### Probiotics for the Prevention of Recurrent Urinary Tract Infections in Women: A Systematic Review

---

*Kristina Elizabeth Abolins, MSN, FNP, USA*  
*Elizabeth Hope Beard, MSN, FNP-BC, USA*  
*Whitney Denae Cochran, MSN, FNP-BC, USA*  
*Carine M. D'Angelo, MSN, FNP, USA*

#### Purpose

The purpose of the poster presentation is to review the literature and evaluate the effectiveness of probiotics in the prevention of recurrent urinary tract infections to determine if probiotics can be included in the current guidelines.

#### Target Audience

The target audience is for healthcare providers who treat urinary tract infections in women of child-bearing age, as well as postmenopausal women.

#### Abstract

**Purpose:** The purpose of this evidence-based practice poster was to review the literature and evaluate the effectiveness of lactobacillus in preventing recurrent urinary tract infections (rUTI) in women. The most common lactobacilli species found in the vaginal tract are *Lactobacillus (L.) acidophilus*, *L. fermentum*, *L. plantarum*, and *L. rhamnosus*, all which are at low levels in women with rUTIs. There is some evidence to suggest that use of lactobacillus may provide protective effects against bacteria commonly associated with urinary tract infections. Findings from a current literature review will be used to provide further support for this intervention and develop recommendations for its use in clinical practice.

**Data Sources:** CINAHL Plus, Medline, PubMed, Cochrane Library, and EBSCOhost

**Conclusions:** Evidence from this review suggests little or no benefit of lactobacilli probiotics in preventing rUTIs in women with a few studies showing antimicrobials being more effective. For probiotics to be included in the prophylactic rUTI guidelines, further research is necessary.

**Implications for Practice:** Advanced Nurse Practitioners (ANP) play a vital role in the healthcare delivery system. With the large amount of urinary tract infection (UTI) cases per year, ANPs should be educated on the current research on preventative measures of UTIs. Lactobacilli probiotics should be included as a possible preventative measure because women who suffer from recurrent UTIs might benefit from probiotics as evidenced by the results of these studies.

## RSG STR - Rising Stars of Research and Scholarship Invited Student Poster Session

### Oral Sexual Activity and the Associated Health Disparities in College Aged Females in the United States: A Systematic Review

---

Peggy Bergeron, MSN, RN, USA

#### Purpose

The purpose of this presentation is to share findings of a systematic review of oral sexual activity and the associated health disparities among college aged females in the United States.

#### Target Audience

The target audience of this presentation is nurses, health care providers, researchers, educators, and policy makers.

#### Abstract

Purpose: To explore the current level of understanding about oral sexual activity and the risk for sexually transmitted infections in the female college population, a systematic review was conducted to summarize scientific literature over the past decade.

Methodology: The following electronic databases were searched: PubMed, Google Scholar, CINAHL, MEDLINE, SCOPUS, SAGE, and ProQuest. The publication dates searched were 2004 to 2014. The keywords used in this search were as follows: oral sex, college females, adolescent sexual behaviors, sexual risk, and sexually transmitted infections. Inclusion criteria included the following: English language only, academic peer reviewed journals, qualitative and quantitative studies, and domestic research. The exclusion criteria consisted of international research, only vaginal sex studies, and pregnancy related studies. A matrix method was utilized for organization of the review of literature.

Results: A total of 93 articles, publicly available at no charge, were selected for full-text evaluation, 38 of which were included. These articles were organized into the following four categories: adolescent/teen sexual behaviors, female college students, oral sex, and college student's sexual behaviors, with the matrix method. Consistent findings were as follows: the prevalence of oral sexual activity among adolescents and young adults is increasing; a shift in attitudes with oral sex has occurred in regards to risk, classification as a sexual act and virginal status; and the existence of a distinct knowledge deficit on the transmission of sexually transmitted infections with oral sexual activity. Specific findings for adolescent women have also revealed that females who engage in oral sex are more likely to have unprotected vaginal sex, placing them at greater risk overall. Gaps were identified regarding the need for further examination of the perceptions of risk with oral sexual behaviors due to the potential for sexually transmitted infections with college females, as well as the need for more educational interventions on oral sexual behaviors. Another gap identified was the need for more research on the factors which influence the decision to have oral sex to help with educational efforts regarding sexually transmitted infections.

Conclusion: Despite some concern over the shift in attitudes and the increased prevalence of oral sexual activity, there is insufficient research performed in the United States which specifically addresses oral sex. More research efforts are warranted to examine oral sexual activity and the associated health disparities specific for the female college population.

### The Potential Role of the Vagus Nerve in HIV-Associated Cognitive Disorders

---

*William Chance Nicholson, MSN, RN-BC, PMHNP-BC, PMHNP, USA*

*David E. Vance, PhD, MGS, USA*

*Linda D. Moneyham, PhD, RN, FAAN, USA*

#### Purpose

The purpose of this presentation is to introduce the vagus nerve as a potential pathogenic mediator for select HIV symptomology, but more specifically, HIV-associated neurocognitive disorders; furthermore, it will introduce vagus nerve stimulation as a potential intervention to assist in reestablishing physiologic and cognitive homeostasis in adults with HIV.

#### Target Audience

The target audience for this presentation is clinicians, direct care nurses, educators, research nurses, and students.

#### Abstract

With the introduction of combination antiretroviral therapy (cART), HIV replication is hindered and gross immune responses are reestablished for many; however, even in the presence of antiretroviral therapy, HIV stimulates constant activation of both the adaptive and innate immune systems which results in a chronic, mild inflammatory state. Despite improved outcomes with cART (e.g., decrease in HIV-associated dementias), adults with HIV continue to exhibit central nervous system mediated cognitive disorders when compared to the HIV negative population. The cognitive disorders, known as HIV-associated neurocognitive disorders (HAND), have been suggested to be related to this chronic, mild inflammatory state. HAND remains quite prevalent, ranging from 52% to 59% of the adult population. These disorders include alterations in executive function, memory, speed of processing, attention, and psychomotor speed.

HIV can infect the brain and impair central nervous system function by influencing endocrine, neuronal, and immune processes. In particular, HIV has been suggested to affect the hypothalamic-pituitary-adrenal axis (HPA-axis), inflammatory response, and microbiome (gut-brain axis) which function concomitantly to regulate physiological function. The interactions of these mechanisms have implications for cognitive function due to their capacity in maintaining systemic homeostasis during physiological stress. Dysfunction in these systems can contribute to the pathogenesis of neurodegeneration when physiological stress becomes chronic. The autonomic nervous system (ANS) regulates a bidirectional interaction between the brain and the gut. The vagus nerve is central to this bi-directional, homeostatic function of the ANS due to its parasympathetic properties and its utilization of afferent and efferent connections.

The vagal nerves convey information between the brain and the gastrointestinal tract forming a neural circuit both in afferent and efferent directions. The efferent vagal nerves regulate gastrointestinal activity, endocrine system, motor function, and mediate inflammatory responses. Vagal afferents transfer information from the gut to the brain (e.g. inflammation) and are suggested as being responsible for behaviors that include lethargy, depression, anxiety, loss of appetite, and sleep disturbances. During stress states, vagal afferent nerves stimulate the HPA-axis which has a primary role in innate immune function by regulating acute stress responses. If the HPA-axis is unable to restore homeostasis (e.g., HIV induced chronic inflammation) over time, it exhausts hormones and neurotransmitters needed for healthy cognitive function. The imbalance in physiological systems leaves the body vulnerable to stress-related effects such as headaches, fatigue, upset stomach, blood pressure and heart rate changes, cognitive impairment, and sleeping problems. In addition, vagal signals from the gut initiate anti-inflammatory responses through afferent signals to the brain which then activate an efferent nerve response. The

efferent response activates the cholinergic anti-inflammatory pathway through immune cell interactions which attenuates inflammation through the production of acetylcholine. Acetylcholine has a primary function in cognition and regulating immune responses; however, chronic stress changes how the body utilizes and stores it. The result of these changes could deplete or interfere with the brain's ability to store and utilize acetylcholine for cognitive function, therefore, contributing to cognitive disorders.

Chronic inflammatory states can also weaken gut mucosa and epithelial barriers; furthermore, HIV can pervade the gut and alter microbiotic composition into a pathogenic state. Microbiota have been implicated in brain function, homeostasis, immune responses, and digestive processes. Pathogenic microbiota and chronic inflammation could disrupt homeostatic physiological processes and also facilitate the crossing of microbiota into the blood stream through weakened gut barriers (microbial translocation). Microbial translocation is a process when pathogenic material enters the blood stream and threatens the blood-brain barrier by stimulating an inflammatory response. These pathogens induce responses that stimulate subtle brain inflammation which impairs normal cognitive function. The vagus nerve functions to help maintain gut barriers through immune-related processes and its ability to communicate with gut microbiota, but loses this ability in chronic stress states, as is common with HIV (i.e., inflammation).

It is important to note, that stress responses cause the body and brain to utilize essential resources (e.g., nutrients, neurotransmitters, hormones, etc.) for the purposes of survival or removing the threat. If the threat is not removed (e.g., HIV) then the body continues to shunt essential resources to areas specific to the stress response and redirects them from areas unrelated to homeostasis (e.g., select cognitive function). The consequence of this shunting could chronically impair select cognitive functionality due to lack of essential reception and stimulation.

The vagus afferent and efferent connections involve a physiological circuit that is designed to produce a parasympathetic or anti-stress response. On the other hand, HIV promotes a chronic stress state (sympathetic response) which chronically overrides the homeostatic properties of the parasympathetic responses mediated by a functional vagus nerve. Theoretically, HIV could have a pathological effect on the vagus nerve causing dysfunction in its ability to mediate immune responses and signals, thus contributing to the development of cognitive disorders.

In order to explore cognitive interventions in adults with HIV, identifying a pathogenic mediator that coordinates the homeostatic interactions of the neuronal, immune, and endocrine systems would be of interest. It would allow the possibility of more precise targets for treatment which focuses on HIV symptom regulation (i.e., fatigue, upset stomach, cognitive impairments, etc.). Vagus Nerve Stimulation (VNS) is one potential intervention as it targets the vagus nerve and has been utilized as a standard treatment both in clinical depression and epilepsy; furthermore, it has also been utilized in cognitive-based disorders (e.g., Alzheimer's disease) with mixed results. VNS targets neural plasticity and has the potential to transform current treatment of neurological disorders, but the complexity of physiological interactions that promote plasticity makes it difficult to control. Under normal conditions (homeostasis), plasticity is designed to promote learning through dynamic physiological processes. However, in pathological conditions, the physiological processes driving plasticity are insufficient to restore function (chronic stress). Research has suggested VNS can improve motor speed, psychomotor function, language, and executive functions in patients diagnosed with depression. VNS has also been shown to have a positive effect on memory consolidation, enhancing recognition and recall when utilized in cognitive disorders. Unfortunately, the role of VNS in HIV has not been explored.

The vagus nerve could function as a pathogenic mediator for some HIV symptomatology, more specifically cognitive impairment, due to its mediating role in the ANS. Furthermore, VNS has been utilized in adults and is considered to be a safe treatment option for depression, epilepsy, and as an experimental option for Alzheimer's disease. The benefit in identifying a pathogenic mediator allows for more comprehensive treatment options for adults with HIV as it provides a target for interventions (e.g., pharmaceutical, VNS); furthermore, the potential symptomatic improvement would increase the quality of life for adults who experience HAND.

### Opinions about Smoking Policies, Exposure to Secondhand Smoke, and Smoking Behaviors of Freshman College Students

---

*Haley E. DeYoung, USA*

*Megan M. Eggert, USA*

#### Purpose

The purpose of this presentation is to examine freshman college students' opinions about smoking policies and smoking behaviors at a private, mid-western university.

#### Target Audience

The target audience of this presentation is those interested in supporting smoking abstinence and working with young adults

#### Abstract

College years are a time of life transition and therefore smoking abstinence programs are needed on college campuses in order to prevent initiation of smoking behaviors and promote smoking abstinence (Rogers, 2012). The purpose of this project was to assess freshman college students' opinions of smoking policies, secondhand smoke exposure, and smoking behaviors within a smoke-free campus. The Transtheoretical Model (Prochaska & DiClemente, 1983) provided framework for assessment of behaviors and intentions. An on-line cross-sectional survey was used to collect the data. Surveys were emailed via Zoomerang and Survey Monkey to all undergraduate freshman students at a private, Midwestern university consecutively over four fall semesters from 2011 through 2014. Survey questions contained 56 forced-choice or open-ended options. Data were analyzed using descriptive statistics. A total of 1,294 freshman responded yielding a 42.9% response rate. The majority of the subjects were female (59%) and white (85%). Twenty-eight percent were unaware that the campus is a smoke-free environment. While 75% of the respondents agreed or strongly agreed that the campus should be a smoke-free environment, 68% reported seeing students smoking on campus. When asked about second-hand smoke exposure, 22% of the freshman students were exposed to secondhand smoke in their environments, and 46% indicated they have friends who smoke a tobacco product. Fifty-two percent agreed or strongly agreed that they would ask others not to smoke around them, and 91% indicated they would rather date a non-smoker. Thirty-five percent ( $n = 450$ ) of freshman students admitted to smoking at some point in their lifetime. On the average, students indicated they started smoking at the age of sixteen ( $SD = 2.34$ ). When asked about current smoking behaviors, 14% ( $n = 139$ ) indicated they smoked during the previous 30 days, but only 48 (26%) of these smokers would consider themselves a "smoker". To further describe smoking behaviors ( $n = 139$ ), 18 (21%) freshman said they smoked only once in the last 30 days while 14 reported they smoked every day ( $M = 8$ ,  $SD = 10.7$ ). Smoking was reported as a social behavior with 94% indicating they smoked with others. Based on the TTM stages of change, intentions to abstain from smoking were assessed. Twenty-two smokers (14%) said they decided to stop smoking within the next month and had a quit date, while 41 (27%) did not think smoking was a problem and did not plan to quit. Findings from this campus indicated that the rate of smoking behaviors of freshman students was similar to national college data. Data from this study adds to the growing body of evidence about college students' opinions concerning smoking and their smoking behaviors. These data are being used to form a foundation for an evidence-based project on smoking abstinence across campus.

### Sexual Risk Outcomes of U.S. Adults Exposed to Parental Incarceration

---

*Samantha Boch, BA, BS, RN, USA*  
*Jodi Ford, PhD, RN, USA*

#### Purpose

The purpose of the presentation is to gain invaluable experience presenting original research investigating the associations between lifetime exposure of parental incarceration (PI), timing of PI with respect to child's age, and frequency of PI and sexual risk outcomes of U.S. adults.

#### Target Audience

The target audience of this presentation is researchers and policy makers interested in the long-term health outcomes of those exposed to the parental incarceration during childhood and adolescence.

#### Abstract

**Purpose and Background/Significance:** In the United States, approximately 1.7 million children have a parent incarcerated in prison. Due to mass incarceration, the spillover consequences onto the health of children are burgeoning. Studies have found that children exposed to parental incarceration (PI) are more likely to experience numerous economic, educational, and behavioral difficulties, as well as poor physical, and mental health. Recent studies have also highlighted that the timing and frequency of PI, and gender of the parent incarcerated may have particularly deleterious effects on the well-being of children across the life course. However, to date, few have investigated the effect of PI on sexual risk outcomes despite evidence linking PI to substance use, which commonly co-occurs with sexual risk behaviors. Thus, the purpose of this study is to investigate the associations between (1) lifetime exposure of PI (2) timing of PI with respect to child's age, and (3) frequency of PI and sexual risk outcomes.

**Theoretical framework:** A bioecodevelopmental framework will guide the study, which centers on the effects of early childhood adversity (e.g. PI) on health outcomes across the life course.

**Method:** Secondary data from the National Longitudinal Study of Adolescent to Adult Health will be analyzed. Dependent variables include sexual risk outcomes: multiple sexual partners and STIs in the prior year. Independent variables include biological father and mother incarceration occurring in child's lifetime, frequency of PI, and timing of PI with respect to the child's age (0-18 years, or >18 years v. never). Consistent with prior PI research, analyses will be stratified by gender of parent and child as associations may differ.

**Results:** Research is underway.

**Conclusions:** This study builds upon prior research by the authors on the lasting effects of PI exposure during adolescence on adult health outcomes. Consistent with emerging nursing science elucidating the importance of early childhood events on health across the life course, the knowledge gained from this study will enhance our understanding of the longitudinal impact of PI on sexual risk outcomes among adults and illuminate pathways for STI prevention.

## Advanced Practice Nurses on the Stroke Unit: A Cross-Sectional Study

---

Janet G. Wood, MSN, RN, FNP, NP-C, USA

### Purpose

The purpose of this presentation is to disseminate research describing the outcomes associated with presence of advanced practice nurses (APNs) on the in-patient stroke unit care team, as compared to usual physician-led care.

### Target Audience

The target audience of this presentation includes nurse clinicians, advanced practice nurses, and healthcare administrators.

### Abstract

**Objective:** To evaluate the economic and quality outcomes associated with a collaborative advanced practice nurse and hospitalist physician model of care on the in-patient Stroke Unit as compared to usual hospitalist physician-led care. **Background:** In the standard medical model, physicians have historically assumed responsibility for all aspects of medical decision making for hospitalized patients. Value-based reimbursement now creates a pressing need for transformative care models which promote evidence-based care while providing high quality experiences for patients and families. High functioning collaborative teams are anticipated to be essential under value-based reimbursement. **Methods:** The study developed from a care improvement effort implemented within a Joint Commission-designated Primary Stroke Unit at a large Midwestern private Catholic hospital. Hospitalist nurse practitioners were assigned to the Stroke Unit in collaboration with hospitalist physicians to implement daily hospital management for patients with stroke and transient ischemic attack. To evaluate outcomes associated with the care model, a retrospective cross sectional design was used with 100 patients in the collaborative advanced practice nurse and hospitalist physician care group and 100 patients in the usual hospitalist physician-led care group. Primary outcome measures were length of stay, 30-day re-admissions, stroke core measure documentation, and patient experiences of care. Analysis of demographic characteristics assured that the samples were similar. **Results:** The collaborative care group performed better on one of five stroke core quality measures and on two of three patient experience of care measures. Mean length of stay and hospital re-admissions were similar between groups. Five patients left the Stroke Unit against medical advice in the usual hospitalist physician-led care group, while there were no discharges against medical advice in the collaborative care group. **Conclusion:** Advanced practice nurse and hospitalist physician collaboration is a promising model for healthcare quality improvement during inpatient stroke care; results are likely generalizable to other adult medicine populations.

## A Journey of Challenges with Medication Reconciliation

---

*Julie Vinod, MS, BSN, RN, ANP-C, USA*

### Purpose

To increase awareness among healthcare providers regarding accuracy of electronic medication reconciliation and factors leading to medication discrepancies

### Target Audience

TARGET AUDIENCES 1. Registered Professional Nurses 2. Nurse Practitioners 3. Physicians 4. Physician-Assistants 5. Nursing Leadership Team 6. Hospital Administration

### Abstract

**Background:** Unintentional medication errors are a significant problem in healthcare in terms of morbidity, mortality and cost. Hospitalized patients are at particular risk for unintentional medication errors. At least 1.5 million Americans are injured every year by medication errors (IOM, 2006). On average, every hospital patient is likely subjected to at least one medication error per day, leading to approximately 98,000 annual deaths. Furthermore, the cost of medication errors is high in terms of negative patient outcomes and litigation. Over 3 billion dollars are spent annually towards treating the consequences of medication errors. Medication reconciliation is one of several strategies used to reduce medication errors. Medication reconciliation is the process of comparing a patient's medication regimen across the continuum by reviewing, analyzing and resolving any discrepancies.

**Purpose:** To examine the accuracy of electronic medication reconciliation upon admission compared to discharge.

**Theoretical Framework:** One strategy to improve quality and prevent medication errors is to properly conduct medication reconciliation. Proper medication reconciliation is collection of a detailed medication history with open-ended questions, accurate documentation of medication reconciliation, and congruence with electronic technology. Changing processes supporting medication reconciliation is a challenge for healthcare systems. Rogers' theory of Diffusion of Innovations informs the process of change and adoption of improved medication reconciliation systems.

**Review of Literature:** Medication reconciliation emphasizes evaluating and improving medication regimen throughout the continuum to reduce patient harm. Few investigators have studied medication discrepancies on admission to discharge using electronic medication reconciliation. Patient safety is a challenge pertaining to preventing unintentional medication errors. Recent studies demonstrated that pharmacist- enhanced medication reconciliation improved patient outcomes, safety and reduced healthcare costs. Evidence supports using medication reconciliation processes to prevent medication errors. When nurses identified discrepancies, physicians changed the discharge orders of 94% of patients ([Barnsteiner, 2005](#)). Using electronic technology for medication reconciliation may generate a false sense of accuracy and security.

**Method:** A retrospective electronic chart review (n=200) was conducted at a tertiary care safety-net hospital, between July 2014 and December 2014 using a data extraction tool created for the study. Medication reconciliation conducted at admission and discharge was examined for medication discrepancies for patients admitted from the emergency department to cardiology and medical surgical units. Non-modifiable predisposing factors for medication reconciliation examined included age, gender, marital status, ethnicity, and comorbidities. Modifiable precipitating factors examined were medication discrepancies, change in medication regimen on discharge, polypharmacy, critical lab values and combination drugs. Variables were analyzed using descriptive statistics.

**Results:** The sample of 140 patients (mean age 58.8 years, SD 9.4) had more males than females and was predominately white. Preliminary results suggest that the prevalence of medication discrepancies were detected and corrected in greater than 50% of discharge medication reconciliations. More than 80% of patients were discharged home with a change in medication regime compared to their home regimen. Approximately 71% of patients reported to be on at least five medications or more. Most patients had comorbid illnesses; 86% had a history of hypertension; 67% had history of hyperlipidemia; 60% had a history of coronary artery disease.

**Implications:** Discharge Medication Reconciliation is costly in terms of nursing workload. Discrepancies detected during discharge medication reconciliation took approximately 30 minutes to correct. Delay in discharge to correct medication discrepancies may have a negative impact on patient satisfaction and financial management of the institution. Identification of risk factors for medication reconciliation serves as the potential targets of intervention. Outcomes rely on the health care provider's ability to identify risk factors and enter complete and accurate information in the electronic medical record.

### The Effect of Self-Reported Levels of Optimism on Blood Pressure in an Adult Population: A Pilot Study

---

*Christopher Ross McConnell, USA*

#### Purpose

The purpose of this presentation is to examine a possible correlation between optimism (otherwise defined as positive affect) and blood pressure.

#### Target Audience

The target audience of this presentation is any individual with an interest in the topic material.

#### Abstract

The purpose of this research study is to examine a possible correlation between levels of self-reported optimism and blood pressure readings. Current research has denoted a possible link between levels of optimism and cardiac health, but has not specifically looked at measures of blood pressure. Research was guided by the research question; what is the correlation between self-described optimism levels and blood pressure readings in the elderly male population of Marin County? Study participants were recruited by convenience sampling for this cross sectional, correlational study at Whistle Stop, a senior service center located in San Rafael, California. Participants were asked to sign consents, fill out a demographics sheet, and fill a Life Orientation Test – Revised (LOT – R). Following the completion of paperwork, subjects had their blood pressures checked, once on each arm and the numbers were recorded.

**\*Results, data analysis, and conclusions are pending SPRING 2015\***

## Super Utilizer Case Management Program with Nursing Students

---

*Katharine H. Atwood, BA (THR), PEARS, BLS, CNA, USA*

*Jessica C. Carroll, BA (BIO), BLS, PEARS, USA*

*Laurel Edwards, PEARS, BLS, USA*

*Tiffany Joy-Egly, BS (CrimJst), PEARS, ACLS, NREMT, BLS, USA*

*Thuy Nguyen, PEARS, BLS, USA*

*Melissa Naff, PEARS, BLS, CNA, COA, CMA, USA*

*Carly Schmidlein, PEARS, BLS, CNA/HHA, USA*

### Purpose

The purpose of this presentation is to display the review of literature and results from our retrospective study evaluating the effectiveness of a Super Utilizer Program which uses baccalaureate nursing students as health care coaches.

### Target Audience

The target audience of this presentation is faculty of nursing programs, Emergency Department nurses, nurse case managers, nurses involved with vulnerable populations, and nursing students.

### Abstract

**Background:** There are many patients who use the emergency department as it was intended. However, there are a small number of patients, or Super Utilizers, who make numerous visits to and incur high charges at the ED for issues that could be addressed elsewhere. In response to this situation, The Super Utilizer Program was launched. Modeling the care management program in Camden Coalition, the Super Utilizer Program is a joint effort between the continuum of care and Emergency Department (ED) at Stormont-Vail HealthCare (SVHC) and Baker University School of Nursing (BUSN). The goal of the program is to guide the Super Utilizer (SU) population in accessing resources, which would more appropriately address non-emergent health care issues.

**Purpose:** The purpose of this study is to evaluate the effectiveness of a Super Utilizer Program which uses baccalaureate nursing students as health care coaches. A secondary purpose is to discover and understand the underlying issue(s) for high ED use.

**Study Design:** This is a quantitative, observational retrospective study.

**Methods:** IRB approval for this study has been obtained. We will examine the number of emergency department visits, client access to and utilization of primary care and/or insurance, and connection with community resources (food, shelter, transportation, childcare, mental health, dental, disease management, medical assistance programs/pharmacy, workforce, health home/case management, rent or utility assistance, clothing assistance, and other services). To accomplish this task, we will conduct a retrospective chart review of all enrollee records enrolled in the program during the Fall 2013 and Spring 2014 semesters. Data will be collected from the six months prior to and six months after enrollment into the Super Utilizer case management program. Data collection will involve a manual chart review of SVHC records to obtain baseline and post enrollment data including chief complaints, number of ED visits at SVHC and surrounding facilities, number of student to client encounters, number of community services in use, other comorbidities, connection with a primary care provider, insurance coverage, medical and mental health referrals, hospital admissions, and client demographics. A form for data collection will be tested for inter-rater reliability with three case studies prior to the start of data collection.

**Findings:** Results will be collected and finalized by May 1, 2015.

**Conclusion:** The study has not been completed yet, however, we believe that the Super Utilizer Program using baccalaureate nursing students as health care coaches will show a decrease in the amount of inappropriate ED usage, an increased connection to primary care, and community resource referrals.

**Clinical Relevance:** This study will present evidence about the efficacy of an innovative way to assist Super Utilizers find appropriate care. In addition, this study will help the emergency department understand the main reasons for these high frequency visits.

### Clinical Reasoning on an Assignment: Perceptions of Third Year Baccalaureate Nursing Students

---

*Karen Lynn Oostra, BN, BSc, RN, Canada*

*Barbara Astle, PhD, RN, Canada*

*Heather Meyerhoff, MSN, RN, Canada*

#### Purpose

The purpose of this presentation is to explore the clinical reasoning skills of students who, during their third year of their Baccalaureate nursing program, applied the nursing process to complete a Clinical Judgment Exercise (CJE) assignment.

#### Target Audience

The target audience of this presentation is nurses and graduate students interested in nursing education and in the development and practice of clinical reasoning.

#### Abstract

Nursing students must develop strong clinical reasoning skills during their undergraduate program in order to be able to make sound clinical judgments regarding patient care. How students understand the evolution and application of their own critical thinking/clinical reasoning skills is of interest to nurse educators as they seek to support and enhance these skills through educational interventions and assessments.

**Background:** Both critical thinking and clinical reasoning exist as terms in the literature. Critical thinking can be defined as “purposeful, self-regulatory judgement, that results in interpretation, analysis, evaluation and inference” (Facione, 1990, p.2). Clinical reasoning may be defined as the process of generating alternatives, weighing them against the available evidence and choosing the best alternative (Tanner, 2006). Both terms are used to represent the problem-solving skills used by nurses. Nurses require these problem-solving skills to function in a complex and changing health care environment (Lee & Brysiewicz, 2009; Marchigiano, Eduljee, & Harvey, 2011; Chabeli, 2007). Nursing education must strive to teach and to facilitate the development of this type of thinking (Marchigiano et al., 2011). Various educational interventions have been studied in order to improve the critical thinking of students or new graduates, but have not shown more than modest success (Thompson & Stapley, 2011). Several studies have focused on critical thinking dispositions in an attempt to find out, using quantitative methodologies, the skills and traits possessed by students that may facilitate critical thinking (Profetto-McGrath, 2003; Paans, Sermeus, Nieweg, & Van Der Schans, 2010).

Three qualitative studies were found that described students’ or new graduate nurses’ experience of developing or applying critical thinking. Duchscher (2003) described the development of critical thinking in new graduates in their first six months of practice as moving from no reflection and unable to see beyond the task to critical thinking being woven into the nursing process, keeping an open mind, generating various perspectives and finally to coping with uncertainty. Di Vito-Thomas (2005) utilized a qualitative approach to explore students’ perspectives on learning to think like a nurse. Students identified their thinking as a cognitive process developing through experience in practice (Di Vito-Thomas, 2005). Ellermann, Kataoka-Yahiro, & Wong, (2006) also collected qualitative data and asked students how they made decisions about care in the clinical setting. Content themes such as identifying priorities, assessing causes and solutions, logical thinking and using the nursing process were identified.

In comparison to the published quantitative research on this topic, there were very few qualitative studies that sought to describe the student experience of critical thinking either in practice or through assignments. Marchigiano et al. (2011) reflected that “little information is available regarding how

students perceive their abilities to think and process information related to their delivery of patient care” (p. 145). Marchigiano et al. (2011) also state that the use of qualitative methods may “provide information about how an assignment affected thinking skills within a nursing process framework” (p. 150). This project seeks to address this gap in the literature and provide qualitative data with respect to student thinking on an assignment.

**Purpose and Methods:** The purpose of this study was to explore the clinical reasoning skills of students who, during their third year of their Baccalaureate nursing program, applied the nursing process to complete a Clinical Judgment Exercise (CJE) assignment. Eight third year students were interviewed regarding their understanding of the development of their critical thinking skills and the application of these skills as they worked through the CJE assignment. A qualitative research method was employed using Interpretive Description to analyze the data from the transcribed interviews.

**Preliminary Findings:** During data analysis, one overarching theme emerged from the data: Over Time. During the interviews, students reflected on how they had come to understand the development of their critical thinking over their time in the nursing program. Emerging from this overarching theme was Theme One: “understanding of critical thinking.” Students also described how they approached and moved through the CJE assignment over time, from the initial phase of figuring out what to do with the data through to the completion of the assignment. The second theme to emerge was Theme Two: “making sense of the assignment expectations.”

Theme One was identified as “understanding critical thinking” and refers to the student perceptions that their critical thinking/clinical reasoning abilities progressed from not knowing in year one, coming to know in years two and three, able to know at the end of year three and valuing the knowing in terms of preparing for independent practice at the onset of year four. Theme Two emerging from the data, was “making sense of assignment expectations.” As in the first theme, a progression of knowing over time was evident in the data. Students moved from a place of not knowing in the initial phase of the assignment, coming to know as steps were taken to understand and engage with the assignment, application of knowing as experience and prior knowledge were applied to the assignment and finally valuing the need to know as students prepared to move the nursing process into practice.

Data analysis is currently ongoing and conclusions forthcoming.

## Parent Satisfaction with School Health Delivery Models

---

*Sherri R. Becker, MSN, MBA, CSN, RN, USA*

### Purpose

The purpose of this project is to compare parent perceptions of quality of health care delivery in two different school health staffing models.

### Target Audience

School Nurses, School Administrators, School Boards and Policy Makers.

### Abstract

**Background** Rising levels of student health needs in K-12 public schools, legislative mandates, and shrinking educational budgets are increasing the complexity and challenges in school healthcare delivery. In response to these changing needs in school health, school nurse staffing levels and configurations are adapting. The traditional staffing model of school health delivery is often described as a school nurse ratio, the number of school nurses employed in relation to the number of students. Nontraditional models incorporate various combinations of registered nurses, unlicensed assistive personnel, physician's assistants, nurse practitioners, and medical assistants. The literature presents evidence regarding how different levels of the traditional school nurse ratio model impact care. However, limited information exists describing the impact of these newer approaches.

### **Objectives:**

1. Compare parent satisfaction of two school health models: one that follows the school nurse ratio model and the other a school based health center which is staffed with a nurse practitioner and a medical assistant.
2. In addition to learning if satisfaction levels differ between the two schools, the researcher hopes to learn if satisfaction levels differ between parents of children with chronic illnesses and parents of children without chronic illness
3. The survey will include a comment section that will provide parents with an opportunity to share their experiences with school health delivery.

**Design and Method** This is a comparative descriptive design study. All parents/guardians whose children attend these two schools will be invited to participate on this study. Study participation involves completing a short survey consisting of a six question Likert questionnaire, along with a section to list any special health needs and an optional section for comments. Both schools are k-8 urban charter schools with approximately 700 students. They differ in their school health delivery models. One school uses the traditional nurse-ratio model and is staffed with a full time Licensed Practical Nurse. The second school has a school-based health center which is staffed with a nurse practitioner for four hours a day and a medical assistant who is present throughout the school day.

**Results and Conclusions** Pending

**Significance** This project has implications for health policy. Understanding how school health care is delivered by administrators and policy makers is vital as it influences the choice of school health care model which ultimately affects the health of children attending school.

## Assessment of Moral Courage throughout the BSN Curriculum

---

*Misty L. Southerland, AA (HlthSc), EMT-I, USA*  
*Ronald S. Golemboski, AS, USA*

### Purpose

The purpose of our research and presentation is to identify the demographics/characteristics of nursing students that are more likely to display morale courage. Utilizing the research we would like to assist nursing programs as well as hospitals to implement morale courage into curriculum/training.

### Target Audience

The target audience of this presentation is nursing school faculty and hospital leadership looking to implement morale courage into their curriculum/training.

### Abstract

Moral courage is lacking in students that are currently going through various college curriculums. The objective of this research is to bring awareness to the fact that students view academic dishonesty as normal and acceptable but not necessarily ethical (Balik, Sharon, Tabak, 2010). The focus is on the nursing program because the same study indicated that there is usually a correlation between bad student behavior and bad nursing practices (Balik, Sharon, Tabak, 2010). A separate study concluded that there is a higher rate of cheating and dishonesty among nursing students than any other discipline (McCabe, 2009). To accomplish our objective we will administer a 30 item questionnaire via online Survey Monkey website. This questionnaire will be administered to pre-nursing, BSN, and MSN students. The questionnaire will be used to assess whether the factors of gender, age, ethnicity, or upbringing correlate to an individual's aptitude to exhibit moral courage. Nursing students will be asked to volunteer and required to read and provide consent prior to participation within the study. The data will be compiled and analyzed to assess which factors, if any, influence moral courage. Our results will be available for presentation at the biennial conference. We hope to identify potential factors that could compromise a student's moral courage and thus their ability to exhibit integrity in the healthcare arena. The findings could also bring awareness to nursing faculty about individual factors that could influence appropriate student behavior. Ultimately, we would like to begin to determine if implementing a moral courage curriculum will affect outcomes once students transition to the workforce.

