise (the homework). These variables were: pain, sadness, shame, anger, fear, and joy. The subjects also monitored six variables likely to interfere with homework completion: family obligation, motivation, overwhelmed, relationship, pain, and depression/mood. The mindfulness exercises were as follows: Breathing Mindfully, Inner-Outer Shuttle, Body Awareness, Safe Place Visualization, Loving Kindness, and Walking Mindfully.

**Results:** A t-test analysis was completed on the pre and post intervention scores resulting in a significance of  $p < .05$  in each category: pain ( $p < .000301$ ), sadness ( $p < .000268$ ), shame ( $p < .004028$ ), anger ( $p < .000223$ ), fear ( $p < .003262$ ) and joy ( $p < .002928$ ). A trending analysis also supports these findings. Reliability and validity were not attached to the homework findings, as the assessment tool was designed by the researcher and not yet tested. It was found that subjects reported family obligation or motivation to interfere 67-68% of the time with the completion of their daily mindfulness homework.

**Conclusion:** This research study proposed to further understand the impact a mindfulness-based intervention had on cancer patients' emotions and pain levels and to learn the variables that interfered with their mindfulness homework completion. The findings did support that mindfulness-based interventions did have a positive impact on the cancer patients' emotions and pain levels. The findings also identified common variables that interfered with the subjects completing their mindfulness homework,

namely, family obligations, motivation, and depression. What the research doesn't detail is the human side of the study. One subject, who was terrified of needles, told the story of going to the hospital for a blood transfusion, a frequent ordeal, and said, "I just told myself to breathe and start at my toes and work my way up" and the fear and anxiety was at a level one nurse could handle! Another subject was so taken with the mindfulness program that she passed it on to her family members to practice. Still another shared that focusing on mindfulness helped prepare her for her medical appointments especially after being newly diagnosed with another cancer. Yet, the most poignant story came from a subject who had just been informed by his doctors that there were no more options left for him; his response was, "What do I do now? It's all about perspective. Isn't it? This stuff (mindfulness) is about the now so I just stick with what I have right now."

## RSG STR - Rising Stars of Research and Scholarship Invited Student Poster Session

### End-Tidal Capnography Use by Registered Nurses in a Rural Appalachian Acute Care Hospital

---

*Andrew James Leslie, MSN, BSN, ASN, RN, PHRN, CEN, USA*

#### Purpose

The purpose of this presentation is to present the findings on the perceived barriers that registered nurses in a rural Pennsylvanian hospital have to the utilization of end-tidal capnography.

#### Target Audience

The target audience of this presentation is nurse Leaders in practice settings, Registered Nurses in clinical practice, clinical nurse educators, rural critical care nurses, and rural nurses.

#### Abstract

**Purpose:** The utilization of capnography is an important part of care to patients in the emergency department or intensive care unit with respiratory complaints. The researcher personally noted nurses not routinely using this technology, even though the capabilities were made available to them. This research project was developed to answer the research question: "What are the perceived barriers that registered nurses in a rural Pennsylvanian hospital have to the utilization of end-tidal capnography?"

**Methods:** The study employed an anonymous, researcher-developed data collection tool which was made available to 25 nurses in the emergency department and intensive care unit at a rural acute care hospital in northwest Pennsylvania. The data collection tool consisted of two demographic questions, asking what academic nursing degree the respondent held, and how long they have practiced nursing. The data collection tool then had eight Likert-type items related to the nurse's perceived barriers of capnography use. The data was then tabulated and analyzed using quantitative descriptive statistics.

**Results:** There were 12 nurses who completed the study, indicating a 48% response rate. The data obtained from this research project revealed that the participants indicated that they knew how to use the capnography equipment available at the study hospital. The participants were divided about receiving adequate training on the indications and clinical significance of capnography. Approximately 49% answered that they had received adequate training, and 49% answered that they have not received adequate training on the indications and clinical significance of capnography. However, 67% of the study participants reported that they know the indications of capnography and what the results mean; likewise, 92% of respondents stated that they do understand the clinical significance that capnography has. The Likert items which asked if the nurses had current knowledge of capnography were answered in the affirmative, yet half of the participants reported not having adequate training on the subject. The respondents indicated that they do seek out new technologies, and that they guide their practice because of evidence-based research. However, they also indicated that while they do understand the clinical significance of end-tidal capnography, they have not received adequate training on the subject.

**Conclusion:** The research project answered the research question of what are the perceived barriers that registered nurses in a rural Pennsylvanian hospital have to the utilization of end-tidal capnography? The data that was collected indicated that the nurses in the study hospital expressed a learning deficit related to the theory of capnography and the impact it has in patient care, and a lack of knowledge related to the proper use of the capnography equipment available at the study hospital. However, the difference in data with the participants expressing that the majority understands the clinical significance of end-tidal capnography requires further study to determine the perceived learning deficits the nurses have. The research project has the potential to influence evidence-based nursing practice regarding the use of capnography in patients with respiratory difficulty in this acute care hospital.

### **Transforming Forensic Care in Level-One Emergency Departments in Gauteng through Emancipatory Practice Development**

---

*Celia J. Filmalter, RN, South Africa*

#### Purpose

to inform the audience on the emancipatory practice development methodology used to transform forensic care in level-one emergency departments in Gauteng South Africa.

#### Target Audience

any researcher interested in action research, emergency nurses and forensic nurses

#### Abstract

Violence and crime are escalating worldwide with South Africa as the eighth violent country in the world. Although death is often the outcome of violence many more victims survive the incident and seek medical attention in emergency departments. Therefore every patient in the emergency department is a forensic patient until otherwise proven. Healthcare providers – doctor or nurse - in the emergency departments however are inadequately prepared to recognize and care for the forensic population. Healthcare providers as custodians of human rights should be able to assist the criminal justice system to corroborate versions of statements provided to the police with the evidence found on the victim. The contributions made by the healthcare provider can assist with the realization of the human right to justice. The aim of the study was to transform forensic care in level-one emergency departments in Gauteng South Africa through emancipatory practice development.

In order to transform the forensic care, emancipatory practice development that emphasizes collaboration, inclusion and participation with action research was used as the methodology for this study. Emancipatory practice development staged the three phases of the study making healthcare providers aware of the changes that are required, acquiring information to act on the changes needed and to take action to change their practice in the work context. To start the process access to the level-one emergency departments were negotiated, informed consent was obtained, practice development facilitators volunteered per emergency unit, communication platforms was established and the terms of engagement was discussed. Afterwards a values and beliefs clarification was done with the nurses as they were the key drivers of the study in the emergency departments. The values and beliefs clarification was done to ensure that a shared vision was declared in an effort to enhance collaborative action. Action taken and learning that took place happened, in and from practice using systematic approaches to monitor and evaluate the progress made by the healthcare providers. Practice development facilitators were trained on using the talking wall, the modified nominal group technique, critical conversations and reflection to identify problems and start developing their practice within their own practice contexts. Data was analyzed through the utilization of the DEPICT model for collaborative data analysis.

Negotiating access took longer than initially anticipated and though no one opposed the study the healthcare providers were skeptical at the start. They were weary of the ideas that the research will be done with them and not on them as well as that they would had to take responsibility for the research in their departments. The values and belief clarification was an valuable exercise as it provided a shared vision and opened the floor for other important conversation needed for a conducive working environment. The practice development facilitators of one of the level-one emergency department used the data collection techniques to solve other issues in their unit with success.

Nurses working in the emergency department are so busy with their everyday practice that they can become desensitized to the changes that are required. All the healthcare providers involved in the study acknowledged that forensic care was a problem and mostly the nurses took responsibility and

participated. Nurses are not used to being responsible for research as they are mostly just participants being studied and are rarely given direct feedback after a study is completed. Even though the start of the research was slow as the study progressed at least the practice development facilitators started taking on bigger responsibility for their part of the study. Nurses in practice need to be emancipated to enable them to research their own practice and reap the fruits of their initiative.

## Effects of Experience Level of the Nurse on Triage Accuracy

---

April H. Ganz, MSN-Ed, RN, CEN, USA

### Purpose

present findings on the relationship between emergency nursing experience and the accuracy of assigning triage acuity ratings.

### Target Audience

nurse leaders in the emergency care setting, registered emergency nurses in clinical practice and clinical nurse educators.

### Abstract

**Aims and objectives.** To explore the relationship between the length of clinical nursing experience and the accuracy of assigning triage acuity levels to provide a model for triage nurse preparation.

**Background.** As many emergency centers across the nation struggle to fill staffing vacancies with experienced emergency nurses, professional dialogue is emerging about the length of clinical experience necessary to perform triage, a core competency of the emergency nursing professional. Different belief systems about the development of competency have led to much disagreement in the professional nursing community.

**Research methodology.** A retrospective, descriptive, quantitative design was employed in this research. The setting was a level three trauma center with approximately 65,000 patient visits per year. Twenty nurses were included in the participant sample and divided evenly into an experienced and an inexperienced group based on Benner's Model of Clinical Competence. The first strata of participants had six months to less than three years emergency nursing experience (Advanced Beginner-Competent) and the second strata had greater than three years emergency nursing experience (Proficient-Expert) on Benner's model. The results from 200 chart reviews were included in the study.

**Results.** Overall, a shorter clinical experience was not shown to inhibit a nurse's ability to accurately assign triage levels. The inexperienced nurses (mean 1.8 years with SD=0.67) assigned the correct triage level 83% of the time; the experienced nurses (mean 10.9 years with SD=9.6) assigned the correct triage level 75% of the time.

**Conclusions.** Study findings indicated that experience level did not influence the nurse's ability to triage accurately. Data indicated that nurses with less experience (inexperienced group) who have received formal triage training, obtained emergency specific certifications, and demonstrated baseline competency in the clinical setting accurately assigned triage acuity levels 83% of the time.

**Implications for clinical practice.** The findings of the study offer valuable insights to nursing leaders. Data suggested emergency centers may develop policies that allow newer nurses to triage without jeopardizing the quality of triage assessments. Additionally, data indicated emergency center nursing leaders may shift emphasis from length of clinical experience to completion of appropriate training and preparation for the triage role in emergency nursing care.

## RSG STR - Rising Stars of Research and Scholarship Invited Student Poster Session

### The Study of Emotional Intelligence of Registered Nurses in the Ambulatory Care Setting

---

*Kathleen Gately Schortzmann, BSN, MSW, RN, USA*

#### Purpose

The purpose of this presentation is to present the findings regarding the identification of feelings experienced by registered nurses in the ambulatory care setting when confronted with emotionally charged, uncomfortable scenarios.

#### Target Audience

The target audience of this presentation are ambulatory care nurses, registered nurses, and administrative nurses who are interested in the emotional intelligence of nurses in the ambulatory care setting.

#### Abstract

**INTRODUCTION:** The level of a person's emotional intelligence depends on how they identify, use, understand, and manage their own emotions in a given situation. This phenomenological study sought to explore the feelings experienced by registered nurses, in the ambulatory care setting of the medical schools studied, when faced with emotionally charged scenarios. The appropriateness of this research study lies in the fact that there is a lack of research concerning emotional intelligence among nurses in the ambulatory clinic setting.

**PURPOSES:** Nurses encounter a variety of emotionally charged scenarios throughout their careers as ambulatory care nurses. The research should help to determine that nurses may knowingly, or unknowingly, employ emotional intelligence strategies, during their course of employment within the ambulatory clinic setting, to garner positive outcomes in three key areas: 1) the delivery of quality patient care; 2) effectiveness in the nurse leadership role; and, 3) personal job satisfaction.

**METHODS:** Descriptive, qualitative data was gathered from the nurse participants' responses to open-ended, questions via an online survey. The questions were composed of emotionally charged scenarios that sought to evoke the nurse participants' initial reactions to the scenario. Following their initial reaction, the nurses were asked to elaborate about their feelings to the given scenario.

**EXPECTED OUTCOMES:** It is expected that the registered nurse participants will have limited knowledge about emotional intelligence. Before one can educate the nurses about emotional intelligence, they must understand how the nurses react to certain emotionally charged situations.

**IMPLICATIONS FOR NURSING EDUCATION, PRACTICE, AND RESEARCH:** The conclusions drawn from the survey results will aid in determining if future interventions are warranted to assist the nurses in improving their understanding of emotional intelligence and how it relates to their quality of patient care, the effectiveness of their nurse leadership role, and their personal job satisfaction. If needed, the improvement in all three areas will benefit the nurse-patient relationship in the outpatient setting of the medical school/s studied.

### Indigenous Knowledge of Traditional Health Practitioners in the Management of Rigoni: A Grounded Theory Approach

---

*Steppies Richard Rikhotso, MCur, BCur (EDetADMN), RN, South Africa*

#### Purpose

The purpose of this presentation is to co-create substantive theory that will explain and guide the indigenous knowledge of traditional health practitioners in the management of rigoni, that may assist to reduce infant mortality from some of the unknown causes in Vhembe district, Limpopo Province (South Africa).

#### Target Audience

The target audience of this presentation are Indigenous Health Practitioners, Indigenous Knowledge Systems, Academics, Hospital managers and Health care providers as well as Traditional leaders

#### Abstract

Infant mortality in developing countries is decreasing at a slow rate. World Health Organization and the United Nations are calling for reduction in infant mortality by two-thirds by 2015, (Millennium Development Goal 4), but infant mortality rate is still at 42% per 1000 birth from unknown causes. One of the unknown causes of infant mortality may be rigoni, a condition unknown in modern medicine, but managed through indigenous knowledge of traditional health practitioners (THPs). There are THPs specialists who deal with infant illnesses, especially rigoni.

The study is aimed at co-creation of a theory that explains the indigenous knowledge of THPs in the management of rigoni in Vhembe district, Limpopo Province, South Africa. The study will be guided by the main research questions and research objectives.

Grounded theory method will be used to explore and describe how rigoni is understood and managed through indigenous knowledge of THPs. The grounded theory method will be underpinned by indigeneity lens, embedded in Indigenous Knowledge Systems. Initial sampling will be done through Makhado Traditional Health Practitioners Association. Network and theoretical sampling methods will then be used to sample traditional health practitioners specialising in management of rigoni. Data will be collected through semi-structured, individual interviews. Observation and digital recording will also be used to capture data, as data collection and analysis will be done concurrently until theoretical saturation occurs. Data will be analysed through open coding, axial coding and selective coding. Codes and categories from the data will be constantly compared with relevant literature to assist in co-creation of a theory. At the end of the study a theory will be co-created that will explain and guide the indigenous knowledge of traditional health practitioners in the management of rigoni, that may assist to reduce infant mortality from some of the unknown causes in Vhembe district, Limpopo Province (South Africa).

### Neonatal Resuscitation Program Cognitive Knowledge Acquisition Validation after Change in Instruction Method

---

*Donna M. Fletcher, BSN, RNC-OB, USA*

#### Purpose

The purpose of this presentation is to give evidence-based validation that the mandated change from an instructor-led to a computer-based teaching method for the NRP course, showed cognitive course content acquisition effective under both teaching methods thereby supporting the American Academy of Pediatrics change to an e-learning based course.

#### Target Audience

The target audience for this presentation is Registered Neonatal Nurses in clinical practice, Neonatal Resuscitation Program instructors, and Nurse Leaders in clinical practice settings.

#### Abstract

**Purpose:** The Neonatal Resuscitation Program (NRP) followed the trend of many clinical competency programs, such as Basic Life Support (BLS), Advanced Cardiac Life Support (ACLS) and Pediatric Advance Life Support (PALS), that moved away from instructor-led to computer-based learning supported by instructor-facilitated skills review and testing. The change in teaching methods has been supported by scholarly evidence. Evidence-based research indicated blended-learning has been an effective format for teaching clinical skills. The BLS, ACLS and PALS programs use a computer-based, interactive progressive program with video scenarios for content and skills instruction with instructor-facilitated skills review and testing. The NRP or Neonatal Advanced Life Support (NALS) training course uses a self-directed reading with computer-based testing and optional DVD of skills video clips for content and skills learning, followed by the instructor-led skills review and testing. The purpose of this research study was to validate whether the change from an instructor-led course to a self-directed computer-based course equally supported cognitive content acquisition for nurses taking the NALS course.

**Method:** A quantitative, retrospective, data review of NALS test scores from 2010 to 2013 was conducted to compare nurse competency scores following the instructor-led and self-directed computer based courses. A comparative independent-samples t test analysis was used to compare the mean passing score from each group. The instructor-led group had n-327 with the mean passing score of 94.08 and standard deviation of 3.927. The self-directed computer-based group had n-382 with the mean passing score of 93.21 and standard deviation of 3.344. The significance or p value from both the Levene's test for equality of variances and the t-test for equality of means was 0.002.

**Results:** The results from the comparison of the two groups of data indicated that the cognitive content acquisition of the instructor-led group was higher as indicated by the passing score group mean of 94.08 than was the cognitive content acquisition of the self-directed computer-based group with the passing score mean of 93.21. Data analysis showed a statistical significant p-value of 0.002 indicating a .2% chance that the higher mean score for the instructor-led method occurred by chance. The researcher's null hypothesis stated that there is no difference in cognitive knowledge acquisition of course content in participants who receive Neonatal Advance Life Support training by an instructor-led or self-directed computer-based instruction method. This research showed there was a statistically significant difference in the test score mean between the instructor-led and self-directed computer-based instruction method; therefore, the null hypothesis was rejected.

**Conclusion:** Based on the research analysis the researcher concluded that, in the current self-directed computer-based cognitive content instruction format of the NRP course, student cognitive knowledge acquisition of course content was significantly better with the instructor-led method. Although the

evidence does not support the NRP instruction method change to the self-directed computer-based format, data does not conclusively suggest this program should return to the previous instructor-led method. A limitation of this study was a lack of available data to compare the BLS, ACLS, and PALS computer-based, interactive progressive scenario program instruction format with the NRP instruction formats. Several implications of these findings for clinical leaders and clinical educators were noted. Data indicated the importance of instructor engagement with course participants during the course, particularly during the skills review and integrated skills testing component, to confirm content knowledge and translation into clinical competence to ensure quality, safe patient care. Findings also suggested the importance ongoing competency assessment in the clinical setting to ensure continued content understanding and maintenance of skills for neonatal resuscitation. Finally, study data highlighted the importance of securing the necessary financial and human resources required to support interactive progressive computer-based NALS course content, particularly with respect to instructor engagement in skills review to ensure application of content knowledge and achievement of required certifications.

### Faculty Perception of Proposal to Increase Simulation Hours to 50% of Clinical Experience

---

Stacey Marie Bowen, BSN, RN, USA

#### Purpose

The purpose of this presentation is to communicate the results of research studying the feelings of faculty members when asked their feelings about replacing up to 50% of traditional clinical with simulation.

#### Target Audience

Nursing education directors and faculty members were the targeted audience for this presentation. Understanding the feelings faculty members are experiencing, while participating in the implementation of this initiative, may improve communication between the pertinent parties, as well as the probability of success.

#### Abstract

**INTRODUCTION:** The importance of nursing faculty in the utilization of simulation in nursing education is pivotal; however, research about faculty perceptions regarding clinical simulation is lacking. Academic and clinical faculty feelings and attitudes may impact the viability of clinical simulation as an alternative to clinical experiences. Therefore it is essential to solicit information on these factors.

**PURPOSE:** The purpose of this research was to solicit affective faculty feedback about clinical simulation as a substitute for clinical experiences.

**METHOD:** This was a descriptive, qualitative study, using a researcher- created tool. Purposeful sampling was utilized in order to limit sample size, due to time constraints. Descriptive statistics were used to describe the sample. Responses were transcribed and aggregated into a multi-page Excel spreadsheet. A summary page was created, from which pivot tables were utilized to analyze, compare, contrast, and present the data.

**OUTCOME:** The research question for this project was: How does the faculty of the surveyed ADN program feel about the possibility of replacing up to 50% of traditional clinical with simulation? A global view of the results revealed a majority of participants harboring both positive and negative feelings about the possibility of replacing up to 50% of traditional clinical with simulation. The over-arching theme revealed in this survey was concern for student preparedness for professional practice. Supporters of clinical simulation as a replacement to clinical experience cited that students would continue to experience "real" clinical. Respondents indicated that students would practice communication skills with real patients, interact with real healthcare team members, and experience the pace of reality. Additional advantages to clinical simulation included consistent experiences for every student, experience in a safe environment, exposure to experiences not typically encountered in clinical experiences, opportunity to recording performance, and post-simulation debriefing. The survey data revealed that opponents to clinical simulation also cited the above positives regarding simulation; however they assigned more value to traditional clinical experiences. Respondents felt that while simulation has a definite place in the learning experience, it should be utilized for learning and practicing, that there is no replacement for traditional clinical.

The second theme identified was excitement and resignation. Nursing educational programs are finding it increasingly difficult to secure rich clinical experiences for students This fact appeared to contribute to the resignation reflected in the data showing that every participant gave a response, other than zero, for what portion of simulation should replace traditional clinical. The lowest of these percentages was 10%, while the highest was 50% among respondents who expressed positive and negative support. Twenty-five

percent of the participants were not resigned to the initiative, rather they voiced excitement that evidence supports what they believed. The nursing profession is known for making things work whether we completely believe the evidence or not,-as long as no harm comes to the patients.

**IMPLICATIONS FOR NURSING EDUCATION, PRACTICE, AND RESEARCH:** Simulation has presented nursing education a promising way of providing quality experiences for nursing students. While many faculty members are strong proponents of this initiative, many others are reluctant to accept simulation as alternative to clinical experience. Understanding faculty feelings about clinical simulation will assist leaders in academia to develop strategies to successfully engage reluctant faculty

## Understanding Generational Diversity in Acute Care Facilities to Enhance Nurse Retention

---

Janice A. Martincavage, MSN, RN, USA

### Purpose

The purpose of this presentation is to enhance nurse retention by providing an awareness and understanding of the multi-generational workforce. The introduction of soft skill sets will empower nurse leaders to minimize conflict and retain quality skilled nurses.

### Target Audience

The target audience of this presentation are nurse leaders, nurse managers, nurse directors and nursing supervisors.

### Abstract

**INTRODUCTION:** Never before in the history of nursing has there been a workforce of three generational cohorts spanning over seventy years. There is a lack of understanding regarding their diverse behaviors, beliefs and attitudes which were developed in the era of history in which they were raised. Miscommunication, negative perceptions and attitudes arise on the nursing units causing conflict between the generational cohorts. This conflict causes lateral violence, gossip, and job dissatisfaction resulting in high nursing turnover rates.

**PURPOSE:** The purpose of my project is to explain general traits and characteristics between the Baby Boomer, Generation X and Millennial generations to nurse leaders in order to reduce conflict and enhance the nurse retention rates on the nursing units.

**METHOD:** Review of thirty scholarly peer reviewed articles acknowledged conflict between these generational cohorts at the workplace through quantitative and qualitative studies. After critical analysis and synthesis, best practice recommended a quality improvement measure to empower nurse leaders to recognize, lead and mentor these generational cohorts on the nursing units.

**EXPECTED OUTCOMES:** Soft skill sets were implemented consisting of communication, attitude, teamwork, networking, critical thinking and professional modules. These skill sets combine the differences and strengths between the generational cohorts which when melded together create a strong bond of cohesiveness among these cohorts. The expected outcome (over time) is a respectful, collaborative, positive workplace environment which will enhance nurse retention.

**IMPLICATIONS FOR NURSING EDUCATION, PRACTICE AND RESEARCH:** Understanding generational diversity is an ongoing research practice since society is living longer and working longer in the workplace. As life expectancy of the general population is on the increase, there is a growing number of people who will need quality healthcare now and in the future. Chronic diseases and age specific illnesses will send people to acute care hospitals where it is expected that there will be competent nursing staff to care for these patients on a 24/7 basis. Nurses are the primary care givers in these environments. A shortage of staff nurses could be devastating to the patient population and their communities.

*Thomas H. Cook, PhD, RN, FNP, USA*

#### Purpose

The purpose of this presentation is to inform the viewer of current recommendations for tobacco cessation and tobacco cessation counseling through the framework of a Doctor of Nursing Practice translational project, consisting of a systems-level training for primary care providers of a tobacco cessation protocol and Motivational Interviewing.

#### Target Audience

The target audience for this presentation is the primary care provider, the nurse educator, the Doctor of Nursing Practice student and the evidence based practice reviewer at the systems level.

#### Abstract

**Purpose of Project:** This project seeks to answer the question of: in primary care providers, how does implementation of a tobacco cessation (TC) protocol and TC counseling training (to include Motivational Interviewing, or MI), when compared to current practice, effect knowledge of MI, PCP self-efficacy of TC counseling, and incidence of brief TC counseling over three months?

**Poster presentation:** This poster presentation will demonstrate the implementation of a Doctor of Nursing Practice translational project. Additionally, it will provide an overview of current recommendations for tobacco cessation and tobacco cessation counseling in the primary care setting.

**Background information:** Despite the known dangers of smoking, Tennessee continues to have a higher than national average of adult smokers (23 to 18.1%) and that 69% of them would like to quit (CDC, 2012 and 2011). Primary care providers (PCPs) are in a key position to have to have motivational conversations to help patients make a quit attempt and to be successful. However, due to demands of time and limited resources, PCPs may be reluctant to do so. Review of literature indicates that providing training for PCPs can increase the self-efficacy for performing tobacco cessation counseling, knowledge of skills for and incidence of tobacco cessation counseling.

**Description:** This Doctor of Nursing Practice translational project will analyze current tobacco cessation counseling incidence and practice. A tobacco cessation protocol and Motivational Interviewing (MI) training will be offered to Middle Tennessee PCPs in a clinic system. Tobacco cessation counseling self-efficacy and MI knowledge will be assessed pre-, post-intervention and at project conclusion. Tobacco cessation counseling incidence and practice will be measured at 30 and 90 days and compared to baseline.

**Outcomes:** In a practice of 6,000 patients, there is potential to positively interact with the estimated 1,380 smokers. By effectively employing a tobacco cessation protocol and using the spirit of Motivational Interviewing, PCPs will have the opportunity to transform their practice.

**Impact:** Through this project, we are poised to broaden the body of known nursing knowledge in regard to tobacco cessation protocols and Motivational Interviewing training for use in the primary care setting.

# RSG STR - Rising Stars of Research and Scholarship Invited Student Poster Session

## Oxygen Saturation Targeting in Premature Infants

---

*Barbara Smith Weaver, MSN, RN, CCRN, USA*

### Purpose

The purpose of this presentation are to showcase the full-scope of the nurse educator role via an evidence-based practice change to guide and support clinical decision making to reduce morbidity, mortality, and eliminate disparities in care in infants less than 28 weeks gestation.

### Target Audience

The target audience of this presentation includes nursing students, Clinical Nurse Educators, Neonatal Nurses, and Nurse Leaders.

### Abstract

Infants born prior to thirty-seven weeks gestation are premature and constitute fifteen million infants a year worldwide (Centers for Disease Control, 2012). Prematurity is the leading cause of infant death in the United States and contributes to a societal burden of 26 billion dollars annually (Institute of Medicine, 2013). Prematurity is a public health concern. Nursing maintenance and titration of supplemental oxygen requires meticulous attention to supporting the immature respiratory system. Nursing must balance oxygen delivery to tissues while minimizing the detrimental effects of oxygen-induced damage to the developing eye, bowel, brain, and lungs. Emerging evidence suggests that oxygen targeting in infants less than 28 weeks gestation reduces morbidity and mortality prior to discharge from the neonatal intensive care unit. This project identifies evidence-based practices to target supplemental oxygen and guide clinical and operational decision making in premature infants less than 28 weeks gestation. Multi-faceted stakeholders include departments who share a vital interest in oxygen administration, quality, safety, cost and the outcomes of premature infants. Each stakeholder has a unique interest, view, level of power, and influence for the translation of current evidence into practice. The project facility utilized Dr. Jean Watson's Philosophy and Science of Caring and the IOWA model to provide nursing care to drive institutional changes. A multidisciplinary team used Kotter and Cohen's change model to create a shared vision, utilize rapid cycle testing, and lead institutional education and change. The prevention of the harmful effects of oxygen administration was done by utilizing standardized order sets, clear oxygen targets, education, transparency, visibility, and shared institutional goals. Closing the gap between research and clinical practice is critical to improve outcomes, decrease unnecessary complications, sustain a culture of change, and sustain satisfaction, quality, and safety. Exemplary professional practice requires evidence, judgment, and expertise to empower nurses and expand their skills. Clinical decisions and practices must be based on evidence, clinical expertise, and client values (Institute of Medicine, 2015). Implementing evidence-based practice is reported to improve nursing satisfaction, increase engagement, and autonomy, and improve client outcomes (Melnyk, Fineout-Overholt, Gallagher-Ford, & Stillwell, 2011). The Master of Nursing Education program prepares nurses to lead multidisciplinary teams in synthesizing empirical data into evidence-based care across the healthcare institution. Graduate preparation enables the practitioner to utilize theory, change models, evidence, and clinical reasoning to transform health services and improve client outcomes. The advanced practice nurse is competent to navigate major barriers to developing a shared vision, motivate colleagues, and improve care delivery. Research outcomes are intertwined with sound ethical, legal, and professional practice standards to improve nursing services across life continuum and with diverse populations. The prevention and mitigation of the deleterious effects of supplemental oxygen are crucial to improving outcomes for premature infants. Oxygen saturation targeting based on empirical data will impact life, death, disease, and disability of the most sensitive, vulnerable, and voiceless of patients.

### Improving Student Learning Outcomes by Utilizing an End-of-Life Nursing Simulation Scenario

---

Carol B. Murch, MSN, BSN, RN, APRN, ACNS-BC, CHPN, CNE, USA

#### Purpose

The purpose of this presentation is to describe a recent capstone project that highlights an innovative, interdisciplinary approach to educating nursing students about how to provide end of life nursing care to patients and families.

#### Target Audience

The target audience of this presentation is professional nurses who desire to learn of an innovative approach to educating future nurses about end of life care as well as graduate nursing students who are in the process of completing his or her capstone project.

#### Abstract

**Purpose of Capstone Project:** To determine whether participation in a newly developed End of Life Nursing Simulation Scenario significantly improves student learning outcomes for providing palliative nursing care.

**Clinical Question:** In students who are completing an Associate Degree Nursing Program, how does providing education through an End of Life Nursing Simulation Scenario compared to two clock hours of theory education increase knowledge and competency in providing care to patients who are dying?

**Significance to Nursing Profession:** A nursing student must gain the knowledge and competency level that is vital in providing palliative care measures for patients who are near death, yet faculty are faced with limited allocation of theory hours and clinical focus to assist in student success. By participating in an innovative End of Life Nursing Simulation Scenario, students may achieve learning outcomes by demonstrating increased knowledge and understanding of how to provide quality palliative nursing care to his or her patient population.

**Statistical Methods:** A quasi-experimental, pre-test, post-test design was utilized to evaluate the effectiveness of the simulation scenario. While building upon the knowledge gained through two theory hours of lecture on end of life care, each student voluntarily participated in a two hour clinical simulation held in a college nursing lab located in western Kentucky. All students completed a post-survey evaluation of the teaching strategy.

**Study Results:** The quantitative study results indicated significantly higher post-test scores when compared to the pre-test ( $p = 0.0001982$ ). The qualitative findings from the post-survey showed all students strongly agreed or agreed that the End of Life Nursing Simulation Scenario was effective. The conceptual framework, intervention objectives, effects of the intervention, and study methods are reported. According to the test comparison, survey results, and participant comments, the innovative teaching approach of utilizing an End of Life Nursing Simulation Scenario to improve learning outcomes was beneficial and valid in achieving the student's success in learning how to provide quality nursing care to a dying patient.

## Evaluating Asthma in 3rd and 4th Graders

---

Mary Eve Rice, MSN, DNP-S, CPNP-C, USA

### Purpose

The purpose of this poster presentation "Educating families of children with asthma through school health asthma education programs can help improve compliance with their asthma therapeutic plan thereby decrease overall absenteeism, and improve the well-being of student's with asthma."

### Target Audience

The target audience is 3rd & 4th grade asthma students and their caregivers, school nurses, and their school administration.

### Abstract

Asthma related morbidity and mortality, is an increasing concern for our nation. It is the third leading cause of hospitalization in children less than 15 years of age, and the leading cause of absenteeism from school which can negatively affect students' academic performance. In 2008, asthma accounted for about 14.4 million lost school days. Missed school days for children lead to missed days from work for their caregivers. According to the CDC (2013), approximately 3 children in a class of 30 will have asthma and about nine people die from asthma each day. In the last decade, the proportion of people with asthma in the United States grew by nearly 15% (CDC, 2013). In 2009, asthma caused: 479,000 hospitalizations, 1.9 million emergency room visits, and 8.9 million doctor visits bringing the average cost of asthma management above 20 billion dollars annually, (CDC, 2013). Failure to comply with the often time complex medical regimen required for asthma management is a major contributor to asthma associated problems.

Educating families of children with asthma through school health asthma education programs can help improve compliance with their asthma therapeutic plan thereby decrease overall absenteeism, and improve the well-being of student's with asthma, (CDC, 2008).

The purpose of this capstone project is to help move the asthma programming at Byrns Darden Elementary closer to achieving the NAEPP recommendations for asthma by implementing an after school asthma education program for third and fourth grade students and their parents or caregivers. At Byrns Darden Elementary school, asthma action plans are in place but currently no education initiatives have been implemented specifically for students with asthma or their families. The intent of the education program is two-fold. First, it is designed to provide children and parents with knowledge that will help them better comply with the prescribed asthma management regimen. Secondly, it lays the foundation for ongoing asthma education programming that will be provided by the nurses in the school system.