### **Knowledge, Skills, and Attitudes of Pre-Licensure Nurses Regarding Dementia Care: A Systematic Literature Review**

---

*Modupe F. Adewuyi, MSN, MPH, RN, APHN-BC, CHES, USA*

#### Purpose

The purpose of this presentation is to provide a review the extensive findings of published research studies on the knowledge, attitudes, and skills of pre-licensure nurses regarding dementia care and associated pedagogies strategies.

#### Target Audience

The target audience of this presentation is nurse educators, nurse clinicians, nurse administrators, and nurse researchers.

#### Abstract

Background: Globally, the prevalence of older persons with dementia is increasing because of a rise in the aging population. Associated with this increase dementia prevalence are the increasing needs for nursing care of affected individuals and their families/caregivers across healthcare continuum. Therefore, it is essential that pre-licensure nurses acquire appropriate knowledge, skills, and attitudes regarding dementia care during their undergraduate programs to enable them provide effective and holistic dementia care.

Aim: This review presents the extensive findings of published research studies on the knowledge, attitudes, and skills of pre-licensure nurses regarding dementia care and associated pedagogies strategies.

Methods: The framework for this systematic literature review was the Preferred Reporting Items for Systematic Reviews and Meta-Analyses (PRISMA) guideline. Electronic PubMed, Cumulative Index to Nursing & Allied Health Literature (CINAHL) and Web of Science databases were conducted for eligible studies using keywords that include attitudes, clinical, dementia, knowledge, nurse, skills, students, undergraduate, and teaching. The eligible criteria applied in selecting the studies were: 1) Inclusion of student nurses as participants, 2) Measurement of knowledge, skills, or attitude regarding dementia care, 3) Measurement of the effectiveness of pedagogy strategies, 4) Published in English language, and 5) Published in peer-reviewed journals between 2004 and 2014.

Results: This review included 12 studies, of which seven were quantitative and five were qualitative. The studies' locations included Australia, Hong Kong, Korea, Malta, India, Northern Ireland, U.K., and USA. Most of the studies' findings suggested significant lack of knowledge and skills among most pre-licensure nurses. In addition, most studies reported negative attitudes among pre-licensure nurses toward dementia care. Appropriate clinical placements and hours of teaching were positively correlated with self-efficacy in dementia care and level of dementia knowledge among pre-licensure nurses.

Conclusion: The lack of knowledge, skills, and positive attitude among pre-licensure nurses is an indication of a gap between pre-licensure nurses' preparedness to meet the needs of dementia patients and their families and the provision of high quality dementia nursing care.

### **A Strategy to Preserve Family Integrity, Promote Patient and Family Centered Care and Simultaneously Support a Safe Hospital Environment for Overnight Visitation**

---

*Donna M. Casey, BSN, MA, NE-BC, FABC, USA*

#### Purpose

The purpose of this presentation is to investigate the impact of a visitor badging system on nurse perceptions of safety as it pertains to overnight visitation, patient satisfactions, family and/or visitor complaints to patient relations, and visitor- employee violence encounters

#### Target Audience

The target audience of this presentation includes direct care nurses, nurse leaders, educators and executives.

#### Abstract

The importance of family presence and participation in the care of a hospitalized loved one is well established in the literature. Patient and family centered care has been adopted as a mechanism to promote family integrity and maintain wholeness of the family unit. Many studies have evaluated the importance and positive aspects of visitation in the hospital environment. Despite a preponderance of evidence, many nurses continue to view visitation as problematic. The most problematic timing of visitation is overnight and during procedures and resuscitation. Studies show mixed findings related to family presence during procedures and resuscitation however, no study was found that examined the issues of overnight visitation. Christiana Care Health System (CCHS), a 900-bed health system and level one trauma center has adopted patient and family centered care (PFCC) as a model of care delivery. Implementation of the PFCC model resulted in removing restrictions from family visitation. Visitors are welcome all hours of the day and night. This created problems of staff perceptions of safety and concern for privacy and confidentiality. There have been situations of disruptive family members threatening nurses. There are fewer resources available in the hospital in the evening and overnight to assist staff in dealing with disruptive visitors. The health system cares for patients that have been victims of violence. Situations have arisen when perpetrators have come into the hospital seeking their victims and created significant disruption in care and safety. Additionally, there have been situations of visitors providing patients with illicit substances that have contributed to patient harm.

CCHS adopted a policy of unrestricted visitation hours on inpatient care units, as part of PFCC in 2011. The health system administration recognizes concerns for staff and patient safety. Therefore, a strategy has been designed to improve security using visitor identification software and badges for visitation after 9PM and overnight. Prior to implementing the strategy, nurses were surveyed to identify concerns about overnight visitation. Results from this survey will augment an educational initiative planned as part of the technology implementation to address concerns discovered in the survey. Additionally, a family and visitor education pamphlet will be developed to describe expected behavior for overnight visitation.

The purpose of the study is to investigate the impact of a visitor badging system on nurse perceptions of safety as it pertains to overnight visitation, patient satisfactions, family and/or visitor complaints to patient relations, and visitor- employee violence encounters.

An investigator-designed survey was electronically administered to volunteer staff nurses throughout CCHS over a 30-day period. Survey results will be used to develop education in collaboration with the hospital system staff education specialists that will be made available on the system's Education Center portal. This educational material will be launched congruent with commencement of the pamphlet release and badging program launch. The investigator-designed survey will be then be re-administered to

volunteer staff nurses throughout CCHS approximately three months post implementation of the software program.

Principal findings of the initial survey are from 666 nurses representing a 33% response rate. 84% of respondents reported supporting allowing one adult family member to stay overnight with their hospitalized loved one in a private room, but only 19% of respondents expressed support for allowing one adult family member to stay overnight with their hospitalized loved one staying in a semi-private room. 50% of respondents reported that they are either comfortable or somewhat comfortable with overnight visitation.

66% of respondents reported that their opinions and perceptions about overnight visitors were informed by personal negative experience, while 33% reported being influenced by personal positive experience. 39% of respondents reported that colleagues' experiences (30% positive and 9% negative) were influencing their views and opinions about overnight visitors. Only 12% of respondents reported basing their views and opinions about overnight visitation on information from clinical literature.

82% of respondents reported concerns about difficult family members during overnight visitation, 75% reported concerns about patients getting adequate rest, 74% reported concerns about issues of privacy and confidentiality for roommates, 72% reported concerns about family impeding the provision of patient care, 60% reported safety concerns, 45% reported concerns about patient privacy and confidentiality, 44% reported being concerned about negative clinical impact on the patient and 40% of respondents reported concerns about visiting family getting adequate rest.

Whether a nurse had personal experience with overnight visitors for their patients did not significantly impact their support of overnight visitors for their patients in either a private room ( $p=0.06$ ) or a semi-private room ( $p=0.19$ ), nor did nurses' tenure ( $p=0.63$  and  $p=1.00$ ) or gender ( $p=0.85$  and  $p=0.29$ ). However, respondents' positions significantly impacted their opinions about overnight visitation, with non-bedside nurses (assistant nurse managers, nurse managers, nursing coordinators and nurse educators) having significantly more positive views about overnight visitors in both private rooms ( $p<0.01$ ) and semi-private rooms ( $p<0.01$ ) as compared to bedside nurses. Nursing opinion also varied significantly by specialty, with medicine and women's and children's services nurses reporting significantly more positive views about overnight visitors in private rooms ( $p<0.01$  and  $p=0.01$ ). Conversely, critical care nurses reported significantly less support for overnight visitors in private rooms ( $p<0.01$ ). For overnight visitation to patients in semi-private rooms, stepdown unit nurses were significantly more positive ( $p=0.03$ ) and surgical nurses were significantly more opposed ( $p=0.03$ ) than colleagues in other specialty areas.

Nurses historically believed that without restrictions, family members would feel obligated to remain at the bedside. Family concerns focus on the desire to be physically with the patient to enhance emotional support. Opportunities to help care for the patient decrease family's feelings of helplessness and lack of control. Traditionally, nurses feared negative physiological impact of visitation on patients; however, current evidence indicates unrestricted visitation promotes patient stress reduction, a state of calmness, and promotes patient rest. Designing nursing interventions to help families function during a crisis is a primary nursing practice issue. Supporting overnight visitation is a nursing intervention to aid patients in healing and promote family integrity. With implementation of these patient and family centered initiatives, staff concerns for safety cannot and should not be compromised. This initial data demonstrates that nurses have a range of concerns about overnight visitors that should be addressed in overnight visitation policy.

## Pain Management Education for the Hospitalized Patient

---

*Peggy J. Mazzeo, MSN, BSN, BS, RN, USA*  
*Linda E. Jensen, PhD, MN, RN, USA*

### Purpose

The purpose of this presentation is to recognize the benefit of pain management education in the recovery of hospitalized patients. Pain education through the use of an educational brochure for patients, should decrease patient anxiety related to pain, provide realistic expectations, and improve overall patient perception of pain management.

### Target Audience

The target audience of this presentation is nurses who care for patients in the ambulatory setting pre-operatively or hospitalized patients.

### Abstract

Optimal pain management is essential for patient recovery and satisfaction. Patient satisfaction with pain management directly affects their well-being and perception of quality of care received. Current pre-surgical pain education does not allow patients to assist in their self-care in terms of what to expect, medication knowledge, pharmacological and complimentary interventions. A thorough search of CINAHL and MEDLINE databases, as well as professional pain organizations, provided valuable information to develop this educational tool. The pain brochure provides an overview of pain, pain assessment, how to describe pain, and pain treatment options. Valuable input and feedback on the content of this brochure has been obtained from the multi-disciplinary pain committee. The inclusion of information on pharmacological treatment in combination with complimentary treatment should provide patients with a wide-ranging view of how to work with their healthcare team to improve their pain management. Readability statistics with Microsoft Word were performed to ensure the readability for all patients establishing a level of 7.2. Key to this educational brochure is the emphasis on the patient as an advocate for their own pain management. Implementation of this pain brochure in the pre-hospital period should assist patients to be better prepared for what to expect. The brochure has been approved at a Midwestern Academic Medical Center and is in the process of being printed for implementation. Future research to evaluate the usefulness of this educational tool can assist in continuing to provide the highest quality of care to patients.

Keywords: pain, pain management, pre-operative care, patient education, complimentary therapy

## Developing a Leadership Development Program

---

*Melissa A. Burdi, MS, RN, USA*

*Jill S. Walsh, DNP, MS, CEN, USA*

### Purpose

The purpose of this presentation is to enhance the nurse leader's knowledge related to developing a formalized leadership training program, leader competence and business acumen.

### Target Audience

This presentation targets adult learners who possess or have the potential to possess formalized leadership roles within nursing in the acute care environment.

### Abstract

The purpose of this scholarly project was to explore the effectiveness of implementing a standardized leadership program on improving nurse manager competence and the impact on staff nurse satisfaction, nurse manager satisfaction and staff nurse turnover rates. The literature reveals preliminary evidence that suggests overall effectiveness of standardized leadership programs in acute care organizations, but more research is needed. A cross sectional descriptive design was applied, surveying a total of 35 nurse managers. Participants were asked to rate the importance of specific leadership competencies using a 5-point Likert scale via an anonymous Qualtrics survey link. Data was gathered and analyzed and was used to develop a leadership competency framework for the leadership development program. Five leadership modules were created and presented to nurse manager participants. In addition, retrospective secondary data from the organization's 2013 Culture of Safety survey was analyzed for retention and satisfaction opportunities.

### Cultural Competence in Hospice Care: Addressing the Needs of Staff and Volunteers

---

*Kassandra Therese De La Pena, BLS, CNA, USA*

*Mary Grace Valenzuela, BLS, USA*

*Paul Tran Resulta, BLS, USA*

*Daisy Lugtu Verry, CNA, BLS, USA*

*Shellie Aparicio, BS, BLS, USA*

*Cori Wing Yee Lau, BLS, USA*

#### Purpose

The purpose of the presentation is to describe the importance of cultural competency in hospice care, to eliminate health disparities, and to improve nurses' and support staff's cultural competence skills.

#### Target Audience

The target audience of this presentation are nurses, advanced practice nurses, health care professionals, and support staff, who have had clinical and non-clinical interactions with patients and families from different cultural backgrounds.

#### Abstract

This is a community project developed and implemented to address an identified health need. The authors, six students from Nevada State College [NSC], attended their clinical rotation in the hospice community; four of which were at Nathan Adelson Hospice [NAH] at the Swenson and Tenaya locations, while the other two were at Creekside Hospice [CSH]. To complete this project, the authors used the community-focused nursing process model to identify and address the health need for cultural competency in grievance teaching among hospice staff and volunteers. By addressing this need, the authors intend to enhance the staff and volunteers' knowledge in order to enhance the patients and families' experiences while in hospice. The community-focused nursing process involves the following six phases: (a) define the community and establish a contract/partnership; (b) perform a needs assessment; (c) form a nursing diagnosis of the problem; (d) plan interventions; (e) implement interventions; and (f) evaluate interventions (Stanhope & Lancaster, 2014).

In following with the nursing process, the authors performed a background search on both facilities, which included information about the health need, hospice agencies, and the target population's demographics and statistics. After getting both facilities' buy-in and partnership on the project, a needs assessment was then performed by defining the target population and gathering data about the community. The data collection involved different methods such as gathering hospice materials, performing direct observations and interviews, as well as creating a survey for the staff and volunteers. When first speaking to the Directors of Education at both hospices, the proposed need was teaching about loss and grief, and how to intervene when a person is grieving. After interpreting and analyzing the collected data, the authors found a gap in the population's knowledge and a need for cultural competency in respect to grieving. After this gap was identified, a literature review was conducted using evidence-based practices [EBP] to support the need for cultural competency in hospice care. Based on the needs assessment, analysis, and literature review, the authors generated a community nursing diagnosis of risk of ineffective community role performance among hospice staff and volunteers related to knowledge deficit and lack of education, and inadequate role competency in regards to cultural competence.

A teaching plan was then created to educate the hospice staff and volunteers at NAH and CSH about how to be culturally competent in regards to loss and grief. The content topics included education about grief, culture, the process of cultural competency, and the expressions, beliefs and rituals of different culture groups in regards to death and dying. This teaching plan consisted of SMART goals and

objectives to be met, and were based on Campinha-Bacote's (2002) model of developing cultural competency. The presentation at CSH was scheduled on November 3, 2014, while the NAH presentation was scheduled at the Swenson location on November 7, 2014. A pretest was given before the teaching was implemented, and then a posttest was given after the teaching to evaluate whether the teaching was effective and the objectives were met. Data from both CSH and NAH were then compiled, analyzed and evaluated.

The evaluation showed that the SMART goals and objectives were met for CSH; but NAH did not meet all the SMART goals and objectives. The majority of the staff at CSH and NAH (96% and 93% respectively) felt that the presentation was "very" effective in improving cultural awareness and sensitivity, and that they were likely to apply this information in their practice. The students received excellent feedback and comments from the staff about how well the presentation went and that they liked the materials provided. Based on some of the feedback and comments that the students received from the attendees, directors, staff and volunteers, the authors came up with recommendations to improve their performance.

### The Effectiveness of Culturally-Focused Interventions in Increasing Satisfaction of Hospitalized Adult Asian Patients

---

*Xing Lian Chen, DNP, MSN, BSN, RN, FNP-BC, USA*  
*Diana Wint, DNP, MSN, BSN, RN, FNP-BC, USA*  
*Millicent Alfred, DNP, MSN, BSN, RN, FNP-BC, USA*  
*Karolina Ubogaya, DNP, MS, BS, RN, FNP-BC, USA*  
*Priscilla Worral, PhD, RN, USA*

#### Purpose

The purpose of this presentation is to promote understanding of the significant needs of hospitalized adult Asian patients, raise awareness of providing evidenced-based culturally competent care in New York State, as well as to improve quality in health care settings.

#### Target Audience

This presentation targets all health care professionals or any staff members working in the acute care inpatient setting who has a potential impact on the patient experience.

#### Abstract

Culturally competent care has gained global attention as a key element to improving quality and eliminating racial and ethnic disparities in health care. This has been at the forefront of global health considerations because of the increase in population diversity, which presents a challenge that needs to be addressed from a multicultural perspective. The Asian population in the United States is increasing at a significant rate, from 4.8% in 2010 to 9.2% in 2050. It is important to understand the needs of the Asian inpatient, in order to implement culturally-focused services that will lead to increase patient satisfaction.

Patient satisfaction is a driving force for health care organizations to enhance their services, as well as to ensure private and public funding. Improving the inpatient experience of multicultural ethnic groups is a health care challenge that needs to be addressed across all health care settings. To date, the evidence has not been systematically evaluated to determine if culturally-focused interventions for adult Asian inpatients may have a positive impact on their hospitalization experience.

A systematic review of the literature was performed to determine if culturally-focused interventions would have an effect on satisfaction of hospitalized adult Asians. A search of MEDLINE, Cumulative Index to Nursing and Allied Health Literature (CINAHL), PsycINFO, Educational Research Information Clearinghouse (ERIC), the Cochrane Library, the Joanna Briggs Institute Library of Systematic Reviews, Scopus, Excerpta Medical Databases (Embase), and Academic Search Premier was conducted, followed by a reference search of relevant studies and a grey literature search of the Virginia Henderson Library, Google scholar, Mednar, conference proceedings, and websites.

This review first considered randomized controlled trials (RCT), non-randomized controlled trials, and quasi-experimental studies. There was an insufficient number of RCTs, non-randomized controlled trials, and quasi-experimental studies. The reviewers considered before and after studies, cohort studies, and case control studies for inclusion. This review also considered descriptive study designs including case series, individual case reports and descriptive cross sectional studies related to the adult Asian population in acute-care hospital settings. A search of both published and unpublished studies in over 13 databases and several professional conference proceedings revealed two descriptive studies and one interventional non-experimental pilot study that met predetermined search criteria and methodological quality. Based on these three studies, the results suggest culturally competent communication with patients by physicians and registered nurses, quietness of the room, information about treatments and procedures, and cultural foods are associated with increased satisfaction among hospitalized adult Asian patients. Based on the

results, the evidence also suggests that communication between healthcare providers (physicians and registered nurses) and patients may improve satisfaction among adult Asian inpatients (Level 3, Joanna Briggs Institute-JBI Levels of Evidence). Culturally-focused interventions tailored to individual patient needs may be an appropriate strategy in enhancing hospital care in addition to the comprehensive standards of hospital care practice.

### Treating Attention-Deficit/Hyperactivity Disorder in U.S. Children with Complimentary Alternative Medicine Therapies: How Effective are They?

---

Amanda C. Raymundo, BSN, RN, USA

#### Purpose

The purpose of this presentation is to explore the effectiveness of complimentary alternative medicine (CAM) therapies, specifically through dietary changes, as an alternative to pharmaceutical treatment of Attention-Deficit/Hyperactivity Disorder (ADHD) in school-age children in the United States.

#### Target Audience

The target audience of this presentation is pediatric nurses, pediatric nurse practitioners, family practice nurse practitioners, pediatricians, family practice physicians, and their patients and families suffering with ADHD.

#### Abstract

**Introduction:** The American Academy of Pediatrics (AAP) recommends pharmaceutical treatment for children diagnosed with Attention-Deficit/Hyperactivity Disorder (ADHD) (Hodgkins, Shaw, Coghill, & Hechtman, 2012). Complimentary alternative medicine (CAM) treatments are becoming more popular as an alternative to medications.

**Background and Significance:** Worldwide, 5% of children are diagnosed with ADHD (Pelsser et al., 2011). An estimated five to ten percent of children are diagnosed in the United States as having ADHD (Calarge, Farmer, DiSilvestro, & Arnold, 2010). Current medication treatments involve multiple adverse side effects (Laver-Bradbury, 2013). Parents are seeking CAM treatments as an alternative to medication (Belanger et al., 2009). Research from Europe and Canada have indicated dietary changes and supplementation with essential fatty acids may have significant effects on behavior outcomes (Pelsser et al., 2009). The United States is lacking research in this area. Nurses have been called to step forward and fill the gaps in primary care for communities (National Academy of Sciences [IOM (Institute of Medicine)], 2011). Nurses have a responsibility to provide education to families regarding the effectiveness or ineffectiveness of desired treatments and therefore need to be aware of CAM treatments and current research. The purpose of this study is to determine how effective CAM therapies are in behavior outcomes of children diagnosed with ADHD compared to pharmaceutical treatment alone.

A comprehensive review of literature was conducted using CINAHL and PubMed databases from 2009 to 2014. Search terms were ADHD, complimentary alternative medicine, children, evidence-based treatment, best practice, and nursing. Two-hundred and seven articles were located. Of the 207 articles, 18 were selected based on content of random-controlled trials (RCTs), background information, and nursing involvement. Four articles reported systemic research studies focusing on dietary and supplemental effects on behavior in children diagnosed with ADHD (Belanger et al., 2009; Howard et al., 2011; Pelsser et al., 2009; and Pelsser et al., 2011).

**Methodology:** A pilot study using a quasi-experimental design will be used to answer the research question "In children diagnosed with ADHD in the United States, is there a significant difference in behavior outcomes when utilizing complimentary alternative medicine therapies compared to pharmaceutical treatment?". Sixty-seven children volunteering to participate between the ages of six and ten years will be selected locally and randomly assigned to control or intervention groups. Informed consent from parents and/or guardians as well as child assent will be obtained. The control group (Group A) will not change dietary habits or take supplements. Group B will be administered a restricted diet and Group C will be administered the restricted diet plus a supplement of n-3 polyunsaturated fatty acids. The

Conners' Teacher/Parent Rating Scale-Revised S (with permission) will be used pre-study, to evaluate ADHD behaviors, and at the end of weeks 4, 8, and 12 for changes in behavior.

**Conclusions:** Based on the review of studies conducted in Europe and Canada, utilization of a restricted diet with omega-3 EFA supplementation may prove beneficial in the treatment of ADHD in children.

### Acupressure for Cancer Related Fatigue: Empowering Nurses in Symptom Management

---

*Victoria L. Reiser, BSN, RN, USA*

#### Purpose

The purpose of this presentation is to describe the results and nursing implications of the pilot study titled "Use of the Seva Stress Release (SSR) Protocol with hospitalized patients receiving cancer treatment" conducted on the BMTU and medical oncology unit at Ruby Memorial Hospital of WVU Healthcare.

#### Target Audience

The target audience of this presentation is inpatient and outpatient oncology registered nurses, advanced practice nurses, nurse managers, and other oncology professionals interested seeking to incorporate integrative therapies with traditional methods of cancer-related symptoms. Researchers interested in these therapies and symptom management are also included in this audience.

#### Abstract

The purpose of this presentation is to describe the results and nursing implications of the pilot study titled "Use of the Seva Stress Release (SSR) Protocol with hospitalized patients receiving cancer treatment" conducted on the BMTU and medical oncology unit at Ruby Memorial Hospital of WVU Healthcare. The target audience of this presentation is inpatient and outpatient oncology registered nurses, advanced practice nurses, nurse managers, and other oncology professionals interested seeking to incorporate integrative therapies with traditional methods of cancer-related symptoms. Researchers interested in these therapies and symptom management are also included in this audience. This is an ongoing independent study as part of my honors program at West Virginia University. I first developed an interest in oncology symptom management during a clinical rotation in medical oncology in Spring 2012. The following spring, I completed a literature review titled "Acupressure for symptom management: A call for Seva Stress Release Protocol research", in addition to becoming certified in the Seva Stress Release. The following fall, I presented this work at our chapter's biennial research conference in a poster session. Beginning in fall 2014 to the present, I have been conducting the pilot study investigating the impact of the Seva Stress Release on cancer-related fatigue, stress, pain, vital signs, and medication use. The questions being answered by this study include feasibility of implementing this protocol into cancer treatment, if it lowers stress, anxiety, pain, or fatigue, and if it impacts vital signs. Acupressure is a therapy based on the Traditional Chinese Medicine theories involving Qi, or energy. It, like acupuncture, restores the flow of energy through pathways within the body called meridians. These meridians have been linked to the nervous system in the human body and correspond to organs and body systems. Several studies and systematic reviews have already pointed to acupressure as an effective therapy for managing cancer-related fatigue, but suggested that further research is needed. The Seva Stress Release (SSR) Protocol, specifically, was developed by Soul Lightning International after the tragedy on September 11, 2001 to relieve the stress of rescue workers at ground zero. Since this time, it has been taught to healthcare providers and laypersons in a variety of settings worldwide. The protocol includes eight bilateral acupoints that provides a standardized method for stress relief, relaxation, and pain management. The points correspond to specific symptoms involved in stress, fatigue, and pain and are linked to correlating acupoints of Traditional Chinese Medicine. The populations already benefiting from its use are rescue workers, Hospice patients, soldiers and veterans, chemotherapy and radiation patients, health care providers, children with ADHD, and those suffering HIV/AIDS. It has also been used to aid undergraduate students self-manage stress associated with school. Because cancer qualifies as a traumatic event with consequences such as PTSD, patients who have a cancer diagnosis may benefit tremendously from the SSR, as its original intent was to manage stress and promote relaxation. These patients often experience other psychological symptoms including mental dysfunction, fatigue, poor sleep, lack of appetite and depression, all associated with cancer-related fatigue. As this pilot study progresses

and is completed in late February to early March of 2015, patient feedback has been extremely positive. They report feeling less fatigued, improved management of pain, and enhanced ability to manage stressors during hospitalization. Furthermore, some patients are using decreased amounts of narcotic pain medication, which in turn, can decrease associated detrimental side effects such as hypotension, constipation, and respiratory depression. The study is ongoing, and data analysis will be conducted throughout March and April 2015. Data analysis will include paired T-tests, descriptive statistics, and patient notes/comments. \*A finalized abstract will be prepared upon the conclusion of this research study.

## Animal Assisted Therapy Effects on Quality of Life

---

Jessica C. Carroll, BA (BIO), BLS, PEARS, USA

Emily M. Amack, BLS, PEARS, USA

Madeline P. Curry, BA (French), BLS, PEARS, CNA, USA

Amber M. Cessarich, BLS, PEARS, USA

Jenny D. Beaver, BA (Marketing), PCT, BLS, PEARS, USA

### Purpose

The purpose of this presentation is to see if animal assisted therapy improves quality of life in adult patients.

### Target Audience

The target audience of this presentation is health care professionals caring for the adult population, adult population that needs long term care, and anyone interested in animal assisted therapy.

### Abstract

**Purpose:** To see if animal assisted therapy improves quality of life in adult patients.

**PICO Question:** In adult patients, will animal assisted therapy increase quality of life?

**Components/Processes:** We searched CINAHL and PubMed using the terms “animal therapy,” “inpatient,” “quality of life,” “pet therapy,” “mood,” “anxiety,” “depression,” “QOL,” “animal assisted therapy,” “loneliness,” “dog therapy,” “cat therapy.” We selected five articles: two were experimental, two were quasi-experimental, and one was qualitative.

**Discussion of Results:** Most of the studies supported animal-assisted therapy as a useful intervention for increasing quality of life in adults. One study (Johnson, Meadows, Haubner, & Sevedge, 2008) did not find significance, because it concentrated on the comparison between the effects of animal-assisted therapy versus other standard therapies. So, they concluded as well as another study (Nepps, Stewart, & Bruckno, 2011) that animal-assisted therapy was as effective as other therapies, but was not significantly more effective. Therefore, the answer to our PICO question was that animal-assisted therapy is beneficial, but the usefulness in comparison to other therapies should be researched further.

**Conclusions/Implications:** All studies recognize the usefulness and potential benefits of animal-assisted therapy as adjunct therapy. Further research is needed to determine its effectiveness as a primary intervention, but all studies in this synthesis agree that it has benefits. Further research should include larger sample sizes, longer duration, follow-up quality of life measurements, and concentration on specific target populations.

## Facilitation of Reflective Learning in Students to Enhance Student Support

---

*Peggy K. Naicker, MA (HlthSc), AdvDipNursEd, DipICU, BSoc (Nur), RN, CCRN, South Africa  
Gisela H. Van Rensburg, D Litt et Phil, MA Cur; BA Cur(Hons); BA Cur, General nurse (RN), Midwife,  
Community nurse, Psychiatric nurse, Nurse educator, Nurse manager and Orthopaedic nurse, South Africa*

### Purpose

the purpose of this presentation is to share the results of the research study by the author on the above topic; for educators to adequately support students to use reflective activities as learning activities, requires knowledge and skills from the educator.

### Target Audience

The target audience of this presentation is nurse educators, leaders and managers of education institutions.

### Abstract

Over the last 20 years the nursing profession has widely accepted reflective practices and reflective learning as effective measures to help students provide care in a frequently changing context. A quantitative, explorative, descriptive study was conducted in nursing education institutions in one of the nine provinces in South Africa. A total of 121 nurse educators completed a structured questionnaire. The findings revealed that, although nurse educators agree with the importance of reflective practices in the teaching and learning environment they do not necessarily place emphasis on developing their own reflective practices. Reflective learning was not identified as a formal learning approach in the programmes the nurse educators facilitated but the educators did attempt to include reflection in the teaching and learning activities planned. Not enough emphasis is placed on the creation of a teaching and learning environment that will enhance reflection in a non-threatening context. The deeper understanding of reflective learning comes with continued personal reflective practices. Nurse educators should be taught how to facilitate reflective learning activities and how to create an environment conducive to reflection. Through reflective teaching practices students could be supported in developing into critical thinkers hence reflective learning should be a formal teaching and learning approach in nursing curricula.

### R.E.D. Light: Putting a Stop to Human Trafficking by Assessing Nurses' Awareness and Knowledge in Pensacola, FL

---

*Holly Nicole Dickson, USA*

#### Purpose

The purpose of this presentation is to assess the awareness and knowledge nurses have of human trafficking by administering a pretest, presenting a Powerpoint on human trafficking, and administering a posttest. The purpose is also to increase the awareness and knowledge of human trafficking in the health care field.

#### Target Audience

The target audience of this presentation is nurses and nursing students on a global scale, since human trafficking is an international issue.

#### Abstract

According to Dovydaitis (2010), it is estimated that traffickers bring 50,000 victims into the United States each year, adding to the 20 million victims who are already part of the trafficking trade worldwide (Kerry, 2014). The research is significant in the nursing field today because there is a lack of research on the topic of human trafficking, especially research assessing awareness and knowledge nurses have of human trafficking. Many nurses come into contact with trafficking victims without identifying them because they have neither the skills nor the knowledge to work with this population (Isaac, Solak, & Giardino, 2011, p. 2). The research project will assess the awareness and knowledge of nurses in Pensacola, FL. A pre-test and post-test questionnaire will be administered via Survey Monkey and/or in person at local health care settings. After the participants take the pre-test, a Powerpoint will be presented online and/or in person that was developed by the U.S. Department of Health and Human Services and is aimed at increasing awareness and knowledge of human trafficking for health care providers. Following the Powerpoint presentation, a post-test will be administered to assess awareness and knowledge of human trafficking. The data will be analyzed to assess whether the human trafficking Powerpoint presentation increased awareness and knowledge among nurses. An acronym will be developed for nurses to remember what to do when they suspect someone is a trafficking victim, and it will be handed out as a business card with the poster presentation of the research project. A fact sheet will be developed to hand out to explain the acronym more fully and to add details that will not fit on the card itself.

### **The Relationship between Knowledge, Intention and Self-Reported Use of Safer Sex Practices among Youth Aged 20-24 Years in Selected Districts in Botswana**

---

*Mophuthi Liwambano, BNSc, RM, RN, Botswana*

#### Purpose

The purpose of this presentation is to share my research findings with colleagues, experts and stakeholders in research on Sexual Reproductive Health and Rights, get feedback on my work, stimulate discussions on the topic and ascertain understanding of the presentation hence build my research capacity and network with other scholars.

#### Target Audience

The target audience of this presentation is various disciplines, educational backgrounds with Bachelors, Masters, Doctorate degrees. Field of interest; Sexual Reproductive Health. Age; youth in formative years and adults, males / females with years of experience, 90% academics, government, nongovernmental, Private Sector and Parastatal and 10% novice and general public.

#### Abstract

The youth aged 20-24 years account for 38% of the population in Botswana. (Adolescent Sexual Reproductive Health [ASRH] Implementation Strategy, 2012-2016). The youth remain at increased risk of sexually transmitted infections (STIs), unintended pregnancies and increased fertility. Limited condom and other contraceptive use amongst this age group are prevalent despite their reported high knowledge of safer sex practices. (ASRH Implementation Strategy, 2012-2016).

In a bid to respond to the International Conference on Population and Development's Plan of Action (ICPD PoA, ICPD+5) of 1994 and 1999 respectively, the Millennium Development Summit, year, 2000 and the International Planned Parenthood Federation (IPPF) Maputo Plan of Action, the Botswana government placed various strategies in place. One common goal for these major strategic frameworks is the universal access to comprehensive Sexual Reproductive Health Services for all by 2015 (Development Research and Policy Analysis Division, 2003). To this end Botswana incepted guidance and counseling in primary and secondary school curricula. The goal was to give students basic knowledge on issues of sexuality including, contraceptive use (Bennell, Hyde and Swainson, 2002). Another strategy was integration and delivery of free Sexual and Reproductive Health and Rights (SRHR) services through the National SRHR Programme using a right based approach to scale up accessibility of SRHR services. This approach places SRHR services as a fundamental human right that facilitates free access of services by all (Ministry of Health, 2004).

Various partnerships were engaged and documents were developed as guiding tools for the Botswana SRHR care delivery. such documents included amongst others; the National Youth Policy, 1996, the Population Policy, 1997, the National Sexual and Reproductive Health Framework, 2002 and the Adolescent Sexual and Reproductive Health (ASRH) Implementation Strategy, 2003 (ASRH Implementation Strategy, 2012-2016). Amidst these strategic developments, an age specific fertility reflected increased fertility rate and limited contraceptive use amongst Botswana youth aged 20-24 years (Central Statistics Office, 2009; Central Statistics Office and UNICEF, 2009), especially in rural than urban areas (Central Statistics Office, 2009; Central Statistics Office and UNICEF, 2009). This is despite the youth's reported high knowledge and access to contraceptives (ASRH Implementation Strategy, 2012-2016).

Though the general fertility rate in Botswana has dropped following implementation of the planned global strategies, an age specific fertility rate reflected increased fertility amongst age group 20-24 years (Abt Associates South Africa. Inc., 2002 and Central Statistics Office, 2009). This is despite reported 97%

knowledge amongst the youth of at least one method of contraception and where to get it (ASRH Implementation Strategy, 2012-2016). An assessment of knowledge and use of family planning also revealed knowledge of at least one method of contraception and use by participants across all age groups and gender. There was no data on dual protection or abstinence (Central Statistics Office, 2009).

Childbearing in Botswana also starts as early as ages 15 -19 years and reaches peak by age 20-24 years (Central Statistics Office, 2009). In most instances the pregnancies were unplanned or unintended. Limited condom and contraceptive use is reported to remain a reality among adolescents and youth in Botswana (ASRH Implementation Strategy, 2012-2016). Occurrence of unprotected sex reflects increased risk of STIs and most of the records in health facilities reflect youth as the most common beneficiaries of STI treatment in Botswana. Population Services International (PSI,2008) found high levels of STI among youth, both males and females reported concurrent and multiple sex partners in previous months.

The purpose of this study is to explore and describe the relationship between knowledge, intention and use of safer sex practices among youth aged 20-24 years in selected districts in Botswana. This is to identify gaps and guide appropriate interventions to promote safer sex practices amongst youth.

The reported high knowledge of safer sex practices amongst youth in Botswana raises an assumption that it will correlate with increased use hence increased level of prevention of sexual risk. The outcome behavior shows the contrary as it reflects limited contraceptive use and increased age specific fertility amongst this population (ASRH Implementation Strategy, 2012-2016; Central Statistics Office, 2006). This therefore reflects that the reported high knowledge is not translated in to practice. It is hence imperative to explore and describe the knowledge of safer sex practices that the youth are reported to have. The relationship between knowledge, intention to use safer sex practices and the reported actual use of safer sex practices will be determined. The studies that have reported on correlates or predictors of knowledge are more focused on HIV/AIDS knowledge only and do not explicitly reflect other sexual reproductive health risks like increased fertility and STIs, e.g. Letamo (2011), Fako, Kanagara and Forcheh (2010). This study will therefore identify how knowledge, intention and actual self-reported use interrelate to influence outcome behavior of youth in Botswana.

The findings will be utilised to;

**Guide Nursing Practice:** The information will assist practitioners to identify specific problem areas hence develop relevant plan of action to promote adequate, consistent and correct contraceptive use and reduce the risk of unintended pregnancies and STIs amongst the population of youth aged 20 – 24 years in Botswana at health facility level.

**Inform Policy and Programme Planning:** The research will inform the existing strategies aimed at scaling up the sexual and reproductive health programmes for youth in Botswana. It will assist identify gaps in the existing strategies and hence guide programme policy planning and implementation through generation of appropriate protocols.

**Research:** This study will generate hypothesis for further research in the area to explore relationships on a larger scale regarding; factors that affect the youth's knowledge, intention and use of safer sex practices and provide information that can benefit policy, education and practice.

**Education:** The findings will contribute to curriculum review to enhance teaching and learning through evidence based practice. This will benefit the National Sexual Reproductive Health Unit in their bid to scale up training of health personnel and the community on Sexual Reproductive Health issues with emphasis on youth.

The Integrated Behavioral Model (IBM), also known as Integrative Model of Behavior Prediction (Montano and Kaspersky, 2008) will be used to explore and describe the youth's knowledge and intention to use safer sex practices. IBM considers correctness of knowledge crucial for it to be able to influence a positive behavioral outcome and that the most determinant factor of performing a behavior is

intention. Triandis (1980) stated that, even if a person has intention to perform a behavior, they require knowledge and skill to perform such behavior and that performance of behavior depends on absence of environmental barriers. The socio-demographic facilitators and barriers are likely to influence knowledge, intention and the actual use hence it is imperative for the researcher to determine the interactions of these components in health behavior planning and implementation (Montano and Kasprzyk, 2008) which is also the case in this study,

The study will be a triangulation design (convergence model) consisting of cross-sectional survey with interpretive integration. Participants will be youth aged 20-24 years in selected settings in Botswana. They will be selected through purposive sampling based on selection criteria. Permissions will be sought from the Ministry of Health and Ministry of Education and Skills Development. Participants will be recruited from tertiary institutions and youth centers by trained recruiters and they will sign a written informed consent. Data will be collected at the point of recruitment. Participants will complete a self-administered questionnaire for demographic and survey data.

Descriptive statistics, cross-tabulation and multiple regression analysis will be used to determine the relationship between knowledge, intention and self-reported use of safer sex practices, and some demographic variables to determine predictors for intention and the use of safer sex practices. Qualitative data will be content analyzed to identify major themes, subthemes and related categories. The results will be presented in tables and narrative thematic descriptions.

### The Limitations of Body Mass Index (BMI) as an Obesity Assessment Scale and the Implications for Practice: A Nursing Perspective

---

*Sinead Impey, BA, BBs, BSc (Nursing), RGN, Ireland*

#### Purpose

To outline findings from a literature review on limitations of BMI as a measurement of obesity and subsequent effectiveness as a health risk assessment tool. By understanding the various inadequacies, nurses will be able to apply the scale with discretion to determine individual health risk.

#### Target Audience

The target audience for this presentation is nurses working in the community and acute settings and health professionals with an interest in health promotion and management of chronic disease.

#### Abstract

Rising obesity rates have a significant impact on morbidity, mortality and subsequent delivery of health services globally. Therefore accurate assessment of individual weight status is vital (Carpenter et al. 2013). Although, frequently used in clinical practice and research, the ability of the body mass index (BMI) to accurately assess obesity in individuals has been much criticised. Raising awareness among nursing staff of the limitations of BMI is important. By understanding the various inadequacies, the use of BMI as an assessment tool for obesity, and thereby a proxy measure of metabolic risk (Tchernof & Després 2013), nurses will be able to apply the scale with discretion to determine a truer assessment of health risk for the individual. From a literature search (CINAHL, Medline and PubMed) three themes that emerged. That BMI had limited applicability due to: an inability to distinguish percentage body fat from total weight; reduced sensitivity in the intermediate ranges of the scale and an inability to differentiate location and type of adiposity. Based on these three limitations, this review documents how obesity assessment outcomes in practice can be incorrect, specifically across different ethnic, gender and lifespan groups. While consensus was not reached in the literature to cease its use in practice, several authors promote amendments to ranges and/or the inclusion of other anthropometric measures to increase detection rates. However, recommending a change to practice is beyond the scope of this review.

### Reliability and Validity of the Willingness to Adopt Inclusive Teaching Strategies in Nursing Education Instrument

---

Janet A. Levey, MSN, BSN, RN-BC, CNE, USA

#### Purpose

The presentation will share information from a study examining nurse educators' willingness to adopt inclusive teaching strategy based in universal design for instruction. A new instrument was designed to measure factors influencing an educators' willingness to adopt this pedagogy and will assist in professional development on this topic.

#### Target Audience

The target audience for this presentation is nurse educators teaching in Diploma, Associate Degree, RN to BSN Completion Programs, and traditional Baccalaureate Nursing Programs

#### Abstract

**Purpose and Background/Significance:** The purpose of this study is to: (1) examine the psychometric properties of the Willingness to Adopt Inclusive Teaching Strategies (ITSinNE) instrument and (2) measure factors influencing nurse educators' willingness to adopt inclusive teaching strategies based in universal design for instruction (UDI). National nursing organizations are calling for innovative and inclusive science of nursing education demonstrated by the use of teaching strategies that are accessible, responsive and meaningful to diverse student populations, with and without disabilities. Universal design for instruction (UDI) is one approach to facilitate multiple ways of learning and evaluation in various learning environments for all learners; however, it is not well known or researched in nursing education.

**Theoretical Framework:** Diffusion of innovation theory (Rogers, 2003) and universal design for instruction (McGuire & Scott, 2006) provide the theoretical framework for the study. Inclusive teaching strategies are defined as teaching pedagogies based in UDI that enable all students to access and engage in learning throughout the nursing curriculum and environments. Nursing education occurs in multiple environments including the classroom, clinical, online, simulation and skills lab settings.

**Sample/Setting:** A cross-sectional design was used to measure educators' willingness to adopt inclusive teaching strategies in nursing educational settings.

**Method:** SurveyMonkey collected data on the newly developed ITSinNE (55-item) instrument consisting of the following domains: Previous Teaching Strategies, Knowledge of Inclusive Teaching Strategies, Social System Support for Inclusive Teaching Strategies, and Willingness to Adopt Inclusive Teaching Strategies in Nursing Educational Environments. In the preliminary study, face and content validity were examined by national content experts and resulted in a CVI ranging from .84 to .97. The initial internal consistency on the subscales ranged from .51 to .98. For this study, data analysis consisted of descriptive statistics, Cronbach's alpha, correlation, hierarchical multiple regression, and confirmatory factor analysis.

**Results:** A total of 401 nurse educators participated in the study. The sample revealed 311 educators taught in pre-licensure or Baccalaureate programs and the analysis targeted this population. The Cronbach's alphas for almost all of the ITSinNE domain subscales were .7 or greater. The confirmatory factor analysis demonstrated adequate model fit on most indices (exogenous model:  $c^2 = 0.00$ ; RMSEA = .08; GFI = .96; TLI = .95; WRWR = 1.64; endogenous model:  $c^2 = 0.00$ ; RMSEA = .18; GFI = .89; TLI = .87; WRWR = 2.64). When the endogenous model domains were all freestanding, model fit indexes improved ( $c^2 = 0.00$ ; RMSEA = .098; GFI = .97; TLI = .96; WRWR = 1.24). The model as a whole

explained 44.8% ( $R^2 = .448$ ) of the variance in WillAdITS. None of the characteristics of a nurse educator contributed to the model, except for years of teaching ( $B = -.008$ ,  $p < .001$ )

**Conclusions:** Reliability and validity estimates support the continued development of an instrument to examine nurse educator's knowledge, support, and willingness to adopt inclusive teaching strategies. The results will enable intervention research to enhance professional development fostering access to content and environments for all learners.

## RSG STR - Rising Stars of Research and Scholarship Invited Student Poster Session

### Public Access to Naloxone: Provider Awareness and Prescribing Attitudes

---

Kathryn L. Dambrino, BSN, RN, USA

#### Purpose

The purpose of this presentation is to propose a doctoral project that will examine the awareness, attitudes, and intentions of Tennessee providers in response to the Naloxone Rescue Act.

#### Target Audience

The target audience of this presentation includes physicians, advanced practice nurses, pharmacists, policy makers, and patients or families of patients at risk for opioid overdose.

#### Abstract

**Background:** Drug overdose deaths have become an escalating epidemic in the United States (U.S.) and are recognized as the leading cause of injury death. To combat opioid overdose, naloxone distribution to the public has been initiated in some states as a harm reduction strategy. Although new laws have been implemented allowing providers to prescribe naloxone for layperson use, minimal data is available to evaluate providers' awareness, attitudes, and intentions to prescribe naloxone.

**Purpose:** The purpose of this doctoral project is to describe and correlate the awareness, attitudes, and intentions of Tennessee providers in response to the Naloxone Rescue Act.

**Methods:** The sample of physicians, nurse practitioners (NPs), and physician assistants (PAs) from 306 certified pain medicine clinics in the state of Tennessee will be invited to complete electronic surveys assessing knowledge of naloxone laws, attitudes toward public access to naloxone, and intentions to prescribe naloxone. Using the Pearson Product Moment Correlation (PPMC) for statistical calculation, survey responses will be analyzed to determine if a linear correlation exists. Descriptive statistics will be used to display provider sociodemographic information.

**Results:** The investigator anticipates description and correlation of the awareness, attitudes, and intentions of 50% of the invited providers. Descriptive statistics will help illustrate and explain the characteristics of the sample. Linear correlation results will help determine if a positive or negative relationship exists between provider awareness, attitudes, and intentions. From the findings, the investigator may also develop a standardized prescribing tool, which will both educate and guide prescribing practices for Tennessee providers, based on the providers' responses.

**Conclusion:** Because public access to naloxone is a relatively new approach to overdose prevention, more research is needed to evaluate provider awareness and willingness to prescribe naloxone to patients. Information about provider prescribing patterns will be useful for policymakers and healthcare professionals to efficiently implement public naloxone distribution.

### **More Than Just Male Nurses: Initiating Sustainable Processes and Structures to Promote and Protect Gender Diversity among Nevada's Male Nursing Workforce**

---

*Derek S. Drake, MSN, RN, CNML, CNL, USA*

#### Purpose

The purpose of this presentation is to highlight processes and structures implemented to recruit, promote, and protect the diversity of men as nurses improving the proportion of men in nursing in Nevada ultimately reducing the state and overall national shortage of nursing personnel.

#### Target Audience

The target audience of this presentation includes males of all ages who are interested in becoming or are already nurses practicing in the profession. Additional audience members include academic and hospital administrators who will be affected and benefit from an increase in the number of men in nursing.

#### Abstract

With more than 3.1 million practicing members, nursing is recognized as the largest discipline in the U.S. health care system (Ahmed, Andrist, Davis, & Fuller, 2013; American Nurses Association, 2014a). Nurses play a pivotal role in the consistent delivery of safe, high-quality, and cost effective, patient-centered health care, and have essential responsibilities in preventing medication errors, reducing rates of infection, and facilitating patients' transition from hospital to home (Institute of Medicine, 2011; Wendel, O'Donohue, & Serratt, 2014). For 13 consecutive years, 2002 to 2014, nurses have been recognized as the most honest and ethical profession in the U.S. outranking other highly respectable professions including physicians, police officers, clergy, and members of Congress (American Nurses Association, 2014b; Gallup Inc., 2014). Despite tremendous public attention regarding the profession's commitment and dedication to the advocacy, delivery, and promotion of societal health, safety, and well-being, there has been a documented shortage of the nursing workforce dating back to World War II (American Association of Colleges of Nursing, 2014c; American Nurses Association, 2014b; O'Lynn & Tranbarger, 2007). According to the U.S. Bureau of Labor Statistics (as cited by American Association of Colleges of Nursing, 2014C), the total number of vacant Registered Nurse (RN) positions is projected to total 1.05 million by the year 2022. The hallmark 2011 Institute of Medicine (IOM) and Robert Wood Johnson Foundation (RWJF) report *The Future of Nursing: Leading Change, Advancing Health* called upon the nursing workforce to meet escalated demands of a reformed health care and public health system despite prominent shortages of nursing personnel (Institute of Medicine, 2011; Coleman, 2013). The absence of a nursing shortage equates to fewer deaths, lower failure-to-rescue incidents, lower rates of infection, and shorter hospital stays (Blegen, Goode, Spetz, Vaughn, & Park, 2011). The IOM and RWJF recognize today's nursing shortage is unique suggesting it is equally important to increase the overall number of adequately trained and educated nursing personnel while supporting and promoting the general diversity of the overall workforce (American Association of Colleges of Nursing, 2014a; Institute of Medicine, 2011). Diversifying the nation's nursing workforce is imperative to meet the evolving dynamics of a substantially increasing diverse population (American Association of Colleges of Nursing, 2014a; Center to Champion Nursing in America, 2014b). Increasing diversity among health care professionals improves access to care for minority patients, improves patient choice and satisfaction, and allows for better educational experiences for health professional students (Institute of Medicine, 2004). Racial, ethnic, and gender minorities account for 30% of the U.S. population, but fewer than 15% of all RNs (Center to Champion Nursing in America, 2014a). Among those minorities least represented in the U.S. nurse workforce are nurses identifying themselves as Asian, Native American, Pacific Islander, and male (Robert Wood Johnson Foundation, 2011a; 2011b).

Men represent approximately 52.8% of the U.S. working-age population. However, women represent a higher proportion of workers and account for over 80% of the workforce in over half of all health care

related occupations including nursing (United States Department of Health and Human Services, 2015). Social, political, and economic values consistently perpetuate the feminine image of nursing (McMillian, Morgan, & Ament, 2006). Very little has been written regarding the contribution, history, and role of men in nursing (Kenny, 2008). As a result, nursing has been historically and predominately viewed as an exclusively female-dominated profession (Mackintosh, 1997; United States Census Bureau, 2011; 2013; Xu, 2008). Contrary to popular belief, virtually all the origins of the nursing profession lies completely in the hands of men called upon to care for the ill or injured in asylums, workhouse infirmaries, military services, and private associations (Mackintosh, 1997; Kenny, 2008; O'Lynn & Tranbarger, 2007; Roth & Coleman, 2008; Xu, 2008). The first documented nursing school existed in India around 250 B.C. and only admitted male students because only men were considered "pure" enough to perform nursing duties (Kenny, 2008; Xu, 2008). Nursing remained a predominately male dominated professional until the 19<sup>th</sup> Century when Florence Nightingale, the founder of modern day nursing, dramatically transformed and feminized the science of nursing (Hsu, Chen, Yu, & Lou, 2010; McLaughlin, Muldoon, & Moutray, 2010; Xu, 2008). Following her transformation of the profession, Nightingale firmly established nursing to solely be a woman's profession proclaiming women who entered nurse training were only doing what came natural to them because of the innate feminine characteristics of the profession including cleanliness, compassion, and selflessness (Evans, 2004a; 2004b). Since the middle of the last century men have slowly reentered and regained their place in nursing following Nightingale's radical feminization of the profession (Blackman, 2009). However, there remains a noticeable shortage of males entering the nursing profession due in large part to gender-related stereotyping, misconceptions or misperceptions regarding the significance of work done in nursing, and a lack of available male role models for men entering or already involved in nursing. Approximately 56% of male nursing students report significant challenges faced during nursing education based on their sex including being a minority in a female-dominated field, being portrayed as "muscle strength" by female nurses, and being perceived as non-caring (Rajacich, Kane, Williston, & Cameron, 2013). Furthermore, men leave nursing altogether 2.5 times more often than their female counterparts (Hayes et al., 2012; Rajacich et al., 2013). Men contribute unique perspective and skills significant to the profession and society (Robert Wood Johnson Foundation, 2011a). Evidence suggests doubling the number of men entering nursing would likely reduce if not completely eradicate the overall nursing workforce shortage (Bonair & Philipsen, 2009).

Approximately 2.7% of U.S. RNs were men in 1970 compared to 9.1% in 2011 (United States Census Bureau, 2011; 2013; United States Department of Health and Human Services, 2013). Globally men account for 5.8% of RNs in Canada, 10% of RNs in the United Kingdom, and 23% of RNs in the Netherlands (Blackman, 2009; Roth & Coleman, 2008). The state of Nevada currently ranks 47<sup>th</sup> among states in the number of RNs per 100,000 residents at 724.7, significantly lower than the national average of 920.9 (Nevada Legislative Counsel Bureau, 2008; United States Department of Health and Human Services, 2013). Approximately 8.8% of Nevada's RN workforce is male, slightly lower than the national average (Griswold, Etchegoyhen, & Packham, 2014). Currently there are no publically recognized formalized processes or structures in place to recruit, promote, and protect the gender diversity of Nevada's male nursing workforce. The American Assembly for Men in Nursing (AAMN) was founded in 1971 by Steve Miller and Luther Christman and is recognized as the only professional nursing organization dedicated to men (American Assembly for Men in Nursing, 2011; 2014d). Collectively, AAMN exists and is organized to promote the recruitment and retention of men, and provides a framework for nurses to identify, explore, and discuss factors affecting men in nursing (American Assembly for Men in Nursing, 2014a; 2014d). Strategic objectives of AAMN include; 1) encourage men of all ages to become nurses and join together with all nurses in strengthening and humanizing health care, 2) support men who are nurses to grow professionally and demonstrate to each other and to society the increasing contributions being made by men within the nursing profession, 3) advocate for continued research, education, and dissemination of information about men's health issues, men in nursing, and nurse knowledge at the local and national levels, and 4) support members' full participation in the nursing profession and it's organizations and use of the Assembly for limited objectives stated above (American Assembly for Men in Nursing, 2014a, par. 2). Despite great need, there is currently no local chapter of AAMN for Nevada's male nurse workforce to actively participate in.

The Doctor of Nursing Practice (DNP) practices at the most advanced levels of nursing delivering evidence-based direct care, managing systems, and leading quality initiatives impacting organizations

and policy at organizational, intraorganizational, and industry levels (Ahmed et al., 2013; Borkowski, 2009; Dahnke & Dreher, 2011; Institute of Medicine, 2011). Doctors of Nursing Practice (DNPs) are recognized as leaders in health care who demonstrate commitment and dedication for innovative changes that maintains urgency, sets consistent direction, reinforces expectations, and provides resources and accountability for the nursing profession and U.S. health care system as recommended by the Patient Protection and Affordable Care Act (PPACA), IOM, and RWJF (Ahmed et al., 2013; American Association of Colleges of Nursing, 2014b; Borkowski, 2009; Institute of Medicine, 2011). The purpose of this DNP-student led initiative is to charter Nevada's first local chapter of AAMN likely improving the proportion of men who are nurses in Nevada ultimately reducing the state and overall national shortage of nursing personnel.

### An Evidenced-Based Approach to Fall Risk Assessment and Management in an Outpatient Imaging Center: Morse Fall Scale

---

*Dalphy Blalock, MSN, BSN, RN, USA*

#### Purpose

The purpose of the presentation is to broaden healthcare provider's awareness of risk of falls in an outpatient imaging center and to promote an evidence-based tool that improves patient safety, enhances quality of care, and addresses the IOM safety initiative.

#### Target Audience

The target audience for the presentation includes all healthcare providers that practice in any ambulatory or outpatient practice setting as clinicians, administrators, or professional setting.

#### Abstract

**Purpose:** The purpose of this evidenced-based project is to explore the use of the Morse Fall Scale (MFS) risk assessment tool as an intervention to decrease patient falls in an out-patient imaging center.

**Significance:** Falls pose serious consequences to patients, healthcare providers, and society in general, as they lead to serious injuries such as head trauma, fractures, and even death (Johnson, et al., 2011). In addition to the physical impact on the patient's overall well-being and their families, there is an enormous financial burden to them and society in general. Direct medical care costs imposed on healthcare organizations is forecasted to reach an excess of \$43 billion dollars by year 2020 (Johnson et al., 2011). Added to that mix is the Institute of Medicine's (IOM) initiative for patient safety.

**Literature review:** A literature review using systematically reviewed data (Level I/II) was implemented to determine best practices for reducing fall incidences in an out-patient imaging setting.

**Results:** After two months of using the MFS, 550 patients were examined and 416 of those patients, 76% of the population, scored a zero risk for falls. However, 87 patients, 16% scored low risk, and 47 patients, 9% scored high risk for falls. In that initial two month assessment, one-fourth of the patient population assessed is at risk for falls, implicating a need for a standard tool to assess for falls and a policy and procedure to reduce falls and promote safety.

**Conclusion:** Will continue to monitor for fall risk for six months and implement a policy based on the efficacy of the Evidence-based practice project.

### Chronic Perceived Stress, Social Isolation, and Perceived Loneliness as a Symptom Cluster among Dementia Caregivers

---

*Mariya Alekseyevna Kovaleva, BSN, RN, USA*  
*Sydney A. Spangler, PhD, MSN, CNM, RN, USA*  
*Kenneth Hepburn, PhD, USA*

#### Purpose

The purpose of this presentation is to provide a literature review on the experience of unpaid dementia caregivers, by focusing on the effect of chronic stress on neuroendocrine and neuroimmunological regulation (an endogenous mechanism) and social isolation and perceived loneliness as exogenous factors that are pertinent to this population.

#### Target Audience

The target audience of this presentation is nurses who regularly interact with informal caregivers of patients with Alzheimer's disease or another dementia. Additionally, this presentation is intended for nurses who work in academia and whose research and/or teaching involves issues of dementia caregivers.

#### Abstract

**Background:** Caregivers of persons with dementia are at risk for chronic perceived stress, social isolation, and perceived loneliness. Chronic perceived stress disrupts neuroendocrine and neuroimmunological pathways (endogenous mechanisms). Social isolation is a common exogenous factor for this population that may lead to perceived loneliness and exacerbate chronic perceived stress and its sequelae.

**Purpose:** Review the experience of dementia caregivers through the lens of the interaction of pertinent endogenous mechanisms (influence of chronic stress on neuroendocrine and neuroimmunological functioning) and exogenous factors (social isolation and perceived loneliness).

**Methods:** Ninety-seven articles were reviewed using PubMed, CINAHL, EMBASE, and PsycINFO databases and reference lists.

**Results:** Chronic perceived stress disrupts neuroendocrine and neuroimmunological regulation and leads to chronic low-grade inflammation, which is implicated in the development of multiple chronic conditions, including cardiovascular disease, atherosclerosis, arthritis, osteoporosis, cancer, periodontal disease, diabetes, depression, frailty, and functional decline. Social isolation among caregivers may be a result of significant changes that caregiving imposes on caregivers' multiple spheres of life, including employment and family. Social isolation may evoke perceived loneliness; both conditions may contribute to a caregiver's restructuring his or her life in a way that exacerbates depressive symptoms, chronic perceived stress, and promotes neuroendocrine and neuroimmunological disruption.

**Conclusions:** Among dementia caregivers, social isolation may play a role in increasing caregivers' chronic perceived stress. Chronic perceived stress and social isolation may form a symptom cluster. Perceived loneliness may be a marker of this symptom cluster. Components of the proposed cluster may reinforce one another and together play a role in the development of chronic diseases to which dementia caregivers are vulnerable.

**Implications for nursing practice and research:** It is imperative to recognize dementia patients' family caregivers as "patients" too. Early recognition of caregivers at risk for perceived loneliness - a potential marker of a symptom cluster of social isolation and chronic perceived stress - may allow nurses to

implement interventions that would improve caregivers' well-being, increase their health-related quality of life, decrease their caregiver burden, and prevent the risk of the development of chronic illnesses. As a result, early recognition of caregivers at risk for the proposed symptom cluster may ultimately promote higher quality of care for dementia patients and delay their institutionalization. Healthcare professionals may remain the single reliable source of support for dementia caregivers and thus may allow them to mitigate the adversity associated with chronic perceived stress, social isolation, and perceived loneliness.

## Breast is Best: Increasing Healthcare Provider Knowledge and Confidence

---

*Emily A. Lee, MSN, BSN, RN, FNP-C, CLC, USA*

### Purpose

The purpose of this presentation is to increase breastfeeding knowledge and confidence in HCPs who care for pregnant women. An effective preventive measure a mother can take to protect the health of her infant is to breastfeed. Breastfeeding success rates among mothers can be greatly improved through support from HCPs.

### Target Audience

The target audience of this presentation is healthcare providers (HCP) and students including physicians, nurses, advanced practice nurses, nurse midwives, lactation consultants, and lactation counselors.

### Abstract

**Background:** The purpose of this project was to increase breastfeeding knowledge and confidence in healthcare providers (HCPs) involved in the care of pregnant women in rural Obstetrical clinics. Obstetrical healthcare providers are responsible for the care and well-being of pregnant women and their fetuses. One of the most highly effective preventive measures a mother can take to protect the health of her infant is to breastfeed. The breastfeeding success rate among mothers can be greatly improved through active support from their families, friends, communities, and healthcare providers.

**Methods:** The project sites were three separate rural obstetrical clinics in middle Tennessee. Informed Consent was obtained from providers participating in the project. A Pre-Knowledge and Confidence Questionnaire on Breastfeeding was administered to the healthcare providers. An educational program from the American Academy of Pediatrics (AAP), "Breastfeeding Residency Curriculum" consisting of PowerPoints, case studies, and the use of reference tools was presented to all participants. Three presentations were conducted at each site. Healthcare providers counsel pregnant women about breastfeeding using the American Congress of Obstetricians and Gynecologists (ACOG) Perinatal Practice Guidelines. . The healthcare providers documented their counseling efforts in the patient's Electronic Medical Record (EMR). Patient charts were reviewed for comparison of pre-implementation to post-implementation breastfeeding counseling documentation by providers. The three month pre-implementation review included patient visits from January 2014 through March 2014. In developing a project baseline, this pre-implementation chart review established the number of times patients received breastfeeding counseling and prenatal visits from the healthcare providers. Once the educational program was implemented, another chart review was conducted, in the same manner as the pre-implementation review. The post-implementation review incorporated the period of April 2015 through June 2015. A comparison was made between the two reviews to determine any effect of the educational intervention on the providers counseling and documentation. At the end of the three month project, a Post- Knowledge and Confidence Questionnaire on Breastfeeding was presented to the healthcare providers.

**Results:** It is projected that healthcare providers who complete the American Academy of Pediatrics (AAP) "Breastfeeding Residency Curriculum" will display enhanced breastfeeding knowledge and confidence, and will exhibit positive changes to breastfeeding practice patterns. Short-term project goals include a 25% increase in utilization of ACOG breastfeeding recommendations (based on retrospective chart review), and a 25% increase in HCP breastfeeding knowledge through pre/post-testing, and a 25% increase in HCP confidence in breastfeeding counseling abilities through pre/post-testing. Long-term goals after completion of the educational program include a 50% increase in utilization of breastfeeding recommendations from ACOG, an increase in the number of patients with intent to breastfeed, and an

increase in the number of patients who attempt to breastfeed prior to discharge from the hospital after delivery.

Conclusions: The breastfeeding success rate among mothers can be greatly improved through active support from their healthcare providers. More breastfeeding education is required for healthcare providers to become both knowledgeable and confident in their skills to promote breastfeeding and manage the breastfeeding client.

### **Compare and Contrast the Clinical Learning Experiences of Prelicensure Baccalaureate Nursing Students, in a Traditional Group Clinical, Preceptored Clinical and the DEU Model, Utilizing the Cles-T Evaluation Tool**

---

*Lesley L. Connolly, BSN, RN, USA*

#### Purpose

to seek an answer to the question; What is the students' perception of the best way to educate nursing students in the acute care setting?

#### Target Audience

nurse educators, nursing students and acute care clinical instructors/RN's.

#### Abstract

Access of acute care sites for clinical education of nursing students is becoming a real problem for nursing schools around the world. Nursing schools provide clinical experiences in a variety of different ways. Some nursing schools offer group clinical experiences, where a number of students, usually six to ten, are grouped with one faculty on one unit in an acute care setting. Others offer a preceptored model where one student is paired with one registered nurse (RN) on an acute care unit and still others are offered an experience on a dedicated education unit (DEU) where they work side by side with RN's, techs and their faculty support person. All of these experiences provide the student nurse an opportunity to complete nursing assessments and skills with real patients. The purpose of this study was to compare and contrast the clinical learning experiences of prelicensure baccalaureate nursing students, utilizing the CLES-T evaluation tool. An examination of literature supports the preceptored clinical experience and the formation of a DEU as the most common and preferred clinical setting for the student to gain the most confidence, improve communication skills and develop critical thinking skills while in the acute care setting. The proposed nursing research study will provide insight into the development of a DEU in one of our local hospitals and answer the question; what is the best way to educate nursing students in the acute care setting?

## Improving Nurse Engagement with Dedicated Education Units

---

*Angela D. Heckman, MSN, RN, PHCNS, CNE, USA*

### Purpose

to disseminate information about an innovative project meant to stimulate nurse engagement in the work environment. The impetus of this project was to establish an academic-practice partnership with an acute care hospital in Central Indiana, implement a Dedicated Education Unit (DEU) and evaluate the effects on nurse engagement.

### Target Audience

faculty, nurses, academic administrators, and practice leaders. This scholarly work requires a partnership between academia and practice so it is imperative that all stakeholders develop open and honest communication channels, encompass a thorough understanding of the DEU Model, and establish clear and mutually agreed upon goals.

### Abstract

Now more than ever, healthcare delivery systems need knowledgeable, practice ready, engaged nurses as members of every healthcare team; however a lack of engaged nurses and practice ready new graduates has forced health system and academic leaders to form partnerships. These academic-practice partnerships, intended to strengthen nursing practice, are crucial to address the monumental demands of value-based purchasing and the recommendations of the Future of Nursing Committee. Recently, an acute care facility in central Indiana and a local university established an academic-practice partnership to implement a Dedicated Education Unit (DEU). Although the original intent of the DEU was to enhance the clinical learning experience of student nurses, the academic-practice leaders involved with implementation of the DEU believes the project would positively affect nurse engagement and patient satisfaction.

The research question for the project is “Does implementing a dedicated education unit in an acute care setting improve nurse engagement?” Three objectives related to implementation of the DEU project were identified: Nurse engagement will improve on the DEU; nurse engagement will be higher on DEU units than on a control unit; and patient satisfaction scores will improve on the DEU.

The theoretical framework for this scholarly project encompassed one theory and three models to provide the structure and guidance required for a well-designed study. These include Lewin’s Change Theory, the Logic Model, the JD-R Model of Work Engagement and the DEU Model of Clinical Education

The study site chosen for the DEU Project is an acute care hospital in north central Indiana. The DEU Project uses a convenience sample involving approximately 50 nurses. There are 13 nurses on the medical surgical (MS) unit and 14 nurses on the coronary care progressive unit (CCPU). In addition, there are approximately 20 nurses on the telemetry medical surgical (TMS) unit, which serves as the control unit.

The instrument selected to answer the research question is the Utrecht Work Engagement Scale (UWES). Work engagement is the construct in the UWES instrument and the three grouped underlying dimensions are vigor, dedication and absorption. Researchers have used the UWES instrument to measure work engagement among a variety of occupational groups.

The DEU Project utilizes a two-prong approach to answer the research question and measure the objectives. The hypothesis is that the DEU Project will result in improved nurse engagement. The first evaluation approach is a quasi-experimental design since there is a control unit. The second evaluation

approach is a mixed-method correlational pre – post survey design for the units participating in the DEU Project. Two types of surveys are used to measure outcomes, UWES and an investigator-developed DEU survey. Patient satisfaction data using Hospital Consumer Assessment of Healthcare Providers and Systems (HCAHPS) will also be trended. Triangulation of data from the above two surveys and trending of HCAHPS scores provide sufficient evidence to answer the research question.

### Clinical Performance Evaluation Tool Assessment: Faculty and Student Perceptions

---

*Christopher P. Kemnitz, PhD, BSN, BS, AS, RN, PHN, USA*

#### Purpose

The purpose of this presentation is to present the results of a qualitative assessment on the use of the Clinical Performance Evaluation Tool, a QSEN based clinical evaluation tool for nursing students. Perceptions and attitudes of students and faculty having used the tool during medical surgical rotations will be discussed.