## Food Differences among Hispanic Groups and Incidence of Type 2 Diabetes

---

*Stella Lopez-Jimenez, RN, USA*

### Purpose

The purpose of the presentation is to highlight cultural food differences among the Hispanic subgroups as it relates to Type 2 diabetes.

### Target Audience

The group of professionals that would benefit from this poster demonstration is nurses, community nurses, diabetic educators, dieticians, physicians, and social workers. This group is at the forefront of diabetic health care.

### Abstract

According to Schneiderman (2014) the Center for Disease Control indicated 11.8% of Latinos have diabetes in the United States. Healthcare providers tend to generalize that all Hispanics eat the same type of food. The goal of the project is to explore cultural food difference in Latino population as it relates to diabetes. The project will compare and contrast the food differences of several Hispanic groups, such as South Americans, North Americans, and Latin Caribbean Islands. The project will analyze the prevalence of Type 2 diabetes in these subgroups. Different cultural foods and dietary habits will be examined. A literature review will be conducted to determine cultural food differences among the groups and how it relates to diabetes. The glycemic index of the different cultural foods will be determined and compared to incidence of Type 2 diabetes in the groups.

**Purpose Statement:** The purpose of the presentation is to highlight cultural food differences among the Hispanic subgroups as it relates to Type 2 diabetes.

### **Objectives:**

- Distinguish food preferences among the Hispanic groups.
- Identify incidence of diabetes among the different Hispanic groups.
- Explore cultural differences of the Hispanic population as it relates to Type 2 diabetes.

**Target Audience:** The group of professionals that would benefit from this poster demonstration is nurses, community nurses, diabetic educators, dieticians, physicians, and social workers. This group is at the forefront of diabetic health care.

## Secondary Prevention in Patients Admitted with Hip Fracture

---

*Tracy K. Kaltenbacher, BSN, RN, ONC, USA*

### Purpose

The purpose of this presentation is to highlight an Orthopedic Unit's implementation of secondary prevention strategies in the prevention of hip fracture.

### Target Audience

The target audience of this presentation is nurses and administrators interested not only in hip fracture prevention but also an example of a clinical nurse leader master's program project implementation.

### Abstract

Geriatric hip fractures have become nearly epidemic in the United States with over 2 million fractures each year, more than heart attacks, strokes, and breast cancer combined (American Orthopedic Association, 2015). One-fourth of patients who suffer a fragility fracture will die within one year, and many others will not return to previous level of function (American Orthopedic Association, 2015). This poster examines implementation of prevention strategies from the evidence-based practice program of "Own the Bone" by the American Orthopedic Association in an 800 bed Community hospital.

### Does Medication Cost-Sharing Predict Emergency Room Use for Asthma?

---

Blake Tyler McGee, BSN, MPH, RN, USA

#### Purpose

to explain findings from an original investigation into the relationship between cost-sharing burden for preventive asthma medications and risk for asthma-related emergency room use. This presentation should also promote discussion about the role of moral hazard in health insurance coverage for secondary prevention therapies.

#### Target Audience

clinicians, health economists, health plan administrators, and patient advocates.

#### Abstract

**Research Objective:** Growing evidence suggests that reduced cost-sharing for secondary prevention therapies can be cost-effective. And yet, 1 in 5 Americans is now insured with a high-deductible policy, based on the theory that moral hazard causes excess healthcare utilization when cost-sharing is low. The purpose of this study was to determine the relationship between relative level of cost-sharing for daily preventive asthma medications and risk of an asthma-related visit to the emergency department (ED).

**Study Design:** This study consisted of secondary analysis of Medical Expenditure Panel Survey (MEPS) data. The primary outcome was the occurrence of an ED visit due to asthma during the year of data collection, according to the household questionnaire. The predictor was the proportion of total payments for preventive asthma medications paid by the participant or family, according to the pharmacy questionnaire. Quintiles were examined due to non-normality of the cost-sharing data. The sample was then risk-adjusted for race/ethnicity, because being Black and/or Hispanic was associated with both cost-sharing level and ED use. Statistical analysis was performed with the complex samples logistic regression procedure in SPSS v21.

**Population Studied:** MEPS employs stratified cluster sampling and is representative of the civilian, non-institutionalized U.S. population. Data from 2010 and 2011 were pooled, because asthma-related ED visits were assumed to be relatively rare. Participants over age 18 and currently taking daily preventive asthma medication at the time of interview were included.

**Principal Findings:** Contrary to the hypothesis, increased level of cost-sharing for preventive asthma medications was associated with decreased odds of asthma-related ED visit in binary analysis. Relative to the first cost-sharing quintile, the second, third, and fourth quintiles had 90.2% ( $p=.031$ ), 77.5% ( $p=.042$ ), and 85.3% ( $p=.032$ ) decreased odds of asthma-related ED visit. In multivariate analysis, the inclusion of race/ethnicity removed the association between cost-sharing quintile and odds of ED visit for asthma ( $p\geq.098$  for all quintiles). Prescription cost data were missing for 33% of all eligible cases; 41.3% of Black and/or Hispanic cases had missing prescription data compared to 25.3% of others. Cases with missing prescription data were also significantly likelier to have an asthma-related ED visit.

**Conclusions:** Among adult MEPS participants with reported preventive asthma medication use in 2010-2011, there was no difference in likelihood of an asthma-related ED visit across cost-sharing quintiles once the effect of race/ethnicity was taken into account. However, Blacks and Hispanics were notably likelier to have missing prescription cost data, and cases with missing prescription data were at greater risk of asthma-related ED visit. Therefore, the results may not include persons at risk of ED use who could not afford their prescriptions at all.

**Implications for Policy or Practice:** This study is important because it fails to disconfirm earlier studies which found that lower cost-sharing for chronic disease medications may reduce ED visits. It also highlights the importance of minimizing missing data in large, national datasets, especially when the missing data are distributed unevenly across relevant risk factors. Future analyses should further examine the relationship between prescription cost-sharing and likelihood of purchasing needed medications, and other sources of cost-sharing data should be explored.

### **Collaborative Service Learning Project to Bring Theory into Practice in Cap Haitian, Haiti**

---

*Sandy Nelzy, USA*

*Diana Mejia, USA*

#### Purpose

The purpose of this presentation is to describe a collaborative service learning project between York College Nursing Students and Haitian Kennedy Fellows in Cap Haitian, Haiti. York College students attended the third annual Haitian Kennedy Fellows conference. Collaboration occurred on a project at an elementary school and with local farmers.

#### Target Audience

The target audiences of this presentation are: Nursing faculty, nursing students, administrators, and all who are interested in global service learning and collaborative work.

#### Abstract

This presentation is based partly on an elective course taken at York College in the Department of Nursing during the summer of 2014. This course afforded students the opportunity to travel to Haiti for two weeks as part of the clinical component of the course which integrated theory into clinical practice. While in Haiti we had the opportunity to work alongside other health professions in the area of Carriès, Haiti. Another component of the trip was an invitation to attend the third annual Haitian Kennedy Fellows conference in Cap Haitian, Haiti. The fellows were from various regional public universities throughout Haiti. We worked as a group on a hygiene related project with elementary school children and body mechanic and cataract prevention with local farmers. We also had the opportunity to plant trees on the farm. Overall this collaborative project gave both groups the opportunity to work together and learn from each other, even when a language barrier existed.

### Measuring Informal Clinical Leadership: A Comparative Analysis of Two Instruments

---

*Darlene M. Rogers, BS, BSN, MSN, RN-BC, USA*

#### Purpose

The purpose of this presentation is to review the literature for instruments specifically measuring informal clinical leadership among staff nurses and to compare the application and psychometric properties of the instruments identified.

#### Target Audience

The target audience of this presentation is nurse scholars in academe and in clinical practice interested in learning about informal clinical leadership as practiced by staff nurses.

#### Abstract

Background: The complexities of the 21<sup>st</sup> century health care environment necessitate engaging leadership at all levels, both formal and informal, for positive, adaptive change in the clinical setting. Prevalent studies about leadership in health care focus on formal leadership, where leadership is associated with a position of authority such as an administrative or managerial role. Numerous instruments have been identified and applied to measuring formal leadership in those roles. However, if staff nurses are expected to lead change in patient care settings, similar instruments should be available to measure informal clinical leadership.

Aim: This purpose of this analysis was to review the literature for instruments specifically measuring informal clinical leadership among staff nurses and to compare the application and psychometric properties of the instruments identified.

Methods: A search was executed in the PubMed, Cumulative Index to Nursing & Allied Health Literature (CINAHL) and IngentaConnect™ databases on the terms clinical leadership and nurse with the filters peer-reviewed journals, published in the English language, and publication dates between 2004 and 2014. The abstracts in the result sets were reviewed to identify quantitative studies in which the instruments were tested with staff nurses, and psychometric properties were reported.

Results: The concatenated, deduplicated result set yielded 34 articles addressing informal clinical leadership among staff nurses but included only one quantitative study meeting the inclusion criteria. A second study meeting the criteria was selected from the reference list of one of the excluded studies. The concept of clinical leadership was slightly different between the two instruments largely due to the level of abstraction. One instrument measured clinical leadership at a higher conceptual level while the other tested for very specific leadership behaviors. There was a logical overlap between both conceptualizations of clinical leadership. Both instruments were tested among acute care staff nurses; however, the sample size was larger in one of the studies. Internal consistency reliability was reported as acceptable with Cronbach's alpha values generally exceeding .70 for the subscales on both instruments. Both instruments were reported to have content validity verified by panels of local experts.

Conclusion: Informal clinical leadership among staff nurses is a concept of increasing interest among researchers. However, the lack of a consistent definition and extensively tested instruments for the measurement of informal clinical leadership indicates the need for further research and development in this area. The significance of this research would be using this increased nursing practice knowledge to design and test nursing education and nursing staff development interventions to promote informal clinical leadership behaviors among staff nurses. This would help empower nurses to lead change at the point of

care in response to the rapidly evolving and highly complex demands of the 21<sup>st</sup> century health care environment.

### A Proposal to Examine the Effects of Two Interventions in Reducing Perioperative Blood Loss among Older Adults Undergoing Total Hip Arthroplasty

---

*Robert E. Zottarelli, BSN, RN, CCRN, USA*

*Tanya S. Ambrose, BSN, RN, CCRN, USA*

*Joseph I. Jennas, MSN, BSN, RN, CRNA, USA*

*Meriam Caboral-Stevens, PhD, MSN, BSN, RN, NP-C, USA*

#### Purpose

The purpose of this presentation is to present a proposal that will compare two different anesthesia techniques used to control intraoperative blood loss.

#### Target Audience

The target audience of this presentation is anesthesia providers, anesthesia students, nurse anesthesia students, faculty, and other surgical and medical professionals working in the OR and recovery room.

#### Abstract

**Introduction/Background:** Total hip arthroplasty (THA) is associated with a substantial amount of intraoperative and postoperative blood loss. It is among the top ten surgeries with the highest incidence of blood product transfusion. As the elderly population continues to rapidly expand, the projected growth in frequency of THA is expected to increase dramatically over the next two decades, thus unveiling innovative ways to reduce morbidity and mortality associated with this target population becomes increasingly important. There are variety of ways used to reduce perioperative blood loss including administration of erythropoetin or tranexamic acid (TXA), using blood salvage, and hemodilution. Controlled hypotension (CH) with remifentanil infusion is one modality proven in the literature that is effective in controlling intraoperative bleeding in surgeries that are associated with losing large volumes of blood. Another method used in reducing surgical blood losses is administration of tranexamic acid (TXA), a newer, widely used antifibrinolytic. While these techniques were extensively researched separately, there are limited studies addressing the effects of their combined use.

**Purpose/Hypothesis:** We seek to determine if using CH in older adults undergoing THA who are receiving TXA will lead to further reductions in surgical blood loss and transfusion requirements compared to a group receiving normotensive anesthesia (NT) and TXA. To the researchers' knowledge, no such study has been conducted comparing outcomes using these two techniques (CH + TXA) together against a group only receiving TXA. We hypothesize that the CH + TXA group will have an additive effect at reducing blood losses and frequency of blood transfusion during and after surgery.

**Conceptual Framework:** The Roy Adaptation Model (RAM) will be used to guide the present study, which highlights the physiologic-physical mode of the model (Fig.1). In applying the RAM, THA (the external stimuli) causes intraoperative blood loss thus stimulating the regulator to respond physiologically. By utilizing methods such as controlled hypotension with remifentanil and the use of TXA in an attempt to reduce blood loss created THA, the anesthesia provider could manipulate or control the person's hemodynamic responses.

**Methods:** A randomized controlled study design of 60 males and females between 50-80 years of age, with an American Society of Anesthesiologist physical status I and II, and undergoing unilateral THA. All subjects will receive total intravenous anesthesia (TIVA) and TXA bolus (15 mg/kg) before incision and continuous infusion (1.0 mg/kg/hr.) during the procedure. Subjects will be randomly assigned into two groups: the CH group and the normotensive (NT) group. The CH group will received TIVA with remifentanil infusion (0.5 to 3mcg/kg/min) titrated to maintain a mean arterial pressure (MAP) between 50-60mmHg. The NT group will only receive TIVA and their MAP will be maintained above 60mmHg by

titration of anesthetic as well as vasopressors. Intraoperative blood loss will be measured in suction canisters, by quantity weight of saturated lap pads and estimation of blood around the surgical area. Postoperative blood loss is will be measured from blood accumulated in any surgical drains. MAP will be continuously monitored and recorded via radial artery catheter transducer. Power analysis was calculated based on number projections from previous studies, a two-tailed t-test of difference between means and between two-study arms with significance level of 0.05 will yield 90% power for N=30 in each group.

**Implications/Summary:** Reducing blood loss during surgery is important to improve the hemodynamic stability of the patient, create a better operative field, and decrease the need for transfusions, which is associated with various complications. Hypotensive anesthesia has been widely used to decrease surgical blood loss. Results from this study can be used to promote further research in the use of CH and TXA in older adults undergoing THA, as well as combining methods of decreasing perioperative blood loss. If results reveal better outcomes in the CH+TXA group, the use of both these techniques together may provide nurse anesthesia providers with the best method when faced with the need to reduce blood losses during surgery, thus improving outcome of this target population.

### Nurse Care Coordination of Amyotrophic Lateral Sclerosis: A Critical Appraisal of the Process of Care

---

Tricia L. Strombom, MSN, RN, USA

#### Purpose

to determine the effect, of nurse care coordination (NCC) on patient engagement in Evidence-based practice (EBP) parameters for Amyotrophic Lateral Sclerosis (ALS)(AHRQ, 2013).

#### Target Audience

nurses and other healthcare professionals involved in the care and clinical management of complex ALS patient population requiring broad assessment and coordination due to complex/chronic medical conditions requiring an evidence-based multidisciplinary approach

#### Abstract

**Purpose and Background/Significance:** The objective of the project is to determine the effect, of nurse care coordination (NCC) provided to the Amyotrophic Lateral Sclerosis (ALS) patient population, on patient activation in established evidence-based practice parameters (AHRQ, 2013). NCC provides direct patient engagement to manage the overall care process, including the development and communication of the treatment plan to all relevant stakeholders; and ensures that all treatment and care is delivered to meet the unique needs of the Veteran and their significant others (Gardner et al., 2007; CNSA, 2008).

**Theoretical/ conceptual framework:** Rosswurm and Larrabee's Model (1999), is the conceptual framework chosen for this project due to an emphasis on the process of determining the initial need for change through the comparison of internal quality indicators with data/EBP from outside the organization. This approach links the issues faced in the ALS Veteran population to standard intervention of the evidence and outcomes.

**Method:** A retrospective review of medical records will be used to examine the process of care for the ALS Veteran patient. The data focuses on current care practices identified as evidence-based practice parameters, which have been linked to improved outcomes (AHRQ, 2013; ANA, 2012). Utilizing a convenience sample the criteria includes veterans greater than 25 years of age, with a confirmed diagnosis of ALS. The study excludes those who were less than 25 years of age, and had a diagnosis of primary lateral sclerosis, or are non-service connected.

**Results:** Data will be analyzed using the descriptive techniques. All data will be assessed throughout the process, to examine the correlations between the variable of nurse coordination (yes/no) and the selected AAN practice parameters, a Spearman's Rho correlation will be calculated.

**Conclusion:** Research has shown that ALS patients receiving active and aggressive Nurse Care Coordination in collaboration with an interdisciplinary care team, enhances survival, improves quality of life and provides for longer life expectancy (Traynor, Alexander, Corr, Frost, & Hardiman, 2003). This study will provide nursing science the data for further development of the Advanced Practice Nurse serving in an aggregate role of NCC.

## Stroke Awareness: A Community Approach

---

*Shirley Lena Romero, MSN, BSN, RN, PHN, CCRN, USA*

### Purpose

The purpose of this presentation is to understand the effects of a stroke education session on the health related behavior of an at risk sample and describe preventive health-care interventions to help program participants increase their awareness to stroke management.

### Target Audience

The target audience of this presentation is directed to the nursing community. Nursing students, frontline nurses, and nursing faculty can play a significant role in transforming the health of the community by impacting health promotion and prevention methods which can be applied throughout the healthcare landscape.