#### Target Audience

The target audience of this presentation is primarily nursing faculty and instructors at two and four year nursing college or university programs who are actively involved in nursing student clinical performance assessment and evaluation.

#### Abstract

The goal of this study was to investigate faculty and student perceptions related to the use of the clinical performance evaluation tool (CPET) in a baccalaureate undergraduate nursing program. The CPET was developed to measure Quality and Safety Education for Nurses (QSEN) competencies specifically within the context of nursing student clinical performance. Clinical evaluation of undergraduate nursing students is ubiquitously recognized as a difficult and long-standing problem for nursing faculty. The CPET was chosen as a clinical evaluation tool at the research institution because of its theoretical foundations and perceived relevance to the nursing program. However, many faculty and students had voiced concerns related to the utility of this particular evaluation tool. The CPET incorporates clear and adaptable methods for clinical evaluation of nursing students based upon the QSEN competencies and was selected by the research institution specifically for those reasons. However, it is not clear whether such a clinical evaluation tool is functionally effective and limited evidence has been published supporting its use in educational practice. Six fulltime nursing faculty and six undergraduate nursing students were recruited for this qualitative study. Participants were asked a series of five questions related to their use of the CPET during medical/surgical clinical rotations. These questions addressed the participants impressions of the evaluation tool, how well they thought the tool was preparing students to become competent nurses, what participants found most useful versus most challenging about the tool, and their impressions of how they would best like to be evaluated in the clinical setting. Respondent interviews were transcribed and analyzed categorically and several recurring themes were found. The recurring themes pointed out primarily that it is not the CPET as an evaluation tool that is problematic, rather students and faculty were found to be ambivalent towards the tool, the tool was used inconsistently, students and faculty were not oriented in how to effectively use the tool, and the tool was used in isolation and did not follow the student as they grew throughout the program. Faculty uniformly recognized that the QSEN competencies were useful in guiding clinical evaluation, feedback and dialogue, and remediation with the students. However, there was no evidence of consistent use and application of the CPET. Student and faculty concerns that were identified in this study suggest that before any nursing program implements a clinical evaluation rubric, the most important first step might be to closely evaluate the proposed evaluation tool, ensure it aligns with existing curricular goals and outcomes and ensure that the clinical evaluators are all trained in how to consistently and appropriately use the evaluation tool. Students should be regularly oriented to the tool also and be made aware of its purpose. These recommendations are in alignment with current best practices in evaluation as reported in the literature. The CPET was recognized as a valuable tool by faculty primarily because of its QSEN foundation. In order to help students see the relevance of the tool and use it most effectively consistency in the implementation and application of the tool should be considered as a high priority.

### Skin Cancer and Tanning Bed Use in the Young Female Population

---

Stephanie R. Dixon, BS, USA

#### Purpose

To identify the effects of the customers' rationalizations and motivations of tanning bed use and skin cancer development among young adult females through a critical review of peer-reviewed publications.

#### Target Audience

National and international students, nurses, educators, and other health care professionals.

#### Abstract

**Background:** The incidence of skin cancer from indoor tanning-beds has been rising over the past several decades. In the United States, "an estimated 114,900 new cases of melanoma were diagnosed in 2010, with nearly 8,700 resulting in death" (Banerjee, Hay, & Greene, 2013, p. 577). Increased use of tanning beds, increased time outdoors, and better screening are all factors contributing to new incidence of skin cancer. This is a knowledge based problem with implications to clinical effectiveness.

**Objective:** The purpose of the critical review is to find peer-reviewed publications about the effects of the customers' rationalizations and motivations of tanning bed use and skin cancer development among young adult females. **Methods:** Cox proportional hazards models, cognitive rationalization scale, and latent profile analysis were used to investigate frequency of tanning bed use, cognitive rationalization for tanning bed use, and the effectiveness of intervention efficacy in lowering tanning bed use. **Results:** Although the studies were evaluating different aspects of tanning bed use and skin cancer incidence, the results were congruent in the findings. One study determined that the frequency of tanning bed use among females during high school and college increased their incidence of skin cancer. Another study sought to show how the cognitive dissonance theory correlates with cognitive rationalizations used by those to justify tanning bed use despite knowledge of associated health risks. Other results concluded that targeted interventions significantly reduce indoor tanning use, specifically among low-knowledge subgroups. **Discussion:** All three articles appear to be useful in identifying increased incidence of skin cancer and tanning bed use in the young female population. More research is needed to determine how best to convey the damaging effects of tanning bed exposure to young females as well as alternatives to tanning, including a better understanding of motivation of tanning bed use by this population.

### Blazing Trails, Building Fences, and Raising Towers: A Historical Review of Nurse-Midwifery and Childbirth in the United States

---

*Eileen J. B. Thrower, MSN, BSN, APRN, CNM, USA*

#### Purpose

To review the history of childbirth and nurse-midwifery in the United States, including economic, political, and social factors impacting the development and expansion of nurse-midwifery thereby providing insight into the current status of nurse-midwifery, childbirth, and maternity care in this country.

#### Target Audience

The target audience of this presentation is nurses and other health care professionals interested in historical research, as well as those interested in the current state of maternity and midwifery care in the United States.

#### Abstract

**Background:** The United States compares poorly among the world's nations in terms of maternal and infant mortality. Public health experts increasingly argue for midwifery care as an important approach to improving the quality of maternal and newborn care. Despite this growing consensus, nurse-midwives attend only 8 % of births in the United States.

**Purpose:** To review the history of childbirth and nurse-midwifery in the United States, including the economic, political, and social factors impacting the development and expansion of nurse-midwifery, providing insight into the current status of nurse-midwifery, childbirth, and maternity care in this country.

**Methods:** A review of current literature related to the history of childbirth and nurse-midwifery was conducted using CINAHL and Academic Search Complete databases.

**Results:** Issues of financial status, gender, political power, and race impacted the development of nurse-midwifery, providing implications for current research.

**Conclusions:** Childbirth evolved from an in-home, social event among women to a hospital based, solo experience attended by men. Traditional midwifery declined as attendance of childbirth was overtaken by physicians trained in obstetrics. The profession of midwifery was practically eliminated by the 1950s, with the exception of midwives caring for poor, underserved women in the rural south and immigrant women in the northeast and southwest regions of the United States. Nurse-midwifery developed in response to high maternal and infant mortality rates, expanding as women sought non-traditional care within the hospital setting.

### Pilates Cadillac for Chronic Low Back Pain: A Pilot Study

---

Dana D. Stieglitz, RN, DNP, FNP-BC, USA

#### Purpose

The purpose of this presentation is to inform the primary care clinician of the usefulness and effectiveness of Pilates exercise for chronic low back pain. Pilates exercises are performed using specialized equipment and exercise mats. Pilates can be prescribed by physicians and nurse practitioners.

#### Target Audience

The target audience for this presentation are advanced practice nurses who prescribe therapeutic treatment for musculoskeletal conditions. An academic and administrative audience are target to communicate the usefulness of Pilates as a treatment option and a billable modality.

#### Abstract

**BACKGROUND:** Musculoskeletal health problems such as low back pain contribute significantly to morbidity in the general population and contribute to the high costs of health care in the industrialized world. Pilates is an evidence-based form of therapeutic exercise found to improve low back pain and is underutilized in the healthcare setting.

**PURPOSE:** The purpose of this pilot study is to investigate the feasibility, acceptability, and effectiveness of Pilates exercise on the Cadillac exercise machine as a therapeutic intervention for chronic low back pain and disability.

**METHODS:** The study was quasi-experimental one-group pre test post test pilot study evaluating the effectiveness of a Pilates protocol using the Cadillac exercise machine to decrease levels of pain, and increase function. Data were extracted from a SPSS analysis of a pain visual analog scale (VAS) and Oswestry disability index (ODI).

**RESULTS:** The results indicate that the Pilates intervention was effective for reducing pain and improving function. VAS before the intervention were  $M = 41.83 \pm 13.12$  and after the intervention were  $M = 11.08 \pm 19.49$ . The mean difference calculated was  $30.75 \pm 20.27$ ,  $CI = 43.63, 17.87$ ,  $p < 0001$ . ODI scores before the intervention were  $M = 23.83 \pm 16.57$  and after the intervention  $M = 12.58 \pm 12.29$ , respectively. The mean difference calculated from the paired t test from before and after the intervention was  $11.25 \pm 13.20$ ,  $CI = 19.64, -2.86$ ,  $P < .02$ .

**CONCLUSIONS:** The results of this study will inform clinical practice recommendations and direct subsequent research.

### Integration of Evidence for Genetic Risk of Abnormal Neurodevelopment in Preterm Infants

---

*Lisa M. Blair, BSN, RN, RNC-NIC, USA*

*Rita H. Pickler, PhD, RN, FAAN, USA*

*Cindy M. Anderson, MSN, BSN, PhD, RN, USA*

#### Purpose

to synthesize recent evidence of genetic associations with atypical neurodevelopmental outcomes that may pose additional risk to preterm infants who do not have rare, genetic disease.

#### Target Audience

researchers interested in neurodevelopment among preterm infants.

#### Abstract

**Problem:** Preterm infants are at elevated risk for a host of atypical neurodevelopmental problems, including disorders that appear later in life. A growing body of evidence supports a genetic link to risk for atypical neurodevelopment even among infants who do not have apparent genetic disease; however, no genomic risk profiles are currently used, despite the potential benefit of early intervention for those at risk.

**Purpose:** The purpose of this integrative review was to synthesize recent evidence of genetic associations with atypical neurodevelopmental outcomes that may pose additional risk to preterm infants who do not have rare, genetic disease.

**Search Strategy:** Electronic database searches were conducted in PubMed and CINAHL using the terms "neurodevelopment" and "genetic." Searches were limited to English-language, peer-reviewed primary research or meta-analysis reports published between July 2009 and July 2014 involving living human participants. As neurodevelopmental outcomes related to preterm birth may not appear until later in life, the search was not limited to infants, however, articles were excluded if there was no explicit genetic link with neurodevelopment or if no association was found with neurodevelopmental outcomes in novel gene targets.

**Results of literature search:** 28 original research reports and 1 meta-analysis were included (n = 29).

**Synthesis of Evidence:** Articles included in the analysis used a wide range of study designs, genomic approaches, outcome measures, and methodologies; an integrative review design and PRISMA reporting guidelines were used to synthesize these diverse data. Multiple large genetic deletions and polymorphisms of 43 genes were associated with neurodevelopmental outcomes. Articles were ranked based on quality parameters, as multiple studies demonstrated methodological or reporting concerns.

**Implications for Practice:** The creation of genetic risk profiles for complex disorders of neurodevelopment would allow screening and early intervention among infants with the added neurodevelopmental risk of prematurity. This is presently hindered by inconsistent genetic association evidence, methodological considerations, reporting issues, and lack of replication. However, several avenues of investigation offer promising targets for future research, including the candidate genes Met, NRG3, and SLC6A4 and large genetic deletions, each of which were reported to have associations to neurodevelopmental outcomes in multiple, high-quality studies.

## Building Better Bones for a Better You: Osteoporosis Prevention for Adolescent Girls

---

Joanna Christina M. Trice, MSN, BSN, RN, PHN, USA

### Purpose

The purpose of this presentation is to present findings of a thesis project in which an educational session about osteoporosis prevention was designed and implemented. The sample population included adolescent girls in a girls club. This presentation includes the background, problem, purpose/goal, theoretical framework, methodology, findings, conclusions, recommendations/implications, and limitations.

### Target Audience

The target audience of this presentation is individuals in service, educators, and faculty. The target audience will be interested in the successful methodology for educating adolescent girls about osteoporosis prevention.

### Abstract

**Introduction and Background:** Osteoporosis is a serious bone disease occurring with the loss of bone mass and weakening of bone tissue. According to Healthy People 2020, there are approximately 5.3 million Americans aged 50 years and older with osteoporosis. Although this disease affects both men and women, it is much more common in women. Individuals with osteoporosis often experience bone fragility leading to bone fracture, particularly of the hip, spine, and wrist. Bone fractures are the most serious health complications of osteoporosis as they are associated with severe pain, loss of stature, limited mobility, and even death. Healthy People 2020, estimates 50% of all women will experience a bone fracture resulting from osteoporosis during their lifetime. Medical expenses associated with osteoporosis related fractures are extremely costly. The National Osteoporosis Foundation, projects by 2025 osteoporosis will cause nearly three million bone fractures at a cost of \$25.3 billion annually.

**Problem Statement:** Osteoporosis was commonly thought to be a disease of older adulthood. However, osteoporosis truly begins in childhood and adolescence. By the age of 18, females achieve peak bone mass, which contributes to bone strength. Therefore, it is best to begin osteoporosis prevention during childhood and adolescence to build bone mass and promote life long bone health. However, gaps in knowledge about osteoporosis and methods of prevention are present, particularly among adolescent girls. Providing osteoporosis prevention education to this population is essential to reduce the risk of osteoporosis development later in life.

**Purpose and Goal:** The purpose of this thesis project was to design and present an educational session about osteoporosis prevention directed towards adolescent girls. The goal of this thesis project was to bring awareness of osteoporosis and to stimulate motivation for a health promotion change.

**Theoretical Framework:** The theoretical framework for this thesis project was based on Albert Bandura's social-cognitive learning theory. Bandura's theory involves four basic steps for social-cognitive learning. First, the observer watches the behavior modeled by another person. Second, the observer recalls the behavior. Third, the observer has to mimic the behavior correctly. Lastly, the observer is motivated to learn and carry out the behavior. Bandura's social-cognitive learning theory provided the basis for this thesis project to optimize learning, comprehension, and motivation.

**Methodology:** This thesis project consisted of a 40-minute educational session directed towards adolescent girls. The sample of participants included eight adolescent girls ( $n = 8$ ) between the ages of 12 to 15 years old, who were involved in a girls club. The educational session provided an extensive

overview of osteoporosis, risk factors, associated health complications, and methods of prevention. Dietary modification through adequate consumption of calcium and vitamin D and participation in weight-bearing exercise were the primary methods of osteoporosis prevention discussed. Due to the unique learning needs of adolescent girls, learning activities that were age-appropriate, hands-on, interactive, and relevant were incorporated into this educational session. These learning activities included meal planning, reading nutrition labels, re-demonstrating weight-bearing exercise, and creating a calcium-rich snack. Data collection instruments included a demographic questionnaire, pretest, and posttest. The demographic questionnaire consisted of seven questions regarding age, grade, previous osteoporosis prevention patient education, milk intake, daily exercise, and personal exercise preference. The pretest and posttest consisted of the same nine questions having to do with essential osteoporosis related facts, calcium, vitamin D, weight-bearing exercise, personal perception of osteoporosis prevention importance, and motivation to prevent osteoporosis. Participants were asked to complete the pretest and demographic questionnaire prior to the start of the educational session. Once the educational session concluded the participants were asked to complete the posttest. Results from each participant's pretest and posttest were compared to determine changes in knowledge of osteoporosis, personal perception of osteoporosis prevention importance, and motivation to prevent osteoporosis. Data from the demographic questionnaire, pretest, and posttest were analyzed using descriptive statistics, a paired t-test, and IBM SPSS version 21 software.

**Findings:** Analysis of the demographic questionnaires revealed 75% of participants were not educated about osteoporosis prevention by their physician. The majority of participants (62.5%) drank one to two glasses of milk per day. Only 25% of participants exercised on a daily basis. In one day, most participants exercised for 30 minutes (37.5%) or 1 hour (37.5%). Interestingly, participant 2 responded with "not at all" in regards to frequency of exercise and "I don't exercise" in regards to duration of exercise. Additionally, participant 2 did not provide any response when asked about personal exercise preference.

Analysis of the pretests and posttests revealed 100% of participants knew osteoporosis is a bone disease. Knowledge of the best time to begin osteoporosis prevention increased from 87.5% at pretest to 100% at posttest. Knowledge of the recommended daily calcium and vitamin D intake levels increased from 0% at pretest to 100% at posttest. Knowledge of calcium-rich food increased from 50% at pretest to 100% at posttest ( $p < 0.04$ ). Knowledge of exercise best suited for osteoporosis prevention increased from 37.5% at pretest to 100% at posttest. Knowledge related to frequency of performing osteoporosis prevention exercises during the week increased from 75% at pretest to 100% at posttest. At pretest, only 62.5% of participants deemed preventing osteoporosis now as very important. In contrast, at posttest 100% of participants deemed preventing osteoporosis now as very important. Moreover, at posttest each participant's motivation to begin osteoporosis prevention was either increased or reinforced.

**Conclusions :** The data confirms achievement of this thesis project's goal. Participants were made aware of osteoporosis and motivation for a health promotion change was stimulated. Therefore, this educational session and the means in which the education was delivered were successful.

**Recommendations and Implications:** In the future, educators, community health nurses, and school nurses may utilize the foundations of this educational session as a guideline to deliver effective osteoporosis prevention education to adolescent girls. Additionally, foundations of this educational session may be incorporated into standard health and nutrition curriculum for adolescents in middle school and high school.

It is concerning that the majority of participants were not educated about osteoporosis prevention by their physician. Future nursing research is still warranted to determine existing barriers preventing the delivery of osteoporosis prevention education to adolescent girls by physicians. Additionally, other methods of delivering effective education (e.g. interactive websites, smart phone applications) must be studied to determine best practices for teaching adolescent girls. Lastly, future longitudinal research studies must be conducted to determine if motivation to perform osteoporosis prevention methods is still sustained at various intervals (i.e. weeks, months, and years) after the educational session has ended.

**Limitations:** Limitations of this thesis project involved the small sample of participants utilized, as this sample may not be representative of most adolescent girls. Participants in this thesis project were part of a girls club. These participants may have been more motivated and educated, which may have skewed the data collected. Future research that replicates this thesis project but utilizes a much larger sample is warranted so that a more diverse population is represented.

### Activities of Daily Living in Residents of Nursing Home and Assisted Living Facilities: A Multilevel Analysis

---

*Wen Liu, PhD, RN, USA*

*Jay Unick, PhD, MSW, USA*

*Elizabeth Galik, PhD, CRNP, USA*

*Barbara Resnick, PhD, RN, CRNP, FAAN, FAANP, USA*

#### Purpose

The purposes of this study were to examine the trajectory of functional performance in ADLs over time, the variance in functional performance that is attributable to individual and institutional variations, as well as the impact of individual and institutional characteristics on functional performance among residents living in Long-term Care.

#### Target Audience

The targeted audience is the nursing researchers, institutional caregivers as well as policy makers who are interested in the trajectory of functional performance of activities of daily living over time as well as the effects of resident and institutional characteristics on functional performance among Nursing home and Assisted Living residents.

#### Abstract

**Background** The ability to perform activities of daily living (ADLs) is the most basic function for older adults living in long-term care (LTC). Various personal and institutional factors can be associated with functional performance in ADLs among LTC residents.

**Purpose** The purposes of this study were to examine the trajectory of functional performance in ADLs over time, the variance in functional performance that is attributable to individual and institutional variations, as well as the impact of individual and institutional characteristics on functional performance among residents living in LTC settings.

**Methods** This study was a secondary analysis of longitudinal data of 788 residents from 8 Nursing Home (NH) and 16 Assisted Living (AL) facilities from four cluster-randomized controlled trials. The independent variables included time nested within resident (level 1), resident characteristics including demographics, balance, cognition and length of stay in the long-term care setting (level 2), and facility characteristics including type of intervention and facility (level 3). The dependent variable was resident functional performance of ADLs (level 2) measured by Barthel Index. Covariates were determined based on prior research and bivariate analysis of the data. Multilevel modeling approach was used to distinguish resident and facility level variations on functional performance. Both Random Intercept (RI) and Random Coefficient models were examined, and model fit was compared using likelihood ratio difference. Inter-class correlation was reported to demonstrate the percentage of variance attributable to the resident and facility level variations, as well as the variance explained by covariates.

**Results** The 3-level RI model with covariates was a better fit to the data. Functional performance of ADLs declined over time, decreased as residents' balance and cognition deteriorated and among those who lived longer in the long-term care facility. Functional performance of ADLs was higher among male, white and AL residents with higher education compared to their counterparts, while such difference decreased between male and female and increased between AL and NH residents over time. More than 78% of variance in function was accounted for by the resident (28%) and facility level (50.5%) variation, while the individual and institutional covariates captured around 20% of the variance, mostly from the facility level.

**Discussion** This study provided preliminary information to support the effects of individual and institutional characteristics on functional performance among long-term care residents. Attentions that are paid to improve balance, alleviate progression of cognitive decline, and reduce the length of stay in NH settings may hold promise for maintaining or improving functional performance in ADLs.

### Presence of Perverse Violence in the Dependent Elderly

---

*Dafne Gomez-Melasio, RN, Mexico*

*Martha Alicia Magallanes-Monrreal, PhD, RN, Mexico*

*Jesus Acevedo-Alemán, PhD, Mexico*

*Ana Laura Carrillo-Cervantes, MN, Mexico*

#### Purpose

The purpose of this presentation is to identify the presence of perverse violence in dependent elderly and the impact this will have on them.

#### Target Audience

The target audiences of this presentation are those researchers and clinical nurses interested in the caregiving population of the older adult and the global attention in nursing.

#### Abstract

**Background:** In many parts of the world the abuse of the elderly goes almost unnoticed. Until recently, this serious social problem hidden from public view and was regarded as an essentially private matter. Even today, mistreatment of the elderly remains a taboo, usually underestimated and neglected by societies around the world. However, there is growing evidence that this is a major public health and society problem and it was described in 1975 in British magazines using the term "granny battering". The statistics on abuse of the elderly is data unrealistic because most older adults do not report the assault mainly because those are usually from the same family

**Purpose:** To identify the presence of perverse violence in dependent elderly and the impact this will have on them. Describe signs and symptoms of perverse violence.

**Methods:** Co-relational quantitative descriptive study to disseminate the presence of this type of violence in the elderly dependents, and the impact this will have on them, being them more susceptible to violent behavior by not being able to carry out various activities of daily living both as instrumental and literature reflecting it. To carry out the relevant measurements in the study, Barthel scale will be employed, and a instrument to identify the perverse practice of violence in those participants whose first instrument throw as a result functional dependency. The presentation is guide by the theory of Virginia Henderson Nurse, since most of the needs presented by the individual according to the theoretical, are found to assess function on different scales.

**Outcomes:** Collected data will be analysed with Statistical Package for Social Sciences 21.

**Conclusion:** Demonstrate the prevalence of perverse violence in older dependent and its high impact to their functionality, avoiding this malpraxis in nursing staff.

#### Purpose

The purpose of this presentation is determine the relationship between learned hopelessness and depression as risk factor and predictor of functional death in the elderly.

#### Target Audience

The target audiences of this presentation are those researchers and clinical nurses interested in the caregiving population of the older adult and the global attention in nursing.

#### Abstract

**Background:** The learned hopelessness produces negative encouragement for individuals that can take them to lose their motivation, hope to reach goals and give up to the future. The ideas of hopelessness in the elderly produce negative thoughts like his life is meaningless, passive desire to die, and suicidal thinking; same as hopelessness, depression is a common mental disorder in the elderly that when it becomes chronic or recurrent hinders seriously the coping performance of the daily life and as a risk factor that could cause disease and functional decline in its most severe stage produce a functional death.

**Purpose:** To determine the relationship between learned hopelessness and depression as a risk factor and predictor of functional death in the elderly.

**Material and Methods:** This study will focus on non-experimental quantitative research with cross design with explanatory scope as Hernández, Fernández and Batista classified it. The study population will consist of older adults belonging from the Centro Estatal del Adulto Mayor of Saltillo, Coahuila, Mexico. Sampling will be for convenience, depending on the older adults attending the consult at the center in one week. The Yesavage Geriatric Depression Scale will be the measure instrument which consists of 30 items, the Beck Hopelessness Scale, which contains 20 items, and the Barthel Index 10 items to measure functionality. The variables that will be measured are hopelessness, depression and functional death.

**Outcomes:** The results will be measured for data collection with the Statistical Package for the Social Sciences version 2.1 together with graphics for sociodemographic variables, and Pearson correlation coefficient to establish the relationship between the study variables.

**Conclusion:** Find how the learned hopelessness is a risk factor for depression and at time, a functional predictor of death in the elderly. Will discuss the importance of avoiding the functional death in older adults.

**Key words:** Learned hopelessness, Depression, Functional decline, Functional death, Elderly

### Explaining Ethical Sensitivity from the Social Representations of Nursing Students and Professors

---

*Bertha Alicia Alonso Castillo, RN, Mexico*  
*Maria Magdalena Alonso-Castillo, RN, Mexico*  
*María Teresa de Jesús Alonso Castillo, RN, Mexico*  
*Nora Nelly Oliva Rodríguez, RN, Mexico*  
*Nora Angélica Armendáriz-García, RN, Mexico*  
*Karla Selene López García, RN, Mexico*

#### Purpose

Explain ethical sensitivity from social representations constructed during patient care provided by nursing students and professors. Define the meaning and modeling of ethical sensitivity from the perspective of nursing students and professors.

#### Target Audience

nursing students and professors

#### Abstract

Nursing education requires development of awareness and ethical sensitivity in appropriate decision making for quality care of the patient, helping professionals to understand their role and responsibilities. However, in México were not located studies about factors that influence ethical sensitivity in nursing students and professors. Social representations of nurses may be a factor explaining ethical sensitivity. Since beliefs, attitudes, emotions, knowledge and values give a particular way in the acting of the nurses with their patients.

**Objectives:** Explain ethical sensitivity from social representations constructed during patient care provided by nursing students and professors. Define the meaning and modeling of ethical sensitivity from the perspective of nursing students and professors.

**Methodology:** A qualitative method was used with social representations approach (Moscovici; 1983; Jodelet, 2002). A theoretical sampling, considering data saturation criteria was used.

**Sample:** 23 students and 10 professors of nursing from Monterrey, México participated.

**Results:** The main categories of the meaning of ethical sensitivity emerged: Beliefs, Attitudes, Emotions and Values of ideal models of behavior and ultimate goals. Beliefs factors that obstruct quality care were reported: Human and material resources, professional competence, work routines and behavior of the patient for their disease condition. Factors that promote quality care; Confidence given by the patient, ethical sensitivity of nurses. Ethical sensitivity was defined as an ability to listen and attend the needs of the patients, a skill that one is born with but also can be developed. It was also mentioned that ethical sensitivity was essential for a holistic care. Empathy was identified as essential component of ethical sensitivity. Positive attitudes were identified: Be more accepted by the patient, and a faster recovery of the patients, negative attitudes as envy or competence with colleagues. They identified emotions as feeling the anguish or sadness of the patients. They also narrated the important values in quality care as responsibility, respect, equity as well as the consequences of ignorance of Bioethics and values in nursing practice.

**Conclusions:** The main category was ethical sensitivity that derives from beliefs, attitudes, emotions and values. All of them, give a meaning to ethical sensitivity according to the social representations of nursing students and professors.

### Family and Alcohol Consumption in University Students

---

*Nora Angélica Armendáriz-García, RN, Mexico*

*Maria Magdalena Alonso-Castillo, RN, Mexico*

*Karla Selene López García, RN, Mexico*

*Santiago Enriqueta Esparza Almanza, MCE, Mexico*

*Bertha Alicia Alonso Castillo, RN, Mexico*

*María Teresa de Jesús Alonso Castillo, RN, Mexico*

#### Purpose

To identify family history consumption and its relation and influence on alcohol consumption in students

#### Target Audience

professional Nursing

#### Abstract

Alcohol consumption is considered a public health problem due to the high use prevalence, mortality and mental disorders associated to this, particularly in young people. Objective: To identify family history consumption and its relation and influence on alcohol consumption in students. Methods: The study was descriptive, correlational and predictive. The population were university students. Stratified random sampling allocation was proportional to the size of the stratum. Within each stratum was used one-stage random cluster sampling. The sample was composed of 680 college students, with 90% statistical power. The instruments used were the Family History Inventory of Alcohol Consumption and Disorder Identification Questionnaire due to Alcohol Consumption. Results: The present family history of alcohol consumption influenced in a major way the consumption of alcohol by students ( $B = .080$ ,  $p = .001$ ). Conclusions: Family history of alcohol consumption influences alcohol consumption of students. The contribution of this study is to propose a predictive model which in the future will help in the creation of nursing interventions aimed at this population and their families.

### Caring in Traditional and Non-Traditional Nursing Students

---

Denise M. McEnroe-Petitte, PhD, MSN, BSN, AS, RN, USA

#### Purpose

The purpose of this presentation is to share the research findings in traditional and non-traditional nursing students determining if there are significant differences in caring.

#### Target Audience

The target audience for this presentation would include nurse educators who facilitate classroom and clinical nursing students whom are identified as being traditional or non-traditional students.

#### Abstract

The purpose of this study was to examine traditional and non-traditional nursing students to determine if there are significant differences in caring. A descriptive comparative design was conducted using a convenience sampling with nursing students in an associate degree nursing program in northeastern Ohio. A demographic survey and the Caring Efficacy Scale (CES) were given to the students to complete. Data was analyzed to determine the measures of central tendency including frequencies, means, and standard deviation (SD). Independent t-tests were used for the mean responses and SD utilized to measure the dispersion of the data. The total number of students participating was 249. Traditional students were identified as 29.7% of the total while the non-traditional students were 70.3% of the group. The total scores for the CES of the traditional students were 157.24 with a SD of 13.31 and non-traditional students' total scores were 158.63 with a SD of 14.49. Results indicated that there were no significant differences identified between the two groups. Despite the findings, nurse educators must analyze the types of students who are entering nursing programs while assessing for those with caring as a part of their personality and interest for joining nursing. Without caring, patient outcomes may be affected. The results of this study indicated that caring, as the key to the nursing profession, is a needed attribute for those entering and pursuing care for individuals they are assigned to nurse.

### Predicting Nurse Faculty Members' Intent to Stay in the Academic Organization: A Structural Equation Model of a National Survey of Nursing Faculty

---

Lori Candela, EdD, MS, BSN, ADN, RN, FNP, BC, CNE, USA  
Antonio Gutierrez, PhD, MA, BA, USA

#### Purpose

The purpose of this presentation is to investigate the relations between several factors regarding the academic context among a nationally representative sample of U.S. nursing faculty in academic organizations across the U.S. serving at either a CCNE- or NLNAC-accredited institution of higher education.

#### Target Audience

The target audience of this presentation are nursing faculty and academic nursing administrators.

#### Abstract

**Purpose/Aims:** Our objective was to investigate the relations between several factors regarding the academic context among a nationally representative sample of U.S. nursing faculty in academic organizations across the U.S. serving at either a CCNE- or NLNAC-accredited institution of higher education.

**Rationale/Background:** Nursing programs are under pressure from their universities to demonstrate greater accountability as demonstrated by high quality graduates, innovative research and strategic partnerships with the community. This is accomplished through the efforts of the nursing faculty and there is a shortage of them. A recent survey indicated an 8.3% shortage of faculty across nursing programs in the United States with a major wave of retirements anticipated in the next few years. Concurrently there is an ever-growing need to produce more graduates. Nursing faculty are being pressed to do more in their teaching and in their research and service efforts. Nurse administrators are trying to both recruit and retain quality faculty who are able to handle such diverse demands. This provides a compelling reason to investigate factors in the faculty work place that may predict their intent to stay.

**Methods:** Standard confirmatory factor analysis was used to assess the validity of a proposed measurement model and structural equation modeling was used to evaluate the validity of a structural/latent variable model.

**Results:** Several direct and indirect effects were observed among the constructs under investigation. Of special importance, perceptions of nurse administration's support and perceived teaching expertise positively predicted U.S. nursing faculty members' intent to stay in the academic organization.

**Implications:** Understanding the way that nursing faculty members' perceptions of the various factors common to the academic context interact with intent to stay in the organization is essential for faculty and nursing administrators. This information can assist in obtaining more resources for faculty development, lobbying for additional faculty in order to meet the teaching, research and service missions of the organization, and personalizing relationships with each individual faculty member to understand their needs and acknowledge their efforts.

This study funded by a grant from the American Nursing's Foundation.

### The Lived Experience of Moral Distress in Nursing Academe

---

*Elizabeth J. Diener, PhD, MSN, BSN, RN, CNE, USA*

#### Purpose

The purpose of this presentation is to describe the lived experiences of nursing faculty in academe that have experienced moral distress in their role as an educator.

#### Target Audience

The target audience of this presentation is faculty in all roles and levels of nursing education.

#### Abstract

**Background:** Practice dilemmas, labeled as moral distress, have appeared in the nursing literature as a topic of discussion and concern for over 30 years. Less extensively documented has been the occurrence of moral distress in nursing education. As Ganske (2010) has noted, anecdotal reports of moral distress are frequent heard in schools of nursing and higher education, but research and literature exploring the depth and breadth of moral distress in academe is scant. These gaps make development of supportive structures, policy, and interventions impossible.

Situations noted to lead to ethical dilemmas in nursing education have been termed “seeds of moral distress;” namely, academic dishonesty, grade inflation, incivility, poor clinical performance, and unprofessional behaviors. Several authors have speculated on why moral distress in nursing education has received so little attention. Unsurprisingly, opinions center on nursing’s unique characteristic of caring; where nurse educators are unable to separate their educator role from that of their care provider role. While some dialogue has centered on the need to remain cognizant of the separate roles of nurse-as-caregiver and nurse-as-educator, even less attention has been given to the reluctance of educators to act on their ethical concerns, despite an established code of ethics for nurse educators.

**Methodology:** The purpose of this phenomenological investigation was to describe the lived experience of nurse educators who self-identified as having experienced moral distress in their role as an educator. Hour-long phenomenologic interviews were conducted with 10 current and former nursing faculty members who met the inclusion criteria. Criteria for study inclusion consisted of: Possess a Master’s degree in nursing and have been employed as a nurse educator for more than 12 months. Data analysis was ongoing utilizing Giorgi’s approach.

**Findings:** Three themes emerged from the analysis. Environmental turmoil, violation of ethical comportment, and physical & emotional symptomology were the thematic categories which accounted for the deleterious effects of moral distress. Participants in this study expressed that conflicts in the academic environment leading to feelings of moral distress were those that violated the participants’ personal and/or professional ethics, values, and morals. Participants experiencing moral distress often experienced common physical symptoms and/or emotional responses. Physical symptoms expressed by participants were increased heart rate, tension, insomnia, and gastrointestinal disturbances. Emotional responses included feelings of helplessness, hopelessness, guilt, anger, sadness, and frustration.

While most respondents in this study identified negative physical and emotional responses to moral distress, several participants also identified a feeling of strength. This strength developed after the incident creating the moral distress had been resolved or the faculty member had chosen to leave their position. Practice and policy recommendations elicited from the research data call for administrative leadership which proactively supports reviews of morally distressing situations in academe, incorporation of the AACN Four “As” in academic environments, mentoring relationships among new and experienced faculty, as well as well-defined policies to guide faculty.

### How Parents Discuss Dying with Their Child with a Life-Limiting Illness Who Require Long-Term Ventilation

---

*Cheryl Crisp, PhD, MSN, BSN, ASN, RN, PCNS-BC, CHPPN, CRRN, USA*

#### Purpose

describe the paucity of information available on the subject of talking about dying with children with life-limiting illnesses who require chronic ventilation.

#### Target Audience

nurses involved in pediatrics, end-of-life care, home care, and/or who are responsible for ethical decision making in practice.

#### Abstract

The purpose of this presentation is: 1) describe the ethical issues surrounding palliative care in children with life-limiting illness requiring long-term ventilation and their families, and 2) to explain the importance of discussing dying with children with a life-limiting illness who require long-term ventilation and their families.

Major advancements in the field of medical technology have significantly improved the lifespan of children in this very unique population. As those advancements continue and children survive, questions begin to arise about what happens when the child who requires long-term ventilation is nearing the end-of-life. What types of discussions need to happen? Who makes the medical decisions for the child? Is the child included in crucial conversations about end-of-life, or does anyone even discuss dying with them. Families often do not know what to do. Should they tell their child? Should the child be allowed to participate in these discussions? Do children want to leave a legacy for when they are no longer present?

This presentation invites the learner to think about these questions. It also provides information on the importance of discussing dying with children with life-limiting illness who require long-term ventilation and their families. Some suggestions about how to elicit these conversations is also provided.

Importance to the science of nursing: Technology continues to improve and with it the possibilities of extending life are rapidly expanding. As more people live sustained by technology, more ethical issues about end of life care and decision-making will also increase. It is important for nurses to be proactive in their thinking about these types of issues. It is also important for nurses to provide support for the children and families facing these issues. Families often turn to their nurses when they need answers, and as nurses we must be prepared to assist these children and families to have some of these difficult discussions as the child nears the end-of-life to maintain the best life possible for the child and family even unto death.

### Motivation through Sports Related Physical Activity and Alcohol Consumption

---

*Maria Magdalena Alonso-Castillo, RN, Mexico*  
*Arodi Tizoc Marquez, MSN, RN, Mexico*  
*Bertha Alicia Alonso Castillo, RN, Mexico*  
*Nora Angélica Armendáriz-García, RN, Mexico*  
*María Teresa de Jesús Alonso Castillo, RN, Mexico*  
*Nora Nelly Oliva Rodríguez, RN, Mexico*

#### Purpose

To identify the type of alcohol consumption by sex, and to identify the relationship of the days and minutes of motivation through sports related physical activities and alcohol consumption

#### Target Audience

The target audience of this presentation is academic and professional nursing

#### Abstract

**Objective and Methodology:** Alcohol consumption and abuse is part of government's health agendas; it is a causal factor of over 200 diseases and injuries, and is estimated that each year 320,000 deaths worldwide occur in teenagers because due to it. Sports related physical activities may be a protective factor in alcohol consumption, and could be related to intrinsic and extrinsic motivations. Objective: To identify the type of alcohol consumption by sex, and to identify the relationship of the days and minutes of motivation through sports related physical activities and alcohol consumption. The study was descriptive and correlational. The population was composed of 4,719 adolescents from two high schools in Nuevo Leon, Mexico. The sample size was calculated by considering a contrast between a null hypothesis of no correlation with a significance level of .05 and of .90 power, with a non-response rate of 10% and a design effect of 1.15, considering a sample of 415 adolescents. The sampling was random and stratified with a proportional assignment stratum size. The instruments utilized were: Motives for Physical Activity Measure-Rivesed (MPAM-R) of Ryan, et al., (1997) and AUDIT The Alcohol Use Disorders Identification Test (Babor et al., 2001).

**Results:** the type of alcohol consumption by sex showed that a significant difference ( $X^2 = 16.1$ ,  $p < .001$ ) was higher in the sensible consumption of alcohol in girls than in boys, and that the dependent and harmful consumption of alcohol was higher in boys than in girls. The days ( $r_s = .253$ ,  $p < .001$ ) and minutes ( $r_s = .270$ ,  $p < .001$ ) dedicated to sports related physical activities correlated positively and significantly with the intrinsic and extrinsic motivations for sports related physical activities. They also correlated positively and significantly with days ( $r_s = .254$ ,  $p < .001$ ) and minutes ( $r_s = .253$ ,  $p < .001$ ) dedicated to sports related physical activities and alcohol consumption (AUDIT).

**Conclusions:** The days and minutes used for sports related physical activities are related to motivation for sports related physical activities and alcohol consumption.

### Daily Challenges for Teen Moms: Strategies to Enhance Infant-Centered Feeding to Reduce Infant Obesity Risk

---

*Mildred A. Horodyski, PhD, MN, BSN, RN, FAAN, USA*  
*Kami Silk, PhD, MA, BA, USA*  
*Gary Hsieh, PhD, BS, USA*  
*Alice Hoffman, BS, USA*  
*Mackenzie Robson, USA*

#### Purpose

The purpose of this study is to promote infant-centered feeding among adolescent mothers to reduce obesity risk through a novel social media intervention platform. Our emerging intervention addresses one of the conference's priorities, enhancement of patient outcomes through transformative nursing practice.

#### Target Audience

The target audience for this topic would include researchers and practitioners to provide a forum for an exchange of ideas to enrich the achievement of knowledge to promote and sustain collaboration among diverse communities and enhance patient outcomes through transformative nursing practice.

#### Abstract

**Purpose:** Rapid weight gain in the first six months of life is associated with a sharply increased risk of obesity later in life and subsequent health consequences. Unhealthy mother-infant feeding practices contribute to rapid/excessive infant weight gain. Lower-income, adolescent, first-time mothers are also less likely to engage in infant-centered feeding (shared regulation of feeding within the mother-infant dyad) characterized by maternal responsiveness (positive maternal recognition and responses to infant cues), positive feeding styles (maternal guided approach to infant feeding), and healthy feeding practices as recommended by the American Academy of Pediatrics. Infant-centered feeding is needed to reduce rapid/excessive gain in the first six months of life. Infant-centered feeding fosters infant feeding self-regulation, which is associated with healthy growth (weight and length) and is crucial in reducing childhood obesity risk and adverse health conditions later in life. Few published intervention studies on the prevention or reduction of obesity in infants exist. Practical early intervention strategies must be developed to promote infant-centered feeding among adolescent mothers. The proposed intervention addresses a deficit in the literature on infant-centered feeding to reduce rapid/excessive infant weight gain that exists for this high-risk population. Adolescent mothers' feeding behaviors are most directly related to infant weight gain in the first year of life. Compared to adult mothers, adolescent mothers are less knowledgeable, less responsive, more controlling, and less skilled in infant feeding, which interferes with infants' self-regulation, natural weight trajectory, and healthy growth during the first year of life. The purpose of this study is to test a new social media intervention (Tools 4 Teen Moms [T4TM]) and to determine the preliminary efficacy and the feasibility, acceptability, and satisfaction of T4TM. This poster presents data on website usage, as means of acceptability and satisfaction with the social media intervention.

**Methods:** A two-group randomized control trial is being implemented with a targeted sample of 100 low-income, first-time adolescent mothers, ages 15 to 19 years old, with infants (0 to 6 months of age) to obtain evidence for efficacy, feasibility, acceptability, and satisfaction related to T4TM. Participants are randomly assigned to the intervention group (n = 50) or control group (n = 50). Adolescent mothers must be a primary caretaker of the infant who feeds her infant at least once a day. Adolescent mothers are recruited from Maternal Infant Health Programs, a program for pregnant women and infants who are Medicaid-eligible, promotes healthy pregnancies, positive birth outcomes, and healthy infants through home and office visits during the first year of life. The intervention consists of six weeks of daily challenges via the T4TM website within four urban, Michigan counties. Tools4Teen Moms challenges are being delivered for six weeks starting when the infant is four to six weeks old. T4TM includes cell phone text message reminders, an infant feeding website, and a Facebook interface to increase infant-centered

feeding. Participants perform daily behavioral challenge activities, which consist of daily challenges for six weeks via the T4TM website. Daily challenges focus on promoting maternal-infant feeding interaction and healthy feeding practices. Data are collected at three time points (baseline, when the infant is 10-12 weeks old, and six months old), using self-report and anthropometric measures. Data analysis for challenge feasibility: For those in the intervention group, the number and percent of participants who completed all the challenges will be determined. Acceptability and Satisfaction: The results of the satisfaction survey will be summarized and evaluated for overall satisfaction. Open-ended questions will be transcribed to identify key reasons for satisfaction levels and suggestions for improvement.

Results (Preliminary): Currently, the participant age range is 16 to 19 years with a mean of 18 years; 33% of participants identify themselves as Hispanic/Latina, 27%, identify as Black/African American, 20% White, 7% Asian, and 13% as multiracial. Most participants (87%) are not currently employed. At the time of data collection 33% of participants were currently breastfeeding, while 67% were not; of the 67% who were not currently breastfeeding, 50% had breastfed their baby at some point. Birth weight of babies in the study ranges from 5.58-9.19 lbs (mean = 7.29 lbs).

Preliminary results indicate engagement with the T4TM website and challenges. Participants visited the website an average of 28/42 days. Many participants have retroactively completed challenges, meaning they visited the "Past Challenges" to complete challenges that had been posted earlier that week. The average minimum challenge exposure for completed participants thus far is 31/42. Preliminary results show that participants engage with quizzes available on the T4TM website; participants have completed an average of 3/4 quizzes.

Feedback from participants indicates enjoyment of the intervention. All participants agreed that they found the website helpful, they learned a lot about infant feeding from this program, and they would recommend T4TM to a friend for infant feeding advice. Participants agreed that they were satisfied with the challenges presented in the T4TM intervention. One participant expressed her opinion of the program: "It's a good program; I like it because it teaches me new things about becoming a great mother, and I really appreciate this program. Thank you so much!"

Conclusions: This study is in progress. Preliminary evidence supports use of text messaging and daily challenges to engage adolescent mothers in healthy infant feeding practices. Nursing can augment education with skill application via social media.

### Becoming Someone Different: A Grounded Theory Study of How Nurses Integrate Pregnancy and Full Time Employment

---

*Paul Gregory Quinn, PhD, MSN, BSN, RN, CNM, RN-BC, NEA-BC, CEN, CCRN, USA*

#### Purpose

The purpose of this presentation is to inform nurse leaders and scholars about the unique experiences of pregnant registered nurses in the clinical arena developed through a grounded theory study.

#### Target Audience

The target audience of this presentation is nurse managers, administrators, or senior leaders and the clinicians and nurse researchers who encounter pregnant nursing staff regularly.

#### Abstract

In the United States, 40% of the contemporary nursing workforce is comprised of women of childbearing age, 65% of whom are employed full-time. Hence, the likelihood of pregnancy occurring for this population at some point in their employment is high. A holistic exploration of how nurses integrate pregnancy and full-time employment has been lacking. The purpose of this research was to explore how primiparous nurses managed pregnancy and full-time employment. Using a grounded theory approach, nurses who were pregnant and delivered their first baby, while employed full-time on 12-hour work shifts, provided a firsthand account of how they incorporated pregnancy with employment.

Nurses, as social actors, experience many interactions in their workplace environment. The basic social process, becoming someone different, emerged to explain those interactions and allowed a substantive grounded theory to be developed. From that exploration, the researcher will present the basic social process, becoming someone different, and the four core categories that arose from the analysis:

- 1) looking different, feeling different – to explain how the physical and emotional changes of pregnancy result in nurses looking and feeling differently about themselves as nurses;
- 2) expectations while expecting – where the nurse, with previous experiences and ideas about what is expected of her and what she expects from others, changes how she sees herself, based upon her interactions in the workplace with her peers and coworkers;
- 3) connecting differently – explains how the nurse, while pregnant, develops new relationships and interactions with the people in her environment, specifically her peers, coworkers and patients, and
- 4) transitioning labor – where, despite challenges from interactions within the workplace from coworkers or tasks, the participant nurses began to focus on their eventual maternity leave and working as long as possible up to the time of delivery in order to prolong that maternity leave

### Unacknowledged Conditions and Workplace Bullying

---

*Laura C. Dzurec, PhD, MS, BS, RN, PMHCNS-BC, ANEF, USA*

#### Purpose

to identify and develop response options to subtle, often-unacknowledged communication patterns that typify workplace bullies' actions.

#### Target Audience

those individuals who work in complex workplaces.

#### Abstract

Where it exists and is allowed to fulminate, workplace bullying is known to have significant and devastating effects on individual employees and on the workplaces that employ them. The purpose of this study was to examine the interplay of often-unacknowledged conditions of workplace bullying--those conditions that subtly drive individuals to become victims of their bully counterparts--as they collectively act to perpetuate workplace bullying acts. Themes apparent in a broad, international literature were accessed through the author's use of hermeneutics and recursive metasynthesis. The sampling frame for this study incorporated both findings of the previous studies of our research team and findings from papers referenced to conduct those studies. Organizational and personal factors representing 'unacknowledged conditions' that facilitated workplace bullying were apparent in the themes emerging from this analysis. These themes included characteristics describing personal states and traits of both bullies and their intended victims; qualities of organizations as wholes that contribute to the perpetuation of workplace bullying acts; behaviors and actions of administrators that tacitly and/or implicitly sanction workplace bullying; significance of organizational and governmental policy to address the typically-unstated drivers of workplace bullying; and features of bullying outcomes that result when, collectively, these 'backseat drivers' commingle, whether overtly or covertly, to facilitate the devastating acts of workplace bullying. Implications for structuring practical and effective programs of intervention, based on findings of the analysis, are presented.

### A Mixed Methods Study Assessing the Effectiveness of Wise Guys

---

*Judith Herrman, PhD, RN, ANEF, FAAN, USA*

#### Purpose

to describe a mixed-methods approach to assessing the effectiveness of Wise Guys, a male-focused sexual health curriculum, and to present two previous pilot studies that validate the need for mixed methodologies.

#### Target Audience

nurses interested in teens, teen sexual health, and reproductive decision-making.

#### Abstract

Youth in the state of study report high levels of involvement in sexual activity and unintended pregnancies contributing to a high statewide infant mortality rate. In response, our team plans to implement a mixed-methods study to evaluate an evidence-based, interactive curriculum, Wise Guys, designed to promote healthy relationships and sexual behavior in young men ages 14-17. Two pilot studies were conducted with local Wise Guys groups suggesting positive changes in knowledge, attitudes, and behaviors. These empirically based investigations revealed significant weaknesses in quantitative data collection with teens and challenges to accessing authentic teen perceptions via survey methods. In an effort to address such challenges, the current study will include focus groups to delineate teens' thoughts on the most salient aspects of Wise Guy which in turn will be used to develop a stakeholder-informed survey instrument. The survey will be administered via REDCap, a computer-based medium. Additional focus groups, member checks, and a video journaling component with content analysis will provide rich data to be interpreted with survey data to determine the value of Wise Guys. Community engagement in the research process, tool development, web-based data collection, focus groups, video journaling methods, and data analysis will provide the infrastructure for future prevention and intervention research, as well as help to improve future evaluation efforts. This poster highlights the previous local pilot studies and their limitations, and the proposed mixed methods study design. Health promotion programs specific for teens can only be accurately evaluated through developmentally appropriate, technology-based, engaging, and valid methods of evaluation. This research pilots the involvement of youth and use of youth perceptions to determine the effectiveness of the Wise Guys program and the feasibility of mixed methods approaches as means to evaluate teen programming.

## Moral Stress in Health Care Professionals

---

*María Teresa de Jesús Alonso Castillo, RN, Mexico*

*Maria Magdalena Alonso-Castillo, RN, Mexico*

*Bertha Alicia Alonso Castillo, RN, Mexico*

*Nora Nelly Oliva Rodríguez, RN, Mexico*

*Karla Selene López García, RN, Mexico*

*Isidro Artemio Gamboa Cázares, RN, Mexico*

### Purpose

The purpose of this presentation is understand the social representations that build physicians and nurses respect to which ethical climate factors may cause moral stress.

### Target Audience

The target audience of this presentation is professional nursing

### Abstract

**Introduction:** With the advent of modernity, today's world debates between what is objective and subjective, between the global and the individual. Achieving modernity in Mexican society, determines the presence of demographic and health transitions, characterized by the increase in infant (neonatal) mortality, aging of the population, the polarization of health problems, which are becoming more complex, resulting the vast majority in deep ethical dilemmas. Changes in the pattern of culture derived from modernity, characterize the individualistic society in less solidarity and more unequal. (Martínez, 2006; Rodríguez, 2009)

The health care professionals face a complex load (moral stress) in their professional practice in health services because they are confronted with moral and ethical challenges created by discrepancies between what they know is right, in other words the ideal and what the health system allows them to do.

**Objective:** Understand the social representations that build physicians and nurses respect to which ethical climate factors may cause moral stress.

**Conceptual Framework:** Moscovici states that social representations are a theoretical construct that stands among the social, psychological and the image that reproduces what is real. The perceptions and concepts are products, derivatives modes to meet the iconic and symbolic respectively.

**Methodology:** Qualitative study within social representations framework of the perception of ethical climate and moral stress that physicians and nurses perceive and experience through individual semi-structured interviews where they deepened into the subject in 2 to 3 sessions with the key informants.

**Results:** Were identified beliefs which lead to moral stress when confronted with ethical dilemmas as: Patient prognosis, lack of resources, lack of training and camaraderie, demands from family of the patient. Also were identified positive and negative emotional and affective states that are triggered and cause from satisfaction for moral fulfillment to moral stress.

**Recommendations:** To carry out a request to authorities in order to classify moral stress as a pathology that can actually cause temporary or permanent disability.

## SCI PST 1 - Scientific Poster Session 1

### An Exploration of Medical Professionals' Perspectives on Medical Futility

---

*Ming Yi Hsu, PhD, MSc, RN, LPN, Taiwan*

#### Purpose

The purpose of this presentation is to introduce Taiwan nurses' and physicians' perspective on medical futility.

#### Target Audience

The target audience of this presentation is medical professionals, clinical care givers, educators, and medical policy developers.

#### Abstract

**Background:** Advanced medical technology helps extend the lives of critical patients. Under certain circumstances, medical interventions only prolong patients' life without ensuring an acceptable quality of life. Therefore, futile treatments are considered wasteful from the perspective of the national health insurance system. Because the term "medical futility" is used in many different ways, it is difficult to define and, therefore, also difficult to assess.

**Purpose:** The purpose of this research was to explore nurses' and physicians' perspective on medical futility.

**Methods:** A phenomenology approach and purposive sampling was applied. Participants were 7 Intensive Care Unit (ICU) nurses working in medical centers in central Taiwan who had more than one year working experience that included experience taking care of critical patients. Following Jovchelovitch and Bauer (2000), a 4-phase narrative interview procedure was used, and data analysis was applied using the Colaizzi (1978) method. Five physicians who worked at ICUs or had experience taking care of critical patients were invited to participate in one-to-one interviews. After the physicians had fully expressed their perspectives on medical futility, medical futility case stories which had been developed from previous interviews with ICU nurses were introduced to the physicians. Four major themes emerged, including definition of medical futility, types of medically futile patients, ethical considerations regarding medical futility, and professional positions on medically futile treatment and nursing care. The trustworthiness of the study was examined using Lincoln and Guba (1985) principles.

**Contributions:** The results of this research could help medical professionals to understand medical futility in clinical situations. The case stories developed from the study's narrative interviews will also be of value in clinical health care, multi-professional communication, and life-ethics education.

### An Exploration of ICU Nurses' Medical Futility Experiences While Taking Care of Critical Patients

---

*Ming Yi Hsu, PhD, MSc, RN, LPN, Taiwan*

*Lien-Ying Chiang, MSN, BSN, RN, LPN, Taiwan*

#### Purpose

The purpose of this presentation is to introduce Taiwan ICU nurses' medical futility experiences while taking care of critical patients.

#### Target Audience

The target audience of this presentation is medical professionals, clinical care givers, educators, and medical policy developers.

#### Abstract

**Background:** Advanced medical technology can often extend the lives of critical patients, but it has its limitations. Under certain circumstances, medical interventions only prolong patients' life without ensuring an acceptable quality of life. It is imperative to develop a policy of medical futility for such patients. However, there is no consensus among medical professionals in Taiwan as to what constitutes medical futility.

**Purpose:** The purpose of this study was to explore ICU nurses' medical futility experiences while taking care of critical patients.

**Methods:** A phenomenology approach, purposeful sampling, and snowball sampling were used to recruit nurses at one medical center and one regional hospital. In-depth, semi-structured interview were conducted, and each interview was tape recorded. The eight nurses who participated in this study worked at Intensive Care Units (ICUs) and had more than one year working experience that included taking care of critical patients. The trustworthiness of the study was examined using Lincoln and Guba (1985) principles. Data were analyzed using the Colaizzi (1978) method. Five major themes emerged, including ICU nurse's definition of futility, the process by which critical patients advanced to medically futile patients, considerations of medical futility, nursing care for medically futile patients, and facing the medically futile patient.

**Contributions:** The study findings will further understanding of medical futility in critical care and provide information valuable to improved clinical care, education, and medical policy development.

### Safety Climate: Perception of Professionals in an Emergency Unit

---

*Fernanda R. E. Gimenes, RN, PhD, Brazil*  
*Mayara C. G. Rigobello, RN, Brazil*

#### Purpose

The purpose of this presentation is to evaluate the perception of the safety climate of professionals working in an Emergency Unit of the State of São Paulo.

#### Target Audience

The target audience of this presentation is interested in the study of safety climate, specifically in medical emergency services.

#### Abstract

**Introduction:** The emergency medical services, characterized as challenging and dynamic environments, are considered particularly prone to adverse events for several reasons, including the fast pace and frequency of complex conditions and life-threatening, the fact that health professionals meet both a great number of patients with poor clinical information without limits to the kind of problems or conditions and under time pressure<sup>1-4</sup>. In 2004, the World Health Organization defined as a priority the development of research based on scientific evidence with best practices focused on patient safety. Since then, several studies have emerged in order to assess the climate of safety in health institutions<sup>5-6</sup>. The Safety Climate can be defined as a temporary measure the state of the institution's safety culture and can be measured by individual perceptions of the organization's attitudes to safety culture<sup>7</sup>. Among the methods of measurement, the most widely used is the number, which takes place by means of scales and questionnaires that assess the attitudes, the climate of teamwork, job satisfaction, working conditions and stressors of individuals<sup>8-9</sup>. The instrument in the context of care for emergency care can provide information about the main points that need to be improved.

**Objective:** To evaluate the perception of the safety climate of professionals working in an Emergency Unit of the State of São Paulo.

**Methods:** survey, transversal, descriptive and quantitative approach. To assess the security climate was used the "Safety Attitudes Questionnaire (SAQ) - Short Form 2006", validated and translated to Portuguese language<sup>6</sup>. Medical professionals, registered nurses, nursing assistants, psychologists, nutritionists, admin support and other professionals who work in this hospital for at least 6 months, with a minimum of 20 hours of work per week, were the study population. 139 professionals participated in the study. The data were entered into an electronic spreadsheet Microsoft Excel by double entry for further processing and analysis. Data processing were performed using Statistical Package for Social Sciences (SPSS) version 17.0.

**Results:** The instrument is divided into two parts: the first consists of 41 items that address the six domains, and the second part aims to collect professional data (gender, professional category, work experience and the work unit, adult or pediatric). The six domains are: "climate of work team", "security climate", "work satisfaction", "stress", and "perception of hospital management", "perception of unit management" and "work conditions". Answers were given in 5 points according to the Likert scale. The final score of the scale varies from 0 to 100, whereupon 0 is the worst perception of security attitudes by health professionals and 100 is the best perception. The majority of study participants agreed partially or totally with the presented questions. Most professionals (79,6%) informed that they like their work. Fifty point seven percent (50,7%) professionals believe less effective at work when fatigued. 36,7% professionals disagree that the levels of staffing in this clinical area are sufficient to handle the number of patients. There was a female predominance among professionals working in the hospital and professionals aged 21 and over in the unit operating time.

**Conclusion:** The satisfaction of the professional, the dialogue and support staff of the administration are factors that contribute to ensuring patient safety, especially in emergency medical services, especially in emergency services, considered particularly problematic with regard to patient safety, making it more vulnerable to incidents and adverse events. Know the perception of professionals about the patient safety climate contributes to the improvement of health care and to reduce risks to patients.

### Using Self-Efficacy and Transformative Learning Theories to Examine Interprofessional Collaborative Practice at End-of-Life in the ICU between Nurses and Physicians

---

*Edonn Vida Ball, MSN, RN, CNE, USA*

#### Purpose

The purpose of this presentation is present the findings of a research study using Self-Efficacy Theory and Transformative Learning Theory as theoretical frameworks to explore nurses and physicians perceptions about Interprofessional Collaborative Practice (IPCP) in end-of-life care situations and examine factors associated with IPCP.

#### Target Audience

The target audience of this presentation are nurse administrators, nurse educators, critical care and non-critical care nurses and physicians who care for patients as their illness trajectory shifts to the dying process in the acute care setting.

#### Abstract

**Background:** Research has documented that the health care system provides inadequate care for the dying patient at end of life (Papadimos et al., 2011). In order to provide appropriate end-of-life care for the patient it is imperative that the nurse be able to recognize that the patient is dying, communicate that assessment to the health care team and contribute to the plan of care by way of interprofessional communication and interprofessional collaborative practice (IPCP). Efforts to change and improve the effectiveness of collaboration and communication between nurses and physicians are evident on an international scale according to Institute of Medicine (2001) and the National Patient Safety Goals Hospital Program (2008). The Accreditation Council for Graduate Medical Education recognized the importance of nurse-physician relationships and has designated team functioning as a competency area to be addressed by residency programs (Baldwin, 2010). The Joint Commission for the Accreditation of Healthcare Organizations recognized communication as important to patient safety and set improved effectiveness of communication among care givers as a safety goal (2009). The Joint Commission identified the need to improve the timeliness of communication between care givers suggesting that this too may further improve patient safety (Manojlovich & Antonakdos, 2008). Effective team work requires mutual respect among members, effective communication, and shared participation and responsibility in the decision making process which are the foundations of the core competencies of IPCP (Interprofessional Education Collaborative Expert Panel, 2011).

Qualitative research suggests intensive care settings that have higher levels of interprofessional collaboration have lower mortality, shorter length of stays, lower intensive care readmission rate, less nurse-physician conflict, and lower job related stress for nurses (Curtis & Shannon, 2006). A practice setting that favors nurse-physician communication and collaboration is strongly related to better nurse and physician job satisfaction and even more importantly better end-of-life care for patients. Better communication between nurses and physicians leads to better satisfaction and positive outcomes for dying patients and their families (Puntillo & McAdam, 2006). Decision making is a major function and responsibility associated with end-of-life care practice. Florin, Ehrenberg & Ehnfors, (2006) conducted a study that investigated nurses' perceptions of the decision making. They found that nurses and physicians involved in the patients care reported that patients and their surrogates noted they would like to have more conversations with the nurses and have them provide more information. Researchers Tan, Lee, O'Connor, Peters & Komesaroff, (2013) reported findings from a six month study that end of life decisions were made 24 hours before death. However, when the decision making process actively involved healthcare professionals, the patient and family, for patients who were seriously ill and near end of life, the patient's wishes were identified and there was less risk of delaying end of life discussions in the illness trajectory. Active involvement in the decision making process about the treatment plan can set the

foundation for increasing understanding and respect of team members feelings, knowledge, and desire to participate more fully in end-of-life care and the decision making process (Yaguchi et al., 2005).

**Purpose:** The study will use the principles of Self-Efficacy Theory and Transformative Learning Theory as theoretical frameworks to explore nurses and physicians perceptions about IPCP in end-of-life care situations and examine factors associated with IPCP.

**Methods:** A cross-sectional, survey design will be used. The setting for this study will be multiple hospital intensive care units (ICUs, ie. step down ICU, MICU, SICU, CCU) in public and private hospitals that have the similar patient populations, including patients requiring prolonged mechanical ventilation (PMV). From the chosen intensive care units, a convenience sample of nurses and physicians who volunteer will be the participants for the research study. Inclusion criteria will be all full and part-time (at least 20 hours per week) registered staff nurses that provide bedside care and physicians who are responsible for managing the care of patients in the intensive care unit. Licensed practical nurses certified medical assistants, nursing assistants and technicians, social workers, nurse practitioners, and physician's assistants will be excluded from the study. This study is interested in the collaborative practices between the bedside staff nurse and the physicians treating these patients. Per diem status nurses and non-active physicians on the medical service of the unit will also be excluded. For this research study, a minimum of 110 participants with complete surveys will be needed for the study's sample.

A 87 item likert-like scale, internet web-based survey will be used to collect data. This study will use separate surveys for nurses and physicians. Quantitative data will be collected by using existing validated and reliable instruments that measure four independent and one dependent variable. The independent variables to be measured are professional valuing, attitudes toward collaboration, communication, and decision making. Self-reported independent variables that will be included are professional education and training and years of ICU experience. The dependent variable to be measured is interprofessional collaboration.

**Data Analysis:** Descriptive and inferential statistics will be used to analyze the data. Descriptive statistics will be used to describe demographic characteristics of study participants. A score will be generated for each independent variable and dependent variable. These scores will be examined for central tendency and distributions for the total sample and for nurses and physicians separately including amount of professional education and training and years of ICU experience. For continuous variables, the mean and standard deviation will be reported. An independent t-test analysis will be conducted to test differences in satisfaction with professional valuing, attitude towards collaboration, communication, decision making, and interprofessional collaboration between physicians and nurses. Pearson's correlation will be used to test the relationship between demographic characteristics, amount of professional education, years of ICU experience, professional valuing, attitude towards collaboration, communication and decision-making. Multiple regression analysis will be used to identify significant factors associated with IPCP.

**Possible Implications:** The results of this research can be used to determine problematic areas that impede IPCP and identify how nursing research, practice and education can impact and facilitate change in academic preparation of nurses and physicians and improve clinical practice for care of the dying patient. The core competencies identified for interprofessional education and collaborative practice as educational program objectives can be integrated into a health science curriculum for implementation into didactic and clinical content as well as continuing education for professionals. The evaluation of achievement of these core competencies would include the use of validated and reliable outcome measurements in a structured didactic learning environment. Implementation and evaluation of achievement of outcomes can be measured in simulated and clinical patient care settings which should include collaboration with nursing and medical disciplines. The goal of this research is to add to the body of knowledge about educational and practice measures that could be implemented into a health science curriculum to improve how professionals engage in IPCP as well as utilizing IPCP as a foundation to improving knowledge and care of the dying patient.

### Evaluating Interprofessional Teamwork during a Large Scale Disaster Simulation

---

*Karen Ainsworth Landry, PhD, RN, USA*

*Courtney West, PhD, USA*

*Lori Graham, PhD, USA*

#### Purpose

to evaluate interprofessional teamwork using three instruments to measure IPE Core Competencies during a large scale disaster simulation.

#### Target Audience

healthcare professionals (nurses, nurse practitioners, nurse educators)

#### Abstract

Healthcare teams are essential today for positive patient outcomes (Zwarenstein, Goldman, Reeves, 2009). Currently, educators face the difficult task of incorporating as many interprofessional education (IPE) activities as possible to prepare students for the 21st century healthcare. IPE Core Competencies have helped define our efforts. However, finding instruments to measure those simulations are just as important.

In 2013, a Texas university's IPE team came together to develop three instruments to measure IPE student simulations. Specifically, these instruments measured IPE experiences during Disaster Day (an IPE simulation event held each year). Each instrument captured the IPE Core competencies; however, each instrument evaluated a different area. The three instruments included:

1. IPE Team Observation Instrument
2. Standardize Patient Team Evaluation Instrument
3. IPE Team's Perception of Collaborative Care Questionnaire

In 2014, IRB approval was obtained to use the instruments to measure IPE activities during the 2014 Disaster Day Simulation (over 500 participants). Data was collected and analyzed. There were statistically significant differences ( $p < 0.05$ ) when comparing team perceptions and standardized patient perceptions. The findings from this study can be used to further our knowledge in the evaluation process of IPE teams and ultimately improve patient outcomes.

### Practice Model for Interprofessional Teaching-Learning of Anatomy at a Higher Education Institution in South Africa

---

*Belinda Scrooby, PhD, MCur, BCur, RN, South Africa*

#### Purpose

The purpose of this presentation is to share my practice model for interprofessional teaching-learning of anatomy. This practice model is unique as it was the first research study conducted on the interprofessional teaching-learning of anatomy at a higher education institution in South Africa without a medical school/faculty.

#### Target Audience

The target audience of this presentation is health educators as well as the clinical practice interested in collaboration and working towards interprofessional teaching-learning.

#### Abstract

The teaching-learning of basic medical sciences generally, and anatomy particularly, have been “diluted” in the health science curricula globally during the past two to three decades. This reduction in anatomy teaching-learning has started showing the consequences in clinical practice, patient care, and health science education (Memon, 2009:125). Turney (2007:104) supports this, saying that between 1995 and 2000, there was a seven-fold increase in claims associated with anatomical errors. This results in public and media pressure for doctors and other health care practitioners to have a sound knowledge of anatomy.

The main aim of this research was to develop a practice model for interprofessional teaching-learning of anatomy at a higher education institution in South Africa to facilitate deep-holistic lifelong learning. The research design utilised a theory-generative, quantitative and qualitative design (Brink, 2006:10-11; Mouton & Marais, 1996:159) to explore (Mouton & Marais, 1996:45) and describe (Mouton & Marais, 1996:46) teaching-learning of anatomy in a specific context (Klopper, 2008:68).

The study was conducted in two phases with two steps under each phase, including three objectives. Phase one consisted of the identification of concepts, description and definition of the three objectives. Step 1 under phase one consisted of identifying main and related concepts and this process was completed for objectives one and two, namely to assess interprofessional students' (IPS) and peer group's (PG) opinions on the teaching-learning approach to anatomy; and to explore interprofessionals' perceptions of the importance of anatomy in clinical practice. All data gathered, synthesized and concepts identified from objectives one and two lead to step 2 of phase one, that is to say concept descriptions and definitions that were completed through objective three, which was to describe a conceptual framework for interprofessional teaching-learning of anatomy.