### Abstract

**Background:** Current approaches to prevention of stroke disease in the community are in need of effective educational programs. Literature identifies perceived susceptibility to illness as a strong indicator for a health action. However, many clients fail to recognize their vulnerability to illness and do not take preventive action. The purpose of this study was to teach a class on stroke awareness to a group of parishioners from a small community church and explore their stroke beliefs, knowledge of stroke factors, and intention to take a health action using the Health Belief Model as the theoretical framework.

**Design:** A quantitative descriptive design, using a survey method for data collection was utilized for this research study. The setting was a community church in Orange County California. A convenience sample of 22 participants, ages 15 to 80 years old, able to read, write, and speak English were drawn from a target population of 210 members. All participants signed-up for the class on a volunteer basis.

**Methods:** A sixty minute educational session was provided to the participants in a natural setting that included strategies for identification of the signs and symptoms of a stroke, calling 911, identification of risk factors, healthy lifestyle, and current stroke treatments. Various teaching methods were used during the session, such as, lecture, Q&A, demonstration, and return demonstration. Five researcher developed questionnaires were utilized: a demographic and health questionnaire, a pre and post-test, and a Commit to Action survey to measure intention to make a healthy change. Data from the questionnaires were coded and analyzed using descriptive statistics, frequency and percentages, and paired-t-tests to find a relationship or associations within this sample.

**Results:** Self-disclosed risk factors for this sample were positive for hypertension, diabetes, high cholesterol, stroke, lack of exercise, unhealthy diet, and smoking. Results obtained from the pre and post-test showed that 60% of responses had statistical significance and 86% of responses had a positive change from pre to post-test. Intention to increase physical activity had the highest frequency reported by the participants on the Commit to Action survey. In particular, those age 15 to 19 years old had the most positive change in their intent to increase physical activity.

**Implications for nursing practice:** There is a need to continue to promote health education in the community. Knowing what motivates people to accept or reject health preventive care can help the nursing community design appropriate teaching interventions. Younger populations have a significant opportunity for lifestyle changes and should be included in educational interventions typically targeting adults. Faith-based organizations, community centers, and schools can effectively promote health education to the public. Further studies are needed to address the effectiveness of the teaching over a period of time.

## Substance Use Behaviors among College Students

---

Taylor J. Thompson, USA  
Jessica Mueller, USA

### Purpose

The purpose of this presentation is to assess substance use behaviors among undergraduate students eighteen years and older at a private, faith-based university in Midwest during the 2014-2015 academic school year.

### Target Audience

The target audience of this presentation is for those interested in working with undergraduate students who partake in high-risk drinking behaviors, and supporting a change in the drinking culture on a campus.

### Abstract

The Task Force of the National Advisory Council on Alcohol Abuse and Alcoholism (2002) has identified that drinking on college campuses is a unique culture and changing this culture is a top priority. Within the drinking culture, binge drinking has emerged as a growing problem that has dangerous consequences. Binge drinking has been correlated with high-risk behaviors, such as unsafe sex, sexual assault, injuries, and even death (National Institute on Alcohol Abuse and Alcoholism [NIAAA], 2013). The NIAAA (2013) defines binge drinking as 4 drinks for women and 5 drinks for men within a few hours. The main objective of this study was to assess substance use behaviors among college students at a private, faith-based university in the Midwest and identify aspects that are associated with drinking on the college campus. Data were collected using a modified version of the Core Alcohol and Drug Survey: Long Form (Core Institute of Student Health Programs, 1994), which asks detailed questions about substance use behaviors. Following IRB approval, all undergraduate students (N = 3,052) during the 2014-2015 academic year were invited to participate in an online survey using Survey Monkey®. A total of 1,164 students responded and 1,095 completed the survey, yielding a 35.9% response rate. Results showed that 62.6% of respondents drank alcohol. There were differences in drinking behaviors based on Greek life affiliation, gender, and athletic participation. There was a statistically significant difference ( $X^2 = 66.001$ ,  $p < .001$ ) based on Greek life affiliation; 83.9% of fraternity and sorority members drink alcohol compared to 57.3% not involved in Greek life. Of all students who drank alcohol, 71.7% engaged in binge drinking in the past 30 days. While there was no statistically significant difference in the rate of drinking alcohol based on gender (64% of males, 65.3% of females reported alcohol use), there was a statistically significant difference in binge drinking among males and females. Among drinkers, 76.5% of males engaged in binge drinking compared to 58.4% of females ( $X^2 = 50.800$ ,  $p = .001$ ). However, there were no significant differences for binge drinking and Greek life affiliation or being an athlete. Of those in Greek life, 75.3% engaged in binge drinking compare to 60.3% not Greek-affiliated ( $X^2 = 30.526$ ,  $p = .106$ ). Of those who reported being an athlete, 71.6% engaged in binge drinking while 64.4% of non-athletes engaged in binge drinking ( $X^2 = 20.281$ ,  $p = .625$ ). The top 3 reasons for drinking alcohol were: 86.5% "to have fun," 75.2% "to feel good and relaxed," 46.8% "makes it easier to socialize." The majority of students on this campus drink alcohol. Moreover, binge drinking is a significant problem among those who use alcohol, particularly males and those affiliated with Greek life. Information from the survey will be used to develop evidence-based interventions to support a change in the drinking culture on this campus.

## Nursing Entrepreneurship

---

*Brenda L. Smith, BScN, BA, OHNdpl, RN, Canada*

### Purpose

To stimulate nursing discourse regarding nursing entrepreneurship as an innovative form of nursing practice that seeks to engender professional advancement and health system transformation.

### Target Audience

Nurses and graduate students interested in innovative delivery of nursing services.

### Abstract

Nursing entrepreneurship presents as a viable and attractive approach for nursing practice that serves to reinstate professional autonomy, advance nursing professionalism, and to participate in health system transformation. And yet, in countries such as Canada where universal healthcare funding has most nurses working as employees for state-funded health service providers, few nurses are self-employed. This thesis sets out to explore the possible contributions of nurse entrepreneurship in Canada.

According to the International Council of Nurses (ICN, 2004), nursing entrepreneurship reflects a return to nursing's traditional right to independent practice while engendering professional empowerment and health care transformation. During the late 19<sup>th</sup> and early 20<sup>th</sup> century, the majority of Canadian graduate nurses practiced independently as private duty nurses (McPherson, 1996). Private duty nurses were responsible for acquiring their own patient cases and defining the conditions of their work in relation to their patient's health care needs. Remuneration for nursing services came directly from the patient or the patient's family and nursing care was usually delivered within the patient's home or the hospital, as a form of supplementary care (McPherson, 1996; Whelan, 2012). The private duty nurse assumed complete care of the patient while enjoying a high level of professional autonomy (Whelan, 2012).

Following World War II, substantial recurrent government funding was made available for hospital capital and operating costs and the supply of private duty nurses could no longer meet the service demands of the growing number of medical institutions (McPherson, 1996, Whelan, 2012). Eventually, hospital administrations abandoned private duty nursing, opting to hire registered nurses in staff positions that were institutionally controlled and under physicians' authority (McPherson, 1996; Wall, 2013b; Whelan, 2012). During the late 20<sup>th</sup> century, administration of the Canadian public health system assumed an efficiency-focused approach (Armstrong & Armstrong, 2008; Wall, 2013a). Today, nurses are increasingly required to participate in corporate interests that support an agenda of efficiency rather than the provision of care that is congruent with the profession's values (Wall, 2013a).

Nursing entrepreneurship - often termed private practice, independent practice, independent contractor, and self-employed practice – sees the nurse as “a proprietor of a business that offers nursing services of a direct care, educational, research, administrative or consultative nature. The self-employed nurse is directly accountable to the client, to whom, or on behalf of whom, nursing services are provided” (ICN, 2004, p.4). It is important to note the distinction between nurse entrepreneur and advanced practice nurse (APN) i.e. nurse practitioners, nurse midwives, clinical nurse specialists and nurse anesthetists. The International Council of Nurses (2003) asserts that nurse entrepreneurs are not necessarily APNs and the majority of APNs are not entrepreneurs.

Within nursing scholarship, there is a paucity of research regarding contemporary nursing entrepreneurship performed by registered nurses. In Canada, as with many other countries with universal healthcare funding, the literature predominantly consists of anecdotal, motivational, or editorial

narratives. Wall (2014, 2013a; 2013b) conducted a qualitative inquiry using focused ethnography to study 20 nurses in independent practice within a western Canadian province. From the data, Wall extracted themes that relate to the innovative possibilities of nurse entrepreneurs as change agents in the quest for professional advancement and health system transformation.

Wilson, Averis, and Walsh (2003) surveyed 54 private practice nurses in Australia (with a similar health system) using a two-round Delphi technique to ascertain the reasons for nurses going into business and their respective experiences associated with being entrepreneurs. In addition to compiling a list of the various independent nursing practices, common influences for pursuing nursing entrepreneurship such as professional autonomy and barriers to practice such as lack of remuneration, a viable referral system, and recognition of their respective nursing services were identified.

Drennan et al., (2007) conducted an integrative review to investigate the scope of entrepreneurial practice assumed by nurses, midwives and health visitors in the United Kingdom and the factors influencing this mode of practice. From the integrative review, only three empirical studies emerged. These studies explored the experiences of nurse entrepreneurs and revealed findings similar to those of Wilson et al. (2003).

The grey literature is largely comprised of a handful of dissertations related to nursing entrepreneurship along with professional practice guidelines and handbooks for the self-employed nurse published by various provincial, national and global nursing organizations, interest groups, and regulatory bodies. Overall, the research supports the common anecdotal evidence and motivational literature that identifies nursing entrepreneurship as an opportunity for the advancement of professional nursing practice while meeting the needs of clients that otherwise risk falling into gaps present within the current health system (Wall, 2014; Wall, 2013a; Wall, 2013b; Wilson, Whitaker & Whitford, 2012). Likewise, national and global nursing organizations encourage nurses to engage in health system transformation that seeks to broaden health care beyond hospitals and other institutional settings while ensuring nurses work to their full scope of practice (CNA, 2012; ICN, 2004). In departing from the organizational constraints that serve to erode nursing professionalism, nursing entrepreneurship affords a level of professional autonomy that supports and exemplifies the profession's values and goals (Wall, 2013a). Global estimates indicate that approximately 0.5% - 1% of working nurses are nurse entrepreneurs (ICN, 2004). No readily available statistics specific to self-employed nurses in Canada were identified as their numbers are often embedded within the generic category "other" which often captures employed nurses in practice areas such as education, research, occupational health, and private insurance companies. Practicing along the margins of the profession, it is surmised that the number of self-employed nurses in Canada likely reflects the global experience (Wall, 2013a). So, why the limited uptake?

Using an interpretive description approach, the **aim** of this qualitative study is to acquire the perspectives of practicing Canadian nurse entrepreneurs to guide the development of national and provincial policies that support nursing entrepreneurship. In conjunction with these perspectives, national nurse leaders will be recruited to participate in qualitative interviews regarding policy formation strategies that seek to promote the expansion of nursing entrepreneurship in Canada.

A research approach specifically developed to reflect a nursing orientation, interpretive description (ID) is a qualitative methodology that seeks to describe and interpret a phenomenon through the lens of those who live it (Thorne, Reimer-Kirkham & MacDonald-Emes, 1997). Thorne et al. (1997) stress that ID "ought to be located within the existing knowledge so that findings can be constructed on the basis of thoughtful linkages to the work of others in the field" (p. 173). Through the use of a scaffolding metaphor, Thorne (2008) emphasizes the significance of establishing a solid platform to guide the research investigation. In the case of nursing entrepreneurship, the scholarly literature, although very sparse, reflects common findings. Themes related to nursing professionalism, autonomy, and the provision of nursing care that reflects the values embraced by the profession are woven throughout the literature identified. Also common within the literature, is the need for viable client referral and remuneration systems for nursing entrepreneurs and institution of public credibility.

From this platform, further investigation is warranted regarding the experience of nurse entrepreneurs to illuminate current economic, political and legislative factors that impact the uptake of nursing entrepreneurship in Canada. Seeking to draw upon the expertise of this unique form of practice, a purposive **sample consisting of 8-12 nurse entrepreneurs** from across Canada will be invited to participate in telephone or in-person interviews. Participants will be practicing self-employed nurses with a minimum of two years of self-employment experience. This investigation will comprise the first stage of this two-stage research project. As interpretive description “responds to the imperative of informed action” (Thorne, 2008, p. 26), **4-6 national nurse leaders** will be invited to explore policy formation strategies using the findings from stage one with the intent to increase uptake of nursing entrepreneurship within Canada.

Thematic analysis will be employed to develop a composite picture of nurse entrepreneurship in Canada and corresponding policy formation strategies. Interviews will be audio recorded and transcribed verbatim. Data will be coded using a dynamic process, providing the opportunity to consider the data from multiple “angles of vision” (Thorne, 2008, p. 147). This poster will introduce nursing entrepreneurship as a means of effecting professional advancement and health system transformation. An interim report on preliminary findings and possible implications for future policy formation will be included.

In conclusion, nursing entrepreneurship can serve to advance professional nursing practice while meeting the needs of nursing clients that otherwise risk falling into health system gaps. As gaps within the public health system continue to widen in the pursuit of efficiencies, more entrepreneurial opportunities for health care delivery services will likely arise. If registered nurses do not position themselves as entrepreneurs, this work will be assumed by others whose primary objective may not include the provision of safe, ethical, effective health care. Engagement in policy formation is essential for nursing entrepreneurs to establish public credibility and legitimate recognition by provincial and national nursing associations and regulatory bodies for this innovative form of nursing practice.

### The Bonny Method of Guided Imagery and Music (BMGIM) for Caring of Oncology Patients: A Systematic Mixed Studies Review

---

*Varshika Manilal Bhana, Masters in Nursing Science, Bachelor of Nursing Science, MSN, BSN, South Africa*

#### Purpose

The purpose of this presentation is to give an overview of the process followed when conducting a Systematic Mixed Studies Review of (quantitative, qualitative and mixed method) studies done on the effect of BMGIM on oncology patients and to communicate the results thereof.

#### Target Audience

The target audience of this presentation is academics, practitioners and postgraduate students who are interested in integrative healthcare practices and research thereof.

#### Abstract

Introduction: The best available research evidence is required to support health care decisions. Evidence based practice implies that the health care decisions and practices are based on knowledge, which is acquired from research evidence. In order to identify research evidence and best practices to support the implementation of BMGIM in cancer care a systematic review was conducted. As the systematic review included studies of quantitative, qualitative and mixed methodologies, a Systematic Mixed Studies Review was conducted.

The objective was to conduct a systematic review to compare the effectiveness of BMGIM to other methods of care on the physical, psychological and spiritual wellbeing of oncology patients.

Research questions which guided the systematic review:

1. What is the effect of BMGIM compared to other methods of care on the physical, psychological and spiritual wellbeing of adult oncology patients?
2. What are the experiences of adult cancer patients receiving BMGIM?

Method: The Cochrane library, PUBMED, Mosby's nursing consult, CINAHL, Clinical key, Health & Wellness Resource Centre, PsychINFO, MEDLINE (OVID & ProQuest), Science Direct, EBSCO, Scopus, ProQuest, Google Scholar, Nordic Journal of Music Therapy, Journal of Music Therapy, Aalborg University, ClinicalTrials.com, Voices.com and Melbourne conservatory of music databases/search engines, journals and websites were searched. Diverse research design studies within the time frame of 2002 to 2014 were considered. Two reviewers conducted the process.

Results: 10 141 studies were identified of which 9914 were excluded during the screening of the study titles. After the exclusion of duplicates, the abstracts of 130 studies were screened for relevance. Thereafter 29 studies proceeded to stage 2, where the full text was retrieved. Upon the review of the 29 full text studies, 23 studies were excluded. Six records proceeded to data extraction.

Discussion: A process of inductive qualitative thematic data analysis guided the data extraction and analysis. Studies found significantly lower anxiety scores at follow up as well as improved quality of life scores at follow up in participants who received BMGIM. The qualitative study findings included detailed descriptions of participants' experiences and a grounded theory on the influence of music and imagery was developed.

Keywords: 'Bonny', 'Bonny Method of Guided Imagery and Music', 'Bonny method', and 'BMGIM'

### Impact of Maternal Childhood Adversity on the Psycho-Neuroendocrine-Inflammatory Profile during Pregnancy

---

*Karen J. Kotz, MSN, BSN, RN, NNP-BC, USA*

*Dina Tell Cooper, PhD, BA, USA*

*Herbert L. Mathews, PhD, USA*

*Linda Witek Janusek, PhD, BS, RN, FAAN, USA*

#### Purpose

The purpose of this presentation is to investigate the relationship between exposure to childhood adversity (prior to 18 years of age) and how this exposure impacts the psycho-neuroendocrine-immune profile of women during pregnancy. This also includes exploring risk and protective factors posited to modify stress vulnerability and newborn outcomes.

#### Target Audience

The target audience of this presentation is any health care provider interested in gaining a better understanding of maternal-infant health. This includes physicians, nurse practitioners, nurses, social workers, etc.

#### Abstract

**Background:** Pregnancy is accompanied by a multitude of physical and psychological changes. Adaptation to these changes through reduced anxiety and attenuated stress responsiveness is necessary across gestation for optimal maternal infant health. Ample evidence demonstrates that perception of high levels of psychosocial stress and/or mood disturbance during pregnancy can disrupt neuroendocrine-inflammatory processes required for successful pregnancy outcomes. In particular, precise regulation of circulating proinflammatory cytokines across gestation is critical for the maintenance of pregnancy; lower levels during mid gestation keep the uterus in a quiescent state, whereas, near term levels of proinflammatory cytokines increase to initiate birth.

**Purpose:** The primary aim was to examine the relationship between maternal childhood adversity and prenatal levels of stress, depression, and proinflammatory cytokines; and, secondly, to explore the relationship of these variables with neonatal birth outcomes.

**Significance/Rationale:** Increased proinflammatory cytokines during pregnancy are linked to maternal depressive risk and poor birth outcomes. Maternal exposure to childhood adversity and poverty may intensify each of these, predisposing to health disparity in birth outcomes.

**Methods/Analysis:** During their second (16-24 weeks gestation) and third trimester (28-32 weeks) of pregnancy, women (N=64), 18-39 years old, provided a blood sample to measure the proinflammatory cytokine, TNF-alpha; and completed instruments measuring childhood adversity (Child Trauma Questionnaire), perceived stress (Perceived Stress Scale), depression (Center for Epidemiologic Studies-Depression and Edinburgh Depression Scale) and social support (Social Provisions Scale). Childhood adversity assessed: emotional neglect/abuse, physical neglect/abuse and sexual abuse. Poverty was determined by current household income and number in the household per federal guidelines. Correlations among variables were evaluated and moderation analysis explored interaction effects.

**Results:** Nearly 25% of the sample reported exposure to childhood adversity, and women with greater childhood adversity had increased perceived stress and increased depressive symptoms. Also, women reporting greater depressive symptoms had higher plasma TNF-alpha levels. Moderation analysis revealed that women exposed to childhood adversity, together with current household poverty, had higher levels of TNF-alpha. Evaluation of relationships with birth outcomes revealed that women with greater

childhood adversity and higher TNF-alpha delivered lower birth weight infants. Also, exposure to childhood adversity was associated with lower infant gestational age; however, higher levels of social support moderated (attenuated) this relationship.

**Conclusion:** Maternal childhood adversity associates with greater psychological morbidity during pregnancy and poorer neonatal outcomes.

**Implications.** Findings emphasize the need for prenatal psychosocial screening to include assessment of childhood adversity and the encouragement of social support to buffer negative effects of childhood adversity on birth outcomes.

### The Virtual Construction of a Community that Normalizes Commercial Sexual Exploitation: A Mixed Methods Analysis

---

*Dawn Bounds, MSN, PMHNP-BC, USA*

#### Purpose

The purpose of this poster presentation is to explore the findings of a pilot study on how a commercial sex website facilitates the normalization of commercial sexual exploitation by building a virtual community of buyers.

#### Target Audience

The target audience for this presentation includes health care professionals from clinical and community settings. Nurses who care for women, children, and families will benefit from the findings of this study as it provides valuable insight into the perspectives of men who frequent a popular commercial sex website.

#### Abstract

The underground nature of the commercial sex industry has made it difficult to articulate numbers of women, men, children, and communities impacted by the harms inherent in an industry built upon exploitation. What is known is that both detrimental physical and mental health harms exist as a result of commercial sexual exploitation. Unfortunately, with increased availability of the internet, access to commercial sex sites has increased. A study conducted in 8 states estimated that underground commercial sex was a \$39.9 to \$290 million industry in 2007 (Dank et al., 2014). The revenue generated undoubtedly fuels the demand for commercial sex and the internet has served to propel the commercialization of sex forward.

The internet has not only transformed and increased the availability and visibility of the commercial sex trade; it also has been used as an integral tool for marketing commercial sex. The USA Sex Guide, a large free website used to educate men on how to buy sex with women, serves as a training ground for men who purchase sex with women (Janson, 2013). Over 800 visitors are online reading the USA Sex Guide at any given moment. The anonymity that is provided by the internet allows visitors to read and post explicit descriptions of sexual exploitation without fear of repercussions.

While women involved in prostitution have been studied extensively, the men who buy sex and drive the demand for commercial sex have remained invisible to researchers, policy makers, and law enforcement. The purpose of this poster presentation is to explore the findings of a pilot study on how a commercial sex website facilitates the normalization of commercial sexual exploitation by building a virtual community of buyers. A content analysis of the postings of Illinois men who frequent the USA Sex Guide was studied for virtual community building strategies used to normalize commercial sexual exploitation. Evidence of community building in this virtual setting was apparent and included elements of relationship building and educating, establishing of a common language and social structure, and normalizing exploitation. Key words were counted and provide additional evidence for the themes found. These findings add to the literature in support of the internet as a facilitator of commercial sexual exploitation and offers insight into how virtual communities such as this one can be used to normalize exploitation of vulnerable populations. An exploration on how this research can be used to build awareness and ignite action will also be employed.

# RSG STR - Rising Stars of Research and Scholarship Invited Student Poster Session

## Exploring Adults' Vigilance Behaviors within a Child's Caregiving Cluster

---

*Kate K. Chappell, MSN, BSN, APRN, CPNP, USA*

### Purpose

The purpose of this presentation is to describe an instrumental case of vigilance by adult caregivers within a child's caregiving cluster that employed multiple qualitative data collection strategies.

### Target Audience

The target audience includes researchers interested in social ecology, child maltreatment, and/or the combination of multiple data collection strategies within one qualitative research study. Clinicians working with families will gain perspectives on vigilance around child sexual abuse beyond the immediate caregiver accompanying child in the healthcare setting.

### Abstract

Introduction: Child sexual abuse has a significant and lasting impact on individuals and families [1]. Children who experience sexual victimization are more likely to present adverse effects in childhood and adolescence, including Post-Traumatic Stress Disorder, substance abuse, and delinquent behavior [2, 3]. Child sexual abuse is an adverse childhood experience (ACE) associated with a higher incidence of certain adult health issues and behaviors, including depression, attempted suicide, cigarette smoking and illicit drug use [4]. The negative impact on the long-term health of individuals and families is significant, given that CSA is, for the most part, a preventable phenomenon [2].

Vigilance around CSA by adult caregivers for children is conceptualized as sustained purposeful attention and behavior to anticipate a child's safety and wellbeing needs [5-7]. Vigilance as behavior does not refer only to recognizing and avoiding placing child in risky situations. Other child protective behaviors include teaching the child about avoidance of risky situations and how to respond if a threat or event occurs. Behaviors also include rules regarding safety and boundaries within a caregiving environment and what aspects of environments caregivers perceive as being protective that may decrease their drive for ongoing vigilance.

The extant research related to children's caregivers' vigilance focuses primarily on the individual caregiver and often excludes fathers and stepparents [3, 8-13]. Furthermore, there is a limited, somewhat linear understanding of the factors that may potentially influence caregivers' protective and preventive behaviors [8, 14-16]. Missing from the literature are examinations of the ways in which caregivers' behaviors relate across and within the various levels of a child's social ecology and how these behaviors relate to CSA risk and protection [17, 18]. Examining caregiver vigilance from a social ecological perspective reflects the view that CSA is a complex, dynamic, and social phenomenon and that caregiver vigilance is not restricted to one caregiver [1, 17-20]. Furthermore, a social ecology model promotes exploration of caregiver vigilance in multiple settings and via multiple caregiver roles [18].

Methods: Situated within a social ecology framework, this instrumental case study will explore vigilance within the context of one child's caregiving cluster. The research questions are: How does vigilance around child sexual abuse exist within the caregiving cluster of a child's social ecology? What are the experiences of caregivers within a child's social ecology pertaining to vigilance around child sexual abuse?

Initially, I will identify a child with a caregiving cluster which meets the inclusion criteria of having a minimum of six English-proficient adult caregivers living within a specified geographic area. The child must be able to communicate through drawn, written, and/or verbal communication about the names and places in their life. In collaboration with the child's primary caregiver, I will identify other caregivers in the

child's social ecology; interacting directly with the child, we will ask the child to identify (through writing, drawing, and report) "the people who live at your house, the people who take care of you, the people who teach you." From this initial list of members of the child's caregiving cluster I will arrange with the primary caregiver access to the other potential participants.

I will conduct individual, semi-structured interviews with at least two of the identified caregivers in the cluster, including at least one of the primary caregivers responsible for child's daily care and supervision. I will conduct a focus group composed of 4 to 8 caregivers from the caregiving cluster. Interview and focus group questions will be open-ended and centered on participant perceptions of CSA risk locations and situations for child, approaches to teaching child about safety, and perception of actions to take if concerned about child's safety or if child reported safety issue. I will conduct a minimum of two field observations of situations involving child-caregiver interactions, ideally in public settings (i.e., park, school ground, public event). A particular focus of the observations will be to identify safety and supervision messages and actions, physical contact/boundaries between the child and adults, and any other relevant behaviors or events.

Results: Data from the interviews, focus groups, and field observations will be analyzed using open and focused-coding, resulting in a descriptive thematic analysis. A social ecology framework will inform the interpretation of the data. Since these data represent the situation of one caregiving cluster, the interpretations and meanings will be presented as an instrumental case study.

Discussion/Conclusions: This exploratory instrumental case study of one child's caregiving cluster will provide an in-depth understanding of how caregiver vigilance against CSA exists across and within levels of a child's social ecology. This in-depth exploration of vigilance in one child's caregiving cluster will also serve as measure of feasibility of a larger, more in-depth research project involving the exploration of multiple caregiving clusters. Further explicating caregiver vigilance perspectives and practices may provide direction for the development of situation-specific interventions aimed at CSA prevention.

### **Effects of an Online Spiritual Care Educational Initiative on Pediatric Nurses' Knowledge, Attitudes, and Competence**

---

*Cheryl L. Petersen, PhD, RN, USA*

#### Purpose

The purpose of this presentation is to delineate the effects of an online spiritual care educational program for pediatric nurses' knowledge and attitudes towards spirituality and spiritual care, as well as their perceived spiritual care competence.

#### Target Audience

The target audience of this presentation is nursing faculty and pediatric nurses who provide care to children with cancer.

#### Abstract

The provision of spiritual care is considered a vital part of holistic nursing care, for spirituality provides comfort, support, and a sense of connection. Spirituality is universal to all individuals, regardless of age, religion, culture, or developmental stage. When a child is nearing the end of life, spiritual care becomes paramount, for it provides the opportunity for enhanced coping as it reduces spiritual distress, allowing for growth in the midst of tragedy. While spiritual care is implicit in holistic models of nursing care, gaps in knowledge and practice prevent children and their families from receiving adequate spiritual care at the end of life.

This study was guided by the Actioning Spirituality and Spiritual Care Education and Training in Nursing Model. This conceptual framework guides the provision of spiritual care training and initiates change in nurses' knowledge and competence to provide spiritual care. A 3-hour, theory-driven educational program based on the literature and the National Consensus Conference Guidelines for Improving Palliative Care as a Dimension of Palliative Care was developed with the assistance of interdisciplinary experts, children with cancer, and their families. This study employed a prospective, longitudinal design to evaluate the effects of the online educational initiative on pediatric nurses' knowledge, attitudes, and spiritual care competence. Nurses were recruited by email from membership of the Association of Pediatric Hematology/Oncology Nurses (APHON). Participants completed the Spirituality and Spiritual Care Rating Scale, a 17-item Likert based instrument, and the Spiritual Care Competence Scale, a 27-item Likert-based instrument, at three time points: baseline, upon completion of the educational program, and 3-months post-completion of the program.

Data is currently being analyzed. Repeated measures ANOVA will evaluate the effect of the educational initiative on nurses' perceived spiritual care competence at the 3 time points; post hoc analysis will be completed with Bonferroni correction. Repeated measures ANOVA will evaluate the effect of the educational initiative on nurses' attitudes towards and knowledge of spirituality/spiritual care at the three time points; post hoc analysis will be completed with Bonferroni correction. Regression analysis will determine if change in nurses' attitudes towards and knowledge of spirituality/spiritual care predicts change in perceived level of spiritual care competence.

### Short Term Intervention Using the Paleolithic Diet to Prevent Progression from Prediabetes to Type 2 Diabetes in Those with HgA1c 5.7% or Higher

---

Chrystyne Olivieri, BSN, FNP-BC, CDE, USA

#### Purpose

The purpose of this study was to determine if dietary changes of using Paleo Eating Patterns can affect one's progression from prediabetes to type 2 diabetes in patients that have HgA1c level of 5.7% or higher.

#### Target Audience

Primary Care Physicians, Nurse Practitioners, Physician Assistants and Registered Nurses as this group is on the front lines of health care. Early recognition and intervention for populations at high risk for Type 2 Diabetes, those with HgA1  $\geq$  5.7%.

#### Abstract

**Background:** Western metabolic diseases, especially, obesity, prediabetes, diabetes and cardiovascular diseases impose a great financial and quality of life burden on modern society. Chronic diseases are being identified as a health crisis in almost every country in the world today. These problems have continued to progress despite an alarming amount of modern pharmaceuticals. Many studies have identified lifestyle changes as the best to address these diseases. Human history reveals that prior to the advent of agriculture, humans were believed to be free of diseases such as cardiovascular disease and diabetes. Examination of anthropological remains have clearly identified that early humans, especially from the Paleolithic era of 50,000 to 10,000 years ago, did not die from the same diseases that plague modern man. During the end of the 1800's through the 1900's, anthropologists and biologists were particularly active in researching the lifestyles of indigenous, primitive cultures alive on the planet at that time. They found that those societies did not suffer any of the chronic diseases that are so prevalent in the modern world. The diets of these societies have been identified to be much lower in carbohydrates and higher in saturated fats than the Standard American Diet, regardless of where they lived on the planet. It was speculated that it was the diet that made the most profound difference in their health and longevity. Paleo eating patterns keeps a focus on naturally occurring foods like vegetables, fruit, large game, poultry, fish, eggs and nuts, with an eye on what was available during the Paleolithic era prior to the advent of agriculture and animal domestication. It also focuses on an avoidance of processed foods, sugars, grains, legumes, dairy, chemically altered fats and artificial sweeteners. This study attempts to employ Paleo eating patterns to mimic the diet of our ancestors as this may be a viable option to minimize the debilitating effects of metabolic diseases related to lifestyle.

**Purpose:** This study aims to explore to what extent a short term intervention utilizing the Paleolithic diet may affect weight, blood pressure and the specific biomarkers of metabolism in patients with HgA1c  $\geq$  5.7%. We will attempt to see how Paleo eating patterns may affect the prominent risk factors for many chronic diseases of the modern world.

**Theoretical Framework:** Change behavior is difficult for many people. Since diseases of lifestyle are often rooted in behavior, the psychological, social and cultural aspects of poor lifestyle choices must be considered if behavior modification is to be successful. A skilled provider can help patients to commit to change through the use of Brief Action Planning. This is a technique which allows patients to commit to making the changes in their lifestyle based on which behaviors they want to change rather than what the providers deems necessary to change. This patient centered approach respects patients autonomy by facilitating behavior modifications using the biopsychosocial model instead of the traditional biomedical model. Lifestyle modifications requires a broader approach if behavior change is the goal.

**Review of Literature:** For over twenty years, research has been conducted showing how diet and lifestyle interventions can reduce the morbidity and mortality associated with pre-diabetes and diabetes. Despite this, the prevalence of diabetes has risen. It wasn't until 1985 that the first study of a specific ancestral diet was conducted in the United States by Eaton and Konner. It attempted to identify what would constitute the optimal human diet based on anthropological evidence. Since then, many researchers have also looked at the diets of indigenous cultures that had avoided contact with the modern world. Native cultures do not seem to experience the energy imbalance of food energy intake exceeding total energy expenditure, which is the basis of the Standard American Diet. Although many weight loss programs produce weight loss and improved glycemic control, the Paleolithic diet has been found to be superior for its effects on overall health. To date, there have been nine human studies conducted throughout the world evaluating the effectiveness of the Paleolithic diet in human health from 2007 to 2013. As a result, the evidence is well supported that the Paleo diet is a viable strategy to prevent or reverse the metabolic diseases so prevalent in our society. Humans have successfully evolved as a species eating a diet essentially void of high glycemic index carbohydrates, sugars, processed foods, artificial sweeteners and chemically altered oils and fats for hundreds of thousands of years. The evidence suggests that an ancestral diet can be employed to help treat and manage many chronic health problems associated with poor lifestyle choices.