Phase two (model construction), step 1 (to construct relational meaning of main and related concepts) and step 2 (model construction through theory synthesis) was completed from the concept descriptions and definitions identified in phase one. This practice model will be implemented in the health sciences faculty of the higher education institution where the researcher is working.

### Learning Methods Related to the Design of Learning Environments for Clinical Mentors, as Viewed from the Perspective of Educational Supervisors

---

*Yoshiko Doi, MS, RN, Japan*  
*Yasuko Hosoda, PhD, RN, Japan*  
*Mitsuyo Nakahashi, MS, RN, Japan*  
*Akiko Nakaoka, PhD, RN, Japan*  
*Kaori Ikeuchi, MS, RN, Japan*

#### Purpose

The purpose of this presentation is to convey a learning methods related to the design of learning environments for clinical mentors, as viewed from the perspective of educational supervisors in japan.

#### Target Audience

The target audience of this presentation is nurse educators.

#### Abstract

**Aim:**To identify learning methods related to the design of learning environments for clinical mentors, as viewed from the perspective of educational supervisors in Japan.

**Background:** In the healthcare environment, it has recently become important to train clinical mentors to support nursing students and newly graduated nurses. Learning environment design is a process of designing a learning community and is classified into organization, activities, and tools.

**Methods:** Seventy-four educational supervisors (staff responsible for planning and managing nursing education programs provided by hospitals) from 89 hospitals in Japan participated in the survey. The participants chose their preferred learning methods for clinical mentors from "learn from experts," "learn with peers," and "learn on my own" for 36 items related to the learning environment design (according to organization, activities, and tools), and the respective learning method ratios of respondents were calculated using descriptive statistics.

**Results:** In organizational design, at least 70% of the educational supervisors chose the "learn from experts" method for mental health countermeasures, structure of the nursing education system, management of the organization, preparation of the education system, and guidelines for nursing ethics, and the "learn with peers" method for cooperation between instructors. In activity design, at least 70% of the educational supervisors chose the "learn from experts" method for coaching techniques, logical thinking, use of learning theory, and education evaluation techniques. In tool design, at least 70% of the educational supervisors chose the "learn from experts" method for data analysis and the "learn with peers" method for preparation of a checklist. The proportion of educational supervisors who chose the "learn on my own" method did not reach 70% for any of the items.

**Conclusions:** As a preferred learning method for clinical mentors, the "learn from experts" method was chosen most frequently, which was particularly noticeable in organizational and activity design. In the future, clinical mentor education programs should take these learning methods into consideration in learning environment design.

### The Effects of the Clinical Learning Environment on Japanese Nursing Instructors' Support in Facilitating Students' Metacognition: A Comparison between University and Vocational School Instructors

---

*Yasuko Hosoda, PhD, RN, Japan*  
*Yoshiko Doi, MS, RN, Japan*  
*Yukari Katayama, PhD, RN, Japan*  
*Mayumi Negishi, MPH, BS, RN, USA*

#### Purpose

The purpose of this presentation is to describe the effects of the clinical learning environment on nursing instructors' support in facilitating students' metacognition between university and vocational school instructors in Japan.

#### Target Audience

Nursing instructors, clinical nursing staff and administration, nursing students, and researchers interested in nursing education will benefit from this presentation.

#### Abstract

**Aim:** This study aimed to compare university and vocational school instructors regarding the effects of the clinical learning environment on Japanese nursing instructors' support in facilitating students' metacognition.

**Background:** Metacognitive knowledge and activities are valued in clinical learning. The clinical learning environment helps determine the quality of the clinical experience of the nursing student. It is necessary to investigate how educational activity can promote students' metacognition in the clinical learning environment.

**Methods:** Participants were 145 university instructors (67.1% response rate) and 110 vocational school instructors (56.4% response rate) from nursing programs in Japan. The Clinical Learning Environment Diagnostic Inventory—which measures the affective, perceptual, symbolic, behavioral, and reflective aspects of the clinical learning environment—and a questionnaire regarding support that facilitates students' metacognition—consisting of items to measure metacognitive knowledge and metacognitive activities—were administered. The data were analyzed using IBM SPSS Statistics to compare the clinical learning environment and the support to facilitate students' metacognition between two groups (university instructors and vocational school instructors). Simultaneous analysis of multiple groups was conducted between the two groups using AMOS. The study was approved by the Ethical Review Board of School of Nursing, Osaka Prefecture University, Japan.

**Outcomes:** The results indicated that university instructors were significantly higher than the vocational school instructors in all subscales for the Clinical Learning Environment Diagnostic Inventory. The university instructors had higher values of support that facilitates students' metacognitive knowledge for students' problem solving compared to the vocational school instructors. In structural equation models with latent variables, "support that facilitates students' metacognitive knowledge" was influenced by the "clinical learning environment" as perceived by the instructors, and "support that facilitates students' metacognitive activities" was affected by "support that facilitates students' metacognitive knowledge." Multiple-group structural equation modeling between the two groups was tested with equality constraints placed on each path coefficient. The fit indices for the hypothetical model were goodness-of-fit index = .904, adjusted goodness-of-fit index = .867, and root mean square error of approximation = .037. The standardized parameter estimates of path coefficients indicating degrees of influence of the "clinical learning environment" on "support that facilitates students' metacognitive knowledge" were .42 for the university instructors and .56 for the vocational school instructors. The critical ratio for the difference

between these parameters for the two groups was not significantly different. The path coefficients (standardized parameter estimates) of “support that facilitates students’ metacognitive knowledge” on “support that facilitates students’ metacognitive activities” were .88 for the university instructors and .96 for the vocational school instructors. The critical ratio for the difference between these parameters of the two groups was significantly different ( $P < 0.05$ ).

**Implications:** Results revealed that the “clinical learning environment” affected the instructors’ “support that facilitates students’ metacognitive knowledge,” which in turn affected the “support that facilitates students’ metacognitive activities.” These effects were seen in both university instructors and vocational school instructors. In particular, the vocational school instructors seemed to have a more consistent effect on the clinical learning environment regarding their support to facilitate students’ metacognition. It is assumed that enhancing the clinical learning environment will lead to the instructors’ support facilitating students’ metacognition.

### Methods of Sharing Clinical Decisions within Nursing Teams to Improve the Quality of Nursing

---

*Yukari Katayama, PhD, RN, Japan*  
*Yasuko Hosoda, PhD, RN, Japan*  
*Etsuyo Sonoda, MS, RN, Japan*

#### Purpose

The purpose of this presentation is to clarify how clinical decisions made by expert nurses in Japan are communicated to nursing teams in order to improve the quality of nursing.

#### Target Audience

The target audience of this presentation is clinical nurses and nurse educators.

#### Abstract

**Aim:** To clarify how clinical decisions made by expert nurses in Japan are communicated to nursing teams.

**Background:** Nurses' clinical decisions are important for maintaining the quality of nursing care and for preventing medical errors. Furthermore, in medical settings where treatment is being given on a continuous basis, it is extremely important how clinical decisions by nurses are communicated to nursing teams who support patients 24 hours a day. Nurses' decisions are shared with the team through methods such as record making and oral communication. However, varying levels of competence exist among nurses, and not all communications can be publicly and explicitly confirmed. Accordingly, in such situations it is assumed that outstanding nurses use their ingenuity to communicate clinical decisions to nurses within the team so that important clinical decisions can be faithfully shared. These are experienced daily by nurses, and shedding light on these daily experiences can help to integrate practical nursing knowledge in the area of clinical judgments in decision-making in nursing teams.

Compared to international standards in leading countries, the ratio of nurses to patients in Japan is extremely low. New standards for nurse allocation were established in 2006, but there are still particularities, the nurse to patient ratio during night shifts has remained at about 1 to 20. On the other hand, the mean length of inpatient stay has decreased in recent years; specifically by more than half over 20 years, from 20 days down to 10. Until now, it was possible for nurses to understand the situation of patients even when nurses were few in number, due to the extremely long period of stay, but this is now very difficult. Attrition rates of nurses in Japan have always been high, and there are big gaps in nurses' skills and experience, including the issue of a lack of nurses in their 30s. The number of nursing assistants is being increased, but in nursing education and in nurses' beliefs, it remains the case that the daily help for patients is perceived as work for nurses to do directly. In Japan, the difficulties of training new nurses and the decline of clinical decision-making abilities of nursing teams are critical issues. This study offers insights into ways in which expert nurses in Japan are striving to support medical treatment and nursing.

**Methods:** Participants were expert nurses who were directly engaged in patient care and who belonged to nursing teams working on a shift system. Data were collected through semi-structured interviews. In the interviews, nurses were asked to speak about how they would communicate important clinical decisions to other nurses in their team when making such decisions when providing nursing care by looking at specific nursing case examples. Analysis involved transcribing interviews verbatim, coding the actions taken by expert nurses when communicating to other nurses, and categorizing codes by examining similarities and differences. The study was approved by the ethical review board of Kyoto Tachibana University.

**Results:** Interviews with 8 nurses from 3 hospitals were analyzed. Mean duration of interviews was 75 minutes. The mean length of nursing experience of the analyzed participants was 20 years. All nurses had work experience in at least 3 wards and half held positions of rank equivalent to deputy head nurse.

From the data, a total of 27 codes were obtained as actions taken by nurses when communicating to team members. These codes were subsequently condensed into 6 categories. Specifically, these categories were:

Avoid proceeding on decisions made by oneself or one other single person”, for example, ‘I informally consult others orally about my decision’ or ‘I check many times as we go along rather than making a final single decision’; “Integrate each individual staff’s actual practice as it is”, for example, ‘I watch carefully what happens when someone else makes a decision different from mine’ or ‘I anticipate doctors’ ideas and actions when communicating nurses’ decisions’; “Proceed in accordance with the decisions of superior nurses”, for example, ‘I actively seek the decisions of superior nurses’ or ‘I make an effort to go and confirm things face-to-face with superior nurses rather than relying on written records’; “Take experts’ decisions as opportunities to learn”, for example, ‘I show my decisions as examples for other nurses’ or ‘I communicate in consultation with predetermined people to make it easier to consult’; “Create an environment in which the observations and awareness of new nurses are respected”, for example, ‘I try to make it possible for new nurses to express their intuitive ideas without hesitation’ or ‘I get nurses of lower rank to just communicate the facts of what they have observed to reduce the burden of decision-making’; “Support the desire to cooperate with each other”, for example, ‘I place myself between new and veteran nurses and interpret and communicate what both sides are saying’ or ‘Through communication, we share the situation of the patient and the suffering involved in medical treatment’. The interpretation drawn was that at the core of these categories is “maintaining harmony in the nursing team in order to maintain better care”.

**Discussion:** Expert nurses used a wide variety of methods to communicate their own decisions to other nurses while taking into consideration the competence and position of each individual nurse. In concrete terms, expert nurses respected the position of each nurse, and created a space in which each nurse could participate naturally by distinguishing each stage of the judgment process from observation to practice, employing various methods to maintain team harmony. It seems that expert nurses do not merely communicate the results of decisions, but place emphasis on ensuring that each nurse is involved in the decision-making process. Also, it seems that expert nurses do not just communicate the decision content based on knowledge and information, but also take into account others’ emotions when communicating.

In a shift system, it is not possible for nurses to directly cover gaps in competence among nurses in charge of other shifts at care settings, and thus nurses in charge of each shift are required to maintain some tension and autonomy. In order to connect decisions made to actual care in practice implemented by nurses in charge to the maximum extent, expert nurses encourage deep understanding that enables other nurses to take action enthusiastically. However, this remains at the individual level of effort made by expert nurses, and organizationally is an insecure nursing practice.

## SCI PST 1 - Scientific Poster Session 1

### Missed Nursing Care in Hospitalized Patients in Two Health Institutions

---

*Maria Guadalupe Moreno Monsivais, Mexico*  
*Ma. Guadalupe Interrial Guzmán, MCE, Mexico*  
*Sofía Cheverría Rivera, MAAE, Mexico*  
*Leticia Vázquez Arreola, Mexico*

#### Purpose

Disseminate findings of missed nursing care research in hospitalized patients from two health institutions, where missed care and its contributing factors were determined from the nurses' and patient's perception.

#### Target Audience

Nursing staff that work in different health institutions, nursing administrators, nursing leaders, teachers, and nursing students.

#### Abstract

**Introduction:** Patient safety is a priority worldwide and the effectiveness of health systems in different countries is being reconsidered (WHO, 2010). The aim is to prevent patient injury as a result of the care provided or omitted by health personnel. In this care process all health professionals are involved; however, nursing stands out because of its close and continuous contact with patients (Kalisch, Landstrom & Hinshaw, 2009). Therefore, nursing administrators face the challenge of ensuring that their staff, in the different health institutions, both public and private, provides quality care and safety.

It is essential that nursing staff perform all care activities that their assigned patients need to achieve quality and safety; when activities are not performed this is called missed nursing care or errors of omission (Kalisch, 2006; Kalish, Tschannen & Lee, 2012), which favors the presence of harm to the patient, and increases costs and hospital stay (Ausserhofer, Zander, Busse, Schubert, De Geest, Rafferty et al. 2014).

The theoretical basis of this study is the missed nursing care model (Kalisch, 2006), where the different types of nursing that are missed or omitted during care are identified; likewise, organizational factors that contribute to missed care are presented. The most common are attributed to human resources, material resources, and communication (Ball, Murrells, Rafferty, Morrow & Griffiths, 2014). Therefore, this study aims to determine missed nursing care and their contributing factors from the perception of nurses and patient in two health institutions: one public and one private. This study contributes to nursing knowledge, mainly because it includes the perception of the patient and the nursing staff, who are the main individuals involved in care. These results will provide a basis for nursing administrators to design and implement effective strategies that improve the quality and safety of care.

**Method:** The study design was descriptive (Grove, Burns & Gray, 2013). The population corresponded to nurses and patients hospitalized in two health institutions, one from the public sector and another from the private sector in Monterey, Nuevo León and San Luis Potosi, San Luis Potosi, Mexico, respectively. Thirty-two nurses from the public hospital and 160 from the private hospital participated. Patients were randomly selected, 180 from the public hospital and 160 from the private hospital. A patient assigned to each of the participant nurses was considered. Data collection was done by applying the MISSCARE Nursing Survey (Kalisch & Williams, 2009) to nurses and patients. This survey consists of 64 items in three sections: demographic and labor data of nurses, missed nursing care, and reasons for missed nursing care. This study complies with the ethical guidelines set forth in the Regulations of the General Law on Health in Matters of Health Research (Secretaría de Salubridad y Asistencia, 1987). For data analysis, descriptive statistics were used. Characteristics of the participants were profiled, indices were designed with values from 0 to 100 for each of the dimensions of care as well as factors contributing to missed care; a higher score meant greater care (the difference between the score obtained and the

maximum, which equals 100, corresponding to missed nursing care) and greater significance for the reason for missed care.

**Results:** Regarding the characteristics of nurses in the two institutions, women predominated in the private hospital 86.3%, and 81.3% in the public hospital; regarding age range, in the private hospital a range of 18-25 years predominated, while in the public hospital range of 31-35 years was reported. With regard to the level of education, in the private hospital 53% reported being a general nurse; in the public just over half had bachelor's degree training.

In relation to patient characteristics, in the two institutions, similar results in gender were found: in the private institution women predominated with 55% and in the public institution it was 47.8%. Regarding level of education, there was a higher percentage of university education in the private institution (50% in the private vs. 18.7% in the public institution). In terms of age, in the private institution more than half of the participants reported an age over 51 years; in the public institution and age range of 47-56 years predominated.

In both institutions, the patient perceived greater omission in relation to nursing care. The greatest omission from the patient's perspective corresponded to discharge planning and patient education (mean = 44.00, SD = 25.86 public institution; mean 55.00, SD = 28.38, private institution) and the lowest omission in ongoing care evaluations (mean = 20.74, SD = 3.68 public institution; mean = 11.07, SD = 0.30 private institution).

The nurses perceived greater omission of basic care interventions (mean = 41.52, SD = 17.03, public institution; mean = 19.18, SD = 4.60, private institution) and less omissions in ongoing care evaluations (mean = 17.78, SD = 13.73, public institution; mean 5.44, SD = 0.64, private institution). The nursing staff of the public institution perceived greater omission in care.

Regarding the factors that contribute to missed nursing care according to the perception of nurses in both the private and the public institution, those related to human resources predominated (mean = 80.67, SD = 17.06, private institution; mean = 82.46 SD = 12.94, public institution), followed by material resources (mean = 69.72, SD = 23.45, private institution; mean = 73.17, SD = 17.92, public institution) and communication factors (mean = 65.16, SD = 21.55, private institution; mean = 65.62, SD = 19.45, public institution).

Regarding the perception of the patient, while in the private institution missed care was attributed only to aspects of human resources, in the public institution they perceived human resources as the first problem, followed by material resources and communication.

**Conclusions:** The study results helped identify the care that is missed or omitted during hospitalization as well as factors related to its omission. It is noteworthy that greatest omission of care is perceived by patients in both institutions and by the nurses in the private institution. The findings of the study helped identify errors of omission in a complementary way between the parties involved in the care process. This knowledge allows the nursing administrator, first, to propose action strategies aimed at reducing these areas of opportunity and promote continuity of care with a positive impact on the quality and safety of care; moreover, it strengthens aspects related to human resources, a key factor that contributes to missed care.

### Chinese Nursing Students' Perceptions of Case Study Use as a Teaching and Learning Strategy

---

*Shirleatha T. Lee, PhD, MSN, BSN, RN, CNE, USA*  
*Lin Zhan, PhD, MSN, BSN, RN, FAAN, USA*

#### Purpose

The purpose of this presentation is to examine Chinese nursing students' perception of the use of case studies in nursing education. Lecture serves as the primary method of teaching in Chinese nursing schools. Case studies incorporated with lecture help students become active learners and relate topics to real world situations.

#### Target Audience

The target audience of this presentation are nurse educators and researchers interested in leading and transforming nursing education globally to prepare professional nurses to meet healthcare needs.

#### Abstract

**Background:** Chinese nursing education is in a process of transformation aimed to prepare professional nurses to meet the demands of health care. Lecture often serves as the primary method of teaching in Chinese nursing schools. However, lecture is passive and prevents critical thinking. Case studies when incorporated with lecture can help students to become active learners and relate topics to real world situations. The purpose of this study was to examine Chinese nursing students' perception of the use of case studies in nursing education.

**Methods:** Data analysis consisted of associate (n = 21) and baccalaureate (n = 83) undergraduate nursing students in China (N = 104). Students ranged in age from 19- 25 years and 97% were female. Students were presented with case study scenarios in class and were required to work with group members to solve and answer questions, present group findings, and engage in open dialogue. Following the completion of the course students were administered a 5-point likert survey (Strongly Agree=5; Agree=4; Neither Agree nor Disagree=3; Disagree=2; Strongly Disagree=1) that assessed the students' perceived satisfaction with the use of case studies in the classroom setting. The survey was anonymous and no identifying information was collected. Descriptive statistics were calculated using SPSS v. 17.0.

**Results:** The results indicated students displayed high satisfaction with the use of case studies. Students indicated working with their classmates on clinical case studies helped their understanding ( $4.66 \pm 0.51$ ); will help them to be successful on the national nursing examination ( $3.98 \pm 0.76$ ); and will help them to be better nurses ( $4.56 \pm 0.58$ ). Students also indicated they could apply what they learned ( $3.85 \pm 0.62$ ) and they gained new knowledge to use in nursing ( $4.44 \pm 0.58$ ).

**Conclusion:** Chinese nursing students had positive perceptions and were highly satisfied with the use of case studies as a teaching and learning strategy. Globally, as nurses are faced with more complex issues, challenging and acutely ill patients, advancing technology and ethical dilemmas it is important that students are equipped and presented with teaching and learning strategies that enhance learning and improve patient outcomes.

### Minimizing Strain: How Nurses Sustain Their Image as "Good Nurses"

---

*Sherry Dahlke, PhD, MSN, BSN, BVeD, RN, CGN(C), Canada*

#### Purpose

The purpose of this presentation is to explain how nurses are practicing with an aging population within healthcare systems that contribute to sub-optimal care and still sustain their image of themselves as "good nurses."

#### Target Audience

The target audience would be practicing nurses, academics, leaders, and educators.

#### Abstract

Older adults are the population most likely to access healthcare due to an increasing incidence of chronic illnesses with age. As a result, nurses are managing the care of an older population within healthcare institutions which perpetuate societal ageist perspectives. Moreover, basic nursing education does not adequately prepare nurses to care for an aging population and little is known about how nurses are managing care of hospitalized older adults. A grounded theory study guided by symbolic interactionism examining a nursing perspective of caring for hospitalized older adults provides valuable insights into how nurses are practicing with an aging population. Nurses are prioritizing keeping their patients safe at all costs in institutions; they perceive the increased care requirements of older patients are under-recognized and inadequately resourced. To cope, they are re-defining nursing actions they perceive as morally distressing in order to preserve their image of themselves as "good nurses," who are working within healthcare systems that are inadequately supporting them in providing what they define as "good care" to their older patients. Much can be learned about how to improve care of hospitalized older adults by listening to nurses' perspectives about how healthcare systems are contributing to sub-optimal older adult care and engaging nurses in conversations about their nursing practices that are ethically distressing.

### The Relationships of Conscience, Ethical Climate and Moral Distress in Registered Nurses Working in the Acute Care Setting

---

*Theresa Kyzar, MSN, MBA, RN, USA*

#### Purpose

The purpose of this presentation is to describe an investigation on nurse attitudes regarding the use of conscientious objection and their perceived rights to refuse to participate in morally objectionable procedures. Factors leading to an intent to turnover or changing clinical specializations due to moral distress will be discussed.

#### Target Audience

The target audience of this presentation are clinical nurses, nurse leaders and/or administrators and academic faculty.

#### Abstract

**Background/Significance:** Health care providers, including nurses, are often faced with ethical dilemmas on a daily basis and experience conflicts between their professional oath, a desire to care for the suffering, and a fiduciary duty to serve when weighed against the ever expanding body of legal and regulatory requirements. This is compounded further when resulting moral dilemmas ensue because of factors involving: quality of life issues, deciding when, or if, life should be terminated and determining how best to honor a patient's or family member's health care decisions—which may inevitably conflict with the moral or religious beliefs of the care provider. Nurses often struggle with how to balance their own personal beliefs with patient care decisions in various work environments. They are responsible for multiple aspects of the healthcare delivery process. Oak (1996) discusses that nurses are accountable to the facility that employs them, to the physician with whom they work, to the patient whom they provide care, to the family to whom they must respond, to the nursing profession which they belong, and to the familial, cultural, and religious communities that shape their sense of identity. In each of these areas, it is possible for moral conflicts to arise causing the nurse to encounter multiple ethical challenges and a stress of conscience (Corley & Selig, 1994; Cronqvist, Theorell, Burns, & Lutzen, 2004; Corley, 1995; Kelly, 1995; Glasberg, Eriksson, & Norberg, 2007; Peter, Macfarlane, & O'Brien-Pallas, 2004).

In general, the rights of nurses consist of human and civil rights, rights based on health care legislation, rights based on professional ethics, and earned rights (Kangasniemi, Viitalahde, & Porkka, 2010, p. 630). Currently, they, along with their physician counterparts, possess their right to conscientious objection to procedures or services which they may deem as morally objectionable. Such protections exist due to the Church Amendment, also known as the "Conscience Clause", which was passed in 1973 by the U.S. Congress (Wicclair, 2011). While the right to conscientious objection was initially aimed at protecting physicians and nurses who morally objected to participation in abortion services, it has expanded over the years to include other factors of reproductive rights such as late term abortion, stem cell research, and end of life care issues associated with withdrawal of hydration and nutrition, euthanasia, assisted suicide and the discontinuance of other technological life-saving medical treatments (Curlin, 2007; Lindsay, 2007; Ersek, 2005; Epstein, 2010 ).

The national implication regarding the use of conscientious objection remains an unsettled area of bioethics (Pope, 2010, p. 11) and an intense national debate is occurring. Recently the issue regarding a health care provider's right to conscientious objection has come under greater scrutiny (Roberts, 2014; Pate, 2009; Rienzi, 2012; Kane, 2009; Dresser, 2005; & Lindsay, 2007) and some have called for its discontinuance based on views regarding: 1) the need for fair and equitable care (Savelescu, 2006; Card, 2007; Brock, 2008; Savelescu, 2007; & Meyers & Wood, 1996), 2) addressing the needs of the medically indigent, and 3) to remove the potential access barriers to care. Another concern is that changes in professional roles, referred to as "task shifting" or "task sharing" (such as what transpires when a nurse transfers the care of a patient to another nurse due to his/her moral objections) have frequently not

succeeded in the past, sometimes compromising health care quality and safety (Crisp & Chen, 2014, p. 955).

Registered nurses are experiencing ethical dilemmas with greater regularity in the health care setting and the potential for being placed in situations where the nurse's conscience may be compromised or placed at risk due to a patient fidelity requirement is increasing. A few research studies have examined the general role of stress of conscience in nurses primarily in the critical care settings (Caitlin, Volat, Hadley, Bassir, Armigo, et al, 2008; Glasberg, Eriksson, & Norberg, 2007; van Zuuren & van Manen, 2006; Ferrell, 2006; DeVillers & DeVon, 2012; Wiegand & Funk, 2012 ) and its effect on burnout and moral distress. However, research to date has not provided a clear picture regarding how nurses view the importance of their options to claim a conscientious objection to certain care procedures that they may deem as morally objectionable. Moreover, the possible implications of what nurses might choose regarding their career status or specializations if such rights were modified or even possibly eliminated in the future are not well understood.

**Methods:** The purpose of this research design was to gather quantitative data to determine what, if any statistical relationship exists between the use of conscientious objection, moral distress and intent to turnover among acute care nurses working in obstetrical and critical care departments. Thus, a quantitative non-experimental correlational study design using a random sample of 500 staff nurses working full time was chosen. Corley's Moral Distress Theory and the Stress of Conscience Model were used as the framework design. Using a Pearson's correlation coefficient, four primary research questions were used to guide this study. Preliminary results reveal a higher correlation on the importance of using conscientious objection by nurses working in the obstetrical setting than in the critical care setting. A significant relationship exists among nurses who describe a high importance to religious or spiritual practices and the use of conscientious objection. Moral distress was found to be high in both clinical settings. Data showed that nurses (>70%) in this sample did not tell their employers about their views on conscientious objection during moral dilemmas as prior to their hiring for employment.

**Conclusions and Implications for Practice:** Nurses want to know how to maintain fidelity to patients and their families, follow orders from their physician colleagues, work in a family-centered interdisciplinary team, yet be able to follow their consciences when the care ordered appears to be harmful (Caitlin et al, 2008, p. 106) or involves the ending of life. However, the study findings could greatly influence how the professional nursing community views the challenges which may be associated with conscientious objection and moral distress. It is hoped that the results will offer insight into the registered nurses' attitudes about the importance of conscientious objection and whether there may be a causal link to staff retention and turnover for healthcare organizations. Nursing turnover has a profound fiscal impact on healthcare organizations in terms of associated costs, perceptions of quality of care, and places a heightened pressure on nurses to work in an increasingly fractured and unsatisfactory environment (Lee, Dai, Park & McCreary, 2013; Hairr, Salisbury, Johannsson & Redfern-Vance, 2014). With increased technological demands, increased patient acuity, and the complex phenomena of the ongoing nursing shortage, retaining experienced nursing staff at the bedside is of the utmost importance (Aiken, Clark, Sloane, Sochalski & Silber, 2002). The findings provide empirical data on when nurses may opt to change certain clinical specializations where ethical dilemmas are becoming more common instead of choosing to leave their employer or the nursing profession.

### Elderly and the Use of New Technologies as a Communication Support

---

*Ana Patricia Salas-García, RN, Mexico*

*Martha Alicia Magallanes Monrreal, RN, Mexico*

*Jose Gonzalez Tovar, PhD, Mexico*

*María Magdalena Delabra Salinas, RN, Mexico*

#### Purpose

The purpose of this presentation is to habilitate elderly for using new technologies.

#### Target Audience

The target audience of this presentation are those reserarchs and clinical nurses interested in educating elderly for preventing ageing ill.

#### Abstract

In today's society the New Technologies of Information and Communication (NTICs) , impact on Nearly All Tasks Everyday Population . NTICs provide the ability to understand How does new High Technology works and how it can be used . The NTICs support the independent life for older adults to facilitate the interaction of users through the Use of spoken language, writing and computational vision including bodily gestures. Elderly who gain the knowledge and skills of New Technologies on Daily Life Have Another Alternative to communicate, interact with relatives or friends, establish and expand networks of social support and thus promote their self-esteem. Using Internet provides speed Communication for all network computers arrival , the People Have the Opportunity to Be Always Available Anywhere and any Moment . Elderly Digital Literacy includes Knowledge of Computer Hardware , Software , Internet use , cell phones, personal digital assistant ( PDA ) and Other Digital Devices.

Objectives: To evaluate and promote the potential of older adults, facilitate learning and inclusion of NTICs. To identify the ederly NTICs use , implement an intervention that contemplates enabling the NTICs Elderly use.

Methods: A quasi- experimental Quantitative descriptive correlational study. Sampling Convenience by older adults attending a consultation at "Centro de Salud Girasol" in Saltillo, Coahuila.

Results: Results will be measured by Statistical Package for Social Sciences version 21 (SPSS) , Charts will be used for sociodemographic variables , and Pearson correlation coefficient to establish the relationship between the variables of study .

## SCI PST 2 - Scientific Poster Session 2

### Interprofessional Teams Integrate Spirituality into Patient Care: Lessons Learned

---

*Joanne K. Olson, PhD, RN, FAAN, Canada*  
*Suzette Brémault-Phillips, PhD, OT, Canada*  
*Pamela Brett-MacLean, PhD, MA, BA, Canada*  
*Doreen Oneschuk, MEd, MD, Canada*  
*Shane Sinclair, PhD, MDiv, BA, Canada*

#### Purpose

The purpose of this presentation is to share findings of a study conducted to determine how healthcare professionals experience the incorporation of spiritual conversations in their patient care and to identify facilitators and barriers to incorporating spirituality into person-centered care. Lessons learned by the interprofessional researcher team will be shared.

#### Target Audience

Healthcare professionals and researchers interested in incorporating spirituality into clinical practice.

#### Abstract

**Background:** Care of advanced cancer patients and other patients with life limiting illnesses frequently focuses on the physical aspects of disease management. Individuals are inconsistently invited to share their spiritual and psychosocial needs, or discuss how their lives have changed as a result of their circumstance. And yet, seriously ill patients have indicated that the possibility of continued spiritual suffering adds to the distress associated with their illness. Spirituality, broadly defined as that which gives meaning and purpose to life, often is a central issue for patients at the end of life or those dealing with cancer and chronic illness. Growing evidence has demonstrated that spirituality, whether expressed through religious or secular means, is an important component of patient care that affects patient healthcare decision making and healthcare outcomes. Despite a strong evidence base that spirituality is important to patients, clinicians are sometimes reluctant to make spiritual care a core component of patient care. Some healthcare professionals are concerned that such discussions require a substantial time commitment and others feel ill prepared to address spiritual needs.

**Purpose:** This research aimed to (1) explore the value of including spiritual conversations in routine patient care; (2) identify facilitators and barriers to incorporating spirituality into person-centred care; and (3) determine ways healthcare professionals can effectively incorporate spirituality into person-centered care.

**Setting:** Three inpatient hospital units in Alberta, Canada served as the setting for this research: a hospice unit, a tertiary palliative care unit, and a geriatric assessment unit.

**Methods:** Healthcare professionals (physicians, registered nurses, nurse practitioners, social workers, occupational therapists, and physical therapists) were invited to participate in this descriptive exploratory research project. Nine (9) health care professionals (1 physician, 4 registered nurses, 1 nurse practitioner, 1 social worker, 1 occupational therapist and 1 physical therapist) agreed to participate. After a half-day educational event, they intentionally integrated spirituality into their care of 24 patients who had consented to be part of the project. Data regarding the experiences of the healthcare professionals and the outcomes of their care were gathered during focus groups and chart reviews.

**Results:** Findings indicate positive impacts at the organizational, clinical/unit, professional/personal and patient levels when healthcare professionals include spirituality in patient care. The findings specifically focus on strengths, challenges, and opportunities regarding the inclusion of spirituality in patient care at the various levels within the healthcare organization. Recommendations for practice and further research are offered and the challenges of conducting this research will be discussed to inform future research projects in this area.

**Funded by:** Covenant Health, Edmonton, Alberta.

### Multidisciplinary Team Response to Support Survivors of Mass Casualty Disasters

---

*Lavonne M. Adams, PhD, RN, CCRN, USA*

*Susan M. Weeks, DNP, MSN, BSN, RN, CNS, FNAP, FAAN, USA*

*Lisa Smith, MLS, USA*

#### Purpose

The purpose of this presentation is to describe a systematic review undertaken to synthesize evidence about the effectiveness of multidisciplinary response teams used to support individuals who survive a mass casualty disaster.

#### Target Audience

The target audience of this presentation is any health professional interested in methods of providing support for individuals who survive a mass casualty disaster.

#### Abstract

Background and Purpose: Disaster response begins at the local level, but when needs are immense, promoting effective care and recovery for survivors may require activation of multiple systems from other parts of the country or even the world. Mass casualty disasters pose unique challenges, as survivors may be dealing not only with their own physical and/or psychological trauma, but also with the loss of family members and friends (Adams, Smith, & Weeks, 2013). One technique humanitarian response organizations may use to integrate services is formation and deployment of multidisciplinary response teams. Team members include individuals trained to respond to and provide referrals for the physical health, mental health, and financial needs of disaster survivors; additionally, the Integrated Care Team (ICT) model utilized by the American Red Cross may include individuals trained to respond to spiritual needs (Hassmiller, Adams, & Weeks, 2013). The poster describes a systematic review undertaken to synthesize evidence about the effectiveness of multidisciplinary response teams used to support individuals who survive a mass casualty disaster. Specific objectives of the review are to identify effectiveness of multidisciplinary team response on the 1) resolution of immediate needs and 2) support perceived by survivors of mass casualty disasters.

Design: Systematic review

Inclusion criteria: Studies published between 1995 and 2012 evaluating effectiveness of multidisciplinary response teams on the well-being of survivors of mass casualty disasters. These dates were selected because the ICT model was formalized following the April 1995 bombing of the Alfred P. Murrah Federal Building in Oklahoma City, Oklahoma, USA.