**Method:** A convenience sample of men and women (N=34) that fit the inclusion criteria of HgA1c  $\geq$  5.7% were initially educated for 45 minutes in the essentials of the Paleolithic diet. Exclusion criteria were of patients using insulin or sulfonylureas, as they were more susceptible to hypoglycemia when removing high glycemic index carbohydrates from their diet. Bio-markers of metabolism included triglycerides, high-density lipoproteins, fasting glucose and fructosamine and these blood tests were resulted at baseline and repeated 3 weeks post-intervention. Blood pressure and weight were also taken at baseline and again at 3 weeks post-intervention. Differences were evaluated by T-test and analyzed with descriptive graphs to compare pre-intervention variables to post-intervention results.

**Results:** Results are pending. Preliminary data suggests that the Paleo diet is effective for weight loss and lowering triglycerides which are two major risk factor for chronic diseases like diabetes.

**Potential Implications:** Findings suggest that eating a low carbohydrate diet, such as the Paleo diet, has profound effects on risk factors for chronic disease in modern culture. Although it is necessary to exclude many foods and beverages commonly consumed in our modern culture, for those motivated to improve their health through lifestyle modifications, it may be a powerful tool in the prevention of metabolic diseases like diabetes.

### Depression among New Graduate Nurses Working in ICU and Medical-Surgical Units

---

Valery Bessmerthyy, USA  
Keith Taylor, USA

#### Purpose

The presentation will help raise the awareness of the rates of depression among newly graduated nurses working on the medical surgical floor and the intensive care unit. This will help determine whether there is a need to better assist new nurse graduates during this difficult transition.

#### Target Audience

The target audience will include university and college nursing faculty who are in a position to better prepare nursing students for their future transition into the workforce, as well as nursing educators from facilities employing new nurses who have the potential to directly impact the new graduate nurses' transition.

#### Abstract

Recent studies report that in the US healthcare workers suffer the third highest incidence of depressive episodes among all occupations. These studies, however, do not address the levels of depression in specific populations within the nursing community. Nurses who are depressed use more sick days, have lower productivity, higher rates of medication errors, and offer a lower quality of care. The rate of depression for new graduate nurses on different units in the hospital is unknown. This is especially important regarding medical-surgical units, as this is where most new graduate nurses are initially employed, and ICU, which is a high-intensity unit that attracts new nurse.

Objective: The purpose of this research is to gain knowledge of the rates of depression among new graduate nurses employed on medical-surgical units and intensive care units. This is important as depression is a significant contributing factor to nursing turnover with 60% of new graduate nurses leaving their first job within 6 months and 20% leaving the profession entirely.

Method: 108 new graduate nurses will be recruited from similar sized hospitals in in the Sacramento, San Francisco, and Los Angeles areas. They will be between the ages of 22-40 and have at least one, but no more than two years of employment in either a medical-surgical or ICU unit. These nurses will also be graduates of California BSN programs and working on night shifts. Data will be collected through the self-administered nine question PHQ-9 survey, which is based on the depression diagnostic criteria of the Diagnostic and Statistical Manual of Mental Disorders. The Chi Square test of independence will be utilized for data analysis.

Discussion: This research and data analysis can assist in identifying the occurrence of depression among new graduate nurses during transition into their professional lives. This holds the potential to increase patient safety, quality of care, and unit productivity, while also reducing medication errors, sick days, and nursing turnover. Implications include addressing the need for programs aimed to reduce stress levels, workload, and improve working conditions of new graduate nurses.

### Equine Assisted Therapy: A Systematic Review of Interventions to Improve Outcomes in Adults

---

Sharon A. White-Lewis, MSN, RN, USA  
Cynthia Russell, PhD, RN, ACNS-BC, FAAN, USA  
Rebecca A. Johnson, PhD, RN, FAAN, FNAP, USA  
Nancy L. Mueller, USA

#### Purpose

The purpose of this presentation is to report the available literature on Equine Assisted Therapy interventional studies in a systematic review with quality scoring using CONSORT and STROBE criteria.

#### Target Audience

The target audience of this presentation is all healthcare providers interested in health promotion, arthritis, neurology, rehabilitation and animal therapy.

#### Abstract

**Problem:** Half of all adults, over 117 million, have one or more chronic illnesses. A new intervention, equine assisted therapy, is an approach that uses unique qualities of a horse to provide improvement in gross motor, quality of life and self-help skills. No comprehensive systematic reviews have been conducted on equine assisted intervention studies targeting adults.

**Purpose:** To synthesize equine assisted therapy intervention studies.

**Theoretical/Conceptual Framework:** A research methods quality framework was used. CONSORT guideline criteria were used to judge randomized controlled trial study quality while STROBE guideline criteria were used for quasi-experimental studies.

**Methodology/Design:** Using a systematic review design, a search of multiple databases was performed using selected search terms. Databases included ProQuest, CINAHL, Medline, Google Scholar, ERIC, PEDro Database, DOAJ, Cochrane; Psych Info, and DARE, and The DELTA Society's list of equine research articles. Study eligibility criteria included: adult sample 16 years of age or older, sample size of 5 or greater, quasi-experimental or experimental design, intervention involving a living horse or horses and articles published in English. Data were reviewed and scored by two independent reviewers.

**Results/Analysis:** Twenty three studies met inclusion criteria, representing 450 subjects from 9 countries. Sample size ranged from 7 to 32. Ages ranged from 16 to 85 years. Diseases studied include multiple sclerosis, cerebral palsy, brain disorders, stroke, balance deficits and spinal cord injury. Primary dependent variables' measures focused on balance, cadence and stride of gait, stability, spasticity, self-efficacy and quality of life/well-being. Randomized controlled trials (39%) and quasi-experimental (61%) were included. Treatment interventions ranged from hippotherapy programs (goal directed therapy with a licensed interventionist) to therapeutic horseback riding classes (directed at improving horse riding skills and exercise movement). Statistically significant improvements were reported in main outcomes of 17 of 18 (94%) studies. Study methodological limitations included: small sample sizes, no power analysis, inconsistent use of measures, lack of randomized controlled trials and long-term follow up.

**Interpretation of results:** Equine assisted therapy, a non-pharmaceutical modality, shows promise as an intervention to improve psychological, social and physical outcomes in adults. This translates into improved morbidity and mortality in those with chronic conditions.

## Traditional Versus iPad-Assisted Preoperative Education

---

*Liza Mathais Abraham, MSN, CRNP, USA*

### Purpose

The purpose of this presentation is to portray whether knowledge retention using an iPad is more effective than existing traditional methods (i.e. pamphlets) when providing preoperative education in patients scheduled for cystectomy.

### Target Audience

The target audience of this presentation is advanced practice providers, nurses, physicians and other health care professionals involved or interested in multimedia based patient education.

### Abstract

**Background:** Radical cystectomy has become the most common treatment modality for patients with high-grade or muscle-invasive urothelial cancers. Patients scheduled for cystectomy require in-depth preoperative education regarding management of their urinary diversions. When evaluating patients scheduled for cystectomy and urinary diversion in the preoperative area, the author found very poor retention of knowledge regarding the surgery, body image alteration, and the care involved after surgery. Therefore, adding a multimedia tool like an iPad will be utilized in the preoperative education to examine the effects on knowledge retention.

**Methods:** This study will utilize a pretest – posttest design, where subjects are randomly assigned to either receive standard pre-operative education with pamphlets or iPad assisted pre-operative education. Outcome measured will be knowledge retention through the use of a 10 multiple choice questionnaire. The questionnaire will be administered prior to the pre-operative education session and then again in the preoperative are prior to surgery. Questionnaire scores will be measured using repeated measures ANOVA. The Chi-square test will be utilized to compare both groups.

**Results:** The expected sample size of 40 patients will be randomly assigned to receive either standard education or iPad assisted education. The content of the education will be the same and both groups will be given the standard pamphlet to go home to review. The goal will be to investigate whether the iPad assisted preoperative education is similar or superior to the existing standard education utilized.

**Conclusion:** Use of multimedia tools like iPad in preoperative education can be effective in improving knowledge retention in patients undergoing complex body altering surgeries.

### Acute Pain Management: Impact of Opioid Tolerance Leveling on Patient, Provider, and System Outcomes

---

*Jill S. Payne, MSN, BSN, ASN, RN, CNML, CENP, USA*

#### Purpose

The purpose of this presentation is to describe an interprofessional, nurse-led clinical scholarship resulting in the design, implementation, and pilot evaluation of an evidence-based Three-Tiered Opioid Pain Management program within an 18-hospital at a health system.

#### Target Audience

The target audience of this presentation is clinical and academic scholars and practitioners with interest in safe, reliable tools to individually assess and manage patient's experience of pain within the acute care setting using a systematic and interprofessional team approach.

#### Abstract

The human and economic burden related to ineffective pain management is well documented. Factors influencing ineffective acute pain management are multi-factorial and include failure of healthcare professionals to accurately and reliably assess and meet patient's individual pain management requirements. The discipline has been absent an approach and tools enabling reliable, safe, patient-centric assessment and management of pain. Historically, acute pain treatment is focused on the primary admitting condition, which can inadvertently exacerbate existing addiction and improperly manage the patient pain needs. This further potentiates provider biases that conflict with evidence-based pain management strategies. To address these concerns, an interprofessional team was assembled including direct care nurses, clinical nurse specialists, chemical dependency consultants, educators, pharmacists, physicians and hospital leadership. A system pilot was designed with a four prong approach: education of the provider of opioid selection and utilization, tiered approach for assessment of patient experience and tolerance with opioids, consistent and reliable evidenced based selection and administration of opioids, structure and processes enabling surveillance and escalation of pain management. Tiers are assigned based on patients' daily use of opioids. The program uses a systematic, reliable, evidence-based approach to expedite treatment options and interprofessional consultation to design a plan customized to the patient's needs through clearly defined orders. Information system tools were developed to aid transparency and access to data that supports evidence based pain management. An escalation process was created to identify variances and build a robust learning cycle for enhanced program reliability. Program evaluation measures include the following: patient experience (harm composite and satisfaction scores), provider (rate of adoption and nursing knowledge). Preliminary results (n=400) reveal high provider satisfaction, wide-spread adoption, and most importantly improved patient experience including a zero percentage harm composite. Clinical scholarship aligning and integrating implementation science and innovation has the capacity to advance the practice of nursing, patient care delivery, and most importantly exceed the needs of those we are privileged to serve. Additionally, providers can customize standardized pain pathways with less bias while maintaining autonomy in practice and promoting a consistent plan of care across the continuum.

## Sister to Sister Surrogacy

---

*Diana A. Cullati, AS (HlthSc), CPR, USA*

*Joey Regino, AS (GnrIsc), AS (LibArt), CPR, ACLS, USA*

*Lisa Ceynowa, BA (Eng), AA (SocBehSc), CPR, USA*

### Purpose

The purpose of this study is to understand the impact of sister to sister surrogacy. The close ties between the surrogate, the intending parents, and the child will be analyzed. This study will also explore the surrogate experiences, motivations, psychological effects, and attitudes that this type of surrogacy entails.

### Target Audience

The target audience for this presentation is women between the ages of 24-34, who are gathering information in order to make an informed decision about whether or not to consider becoming a surrogate.

### Abstract

The purpose of this study is to understand the impact of sister to sister surrogacy. The close ties between the surrogate, the intending parents, and the child will be analyzed. This study will also explore the surrogate's experiences, motivations, psychological effects, and the attitudes that this type of surrogacy entails. Further research needs to be conducted to fill the gap of knowledge regarding interfamilial collaborative reproduction, specifically information regarding the surrogate's motivations, attitudes, and experiences. None of the research found with an extensive data search pertained specifically to sister to sister surrogacy, with the ovum donor being the intended parent's sister. No specific data on intrafamilial surrogacy exists as of 2012. Ethical issues are at play with sister to sister surrogacy, such as condemnation for selling women's bodies and reducing them to commodities, and or seeing surrogacy as an altruistic gift. Sister to sister surrogacy can be controversial, and has been banned in some countries, such as Japan.

Goals: Illuminate patterns of reactions, interactions, and relationships between the surrogate and her partner, the child, her own children, the intended parents, extended family, friends, and her community relationships.

Methods: Utilize grounded theory, a qualitative method to systematically collect data to discover a pattern of reactions, interactions, and relationships among people. Grounded theory enables the exploration of human actions and interactions where very little information is available. Purposeful sampling and personal interviews and constant comparison will be used. The Relational Model will be used to outline the relationship the surrogate has with the couple, the newborn baby after birth, the surrogate's partner, her extended family and friends, and community relationships. Purposeful sampling will be used to select participants that have credibility and can best answer the research question. Participants will be recruited through fliers sent to fertility clinics throughout California. The privacy of participants will be protected. This study will only gather data, and does not plan any interventions.

### The Impact of Quality of Sleep on Academic Performance in University Students: A Cross-Sectional Study of Adults

---

*Heather Rochelle Raley, BSN, USA*

#### Purpose

to determine if quality of sleep affects academic performance in university students. The outcomes will inform students about the effects of sleep habits and the sleep environment on the body. Also, how disruption of sleep-wake cycles can affect attention span in the classroom.

#### Target Audience

the general population of university students. Conclusions drawn from this research will benefit generalizable knowledge of university students choosing to reevaluate their sleep habits and environment.

#### Abstract

Current literature suggests that the most effective method for improving quality of sleep include regulating a consistent sleep schedule throughout the week. But the relationship between quality of sleep and the academic performance of university students is insufficiently addressed in literature. The aim of this research study was to assess the relationship between quality of sleep on academic performance of university students. The study was conducted between January 2015 and February 2015 at a mid-size university in the South, and included a systemic random sample of students from all student classification levels (freshman, sophomore, junior, and senior) currently enrolled in courses. A self-administered questionnaire was distributed to assess demographics; a sleep profile including sleep duration, sleep environment variables, daytime sleepiness, and the use of sleep remedies; and an academic profile including number of enrolled courses, and current cumulative GPA. This study will report findings that most university students report that they feel they do not get a sufficient amount of sleep and they frequently experience daytime sleepiness.

## Effects of Music Therapy on Pain of IV Insertion

---

*Berenice De La Cruz-Escobedo, CMA, CNA, USA*

### Purpose

The purpose of this study is to explore a non-pharmacological, non-invasive, more cost effective therapeutic measure that may provide similar results as Lidocaine Therapy.

### Target Audience

Target Audience: This research study was created to target health care professionals involved in infusion therapy.

### Abstract

Background: Patients often rely on nurses to use measures that will ease the pain of their intravenous catheterization. As a comfort measure, many hospitals provide the option of lidocaine use to ease this pain, and is often preferred by patients. (Burke, Bercler, Bye, Desmond & Reese, 2011). However, lidocaine administration is invasive and stimulates a burning sensation in the subcutaneous tissue while it is being numbed. This often defeats the purpose it was originally administered for, the relief of pain, and sometimes may even cause more pain than the IV needle would have. Is it possible that a non-pharmaceutical, non-invasive and more cost effective measure, that provides similar results, be utilized?

Objective: The purpose of this research study is to measure the effect of music therapy in comparison to lidocaine administration on intravenous catheterization pain.

Methods: A quasi-experimental, non-probability, convenience sampling method will be employed to compared levels of pain during intravenous catheterization using music and lidocaine therapy. Patient's level of pain will be measured before, during and immediately following the procedure using the Visual Analog Scale (VAS). Soft classical music will play 20 minutes prior to the procedure and throughout the procedure. Only successful first attempts will be utilized in this study. A sample size of 60, 30 music therapy and 30 lidocaine therapy, will be used.

Results: Pending date collection and analysis.

Conclusion: Though Lidocaine has been shown to provide relief of IV procedure pain, it is an invasive therapy. If this research study supported music therapy to be a significant alternative to Lidocaine, persons involved in infusion therapy may be able to provide patients an alternative pain relief measure. By reducing the number of needle sticks from two to one, patients are receiving a less invasive and more comfortable therapeutic intervention.

### **Promotion of Perioperative Normothermia in Patients Undergoing General Anesthesia**

---

*Cassie Marie Ishmael, DNP, CRNA, USA*

#### Purpose

The purpose of this presentation is to educate perioperative providers about the physiological effects of inadvertent perioperative normothermia and taken to minimize the incidence of inadvertent perioperative hypothermia. Education and awareness by perioperative providers remains instrumental in the promotion of perioperative normothermia.

#### Target Audience

The target audience of this presentation is anesthesia providers, perioperative providers and researchers.

#### Abstract

Inadvertent perioperative hypothermia is a common but preventable condition experienced during the perioperative continuum. This phenomenon can be experienced by surgical patients during any phase of the perioperative continuum. The promotion of perioperative normothermia is essential to the prevention of adverse complications related to inadvertent perioperative hypothermia including cardiac events, hematological changes and alterations in the recovery process. An evidence-based quality improvement initiative for the promotion of perioperative normothermia has been recommended.

## Homecare Nurses' Experiences with Telemonitoring Systems

---

*Justin Palmer, USA*

### Purpose

The purpose of this presentation will be to provide background information about home telemonitoring system and to describe the lived experiences of homecare nurses involved with the daily operation of these systems and their perceptions of the systems' benefits and weaknesses.

### Target Audience

The target audience of this presentation is nursing students, practicing nurses, home health nurses and nurse educators

### Abstract

The promise of telehealth in modern healthcare centers on reduction of costs via utilization of the latest communications technology to deliver quality healthcare services to underserved populations. Telemonitoring in particular has held the promise of helping reducing costly hospital readmissions and improving overall health while the patient continues to remain at home. This type of intervention has been targeted primarily towards patients living with chronic diseases requiring long term care and timely follow-up.

Results from clinical trials investigating this hypothesis, however, have been mixed at best. The majority of the studies utilizing a more rigorous research design seem to indicate no significant difference in outcomes between patients receiving telemonitoring vs. standard post-discharge home care. It should be noted, however, that several of these studies reported some secondary benefits for patients receiving home telemonitoring. Additionally, qualitative studies of the experiences of both staff and patients involved with home telemonitoring programs indicate that when implemented properly these programs can empower patients' self-care and improve health status. The research also indicates that the attitudes and style of staff implementing the program have a significant impact on its acceptance and effectiveness.

Exactly what leads to successful implementation of a telemonitoring program is still unclear and requires further investigation. The focus of this study is to describe the lived experiences of homecare nurses involved with the day-to-day operation of telemonitoring systems in the homecare setting, and describe their perceptions of what makes a telemonitoring system a beneficial addition to patient homecare. Two to six one-on-one semi structured interviews with nurses employed by agencies utilizing home telemonitoring systems will be conducted. Nurses' responses will be audio recorded and analyzed for themes such as benefits of home telemonitoring for patients, characteristics of system efficacy, technical and implementation challenges for providers, and staff acceptance and satisfaction with the system. Implications for successful implementation of home telemonitoring programs will be discussed.

### **Nurse's Perceptions of Family Dynamics in Caring for Children with Anorexia Nervosa: Reports of Care Experiences**

---

*Lucy Camarena, BSN, RN, USA*

#### Purpose

The purpose of this exploratory investigation was to identify common family dynamics for families with a child with anorexia nervosa from nurses' perspective in a variety of clinical settings.

#### Target Audience

The target audience of this presentation is nurses who work with children in the clinical setting.

#### Abstract

The research in this paper looked at nurses' perspectives on family dynamics in caring for children with anorexia nervosa in the clinical setting. The purpose of this exploratory investigation was to identify common family dynamics for families with a child with anorexia nervosa from nurses' perspective in a variety of clinical settings. The research questions included: How do nurses describe mother and teen relationships? How do nurses observe interrelatedness in between the family members? How do mothers and teens relationship differ between those with AN and those without? The participants included nurses working in the Bay Area in pediatrics. The exploratory investigation consisted of using surveys that will collect both quantitative and open-ended information.

Keywords: Anorexia Nervosa (AN), Teens, Family therapy, individual therapy.

### The Effects of Baccalaureate Nursing Students' Participation in a Community-Wide Disaster Drill on Perception of Interprofessional Education in a Small, Rural College Setting

---

*Laura R. Madden, MSN, RN, CCRN, USA*

#### Purpose

The purpose is to examine how nursing student participation in a community-wide disaster drill changes perception of interprofessional education. This presentation will report the results of one small, rurally located school of nursing's creative use of participation in a disaster drill to educate about interprofessional collaboration

#### Target Audience

Nurse educators, nursing students, and educational leaders interested in an innovative and creative way to effectively teach interprofessional collaboration to nursing students, especially in small college settings where there are few or no other pre-licensure health care students with which to collaborate on an educational project.

#### Abstract

With both the Institute of Medicine (2001) and the World Health Organization (2010) advocating for interprofessional education (IPE) as a means to improve the quality, safety, and efficiency of patient-centered care, colleges and universities are tasked with finding appropriate ways to provide this education to their health care professional students. According to Reeves, Perrier, Goldman, Freeth, & Zwarenstein (2013), this is best accomplished through interactive education. In small colleges located in rural settings where nursing students may not have the opportunity to collaborate with other pre-licensure health care students, the ability to provide comprehensive IPE is difficult without using creativity and innovation. The purpose of this proposed study is to examine the effects of baccalaureate nursing student participation in a community-wide disaster drill on their perceptions of interprofessional education. This proposed study will utilize the Interdisciplinary Education Perception Survey (IEPS) to study the perceptions of baccalaureate nursing students from one small, rural college in the southeastern United States before and after their participation in a community-wide disaster drill. This instrument was developed in 1990 by Luecht, Madsen, Tauger, and Petterson, using 143 participants to elicit pre-professional healthcare student perception of interdisciplinary collaboration. The 18 items in the scale are rated on a 6-point Likert scale (1= strongly disagree and 6= strongly agree), with higher scores indicating greater professional cooperation (Williams & Webb, 2013). This instrument has been widely used since its development and carries a Cronbach alpha coefficient of .87 (Williams & Webb, 2013). Participants for this study will be recruited from the nursing program of one small, rural college where nursing is the only pre-licensure health care program. All of the nursing students from will be recruited to complete the IEPS survey instrument after class approximately one month before their participation in the disaster drill, and again during the debriefing session at the conclusion of the drill. Prior to their participation in the disaster drill, the students will be provided with didactic teaching on interdisciplinary collaboration using critical thinking. During the drill, the third year nursing students will participate as the victims, while the fourth year nursing students will collaborate with local fire, rescue, police, and hospital professionals to care for the victims. The participants will also be asked to complete a researcher-created demographic survey which will measure age, ethnicity, years of formal education, marital status, current employment status, number of years of work experience in the health care industry, and classification of city size where the participant anticipates they will work upon graduation from the nursing program. The participants will complete the survey during the spring semester of 2015. All data collected will be statistically analyzed, reported to the college, and prepared for presentation. The results of this study have the potential to provide evidence for use of an experiential learning activity to increase critical thinking and collaboration with other health care professionals.

Providing the theoretical framework for this proposed study will be Dewey's theory of knowledge development. Dewey used the pragmatic approach to knowledge development where truth is conditional on its practical applicability for accomplishment (Hookway, 2013). Pragmatism requires receptiveness to new ways of thinking and new resolutions to problem solving (Warms & Schroeder, 1999), which Dewey provided through his ideas of blending inquiry with experimentalism. Dewey posed his theory of knowledge development based on a human's ability to adjust their environment in order to provide a solution for a situation (Field, n.d.; Hookway, 2013). Dewey further believed knowledge and reason developed during interaction with the environment, using knowledge as an instrument to bring about change and adaptation (Field, n.d.). Additionally, as the environment was altered by interaction, a change in behavior was also manifested in the individual (Leffew, n.d.; Papdimos, 2009). During the interventional phase of this proposed study, the participants will draw on the concepts of observation, use of past knowledge, and critical thinking described by Dewey in his model (Kolb, 1984). These concepts will form the context for measurement of the four subscales of competency, perceived need for cooperation, perception of actual cooperation, and understanding the value of others found in the IEPS (Williams & Webb, 2013).

## Effects of Infant Positioning in the NICU

---

*Kristin Sierra Wade, BSN, RN, USA*

### Purpose

To provide a brief overview of the effects positioning has on fragile newborns. This visually-attractive poster summarizes recent research, allowing neonatal nurses to immediately use the information in their hospital to improve patient outcomes.

### Target Audience

Neonatal nurses who provide direct patient care for newborns and nursing students interested in such positions.

### Abstract

When babies are born, they are thrown into a world very different from the one they knew in the womb. This is especially true for premature or critically ill newborns, whose immediate physiological needs are put above long-term and developmental needs. One of the earliest neurodevelopmental interventions in the neonatal intensive care unit (NICU) is therapeutic positioning, and it is often nursing judgment as to how an infant is positioned during rest. This simple, yet powerful, intervention can greatly affect the patient's outcome in either a positive or negative way. If done thoughtfully, positioning can maintain an open airway, allow lung expansion and gas exchange, regulate temperature and intracranial pressure, and promote digestion. In the first three days of life, preterm infants are most vulnerable to brain injury from intraventricular hemorrhage. Their fragile blood vessels simply cannot compensate for the quick changes in arterial blood pressure that often occur in intensive care settings. Lying supine with the head of bed elevated and neck placed midline can prevent these devastating injuries. After those three days, the neonate's needs change. The focus may shift to improving gas exchange or promoting gastric motility. Bedside nurses should adapt their positioning approach based on the infant's changing condition, all while keeping development in mind. Whether the infant is supine, prone, or side-lying, their joints can stay flexed with the help of commercial and handmade positioning aids. These devices help to mimic the constricting effect of the uterus, and allow for proper joint and tissue development. This poster offers a visually-attractive summary of recent research on the outcomes of various newborn positions. It is designed to be a quick read for neonatal nurses so that they can immediately put the information into practice with the articles to refer back to and share with other staff members.

## Infection Rates in Traditional Vaginal Birth vs. Water Birth

---

Natalee J. Snyder, SN, USA  
Stephanie A. Palmer, SN, USA  
Sasha Sinkevich, SN, USA  
Nicollette Singleton, SN, USA

### Purpose

The purpose of this presentation is to increase awareness of the difference in perineal infection rates between traditional and water birthing methods.

### Target Audience

The target audience hoping to be reached are birthing facilities and faculty offering water birth and traditional birthing methods, as well as expectant mothers who are exploring birthing options.

### Abstract

The incidence of infection due to perineal tears during water births is unknown. Approximately 75% of all women who give birth vaginally will suffer from various levels of birth lacerations (Lundquist, Olsson, Nissen, & Norman, 2000). One in ten women who received a perineal laceration during a vaginal delivery later developed an infection (Johnson, Thakar, & Sultan, 2012). The purpose of this research is to determine the effects of water birth on maternal perineal infection in comparison to traditional birthing methods in California. The goal of this study is to determine the difference in perineal infection rates between these two birthing styles. This study defines perineal infection as the presence of swelling and redness at the wound, use of antibiotics, and fever. Fever will be measured using an electronic oral thermometer that will be calibrated per facility protocol and is classified as a temperature reading greater than 38 degrees Celsius. The study will implement a causal-comparative design including low risk mothers who fit within the study's inclusion and exclusion criteria. In this study, sampling will occur through random clustering of charts from 2013 of pregnant women who received a perineal tear at one of 20 California birthing centers that offer traditional and water births. One group will consist of women who used the traditional birth method. The other group will be comprised of women who chose the water birth method. Data will be collected retrospectively from patient files within the sampling groups. All information is confidential and no names were used throughout the study. To ensure confidentiality, all information gathered will be kept in securely locked electronic files on the laptops. Each participant will be given a reference number by which to be identified; her name will not be used to identify her. The patient's information and whether the patient displays the above mentioned defining characteristics of infection will all be recorded on the data collection form. Data will be analyzed using the Chi Square test of independence with a p-value of 0.05% was used to ensure external validity. Implications of this proposed study are patient safety, fiscal responsibility, patient satisfaction, and improvement in practice.

### Incorporating the Chronic Care Model to Improve Health Outcomes and Satisfaction

---

*Marcia A. Potter, MSN, RN, FNP, USA*  
*Jill S. Walsh, DNP, MS, CEN, USA*

#### Purpose

The purpose of this presentation is provide practice based evidence for use of the Chronic Care Model in Primary Care practice.

#### Target Audience

The target audience is Primary Care clinicians, nurses, medical technicians, medical administrative staff, and clinic administrators.

#### Abstract

Patient activation and engagement can be powerful enablers for health outcomes; just as important are staff engagement and satisfaction. This author re-designed clinic templates to accommodate a time-based element of longitudinal care and implemented skill-based competencies to provide collaborative, team-based care to patients with type 2 diabetes. Seventy adults with diabetes and 6 staff members caring for them participated in a 12 week process improvement project utilizing the Chronic Care Model to link satisfaction and health outcomes. Patients completed satisfaction surveys at the end of their clinical encounters; staff completed satisfaction surveys pre- and post-implementation. The authors analyzed hemoglobin A1C levels pre- and post- implementation. As engagement and activation increased for both staff and patients, hemoglobin A1C levels decreased. Clinical implications include broad application of the CCM to daily practice, improved self-efficacy, healthier populations, and health care cost reductions.

### Trusting Relationships: Creating a Conducive Teaching and Learning Environment

---

*Gisela H. Van Rensburg, D Litt et Phil, MA Cur; BA Cur(Hons); BA Cur, General nurse (RN), Midwife, Community nurse, Psychiatric nurse, Nurse educator, Nurse manager and Orthopaedic nurse, South Africa*

*Ellie C. van Dyk, MACur, BACur, BCur, RN, South Africa*

*Elsie Sophia Janse van Rensburg, DCur, DCur, MCur degree, BA Honnours (Psychology) degree, BCur degree and a certificate in Nursing Education., South Africa*

#### Purpose

The purpose of the presentation is to explain how building blocks of trust ensure self-trust and interpersonal trust. The relationships amongst educators, students and professional nurses, professional credibility and the teaching and learning context are interrelated and create professional trust in the nursing education environment.

#### Target Audience

The target audience for the presentation is nursing educators at accredited nursing education institutions, students who are following a nursing program which lead to the registration of a nurse and professional nurses or nursing managers from the clinical learning environment.

#### Abstract

Trust is regarded as the cornerstone of a society and the 'glue' to maintain social order, but also the emotional glue that binds leaders and employees together in leadership (Bell & Duffy 2009:50; Rotenberg, Fox, Green, Ruderman & Slater 2005:271). Dodgson (1993:83) defines trust to be "a state of mind, an expectation held by one partner about another that the other will behave in predictable and mutually acceptable manner. Trust is an essential component of nursing practice and nurse education is potentially influenced upon the formation of trust and distrust in the health care (Pask 1995:190). McCabe (2006:252) argues that nursing is a trusted profession and is perceived on issues of honesty and ethics. The average person refers nursing to caring and the word nurse is a significant term of a clear identity with compassion, caring, and collective comfort which give respect to the profession. It is then imperative to build and maintain professional trust in nursing education where educators, students and professional nurses can rely on quality teaching and performances in the teaching and learning environment for future trust in nursing.

The purpose of the research was to explore the needs of students and the views of educators' regarding trust in the teaching and learning environment of nursing education and to identify strategies to make recommendations in order to develop a model of trust for the nursing education environment. The research was guided by the following objectives. The objectives were to: identify the building blocks of trust for the nursing education environment; discover the value of the building blocks of trust in the nursing education environment; identify strategies to build the trust in the teaching and learning environment and to enhance the performance of students to become a competent professional nurse; make recommendations to build trust in the nursing education environment; and, develop a model of trust that will foster trust relationships in the nursing education environment.

The research was a qualitative grounded theory approach because it follows a systematic approach to data collection and analysis to discover the value of trust in the nursing education environment and to develop a model. A qualitative research was systematic and aimed to describe meanings and experiences to understand the phenomenon. The model for trust is grounded in the reality with the utilisation of a grounded theory approach with a systematic collection of data, categorising them and describes the emerging central phenomenon in the context of the nursing education environment.

The target population in this research consists of two groups which were educators and students, involved at accredited nursing education institutions (NEI). The educators were registered at the South African Nursing Council as professional nurses with a nursing education qualification working at a NEI as an educator. Students were in their third and fourth year at a NEI registered in a programme leading to the registration as a professional nurse. The accessible population was at NEI's of a university and colleges which are in the Free State namely the University of the Free State and the three campuses of the Free State School of Nursing.

In this research fourteen face to face interviews were conducted with female educators between the ages of forty to sixty. Sixty-four students between the ages of twenty to thirty-four years participated in fifteen focus group interviews. Interviews were digitally recorded with informed permission from the participants. Data collection was collected concurrently with literature review. The interviews were conducted until theoretical saturation was evident.

Four categories in the open coding emerged which are important for trust in the teaching and learning environment. They are the educator, student, professional nurse and the context of the nursing education. The categories and subcategories are interrelated to each other. Competencies such as expert knowledge regarding the subject of interest were expected from educators. Educators should be equipped with knowledge and skills pertaining teaching methods and applying it in the classroom or simulation environment. Clinical skills enable educators to integrate the theory and practice. These skills make effective clinical accompaniment possible to students. Student competencies include expectations of creativity and evidence to take responsibility for their own learning. The development of critical thinking is essential for the ability to integrate the theory and practice in the clinical learning environment. The competencies of the professional nurse include their knowledge about nursing, as well as the expected clinical experience in the specific clinical learning environment. The role of facilitating and accompaniment of student specifies the ability of the professional nurse to transfer knowledge and experience to students and create clinical learning opportunities to integrate the theory and practice.

In the shared subcategory of professional credibility, the educator, student and professional nurse need trustworthy attributes such as openness, reliability, honesty, benevolence and integrity. These trustworthy attributes are based on the expectation and internalising of professional virtues, ethical codes and values. In the presence of professional virtues the expected professional ethical conduct and role modelling will emerge. Educators, students and professional nurses required the demonstration of professional credibility and intentions amongst each to promote trust in the nursing education environment.