Methods: The systematic review involves a three-step search strategy: 1) An initial limited search of MEDLINE, CINAHL, PsycINFO, EMBASE, and SocIndex, followed by analysis of text words in the title and abstract and index terms describing the article; 2) A second search using identified key words and index terms in the same data bases, with the addition of MEDNAR and Sociological Abstracts; and 3) a search of the reference list of all identified reports and articles for additional studies. Identified studies will be assessed for relevance and any selected for retrieval will be assessed by two independent reviewers for methodological validity using standardized critical appraisal instruments from the Joanna Briggs Institute Meta-Analysis of Statistics Assessment and Review Instrument (JBI-MASARI). Data from papers to be included in the review will be extracted by two reviewers independently using the standardized data extraction tool from JBI-MASARI. Quantitative data will be pooled in statistical meta-analysis using JBI-MASARI when possible; when not possible, findings will be presented in narrative form.

Results: Although multidisciplinary teams in health care are prevalent, the use of multidisciplinary response teams in disaster have been less frequently studied, and authors acknowledge the difficulty of

assessing quality and effectiveness of disaster response programs (Gill & Gershon, 2010). A preliminary search of multiple data bases for development of our systematic review protocol revealed that the majority of articles describing team response to disasters or their effectiveness were published between 1995 and 2010, with only a few published more recently (Briggs, 2010; Gill & Gershon; Meredith, Zazzali, Shields, Eisenman, & Alsabagh, 2010; Rosen, Greene, Young, & Norris, 2010). We would therefore have anticipated locating existing quantitative systematic reviews on the topic, yet we were unable to do so; we also found very little international literature. We hope to discover additional sources through our search strategy. The detailed search process for the systematic review is ongoing and will be complete by June 2015.

Implications: Disaster-related literature suggests the need for integrated assessment of disaster survivors and collaborative response efforts (Pfefferbaum, et al., 2012). The review's detailed search strategy was designed to uncover and synthesize available literature on the effectiveness of multidisciplinary response teams. Our systematic review seeks to provide a guide for future planning, deployment, and evaluation of these specialized teams that can be crucial to local, regional, or global response to mass casualty disasters.

### Perception of Role Strain among Male Critical Care Registered Nurses: A Quantitative Descriptive Approach

---

Nicholas Carte, PhD, MSN, BSN, A/GNP-C, APRN, USA

#### Purpose

The purpose of this presentation is to present findings from a quantitative descriptive research study completed as part of the requirements for a doctoral education in nursing.

#### Target Audience

The target audience of this presentation include: registered nurses, nurse educators, nurse researchers, nursing theorists, and nursing students.

#### Abstract

Little research has been conducted to examine the experiences of males working in female-dominated professions. The purpose of this study was to examine and describe role strain among male RNs in critical care settings. This quantitative study utilized a descriptive design to examine the four causes of role strain – role conflict, role overload, role ambiguity, and role incongruity. The target population was male RNs in critical care settings in a northeastern state of the United States. The sample for this quantitative descriptive study was obtained from the Board of Registration in Nursing in this northeastern state database. The Sherrod Role Strain Scale (SRSS), a 5-point Likert scale survey, was the instrument used to examine participants' perceptions of the four causes of role strain. Data analysis of the results included descriptive and inferential statistics. Inferential statistics involved the use of repeated measures ANOVA testing for significant difference in the causes of role strain between male RNs employed in critical care settings, and a post hoc comparison of specific demographic data using multivariate analyses of variance (MANOVAs). The findings of this study were significant for two causes of role strain: role ambiguity ( $M = 2.88$ ,  $SD = 0.23$ ); and role overload based on ethnicity ( $M = 2.87$ ,  $SD = 0.27$ );  $F(1, 35) = 9.77$ ,  $p = .004$ . The varied standard deviation exhibited in the participants' scores warrants further exploration and research. This study will serve as the foundation for future studies related to role strain in the healthcare setting.

### Interprofessional Education: Using Simulation to Teach Error Disclosure

---

*Ann Popkess, PhD, CNE, USA*  
*Christine Durbin, PhD, JD, RN, USA*  
*Therese I. Poirier, PharmD, MPH, RpH, USA*  
*Katie E. Ronald, PharmD, RpH, USA*  
*Toni Roucka, RN, DDS, MA, RN, USA*  
*Miranda Wilhelm, PharmD, RpH, USA*

#### Purpose

To demonstrate outcomes of interprofessional education to teach medical error disclosure to prelicensure nursing, pharmacy and dental medicine students using a simulation experience.

#### Target Audience

Health professions faculty; Deans and directors of health professions programs; clinicians; risk managers and other health care administrators

#### Abstract

The Institute of Medicine has reported staggering statistics of medical errors in hospitalized patients in the United States. Full disclosure of medical errors to patients is a new topic in the literature. Health professionals often fear disclosing errors to patients due to a myriad of legal, professional, and administrative constraints and consequences (Robinson & Hughes, 2008). While much of the error disclosure training literature focuses on medical students and physicians, (Barrios et al., 2009; Gilles, Speers, Young, & Fly, 2011; Gunderson, Smith, Mayer, McDonald, Centomani, 2009 ; ) very little is reported on undergraduate and/or pre-licensure health professions training (Noland & Rickles, 2009; Thompson & Tilden, 2009). Currently, in the United States, health professions students are trained in "silos," absent a team or collaborative approach. Recently, healthcare safety organizations have advocated for a focus on enhancing quality and patient safety education in pre-licensure health professions students (IOM, Health Professions Education: A bridge to quality, 2003). Six health professions organizations have described interprofessional core competencies to guide the development of learning experiences across health disciplines (Interprofessional Education Collaborative Expert Panel, 2011). Interprofessional education is defined by the World Health Organization (WHO) as "when students from two or more professions learn about, from, and with each other to enable effective collaboration and improve health outcomes (2010)." Interprofessional education in the health professions is essential to building teamwork, enhancing communication among providers and patients, and ensuring patient safety (Brock et al., 2013). Widespread patient error in U.S. hospitals associated with substantial preventable mortality and morbidity, as well as major quality issues, has revealed the inadequacies in costly systems of healthcare delivery (IOM, 2000, 2003). Developing effective collaborative, health professional teams and redesigned systems is critical to achieving care that is patient-centered, safer, timelier, and more effective, efficient, and equitable (IOM, 2000; Reeves, Perrier, Goldman, Freeth & Zwarenstein, 2013). However, expecting health professionals to work together if they are not educated together proves challenging.

A collaboration of one university's School of Dental Medicine, Nursing, and Pharmacy schools developed a one-day inter-professional simulation focusing on the disclosure of a healthcare error using theater students as standardized patients. Funding for this initiative was obtained through the SIUE Excellence in Undergraduate Education internal grants program. Teams of eighty dental, nursing, and pharmacy students were formed from a convenience sample of students in the spring semester courses of each discipline. Students completed pre-test knowledge and attitude assessments, independently viewed a video and power point discussing error disclosure before the simulation experience. On the day of the simulation experience, health professional students were formed into interdisciplinary teams of four-five students. Ice-breaker exercises were conducted to familiarize the participants to one another's roles and work to build a team mind-set. Each team was given the scenario describing the facts of a medical error

with a hospitalized patient, adapted from the work of the University of Washington, Center for Health Science Inter-professional Education, Research and Practice and the Josiah Macy Foundation. The teams were given instructions on how to approach the disclosure of a medical error with a patient. The teams were then placed in a simulation experience where the theater student took on the role of the injured patient's family member. Unknown to the team was the response of the family member. University senior level theater students were trained to respond in three manners: a pleasant manner, a very upset and grief-stricken manner, and in an angry manner. Following the simulation experience, health team students were de-briefed regarding their responses to the patient's family member, how well the team functioned, what they did well, and what they did poorly. The students completed another assessment of the knowledge and attitudes toward error disclosure. Lastly, the students completed a reflection of the simulation experience and their responses to the event.

The purpose of this poster presentation will be to demonstrate outcomes of interprofessional education to teach medical error disclosure to prelicensure nursing, pharmacy and dental medicine students using a simulation experience. Demographic data describing the student's healthcare discipline will be collected. Instruments will be used to assess student knowledge and attitudes about error disclosure pre and post simulation. Pre and post mean scores on knowledge and attitudes towards error disclosure using a Likert scale will be compared with a T-test and MANOVA. Cronbach's Alpha will be used to assess reliability of the instruments used in this study. A thematic analysis will be conducted to determine themes revealed in student reflective writings. A sustainable model of interprofessional education will be recommended based on analysis of the barriers and facilitators of this project.

### Nurse Religiosity and the Provision of Spiritual Care

---

*Iris Mamier, PhD, MSN, RN, USA*

*Carla Gober, PhD, RN, USA*

*Kathy Schoonover-Shoffner, PhD, RN, USA*

*Elizabeth Johnston Taylor, PhD, MSN, RN, USA*

#### Purpose

to present data from a large, online survey that explores nurse opinions regarding the appropriateness of initiating spiritual or religious (S/R) discourse, S/R self-disclosure, and prayer, and related factors.

#### Target Audience

Any nurse clinician, educator, or administrator; researchers who study spirituality and health.

#### Abstract

**Background:** Many nurses are religious. Indeed, religious motivations often prompt individuals to be nurses. Likewise, religious beliefs provide nurses with cognitive structures that comfort them as they continually witness patients' suffering. Professional ethics codes, however, admonish nurses to never proselytize their religion while caring for patients. Indeed, the power differential in the clinician-patient relationship and non-ecclesiastical role of the nurse support the argument that clinicians should not impose their religious beliefs at the bedside.

Nurses are increasingly expected to screen for spiritual distress and intervene to promote spiritual well-being in clinical settings. There is, however also the possibility for this boundary between a nurse's personal religiosity and professional care to become blurred. Lack of professional skills in the area of spiritual care may lead to misunderstandings how to navigate the communication with a patient in the area of spirituality in a way that is wholesome and warrants ethical boundaries.

It is unrealistic to assume that a nurse can—or should—leave personal beliefs in a locker when at work. Thus, it is important to consider how a nurse's personal spiritual and religious beliefs affect nursing care, rather than if they do.

**Purpose:** This poster will present findings from a larger study investigating how nurse spirituality and religiosity (S/R) affects spiritual care. In particular, data about nurse opinions regarding the appropriateness of initiating S/R discourse, S/R self-disclosure, and prayer will be presented. Demographic and work-related factors associated with these opinions will also be explored to determine if there is a profile for nurses who are apt to initiate such discourse or avoid such discourse while providing patient care.

**Methods:** This study involves a cross-sectional design allowing for a convenience sample of over 600 Journal of Christian Nursing readers and website visitors who will complete an online survey. Data for this poster will be responses to an investigator-designed opinion survey and "Information About You" questionnaire that solicits data about a variety of demographic and work-related variables. These quantitative data will be analyzed using measures of central tendency, appropriate bivariate analyses to determine associations, and regression analyses to identify factors that predict initiators and avoiders of S/R discourse with patients.

**Implications:** In spite of the prevailing call for nurses to conduct spiritual assessments and support patient spiritual well-being, there is inadequate discussion about the ethics of such care. Findings can be used to guide administrators and educators—and ultimately, nurse clinicians, as findings will provide evidence about how personal religiosity affects patient care—for better and/or for worse. This evidence will need to shape curricula and policy so that patient and nurse religious beliefs can be safely supported in a pluralistic society.

### The Healthcare Coach Role and Its Impact on Healthcare at Palomar Health

---

*Pamela Kohlbry, PhD, RN, CNL, USA*  
*JoAnn Daugherty, PhD, RN, CNL, USA*  
*Joseph A. Parker, MSN, BSN, RN, CNL, USA*  
*Joy A. Gorzeman, MSN, MBA, RN, NEA-BC, USA*  
*Marcy L. Adelman, MSN, BSN, RN, PHN, CCM, ACM, USA*  
*Ingrid Douglas, BSN, USA*

#### Purpose

The purpose of the presentation is to describe research on satisfaction, benefits, and challenges in the healthcare coach role developed to facilitate care transitions.

#### Target Audience

The target audience of this presentation is researchers, hospital healthcare providers and clinicians, communality and home health nurses, leaders, administrators, healthcare coaches, nurses, and nursing educators.

#### Abstract

Patient transitions between healthcare agencies are fragmented often creating a gap in services, medical errors, and unnecessary repeated hospitalizations. To manage and improve transitions of care Palomar Health (PH) developed an innovative comprehensive community-based plan, the Community-Based Care Transition Program (CCTP), with the nurse in the role of the healthcare coach. Researchers at California State University San Marcos, School of Nursing partnered with healthcare leaders from PH to research satisfaction with the healthcare coach role in the program. The research methodology is a cross sectional design. Survey data regarding healthcare coach role evaluation will be collected from inpatient staff nurses, home healthcare nurses, case managers, physicians, and healthcare coaches. Research findings will describe challenges and benefits of the healthcare coach role. The presentation will focus on research on this innovative program and future recommendations for the healthcare coach role.

### Faculty Perceptions of Innovation and Change Dynamics in Interprofessional Education

---

*Jacqueline M. Loversidge, PhD, MS, BSN, RN, C-AWHC, USA*  
*Ada Demb, EdD, USA*

#### Purpose

The purpose of this presentation is to describe nursing and medical faculty perceptions of essential factors in interprofessional education (IPE), particularly structural aspects and innovation/change dynamics, as revealed in the findings of a phenomenological study of faculty IPE experience, and to describe implications for nursing and medical education.

#### Target Audience

The target audience for this presentation is nursing educators; however the findings are of interest to any health professions faculty in settings where interprofessional education is practiced or desired, and also of interest to health professionals in practice settings where health professions students engage in clinical experiences.

#### Abstract

The effectiveness of interprofessional teams is critical to the safe and effective delivery of health care. Improvements in team behavior rely on collaboration, and, result in reductions in medical error. Educators in the health professions are consequently encouraged to embed interprofessional education (IPE) into their curricula. However, integrating IPE presents structural, curricular and human factor challenges.

Nurses and physicians comprise the dominant dyad in health care teams, therefore insights from nursing and medical faculty are essential for guiding IPE strategy. IPE research has focused heavily on learners, in pre-licensure and continuing education settings, but less is known about IPE from the faculty point of view. A phenomenological study of nursing and medical faculty perceptions regarding key factors in IPE was conducted to that end. This poster presents findings focused on the structural and change aspects revealed in that study.

Collaboration and cooperation theories guided development of the study and construction of the research questions, a semi-structured interview guide, and data analysis. Faculty were asked to reflect on the pedagogical and environmental factors that helped students learn interprofessional teamwork and collaboration, and to describe their experiences. Interviews were conducted with 32 faculty from three Midwest universities. Approximately half the participants were nursing and half medical faculty. Data were analyzed thematically, and the perceived realities of the two faculty groups explored and compared for common themes.

Two major thematic categories, student-centered, and environment and cultures, were used to organize 6 emergent themes: curricular methods/pedagogy, clinical environments, student roles/role understanding, educational program structures/cultures, faculty engagement/competency and development, and curricular change considerations. Findings related to the six major themes are reported elsewhere (Loversidge & Demb, 2014). During the data analysis, the researchers noticed strong references to innovation and change threaded throughout the participant's descriptions of their lived experiences and felt this warranted a secondary analysis of the data. Innovation and change theories guided the secondary analysis. Two rounds of data coding, reduction, and analysis were conducted using NVivo10.

Findings revealed faculty perspectives related to IPE innovation and change. Participants discussed processes they engaged in or observed that advanced or hindered IPE and focused on aspects of academic medical center structures, the presence of committed leadership, curricular restructuring, curricular funding, inter-college and departmental relationships and partnerships, and authentic/comprehensive faculty engagement. Changes in education and practice partnerships

emphasizing the cultivation of positive collaborative environments were considered essential. Not only does IPE require innovative pedagogy and faculty proficiency, but supportive academic structures and clinical environments are also necessary. Achieving real change toward embedding IPE in curricula was described as an achievable but formidable task: an effort requiring both innovation and organizational change. These findings reveal implications for nursing and medical educators, which include addressing the structure of relationships between colleges and departments in academic medical centers, developing processes essential for realizing fundamental curriculum change, and managing forces for improving faculty engagement in IPE.

### ECG Memento®, an Innovative Approach to Adult Bereavement Care: A Pilot Study

---

Mary E. Beiermann, BSN, RN, CCRN-CSC, USA  
Peggy Kalowes, PhD, RN, CNS, FAHA, USA  
Amanda Brubaker, BSN, RN, CCRN, USA

#### Purpose

The purpose of this presentation is to examine the impact of the electrocardiogram, ECG Memento®, (laminated 3" ECG tracing) as a transitional object for families moving to bereaved status; and, evaluate nursing practice and satisfaction about bereavement care using the ECG Memento®.

#### Target Audience

The target audience for this presentation are clinical nurses, educators and students.

#### Abstract

**Background:** Twenty percent of Americans take their last breath in the ICU. About 14% of people 85 and older die in the ICU. In no other country do so many people die in intensive care. Prior to the twentieth century, people used to die at home. The patient and family members prepared for death, said good-bye, completed end of life (EOL) closure tasks and created memories. The significance of objects in relation to death and grief has poignant accounts in the literature, particularly among the pediatric literature. The concept of Attachment Theory, Continuing Bonds and Object Linking has been used for bereavement support, to aid the mourning process. Families of deceased infants, children and teenagers are offered mementos, such as locks of hair, foot prints, etc. Yet, according to the IOM (2001), there is a paucity of data available to validate the benefits of these interventions among adults. This research evaluated the impact of using the ECG rhythm strip as a Memento, to provide the grieving or bereaved family members a transitional object, to displace the experience of grief.

**Purpose:** This study examined the effectiveness of the ECG Memento®, as a transitional object for families who have experienced the loss of a loved one in the ICU/ICCU, as they transitioned from anticipatory to bereaved status. We also examined the role of the staff nurse and their experience/satisfaction facilitating the use of the ECG Memento®, as a mediating object to facilitate and meet the emotional and psychological needs of the families.

**Methods:** A prospective, posttest, survey design was used to observe and describe the effect of the ECG Memento®, on the anticipated bereavement process among families who have lost a loved one in the intensive care units (ICUs) or intermediate cardiac care unit (ICCU).

**Sample:** A convenience sample of 50 patients/families (dyad); actively dying, with a "Do Not Resuscitate (DNR)" Comfort Care, Hospice order; or who are recently deceased, will be study eligible. Families provided consent and agreed to participate in post-discharge bereavement survey. We also recruited 50 nurses who have provided care to enrolled patients/families during the EOL process and death, to take the Quality of Dying and Death Questionnaire for Nurses (QODD).

**Instruments:** Families completed the Satisfaction and Bereavement Experiences Questionnaire (SBEQ), to examine their perceptions of the EOL experience and utility of the ECG Memento®, 5-6 weeks after the patient death. Whereas, the nurses completed the QODD, to examine their experience of EOL care and the death experience within 2-3 weeks post-care of a study patients. Ratings were based on how nurses thought these experiences affect the quality of the patient's dying and death. We also examined the severity of illness, and predicted mortality of patients at admission, using the Charlson Comorbidity Index (CCI) score.

**Results:** Preliminary: 12/50 patients-66% male; mean age 73; mean-ICU stay 7.3 days; 58% > 3 days. Family member-91.7% female; age <50 years (33%); 50-70> (66%); SBEQ: Completed-(41%) spouse; (58%) children; Scores (1=very satisfied, 4=very dissatisfied); Hospital Experiences 1.6 (1.01) SD; Personal Responses 1.8 (0.9SD); Ritual Experiences 1.4 (0.8SD), Post Hospital Experiences 2.1 (1.2SD). Families found ECG Memento<sup>®</sup> (16.7%) extremely helpful; (50%) viewed ECG daily; (50%) found very helpful/viewed 2-3 days/week: (25%) rarely viewed it. 22 nurses completed QODD; 11.8 years ICU experience; >57.5% Baccalaureate; Nurses rated patient dying experience- 14% pain controlled; 19% breathing comfortably; 50% dignity/self-respect; 68% time with loved ones; 87.5% spiritual support. RN QODD (0-10 scale); mean 8.6 (1.8SD).

**Conclusion:** Impact of this novel, pilot study, shows the 'ECG Memento<sup>®</sup>' provides a tangible link to aid families with grieving, yet, larger studies are needed. 100% nurses described ECG Memento<sup>®</sup> as well received, but, only 40% felt patient symptoms controlled.

## SCI PST 2 - Scientific Poster Session 2

### South African Health Care Provider Perceptions of Barriers to Effective Neonatal Resuscitations in Delivery Settings

---

*Valerie Ann Clary-Muronda, MSN-Ed, RN, USA*

#### Purpose

The purpose of this presentation is to explore perceptions of barriers to neonatal resuscitation from the standpoints of South African health care providers. A constructivist grounded theory approach guides the qualitative interviews of three health care providers who are responsible for neonatal resuscitation in a delivery setting.

#### Target Audience

The target audience of this presentation is the researcher who has an interest in exploring neonatal resuscitation in South Africa, a region in which improvements in neonatal mortality rates have shown less improvement than some other similarly resourced areas.

#### Abstract

The purpose of this qualitative study is to explore the facilitators and barriers to effective neonatal resuscitation for neonatal care providers in South Africa from their South African contexts, to identify potential areas for improvement in the study setting, an area in which improvement has occurred in the past decade, but has not met expectations, despite interventions.

The rationale underlying this inquiry is the need to develop an understanding of factors that affect neonatal resuscitation from the standpoints of healthcare providers from their specific cultural contexts for the discovery of significant issues at multiple levels of care delivery that may remain undiscovered in strictly quantitative research. Additionally, this preliminary exercise can provide useful information regarding constructivist grounded theory (CGT) as an appropriate means of qualitative inquiry in this cultural context.

#### **Specific Aims:**

**Aim 1:** Using semi-structured in-depth qualitative interviews with three health care providers at the University of Johannesburg, South Africa, identify facilitators and barriers to effective neonatal resuscitation upon delivery, and categorize themes that may be consistent with those in a different setting.

**Aim 2:** Using a constructivist grounded theory approach, perform initial, focused open coding with constant comparative analysis, and then theoretical coding of data employing categorizing and memo writing to identify intermediate categories from coded data and final theoretical concepts.

**Aim 3:** Generate theory from the perspectives of participants from their South African contexts regarding neonatal resuscitation and to collect preliminary data to determine the utility of constructivist grounded theory as a means to explore more extensive observational comparisons, and testable hypotheses for future research.

**Expected Results:** The results will reveal useful information identifying multiple level factors affecting neonatal resuscitation that will guide future hypotheses and interventions with the aim of improving neonatal outcomes.

**Conclusion/Implications:** Findings from this study will address a critical element of the neonatal resuscitation process, the multiple level factors affecting neonatal resuscitation as experienced by neonatal resuscitation providers from their situational and cultural contexts, while addressing the Millennium Development Goal 4 which calls for a two-thirds reduction in under five mortality by the year 2015 (2).

**BACKGROUND AND SIGNIFICANCE:** Global estimates of neonatal deaths range from 2.9 million deaths to 3.6 million deaths per year, with the majority occurring due to lack of appropriate resuscitation upon birth (1). Worldwide, there is a call by the WHO for a two-thirds reduction in childhood mortality rates by 2015. In 2013, 6.3 million children under the age of five died, with the highest risk of death for a child being in the first 28 days of life (2). Preterm birth, intra partum related complications such as asphyxia or apnea (20%), and infections constitute the major causes of death in the neonatal period (2). Some of the highest neonatal mortality rates are in sub-Saharan Africa, where neonatal mortality rates have improved in the past 15 years, though less in the countries with the highest NMR (3). Although the United States possesses some of the highest level of resources in neonatal resuscitation (NR), such technological advances have not translated to better outcomes than other high resource countries. NMR in the United States are high when compared to other developed countries, with the US ranking 26<sup>th</sup> with NMR more than twice as high as such rates in Finland, Japan, Portugal, and Sweden (4). Interprofessional collaboration in neonatal resuscitation is necessary in various settings, both high resource settings and lower resource settings for the best outcomes. However, various multiple factors at the individual, interpersonal, environmental, policy, and societal levels can impede or facilitate effective resuscitation in delivery settings. Cost effective interventions such as resuscitation education can significantly reduce neonatal mortality rates, however, some barriers to intervention implementation may exist (3). This qualitative study employing constructivist grounded theory will use qualitative interviews to categorize themes that emerge from interview data to identify the facilitators and barriers to effective NR as described by the participants. The information from this qualitative study will provide the foundation for interventions addressing multiple level factors that impede effective resuscitation efforts that may significantly improve neonatal outcomes. Additionally, information from this study may provide insight to barriers to effective NR that may be common in low, moderate, and high resource settings.

**Neonatal Resuscitation and Simulation-Based Training:** While most neonates require only tactile stimulation, drying, and clearing of the airway, 10% of neonates will require some assistance with breathing at birth, with approximately 1% requiring extensive resuscitation (5). Timely intervention within the first moments of life can reduce the likelihood of birth asphyxia, which contributes to a 27-30% of neonatal deaths in resource-limited countries (6). In resource limited countries, several factors contribute to the lack of improvement of neonatal outcomes over the past 15 years, such as other higher national health priorities, localized training efforts, lack of training for midwives, lack of essential equipment, and failure to initiate resuscitation steps in a timely manner (6). Simulation-based learning programs such as the WHO Essential Newborn Care course, and the Helping Babies Breathe Course, may reduce early neonatal mortality and improve neonatal outcomes worldwide (6, 7) but are still being evaluated without positive outcomes (8). One study by Ersdal et al. (1) in Tanzania revealed that sporadic simulation based training may not lead into improvements in clinical practices and outcomes. In the United States, the American Academy of Pediatric Neonatal Resuscitation Program (NRP) provides providers with comprehensive information and skills for neonatal resuscitation to providers. However, studies show that NRP training does not necessarily translate to excellent performance in neonatal resuscitation (9). Simulation based training is potentially an excellent means to promote collaboration across the disciplines, and low cost simulators such as NeoNatalie (approx. \$50) provides an opportunity for practicing and evaluating core neonatal resuscitation competencies (10). However, simulation based learning is a teaching strategy that is in its infancy and needs to be adapted to settings with differing resources internationally. Moreover, researchers are still developing methods to evaluate the effectiveness and transferability of simulation based learning in neonatal resuscitation to clinical areas. Acknowledgement of the existing barriers and facilitators to effective neonatal resuscitation is a first step to developing sustainable interventions that take into the multiple level systemic issues as experienced by clinicians.

Many barriers exist to effective neonatal resuscitation efforts, regardless of the setting. Barriers at the individual, interpersonal, environmental, community, societal, and policy levels can impede effective neonatal resuscitative efforts in low, moderate, and high resource settings, negatively impacting clinical outcomes. Examination of facilitators and barriers to effective neonatal resuscitation as experienced by care providers at multiple levels is essential to develop sustainable training programs that are more likely to make a positive impact on patient outcomes. This preliminary study takes an exploratory approach to examining the multi-level factors affecting effective neonatal resuscitation in this setting to provide useful

information to guide the formation of a sustainable intervention program. It is unclear how the variations of birth attendants (11) appropriate technology (12), and less success with simulated interventions (1) documented in sub-Saharan countries affect this South African site, which is not low resource. Additionally, this preliminary description will provide the basis for comparing and contrasting themes to determine their relationship to those in different settings.

An integrative review providing information about measurement instruments for assessing effective teamwork and collaboration in neonatal resuscitation in delivery room resuscitations in high resource settings found that few studies with well-documented psychometrics assess interprofessional collaboration and teamwork in neonatal teams with diverse skills. Moreover, many of the existing studies have been done within the discipline of medicine, although most delivery room NRs occur in interprofessional teams, often without a physician team member. Even fewer of the studies reviewed considered the multiple level factors affecting effective resuscitative efforts in the delivery room, raising the following questions for further exploration about neonatal resuscitation:

- What are the perceptions of facilitators and barriers to neonatal resuscitation in delivery room settings as identified by the health care professionals responsible for NR?
- What multiple level supports can improve NR in delivery room settings as identified by health care professionals who provide neonatal resuscitation?
- What (if any) are the similarities in facilitators and barriers to NR in the delivery room in low, moderate, and higher resource settings?

Answering these key questions is paramount for the development of sustainable interventions (and appropriate measures to assess their effectiveness) that can be applicable in various resource settings for improvement of neonatal outcomes. Since neonatal resuscitation guidelines and recommendations are internationally standardized, assessment of facilitators and barriers to effective implementation of these standards is necessary in different settings for significant improvements of neonatal outcomes to occur, particularly in areas that have shown less improvement in neonatal outcomes in the last decade.

### Family Decision about the Treatment Options at the Sudden Change for a Patient with Serious Stroke Condition

---

*Eri Kataoka, MSN, RN, Japan*

*Misae Ito, PhD, RN, RMW, MSN, PhD, Japan*

#### Purpose

When a patient has serious stroke, family will make a decision whether cardiopulmonary resuscitation is performed or not on admission. The purpose of this presentation is to clarify how the family made a decision about the treatment options at the sudden change for a patient with serious stroke condition.

#### Target Audience

The target audience of this presentation are the clinical nurses who are interested in ethical dilemma in critical care, or cultural aspects of patients.

#### Abstract

**OBJECTIVE:** When a patient has serious stroke, family will make a decision whether cardiopulmonary resuscitation is performed or not on admission. It is expected the family is unable to make a decision. The purpose of this study was to clarify how the family made a decision about the treatment options at the sudden change for a patient with serious stroke condition.

**METHODS:** The families of a patient in this study were recruited with an introduction from the physician in charge of the patient who had stable conditions with serious stroke, were independent before admissions, and explained the treatment options including Do Not Attempt Resuscitation at the sudden change on admission. The participants were agreed with the study participation orally and in writing, and asked by interviewing the structured and semi-structured items made by the investigators originally after approving the ethical committees from Kawasaki University of Medical Welfare and the hospital where the investigators recruited the participants. The interviews were recorded by IC recorder with their agreements. Data were analyzed verbatim by the content analysis.

**RESULTS:** One-third patients told the families about a life prolonging remedy in advance orally, and one-third families desired all life prolonging remedies not complying with the instructions of the doctors. Thoughts of the families making decisions on the treatment options at the sudden change for the patients were categorized into the following five categories: 'difficulty in understanding the life-prolonging treatment once'; 'to think whether to do life-prolonging treatment by the patient condition'; 'I cannot but entrust a doctor'; 'To have no doubts how to make decision'; and 'To recall the patient's wishes.'

**CONCLUSIONS:** It's necessary for nurses to understand how the family understand and feel the patient's situations, and how they have the patient's wishes when they are required the decision-making of the treatment options at the patient's sudden change. Nurses also have to collaborate with a physician in an interprofessional team.

### Head Impact Biomechanics in Pediatric Patient Falls

---

Nancy A. Ryan-Wenger, RN, PhD, CPNP, USA

Janet S. Dufek, PhD, FACSM, USA

#### Purpose

to examine the biomechanical aspects of pediatric patient falls in which head to floor contact is made. Analyses include contact velocity, acceleration, contact force, and head injury potential. These findings are compared to hospital Quality Improvement departments' ratings of level of harm.

#### Target Audience

Hospital administration Hospital staff Researchers

#### Abstract

**Problem.** Hospitalized patient falls, defined as any unplanned descent to the floor [or onto an object] with or without injury, are medical errors that have captured the attention of health care quality, regulatory, and third party payers. Despite hospital-wide fall prevention programs, patients continue to fall with some regularity from their beds, cribs, chairs, toilets, and examination tables. Quality Improvement staff use the national MERP index to assign the level of medical error and corresponding patient harm to each fall event. Two levels of error include: 1) the capacity to cause error; and, 2) an error occurred. Harm is defined as "impairment of the physical, emotional, or psychological function or structure of the body and/or pain resulting therefrom", ranging from 1 (capacity to cause error, no harm) to 9 (error that contributed to or caused patient death). Falls that involve head to floor contact are of greatest concern because of the potential for concussion. Unless there is loss of consciousness or skull fracture, the majority of hospitalized children are not examined or followed after discharge for signs of traumatic brain injury after a fall in the hospital. A measure of harm more sensitive than MERP scores is the head injury criterion (HIC), a function of head acceleration rate and the duration of acceleration, is an estimate of the potential for concussion or traumatic brain injury from an impact.

**Purpose.** The primary aim of this study was to evaluate the head injury potential of pediatric patients who fell and made head to floor contact. The secondary aim was to compare hospital-assigned levels of harm to each fall event with calculated head injury potentials.

**Methods.** We used forensic accident reconstruction methodologies and Newton's laws of motion (inertia, acceleration, action-reaction) to calculate the magnitude of forces applied to a child's body from a fall, and to estimate the HIC15 potential for concussion. According to the Federal Motor Vehicle Safety Standards and Regulations, HIC15 threshold levels are: age 5 years to adults 700; ages >2 to 5 years 570; ages 1 to 2 years 390; and <1 year 225. Biomechanical analysis of pediatric patient falls was conducted for 49 hospitalized patients, ages 11 months to 17 years, who fell from a crib, bed, chair, table, or couch, and made head to floor contact. Data for analysis were obtained from event reports and medical records.

**Results.** The children fell onto commercial-grade vinyl-covered concrete floors from a height of 72 cm (couch, chair, bed) to 149 cm (crib) in 0.31 to 0.63 seconds, an average of only one half (0.52) of a second. The force with which the children's heads contacted the floor ranged from 2 to 6.9 times their body mass in kg. The children's HIC15 potentials ranged from 26.4 to 1302.1. Seven children (14.3%) had head injury potential scores greater than their threshold for age. The median hospital harm index score for these pediatric fall events was 4="no harm based on monitoring or intervention" assigned to 36 children; 10 were rated 3="no harm," 2 were rated 5="temporary harm." The only child that received follow-up care for real or potential head injuries had a skull fracture and was assigned a score of 8="intervention necessary to save life." A Spearman correlation between HIC15 potentials and error/harm scores ( $r = -0.251$ ,  $p = 0.041$ ) showed a significant negative relationship to HIC15 levels. Of the 7 children with HIC15 greater than threshold, one was assigned a MERP score of 5 (temporary harm),

and the others received a score of 4 (no harm based on monitoring or intervention). None of these children received follow-up care for real or potential head injuries after discharge.