Trusting relationships amongst the educator, student and professional nurse resulted in benefits of trust in the educators and students. Trust in the educator plays a role in their own self-trust and the relationship with students. Students experiencing trust from the educator and professional nurse expressed how it influences their motivation, confidence, self-trust and performance in both theoretical and clinical learning environment. Disadvantages of trust in the educator and student lead to the opposite of the trust and mistrust resulted in negative relationship between them. Trusting relationships are supported with consistencies and congruencies in expected professional intentions and behaviour. Trust experiences in the teaching and learning affect the views of the program leading to a professional nurse and the end product as a professional.

The fourth category which arose from this research was the context of nursing education. In the teaching and learning context there should have been sufficient human resources such as educators, professional nurses and preceptors to mentor students and facilitate learning. The resources were not only restricted to availability of the mentioned but also the availability of adequate equipment, in the theoretical and clinical learning environment such as access to information medical, pharmaceutical and material supplies in the clinical learning environment. Furthermore, the theoretical learning environment educators' teaching skills, support and students' learning abilities optimise trust in the context. Professional nurses teaching role and clinical support to student enhance the students learning opportunities. Integration of knowledge and skills acquired has to take place in the theoretical and clinical learning environment,

where the educator and professional nurse assist the student to relate the practical exposure and learning to their theoretical content and outcomes. Maintaining of standards includes standards of educator, student and professional nurse as well as the theoretical and clinical environment.

Trust and interpersonal trust in the nursing education environment is essential to optimise the education and learning opportunities for students.

Strategies and recommendations regarding trust and trust relationships focus to building, maintaining, enhancing trust and preventing mistrust. A model was developed to promote trust amongst educators, students and professional nurses, as well as the context of education and training.

### A Q Methodology Study of Operating Room Personnel's Perceptions of Certified Registered Nurse Anesthetists

---

*Rachel Marie Cooper, BSN, RN, USA*

*Neil Schalliol Craney, BSN, RN, USA*

*Desiree Hensel, MSN, PhD, RN, PCNS-BC, CNE, USA*

#### Purpose

to discuss the findings of a Q methodology study on the patterns of attitudes among physicians, nurses, and technicians who work alongside Certified Registered Nurse Anesthetists in the surgical setting.

#### Target Audience

Individuals whom are interested in furthering their education and training to become advanced practice nurses along with those who work beside them, educated them, or employ them.

#### Abstract

**Purpose and Background/Significance:** While the Institute of Medicine has called for nurses to practice to the fullest extent of their training and education, little is known about what perceptions exist towards Certified Registered Nurse Anesthetists (CRNAs) among other operating room team members. The purpose of this study is to explore patterns of attitudes among physicians, nurses, and technicians who work with CRNAs.

**Method:** This study used a Q methodology design with a purposeful sample of operating room personnel recruited from four different institutions in the Midwestern United States. Participants were given a set of 34 attitude statements representing a wide range of beliefs about CRNAs. The participants completed a -4 to +4 rank ordering of their level of agreement with each statement. Data analysis was done using PQMethod software. Natural groupings were determined through factor analysis with varimax rotation. A factor array and narrative report was used to describe the discovered shared viewpoints towards CRNA practice.

**Results:** Analysis of 24 returned Q sorts revealed three distinct viewpoints that explained 66% of the variance. Factor one was associated with high levels of confidence in CRNA abilities. Factor two was characterized by an acceptance for CRNAs with recognition for anesthesiologist supervision. Factor three recognized CRNAs were more patient focused but ultimately preferred the anesthesiologist.

**Conclusions:** Discovering patterns of attitudes towards CRNAs provides new direction for research on how to best support nurses in advanced practice roles.

# RSG STR - Rising Stars of Research and Scholarship Invited Student Poster Session

## Facilitating Intent to Vaccinate, Knowledge, and Change in Vaccine Belief

---

Amy Z. Eby, MSN, RN, APN, USA

### Purpose

There is currently a gap in knowledge for the best way to deliver information to vaccine hesitant parents. The proposed evidenced based research plans on correcting misinformation on vaccine ingredients and vaccine safety. Outcomes can contribute to practice knowledge and help increase infants following the CDC schedule.

### Target Audience

The poster Presentation is targeted to advance practice nurses, nurse educators, and nursing leaders providing routine wellness care to infants and children

### Abstract

The first vaccine was released over 200 years ago and has forever changed the world we live in today (Stern & Markel, 2005). With the help of vaccines, people are able to build antibodies which enable and create a defense against illnesses such as rabies, tetanus, typhoid fever, influenza, measles, pneumococcal, meningococcal disease, hemophilus influenza, and other vaccine preventable illnesses. Vaccination efforts and health policy have been an integral component in the prevention and the fight of unwanted infectious diseases in our local communities. Unfortunately, with the success of vaccines, the fear of contracting a vaccine preventable disease has diminished (Offit, 2011).

Over the past 10 years, the rate of parents refusing vaccines has increased causing the risk of infectious disease to the young and old to also increase (Dempsey et al., 2011). Currently 1:10 parents are reporting the use of an alternative vaccine schedule (Cooper, Larson, & Katz, 2008). Furthermore, in a typical month, 89% of medical providers report parents request to follow an alternative schedule, administer one vaccine per visit, or refuse vaccines altogether (Kempe et al., 2011). As a result, 95% of medical providers state that the amount of time to discuss parent's concerns about vaccines is a major barrier to practice (Kempe et al., 2011).

While the current national vaccine rate remains high enough to develop herd immunity, there are growing pockets in the US with low vaccination rates making herd immunity nearly impossible to obtain (Centers for Disease Control and Prevention, 2014). Parents of today are more concerned with the possible side effects from vaccines and are refusing to vaccinate their children from the deadly diseases of our past and the present (Offit, 2011). The increased rate of refusal and use of alternative vaccine schedule is a threat to our communities. Once the vaccine rate falls below 95%, a community loses its herd immunity and outbreak will occur (Mennito & Darden, 2010). When compared to parents who follow the Centers for Disease Control and Prevention (CDC) schedule, only 28% of parents who follow an alternative vaccine schedule strongly agreed that their child was more at risk for contracting disease and contributing to the spread of vaccine preventable diseases (Dempsey et al., 2011).

In the United States (U.S.), there are current vaccine laws that require vaccinations upon kindergarten entry (Birnbaum, Jacobs, Ralston-King, & Ernst, 2013). Nineteen U.S. states, including the state of Arizona, allow personal beliefs exemptions (Vaccine Exemptions, 2012). School exemption rates, in the state of Arizona, have doubled in the last 10 years and increased 0.8% in one year from 2012-2013 since the implementation of personal belief exemptions (Centers for Disease Control and Prevention, 2012; Arizona Department of Health, 2014). In the 2013-2014 Arizona school year, a total of 4,035 kindergartners, 4.7%, filed for vaccine exemption (Arizona Department of Health Services, 2014). In fact, in 2013 only 69% of children in Arizona were protected from the seven vaccines series compared to 72% nationally (Arizona Department of Health, 2013). A study by Birnbaum et al. (2013) from the University of

Arizona found that schools with significantly higher rates of personal belief exemptions included schools with the highest proportion of higher income white students and lowest proportion of free and reduced lunches.

The above statistics are concerning and definitely affect other communities across the United States. As of January 30, 2015, there was one large measles outbreak at a Disney theme park contributing to smaller outbreaks in 14 states causing a total of 102 cases of measles this year (Centers for Disease Control and Prevention, 2015). Unfortunately, this latest outbreak includes 16% of the total cases documented in 2015 (Centers for Disease Control and Prevention, 2015). The cost to treat a child with measles is 23 times the amount spent on the MMR vaccine (Armstrong, 2007). Vaccinating a child against DTaP, Hib, MMR, and Hepatitis B provides a cost savings of 5:1 in direct health care spending and 17:1 in societal costs (Lieu, McGuire, & Hinman, 2005). As a result, vaccinating 90% of children from 1994-2013 is estimated to have saved society \$1.38 trillion dollars in total societal cost over the lifetime of children born during this time span (Centers for Disease Control and Prevention, 2014). The current CDC immunization schedule could prevent approximately 322 million illnesses, 21 million hospitalizations, 732,000 deaths, and save the U.S. 69 billion dollars spent by the health care industry treating vaccine preventable diseases (National Committee for Quality Assurance, 2012)(Centers for Disease Control and Prevention, 2014).

Pediatricians and other healthcare providers are concerned with the increased number of families choosing to not vaccinate or follow an alternative vaccine schedule (Committee on Practice and Ambulatory Medicine and Council on Community Pediatrics, 2010). The U.S. government has noticed these changes and has set vaccine goals in the Healthy People 2020 report. In addition, the state of Arizona in 2014 implemented an action plan to decrease vaccine exemptions affirming the state's commitment to help educate the public on vaccine preventable diseases (Arizona Department of Health Services, 2013).

## RSG STR - Rising Stars of Research and Scholarship Invited Student Poster Session

### Reasons for the Low Uptake of Adult Male Circumcision for the Prevention of HIV Transmission in Swaziland

---

Charles Maibvise, MPH, MPhil, BSc (Hons), South Africa  
T. R. Mavundla, PhD, South Africa

#### Purpose

The purpose of this presentation is to disseminate the findings from a study done to explore the reasons contributing to the low uptake of male circumcision as an HIV prevention strategy despite intense campaigns for the procedure. The study aimed at establishing a baseline for intervention to promote the procedure.

#### Target Audience

Target audience include all stakeholders involved in prevention and management of HIV infection, especially in the mass male circumcision strategy for HIV prevention. These include policy makers and implementers, individuals, government and non-governmental organizations engaged in related research, clinical or public health practice.

#### Abstract

**Background and introduction:** Male circumcision (MC), the surgical removal of all or part of the foreskin of the penis in a male, has recently been proven to reduce heterosexual female-to-male transmission of HIV by about 60% (Auvert, Taljaard, Lagarde, Sobngwi-Tambekou, Sitta & Puren 2005). Against this background, efforts are being made to scale up MC uptake in thirteen priority East and Southern African countries that are worst affected by HIV and AIDS, one of which is Swaziland.

Swaziland is reported to have the highest prevalence of HIV worldwide, with 19% of the general population and 26.3% of the adult population infected (AVERT, 2013; USAID, 2010). As many as 4,500 people died of HIV/AIDS in 2013 alone (UNAIDS, 2014). As of 2013, Life expectancy at birth is estimated to be at 50 years, one of the lowest in the world (U.S. Central Intelligence Agency, 2013). The number of AIDS orphans was estimated at 73,000 as of 2013 (UNAIDS, 2014), with the result that 15% of the Swazi population consists of orphans and vulnerable children (UNDP, 2013).

In view of this, in 2007, Swaziland adopted mass MC for the prevention of HIV transmission as recommended by WHO and UNAIDS (WHO, 2007; WHO & UNAIDS, 2007a). Mathematical models have shown that if Swaziland could circumcise 50% of males aged 15 to 49 by the end of 2020, one HIV infection could be prevented for every four MCs performed (USAID, 2009; Grund, 2010). Despite intense campaigns to promote the mass MC, uptake of the procedure is way below the set national targets of circumcising up to 80% of all men aged 15-24 over a five-year period (Ministry of Health [Swaziland] 2009b, Grund 2010).

The reasons for this low uptake of MC have not been sufficiently explored scientifically. The purpose of this study was to explore the reasons for the low uptake of MC in Swaziland despite the campaigns for the procedure. The following method was used.

**Methodology:** A generic qualitative study was conducted, in which all men who were targeted by the mass MC campaign were eligible. However, in view of the age criteria for an informed consent, only those who were aged 18 years and above were considered. Ethical clearance was obtained from the Ministry of Health [Swaziland], Scientific and Ethics Committee. Participants were identified and selected by convenience sampling as they were coming for MC or other services, or accompanying their colleagues for such services, at Family Life Association of Swaziland (FLAS) Clinic, Mbabane. FLAS Clinic is one of the main providers of the MC services, among other sexual and reproductive health services in the

country. Participants were fully informed about the study before being asked for their voluntary participation. Those who agreed to take part in the study were requested to sign the consent form before data collection. Data were collected through audiotaped individual in-depth face-to-face unstructured interviews. Sampling and data collection were done concurrently and continuously up to the point of data saturation. A total of 17 participants were interviewed. The manual process of qualitative data analysis was followed as described in Creswell (2003:191-195). The process involved transcription of the audiotapes and reading the transcript several times, identifying, coding and categorising similar segments. Main themes were identified, and each was described separately. Data were interpreted to come up with a comprehensive description of the reasons for the low uptake of MC as presented in the next section.

**Findings:** A total of five themes emerged as reasons for the low uptake of MC, namely: perception of no significant benefit in preventing HIV transmission, fear of the procedure and the possible outcome, lack of patience, religious/cultural beliefs as well as worries about the fate of the foreskin

While participants agreed that circumcision reduces the chance of developing sexually transmitted infections (STI), they felt that HIV is an exceptional STI, whose transmission is independent of circumcision status. They were not convinced that MC offers a 60% chance of protection as reported in Auvert et al. (2005). Moreover, the mass MC activists still emphasise on the use of condoms among circumcised individuals, which participants interpreted as ineffectiveness of MC in preventing HIV transmission. Participants also expressed worries about the MC procedure itself and its possible adverse outcomes, mainly surgical pain and impaired sexual function. Those who were not prepared to know their HIV status were also concerned about the HIV testing and counselling which is attached to the medical MC procedure. Some participants also expressed impatience in queuing for the procedure at the expense of their economic productivity, while others were concerned about the time period needed to allow healing of the operation. According to the mass MC guidelines, a circumcised person should wait for 4 to 6 weeks to allow the operation to heal completely before engaging in sexual intercourse (WHO & UNAIDS, 2007b). Apparently this was reported to be too long a period for sexually active participants.

Religious and cultural beliefs also contributed to the low uptake of MC. Biblically, participants felt MC is a feature of the Old Testament, which is no longer supposed to be followed, while others felt it is an unjustifiable act of tempering with God's temple, the human body. From an African Tradition Religion perspective, participants felt it is against their customs and values to remove any body part and dispose it anyhow, including incineration as is the case with medical MC, without following the proper rituals of traditional dissent burial. Moreover, some participants had a misconception that the foreskins were being used to make some Ben's spices. According to one health care provider of the FLAS clinic, these spices were coincidentally introduced at the time when mass MC was launched. In addition, those who would have agreed to be circumcised were given these spices as incentives, hence the presumed association.

**Conclusion and recommendations:** Results show that most of the reasons for not coming for MC were attributed to insufficient knowledge or misconceptions about some aspects of the procedure. Uncontrollable physiological forces and, to some extent, underutilisation of some potentially influential structures of the community were evident. Apparently some of these drawbacks are modifiable as follows, in an effort to improve MC uptake.

The findings that some Swazis still don't believe that MC can reduce chances of heterosexual transmission of HIV implies that the current teaching is not sufficiently convincing. It is recommended that more precise and scientific or biomedical explanations be incorporated in the MC campaigns. Likewise, worries about the loss of sexual vigour post-operatively have not been explained clearly from a scientific perspective. Studies have shown that MC enhances sexual performance (Plotkin, Mziray, Küver, Prince, Curran & Mahler, 2011; Senol, Sen, Karademir, Sen & Saracoglu, 2008), and such information is necessary to allay people's anxiety and convince them to undergo MC.

With a clear understanding of the mechanism of action of the procedure, the public is likely to appreciate the "partially protective" nature of the MC strategy. Participants did not reflect knowledge about the current concept of the comprehensive package for HIV prevention, of which MC is part. The relevant

stakeholders, therefore, need to clarify and emphasise that MC is essentially meant to compliment other strategies aimed at reducing heterosexual transmission of HIV infection, and thus be a rescue measure in the event that those other strategies have failed, for whatever reason, deliberate or accidental.

Perioperative pain control measures associated with modern medical MC also need to be emphasised at the campaigns level, rather than only in the perioperative phase. Those who would have undergone the procedure may be engaged to attest to the effectiveness of this pain management which is characteristic of the procedure. Similarly, the HIV counselling and testing (HCT) which are attached to MC and currently discussed just before the procedure, may also need to be discussed at the campaigns level. The input of professional counsellors and the emphasis on clients' rights in HTC needs to be considered.

This study also revealed that some men are deterred from MC in preservation of their religious values. Apparently this is out of being misinformed or having misconceptions about the stance of their religions regarding MC, according to some scriptures (Galatians 5:6; Galatians 6:15; Corinthians 7:19). In this regard, the most influential and effective people in clarifying relationship between MC and each religion are the respective religious leaders. It is therefore recommended that these leaders be put aboard in the MC campaigns to assist mobilising their followers.

Over and above these modifiable factors, it is recommended that some efforts be directed towards strengthening neonatal MC. This will ensure that men undergo the procedure before they are sexually and economically active, as these factors have been proven to be challenges of adult MC.

These recommended interventions can be realised if there is collaborative efforts by clinicians, public health personnel, community or institutional.