**Conclusions:** Parents or providers have less than one second to stop a child from falling from their beds, cribs, tables, chairs or couches. Hospital-assigned levels of harm do not adequately reflect the potential for head injury calculated from biomechanical principles. The children with head injury potential scores greater than their threshold for age should have received parent instructions about signs and symptoms of concussion and follow-up care. When fall prevention interventions are unsuccessful, hospitals must develop interventions to prevent or minimize fall-related injuries. Two components of HIC15 calculations are height of the fall and the surface coefficient of restitution, or “stiffness,” which reflects the amount of energy absorbed by the floor-person system. Height-adjustable hospital cribs would be a good investment to protect our most vulnerable infants and toddlers. Research shows that floor mats significantly attenuate head injury potential by absorbing some of the force of the fall. The authors are developing an algorithm for use in clinical settings to estimate head injury potential for early identification of concussion from pediatric patient falls.

### Investigation of Cultural, Social, and Religious Aspects of Saudi Arabia and Neighboring States and Implications for Best Practice in Health Education and Promotion

---

*Sami Abdulrahman Al-Hamidi, MSN, BSN, RN, ICDL, USA*

#### Purpose

The purpose of this presentation is a systematic and evidence supported analysis of health related practices and recommendations for best practice in Saudi Arabia and neighboring Gulf States conducted by a health care professional who is intimately acquainted with the area.

#### Target Audience

The target audience of this presentation includes those health professionals who are concerned in examining a model for systematic inquiry into health related practices and beliefs, and those health care professionals who anticipate practicing in that region or with persons from that culture.

#### Abstract

Gulf culture has been examined in a variety of mediums but a thorough survey of its structure for use by health care practitioners and nurses in particular has not been made. Since the majority of health care in that location is provided by non-Saudis, this work should be a major assistance to health care professionals in that locale. It should further be of assistance as a guide for inquiry to professionals who are working in cultures which they are seeking to understand.

By examining the cultural, social, and religious features of the target population some perspective has been gained into the variety of lives of its people. There are common threads which run through the fabric of the Gulf which gives a starting point for considering the health care needs of the people living there. It can also assist those who practice there to understand these needs.

The central themes which emerged from critical care nurses caring for Saudi clients were family and kinship, cultural and religious influences, and the nurse-patient relationship (Halligan, 2006). When clients ranked aspects of care assurance, information, cultural, and spiritual needs were the dominant needs. Nurse support and proximity were least important to them. After viewing the patterns of the culture, the healthcare professional will understand the lack of priority attached to support and proximity since it is a common practice for clients to have a family companion to meet these needs.

Within the theme of cultural and spiritual needs family members of clients in intensive care units mentioned looking for information, maintaining reassurance, spiritual healing, maintaining close proximity, and most importantly respect and care of the body of an expired family member. However, care of the body was ranked in fifth priority by health providers (Al-Mutair, Plummer, Clerehan, & O'Brien, 2013).

Specific values are contained in the ANA Code of Ethics (ANA, op cit.) which have resulted in the concept of cultural competency. The inherent dignity of the individual, autonomy and the right to self-determination are important concepts when caring for any clientele. Taken from social work values, confidentiality, self-awareness, client individualization, and non-judgmental attitude are part of the values which nurses who wish to be effective in caring must work toward (Galanti, 1991).

Evidence-based research needs to be coupled with values and ethics to form a powerful formula which can be used in any culture to provide culturally competent caring and best practice. When these elements are combined with specific language and lifeways training during pre-service and ongoing orientation a comprehensive orientation for caring for culturally diverse clients emerges.

### The Impact of End-of-Life Care Training on Medical-Surgical Nurses

---

*Suzanne P. Graf, BSN, RN, PHN, USA*

#### Purpose

The purpose of this presentation is to bring to light the necessity of end-of-life care training for medical-surgical nurses in order to improve the quality of care for the growing number of older and chronically diseased patients that will die while hospitalized in these types of units.

#### Target Audience

The target audience of this presentation is practicing medical-surgical nurses, nurse educators in acute care, administrative/managerial support persons for bedside medical-surgical nurses, and pre-licensure nurse educators.

#### Abstract

According to the Centers for Disease Control (CDC), the number of Americans age 65 years and older will double in the next 25 years. This translates to approximately 20% of the United States population being age 65 years or older by the year 2030. The CDC also reports that the predominant cause of death for older Americans has shifted from infectious disease to chronic disease. Currently, two out of three older Americans have multiple chronic diseases. These patients are often in and out of hospitals for intermittent treatments. However, even if the issues are acute in nature, they are occurring in the presence of multiple advancing diseases that together could result in a fatal event.

The National Center for Health Statistics reported that in 2010 one-third of the 2.5 million recorded deaths occurred in hospitals. Of those deaths, 75% were people age 65 and older. The Bureau of Labor Statistics reported in 2013 that of the 2.6 million registered nurses in the United States, 1.5 million were employed in hospitals. Of these professionals, the majority work in acute care areas often referred to as medical-surgical units. Therefore, it is easy to see that most registered nurses will likely experience the death of a patient while on duty during their career.

When one obtains a license to practice as a registered nurse, it is implied that you are trained to care for ill persons throughout the lifespan, which includes death. Currently, in the State of California, there is no specific requirement for nursing schools to teach end-of-life (EOL).

The aim of this study was to investigate the impact of EOL care training and other environmental variables on the lived experience of medical-surgical nurses caring for dying patients. The majority of research with regard to EOL has concentrated on the areas of intensive care and oncology. This research intended to bring to light the necessity of EOL care training for medical-surgical nurses in order to improve the quality of care for the growing number of older and chronically diseased patients that will die while hospitalized in these types of units.

A qualitative, phenomenological study was conducted utilizing a purposive sampling of registered nurses who have cared for a dying patient while working in a medical-surgical unit of a hospital, excluding oncology, in the United States. A total of 31 nurses completed a one-time survey of up to 20 closed and open-ended questions via an internet-based third party data collection service. The first incident of caring for a dying patient was reported to be between pre-licensure and two years of practice by 87%. The vast majority also reported having experienced losing a patient to death while on duty in a medical-surgical unit. Only 55% stated they had some sort of basic training in EOL in pre-licensure school or from an employer. All participants who had training indicated that it was valued and made some difference in their provision of care. More consistent and required EOL training needs to take place both pre-licensure and in continuing education. A vast majority of all participants (91%) desired future EOL care training primarily in the area of communication with the family. Time management and support, both emotional and institutional, were additional issues of concern for nurses caring for the dying.

### Meta-Analyses of Epigenetic Factors in the Prevention of Congenital Heart Defects: MTHFR C677T Human Gene Variations across Generations from Parents to Children

---

Hsiao-Ling Yang, PhD, RN, Taiwan  
Shyang-Yun Pamela K. Shiao, PhD, RN, FAAN, USA

#### Purpose

The purpose of this study is to disseminate current evidence on MTHFR gene mutations in children and their parents and related epigenetic factors in the prevention of the children's CHD, through meta-analyses.

#### Target Audience

The target audiences include nursing and inter-professional colleagues who are interested in learning about population genome health and epigenetics risk factors for the prevention of CHD.

#### Abstract

The purpose of this study is to disseminate current evidence on Methylene tetrahydrofolate reductase (MTHFR) gene mutations in children and their parents, and related epigenetic factors in the prevention of the children's congenital heart defects (CHD), through meta-analyses.

MTHFR gene plays an important role in the methylation pathway for health and wellbeing across generations in the development of CHD. The association between the polymorphisms of MTHFR and CHD is contentious, thus we conducted meta-analyses on MTHFR gene mutations and related epigenetic factors across generations in the development of CHD. Quality scores for the studies, and inter-rater evaluation on data coding was completed to ensure data accuracy for pooled meta-analyses.

Preliminary results included 4039 cases and 6849 controls from 31 studies for children, 817 cases and 836 controls from 16 studies for mothers, as well as 246 cases and 300 controls from 6 studies for fathers, of children with CHD. Based on children's and their parents' genotypes, MTHFR 677 TT homozygous mutation type was associated with increased risk ( $p < 0.05$ ), whereas 677 CC wild genotype was protective for children from CHD ( $p < 0.05$ ). Maternal folate supplementation during preconception and gestation was associated with a decreased risk of CHD ( $RR = 0.60$ ,  $p < 0.01$ , 5 studies, 761 cases and 1428 controls). On the other hand, no supplementation of folate during preconception and gestation for mothers was associated with an increased risk of CHD ( $RR=1.26$ ,  $p < 0.05$ ). Maternal smoking was potentially associated with the development of CHD (3 studies, 799 cases and 1113 controls,  $RR = 1.156$ ,  $p = 0.053$ ).

Future studies are needed to examine epigenetic factors associated with MTHFR gene variations in the prevention of CHD across generations.

### The Relationship between Nursing Specialty Certification and Surgical Site Infection Rates in Acute Care Hospitals

---

*Sandra Bergquist-Beringer, PhD, MA, BSN, RN, CWCN, USA*

*Diane K. Boyle, PhD, MSN, BSN, RN, FAAN, USA*

*Emily Cramer, PhD, USA*

#### Purpose

disseminate preliminary findings for the study “The Relationship between Nursing Specialty Certification and Surgical Site Infection Rates in Acute Care Hospitals”.

#### Target Audience

Clinicians, nurse leaders, and researchers interested in the relationship between nursing workforce characteristics and patient outcomes.

#### Abstract

There is limited research examining whether nursing specialty certification improves patient outcomes. Researchers have not studied the relationship between specialty certified nurses and one of the most common complications of surgical care, surgical site infections (SSI). Urban [1] estimated that costs per SSI vary from \$400 for superficial SSI to \$30,000 per SSI of serious organ or space infections. Other costs are more difficult to translate into financial terms, such as pain, distress, functional impairment, and mortality.

Our study purpose is to examine the relationship between nursing specialty certification rates and SSI rates in US acute care hospitals using merged data from the National Database of Nursing Quality Indicators® (NDNQI®) and the National Healthcare Safety Network (NHSN). Our study rationale is that identification of specialty certification as a factor that reduces SSI would be supportive of promoting specialty certification among nurses caring for surgical patients globally, which is consistent with the language and intent of the Institute of Medicine ‘Future of Nursing’ [2] report. Specific aims are:

1. Examine the relationship between the percent of perioperative area nurses holding specialty certification (CAPA, CPAN, CNOR/CRNFA) and hospital surgical site infection rates.
2. Examine the relationship between the percent of surgical intensive care unit, surgical unit, and medical-surgical combined unit nurses holding specialty certification (any national specialty certification) and hospital surgical site infection rates.
3. Examine the relationship between the number of wound and ostomy certified nurses and hospital surgical site infection rates.
4. Explore whether the perceived autonomy of specialty certified nurses moderates the relationship between specialty certification rates and hospital surgical site infection rates.
5. Explore whether the processes of decision making and nurse – physician relations mediates the relationship between specialty certification rates and hospital surgical site infection rates.

Our study methodology is a retrospective, secondary analysis of merged data from NDNQI and NHSN. All NDNQI hospitals in the US that submitted quarterly administrative staffing data and annual RN survey data for the year 2014 are being invited to participate in the study by downloading their NHSN SSI csv files to NDNQI.

Variable selection for our study is informed by Donabedian’s framework in which the structure and processes of care influence the outcomes of care [3,4]. Structure refers to setting attributes in which patient care takes place. Process is how things work in a hospital or unit and what is done for/to patients. Patient outcomes are results of care and include adverse outcome measures. Our main study structure variables are specialty certification rates (number of wound and ostomy certified nurses at the hospital level; percent of specialty certified nurses in perioperative areas; percent of specialty certified nurses in surgical intensive care units; percent of specialty certified nurses in surgical units; and percent of

specialty certified nurses in medical-surgical combined units) and nurse autonomy. Our study process variables process variables are decision making and nurse – physician relations. Our study outcome variable is SSI. We also will control for a range of hospital structure characteristics [e.g., Magnet status, bed size, ownership, teaching status, case mix index, mean American Society of Anesthesiologists (ASA) score] and unit-type structure characteristics (e.g., staffing, skill mix, education, experience).

Analysis includes generalized linear regression models at the hospital level. We will fit each model using a Poisson-based count of SSIs and the log of total number of operations performed as the exposure, and include specialty certification predictors and all control variables. Poisson-based models account for the zero-truncated, and often skewed SSI data.

Preliminary findings will be presented in the poster.

At the completion of our study, it is our expectation that we will have beginning evidence about whether increasing nursing specialty certification rates in acute care hospitals should be a part of SSI prevention strategies globally. The study is expected to have a potentially important impact for both of promoting specialty certification among nurses caring for surgical patients and decreasing costly surgical site infections among patients in acute care settings.

### 'Sex Will Make Your Fingers Grow Thin and Then You Die': The Interplay of Culture, Myths, and Taboos on African Immigrant Mothers' Perception of Reproductive Health Education with Their Daughters Aged 10–14 Years

---

*Kafuli Agbemenu, PhD, MPH, MSN, RN, USA*

#### Purpose

The purpose of this presentation is to examine the convergence of culture, myth, and taboo about reproductive health issues to which African immigrant women, who currently reside in the United States, were exposed while growing up in their countries of origin.

#### Target Audience

The target audience of this presentation is nurses and other healthcare professionals who work with the African immigrant population.

#### Abstract

**Background:** The purpose of this presentation is to examine the convergence of culture, myth, and taboo about reproductive health issues to which African immigrant women, who currently reside in the United States, were exposed while growing up in their countries of origin. We also sought to understand if their perceptions influenced the reproductive health education (RHE) they provide to their daughters aged 10–14 years.

**Methods:** Twenty African immigrant mothers in the United States were interviewed about the myths and taboos on pregnancy and sexually transmitted infections they heard growing up in their various African countries of origin. Qualitative content analysis was used to collect and examine data.

**Results:** Mothers reported myths and taboos that related to menstruation, sexual intercourse, pregnancy, and HIV/AIDS.

**Discussion:** Although several myths and taboos were reported, they did not appear to influence the RHE that mothers provided their daughters. Differences in U.S. culture vis-a-vis their countries of origin compelled most mothers to provide more education than they would have in Africa.

### Maternal Coordination of Care for Low-Income Latino Children at Risk for Developmental Delay

---

*Eileen K. Fry-Bowers, PhD, JD, RN, CPNP, USA*

#### Purpose

To present the findings of a qualitative study that seeks to understand the perceptions of and expectations for care coordination among low-income Latina mothers of young children who have or are at risk for developmental disability, which has not been previously explored.

#### Target Audience

all nurses providing care to young children and their families, especially those with low socioeconomic status or who are members of ethnic or racial minority groups.

#### Abstract

**Purpose:** This qualitative study seeks to understand the perceptions of and expectations for care coordination among low-income Latina mothers of young children who have or are at risk for developmental disability, which has not been previously explored.

**Background:** Approximately one in five children in the United States is a child with special health care needs, and nearly one in four households with children includes at least one such child. Children with special health care needs (CSHCN) are those who have or are at risk for chronic physical, developmental, behavioral or emotional conditions that require higher than normal health and related services. Developmental disabilities include impairments in physical, learning, language, or behavior areas, diagnosed before age eighteen and generally meet the definition of “special health care needs.”

Children with developmental disabilities who are identified early and begin receiving appropriate and coordinated intervention services demonstrate gains and advantages not shown by their peers who do not participate in these programs. For many children with developmental disabilities however, the array of primary, specialty and other support services needed are poorly coordinated. In addition, families have difficulty navigating the funding and eligibility processes for these programs. Significantly, many parents, especially those parents of low-income children or children of color, report unmet care coordination needs for their children. In fact, for Latino families, care coordination is impeded by lack of access to primary care, low economic status, language and cultural barriers, distrust of and decreased levels of comfort with providers, and low levels of health literacy.

U.S. health reform efforts emphasize care coordination as a key strategy for improving the quality and cost effectiveness of health care. Moreover, these services have the potential to increase patient/parent satisfaction with and engagement in care, support the continuity of care, and improve health outcomes, especially in vulnerable populations. Care coordination is particularly important for children with special or chronic health care needs because, by their very nature, these conditions require on-going attention and management of medical, psychological, social, and economic factors, and the effectiveness of this care can be measured by the experiences of families that receive these services.

High quality care coordination has the potential to reduce health disparities among Latino children with developmental disabilities, yet many Latino parents of CSHCNs, many of whom are low income, report poor coordination of care and services, which leads to significant family dissatisfaction and delays in service resulting in less than optimal health outcomes. Little evidence elucidates the Latino parent experience with the processes of care coordination, and what they expect from care coordination. Additional qualitative inquiry is needed to inform our understanding of Latino parent beliefs regarding care coordination in order to better meet needs and expectations and improve parent engagement and overall child health outcomes.

**Design/Methods:** This investigation uses grounded theory methods to explicate the process of and context of maternal perceptions and expectations of the purpose and practice of care coordination within the context of her child's developmental disability. Low-income Latina mothers of young children, aged 0 to 3 years who have been identified as being at risk for or have a developmental delay, will be recruited from the High Risk Infant Center at a regional Children's Hospital. Data will be obtained using individual interviews guided by a semi-structured interview guide. Investigators will also administer a brief descriptive demographic survey. Prior to use, the interview guide and socio-demographic survey will be reviewed with a focus group of Latina mothers who meet study inclusion criteria to ensure culturally sensitive questions and interview techniques. Investigators will obtain informed consent, collect demographic data, and conduct a private, individual digitally recorded interview of each participant. Data will be analyzed using constant comparative analysis. When complete, data, categories, interpretations and conclusions will be confirmed with a randomly selected subset of participants to ensure truthful representation of participants' experiences.

**Implications:** By exploring maternal understanding of the purpose and practice of care coordination for young children at risk for developmental disabilities, processes associated with maternal caregivers' information-seeking behaviors, use of care coordinators, participation in treatment decision-making, and health system navigation will be explicated. As a result, a richer, more accurate understanding of Latina mothers' perceptions of care coordination will lead to more exacting research, and subsequent design of more effective nursing practice and care coordination strategies for use with this population to improve engagement and satisfaction with care, and child health outcomes, particularly for vulnerable CSHCN.

### An Evaluation of Knowledge, Skills, and Attitudes toward Evidence-Based Practice in On-Line Graduate Nursing Students

---

*Wilaiporn Rojjanasrirat, PhD, MA, BSN, RNC, IBCLC, USA*

#### Purpose

The purpose of this presentation is to report the evaluation of knowledge, skills/practice, and attitudes toward evidence-based practice among graduate on-line nursing students before and after they enrolled in the evidence-based practice course at a private University in Midwestern, US.

#### Target Audience

The target audience of this presentation is nurse educators, faculty, and/or students.

#### Abstract

**Background:** Evidence-based practice (EBP) is an essential element in driving health care delivery and practice. The need to create a culture that values the practice of evidence-based nursing education through the design and evaluation of the education strategies is imperative. In spite of positive outcomes associated with EBP, many healthcare providers do not implement or adopt EBP. Little is known about the on-line graduate nursing students' EBP knowledge, attitudes, and skills/practice related to EBP and research.

**Purpose:** This study aimed to assess changes in EBP knowledge, attitudes, skills/practice among graduate on-line nursing students before and after they enroll in the evidence-based practice course at a private University in Midwestern, US.

**Methods:** A descriptive study with pre and post-test evaluation of students' knowledge, skills/practice, and attitudes toward EBP was conducted. The study sample included 63 on-line graduate students enrolled in the EBP and Research Methods course. Main study outcomes were measured using the Evidence-Based Practice Questionnaires (EBPQ) administering before and after completion of the EBP and Research Methods course. The EBPQ has been validated with acceptable reliability and validity. Descriptive statistics and sample t test were used to assess the mean differences between pre-and post-test scores.

**Results:** Students' overall EBPQ scores were significantly improved following completion of the EBP and Research Methods course  $t(63) = -9.034$ ;  $p < .001$ . Statistically significant differences were found for skills/practice mean scores  $t(63) = -12.78$ ;  $p = .001$ , however, no significant differences were found on knowledge and attitude mean scores. Most reported barriers to EBP included lack of understanding of statistics, interpretation of findings, lack of time, and library resources.

**Summary:** This is one of a few studies that evaluated on-line graduate nursing students' knowledge, attitudes, and skills/practice related to EBP. The findings suggest a systematic plan for implementing future EBP and Research Methods courses and interventions that address barriers to EBP among on-line graduate nursing students. Future research is needed to identify graduate nurses' knowledge and adoption of EBP upon graduation.

### Mediating Role of Resilience in the Relationship between Depression and Perceived Psychological Health in Patients with Heart Failure

---

*Pei-Shan Tsai, PhD, RN, Taiwan*

*Shan-Ying Wu, MSN, Taiwan*

*Ling-Yin Chang, PhD, Taiwan*

#### Purpose

The purpose of this presentation is to present evidence from a study on the mediating role of resilience in the relationship between depression and perceived psychological health status in patients with heart failure.

#### Target Audience

The target audience is nurse/health care scientists, clinicians and educators.

#### Abstract

Background: Depression is associated with a poor prognosis and reduced quality of life in patients with heart failure. Improving resilience may facilitate lessening the negative consequences associated with depression. However, the role of resilience in the relationship between depression and perceived health status in patients with heart failure remains unknown.

Objectives: To examine the relationships among depression, resilience, and perceived health status in patients with heart failure and to determine whether resilience plays a mediating or a moderating role in the relationship between depression and perceived health status.

Methods: A cross-sectional study design was used. Participants were recruited from cardiology outpatient clinics in hospitals located in Northern Taiwan. Included in the study were 128 community-dwelling and medically stable patients with echocardiographically documented heart failure. Hierarchical multiple regressions were conducted to determine whether depression and resilience predicted perceived physical and psychological health status. The moderating role of resilience was examined by testing the significance of the interaction between depression and resilience. The mediating role of resilience was analyzed using the PROCESS procedure in SPSS.

Results: Depression significantly predicted both perceived physical and psychological health status in patients with heart failure after adjustment for demographic variables, comorbidities, New York Heart Association functional class, and health behaviors (both  $p < 0.01$ ). Furthermore, resilience mediated the relationship between depression and perceived psychological health ( $b = -0.05$ ; confidence interval [CI]:  $-0.01, -0.001$ ) but not that between depression and perceived physical health ( $b = -0.004$ ; CI:  $-0.003, 0.003$ ).

Conclusion: Depression is a risk factor for poor perceived health outcomes in patients with heart failure. Interventions addressing resilience may facilitate improving perceived psychological health in depressed patients with heart failure.

### An Integrative Review of Interventional Designs in Studies Utilizing Home Telehealth to Reduce Hospital Admissions for Heart Failure Patients

---

Aimee E. LaBelle, MS, BSN, RN, USA

#### Purpose

The purpose of this presentation is to examine differences in interventional designs of HTM interventions. Clinicians and researchers implementing HTM programs for HF patients need to consider design variations to meet desired outcomes. Further research is needed to determine optimal interventional designs for the reduction of HF hospitalization rates

#### Target Audience

This presentation is aimed at nurses and nurse researchers with an interest in community based nursing, chronic disease care, heart failure, or for those with an interest in the structure and/or implementation of HTM programs

#### Abstract

**Problem:** Home telehealth monitoring (HTM) uses home-based electronic stations to monitor heart failure (HF) patients in community settings. Randomized control trials (RCTs) examining the efficacy of HTM in reducing hospital admissions show conflicting results. While a few studies have shown significant improvement in HF patient admissions, many HTM studies have not shown any significant reduction in HF admission rates. To date, the interventional designs of these studies have not been compared or fully explained.

**Purpose:** Interventional designs used in HTM studies for HF patients vary, including frequency of data input, type of data monitored, provider availability to monitor the input, and interventional duration. This review examines whether differences in design are related to HF admission rates in HTM studies.

**Search Strategies:** A literature search was conducted using PubMed, EBSCO, and CINHL. Key words included HF, telehealth, telemonitoring, telemedicine, and remote patient monitoring. RCTs of HF patients, HTM, and hospital admissions published from 2004 to 2014 were included for analysis. Excluded studies used synchronous telephone support, web-based journaling, or implantable medical devices.

**Search Results:** 172 publications were identified for review. 59 articles did not include HTM, 37 did not include admissions data, 26 were based on remote monitoring using implantable devices, 16 were not RCTs, 8 were mixed morbidity studies that did not include separate admission data for heart failure, 5 only included the study protocol, and 18 studies met the criteria for review. The remaining 3 studies were duplicates.

**Synthesis of the Literature:** Three studies showed consistent, significant reductions in admissions; two of those studies included daily input of heart rate and symptom ratings. The third included daily disease based symptom and medication adherence questions. All three included daily provider monitoring, and lasted from 90 to 365 days. One 120 day study reduced admissions at 60 days when controlled for days in home healthcare. None of the studies with significant findings tracked pulse oximetry. Fourteen studies had no significant improvements in admissions; of those fourteen only two included daily heart rate, symptom monitoring, and provider monitoring.

Due to the small number of studies with significant findings, and the variations in study designs it is difficult to definitively determine the optimal combination of interventional design components to reduce hospital admissions in heart failure patients. Analysis of the interventional design of these studies was also hampered by incomplete descriptions of the intervention components, especially provider monitoring frequency, description of usual care and descriptions of disease based questioning for patients.

**Implications:** The three HTM studies that consistently reduced hospital admission for HF patients included daily input of symptom ratings, and daily provider monitoring. Two of the studies also included daily heart rate monitoring. Daily monitoring of symptoms and heart rate should be prioritized when designing HTM interventions for HF patients in the clinical setting. More research is indicated to determine optimal design of HTH programs to reduce admissions in HF patients.

### **Discriminatory Capacity of Prediction Model Delirium (PREDELIRIC) in Adult Patients Hospitalized in the Intensive Care Unit University Hospital "Los Comuneros" Bucaramanga-Colombia**

---

*Claudia C. Torres Contreras, RN, MSc, Colombia*  
*Astrid Nathalia Páez Esteban, Magister, RN, Colombia*  
*Mayerli Katherine Rincón Romero, RN, Colombia*

#### Purpose

Determine the discriminatory power of the model prediction PREDELIRIC in critically ill adult patients 24 hours after admission to predict the development delirium during their stay in the ICU.

#### Target Audience

Aimed at Clinical nurses, teachers and student nurses, Health Professionals who work in intensive care units (administrative and care).

#### Abstract

The prevalence of delirium in intensive care units (ICU) is 20-80% Carrillo & Sosa, (2010). Delirium is diagnosed in only 66-84% of patients with this complication. Oumet & others (2007)

In addition, delirium is a predictor of re-intubation and increased hospital stay which has a significant impact on costs of hospitals. The development of delirium in intensive care units represents a major impact on patient management therefore directly affects and influences the hospital cost, stay and mortality. Martínez & others (2004)

The most frequent delirium in intensive care units psychiatric disorder is relevant to study the same in order to predict its onset to avoid fatal outcomes in critically ill patients. Ely & others (2004)

As regards the diagnosis of delirium several methods for diagnosis, from simple, practical and rapid methods, to more complex forms. Martinez et al, (2004).

Thus, the method most frequently used in critically ill patients, including patients on mechanical ventilation who can not communicate verbally is the CAM-ICU English confusion assesment method for the UCI, which has high sensitivity and specificity, excellent reliability and validity to identify delirium when used by nurses and ICU physicians, requires 2-3 minutes to complete. (Ely & others, 2004). This applies to patients with Sedation-Agitation Scale Richmond (English RASS Richmond Agitation Sedation Scale) -3 to +4. Sessler & others (2002).

But all the above scales allow assess the presence of delirium but none predicts the presentation. Thus, M van den Boogaard and colleagues decided to build and validate a model to predict delirium in adult patients in intensive care units. Boogaard & others (2012). Since this model of vital importance as it allows establishing preventive measures, reduce the incidence, severity and duration. Further development of this model will reduce risks of adverse effects of pharmacological prophylaxis.

This model was developed through a systematic review of known risk factors for the development of delirium. After calculating the incidence of each of the risk factors for the development of Delirium, found that 25 were the most prevalent, then eight factors were excluded due to prevalence below 10% after leaving the multivariate analysis logistic regression with other risk factors ten factors Predeliric model, easily measurable within the first 24 hours of admission to the intensive care unit. Boogaard & others (2012).

At present there is no model prediction of delirium in Spanish that allows health personnel to identify patients who should objectively implement interventions to prevent delirium. That is why in Bucaramanga Santander research group Everest nursing program, together with a group of nurse researchers from different institutions conducted a study to validate the prediction model PREDELIRIC a Spanish version, this study leave evidence the need to identify and implement nursing interventions aimed at the prevention of delirium in critically ill patients in Bucaramanga. (Torres Marquez, Vanegas & Esparza, 2014).

This research study met the Spanish process of validating the model prediction of delirium (PREDELIRIC) including: internal validity, construct validity, external validity and reproducibility. As a priority, so that this model is applied in the city of Bucaramanga - Colombia, in order to determine the discriminatory power of the prediction model PREDELIRIC adult critically ill patients within 24 hours after admission to predict the development delirium during their stay ICU, in turn facilitating the specific application of non-pharmacological preventive measures patient to determine high risk  $\geq 50\%$ .

Specific objectives.

- To determine the validity and reproducibility of the model prediction of delirium in Spanish, in the patient population of the intensive care unit.
- Determine the facial validity, content, internal consistency, and reproducibility of the model prediction of delirium in Spanish.
- Bringing the urea level conversion m/mol to milligrams per deciliter (mg / dl).
- To determine the incidence of delirium in critically ill patients according to the presence of risk factors model.
- Describe the sociodemographic and clinical characteristics of patients critics three intensive care units of Bucaramanga features.
- Describe the effectiveness of the prediction model PREDELIRIC through comparison with patients who develop delirium by application of CAM - ICU.
- Design and implement a nursing intervention protocol aimed at preventing delirium in patients presenting greater percentage of prediction deliric 50%.

Methodology: A descriptive study of validation or evaluation of diagnostic technologies was conducted in two phases, the first phase of the study was cross-cultural adaptation and validation of the Spanish version of the prediction model of delirium (PREDELIRIC), the second stage evaluated the validity and reproducibility of the prediction model of delirium in Spanish, patients were recruited voluntarily, after signing informed consent and meeting inclusion criteria, in the months of February to May 2014 in "Los Comuneros" university Hospital of Bucaramanga.

Convenience sampling, entering consecutive patients who met the inclusion criteria in intensive care units of study to complete the sample size calculated was performed.

Procedures

- Authorization by the research committee of the UDES and The Communards Hospital Universitario de Bucaramanga
- Coordination with the director of UCI
- Patient recruitment written informed consent of the patient or family
- Home Valuation: Scale RASS, CAM-ICU (rule delirium), PREDELIRIC
- Daily monitoring (RASS, CAM-ICU)
- Exit: delirium, discharge from the ICU or death

Results: The validity evaluated the discriminatory power of the model prediction of delirium in critically ill adult patients 24 hours after admission to predict the development of delirium during their ICU stay was performed by analyzing the ROC curve for short English, Receiver operating characteristic curve (ROC); thus, the sensitivity, specificity, positive predictive value, negative predictive value, test efficiency, positive likelihood ratio and negative likelihood ratio in the cut proposed by the author of the prediction model for

delirium was calculated. It was also evaluated whether there was a differential behavior of the ROC curve by gender.

Data showing the validity of the criterion of  $\geq 50\%$  probability resulting conclusion that the prediction model delirium Predeliric has adequate discriminatory power, demonstrated by a sensitivity of 78% and specificity of 70%. So, The discriminatory capacity of the prediction model PRE DELIRIC was good given for under the ROC curve of 81% area with confidence intervals of 95% from 70% to 93%, ie the model does predict and properly classify the outcome delirium or delirium in approximately 8 out of 10 patients.

Recommendations: It is recommended once the results with a total sample size are proposing a new cutoff Predeliric prediction model in its Spanish version.

It requires the application of the model to proactively identify and treat patients at high risk (predicted values > 50%).

This highlights the importance of implementing a program aimed at early detection and prevention of delirium in the intensive care units of Bucaramanga and Colombia

## SCI PST 2 - Scientific Poster Session 2

### The Impact of Warming on Term NICU Admission Rates in Women Undergoing Scheduled Cesarean Delivery

---

*Melanie Chichester, BSN, RNC-OB, CPLC, USA*

*Lynn Elizabeth Bayne, PhD, MSN, BSN, NNP-BC, USA*

*Matthew Hoffman, MPH, MD, USA*

#### Purpose

to demonstrate the effect of a bundle of interventions designed to decrease preterm NICU admission hypothermia delivered by cesarean section on term neonates and potentially the mothers.

#### Target Audience

obstetric nurses, neonatal nurses, and nurse practitioners caring for women and newborns.

#### Abstract

Background: In 2011, a new "bundle" of care, multiple changes in practice instituted together, was developed to produce an improved outcome in preterm neonatal hypothermia, as cold infants are at increased risk of morbidity and mortality. This included the pediatric caregiver receiving the infant at the Operating Room (OR) table with warm blankets, preheating the infant warmer, caregivers warming their hands, use of polyethylene covers for premature infants, and increasing the OR room temperature to 68° F. The results of these changes have markedly reduced preterm neonatal hypothermia. Initially, the goal was to reduce preterm morbidity and mortality; however, we also wished to determine if there was a benefit to term infants. Further, it was anecdotally noted that the mothers may also be receiving a benefit, as there seemed to be fewer women who were hypothermic upon arrival to the OB PACU.

Hypothermia, defined as temperature < 36° C, is an anticipated morbidity during a surgical procedure. It contributes to the risk of coagulopathy, increased surgical blood loss, postoperative wound infection, increases patient discomfort, and delays transfer from the post-anesthesia care unit [PACU]. Women undergoing cesarean delivery have 2 risk factors which increase their chance of emerging from the OR) hypothermic- being female and level of spinal anesthesia. Further, the uterus is also exteriorized for repair after delivery of the baby, exposing internal organs to cold stress. The Obstetric (OB) OR rooms were previously set at approximately 62-65°. As such, there are standards of care initiated to prevent hypothermia: warmed intravenous fluids, warm blankets, warmed oxygen, and warm irrigation fluids. But despite use of these measures, hypothermia and associated shivering have been relatively common occurrences in the OB PACU.

Purpose: We sought to determine the effect of a bundle of interventions designed to decrease preterm NICU admission hypothermia after cesarean delivery had on term neonate NICU admission after scheduled cesarean delivery. Secondary objectives were to determine if there has been a significant improvement in maternal post-cesarean hypothermia, decreased blood loss, and the incidence of postoperative infection.

Methods: We performed a retrospective pre-post analysis assessing the impact of a series of interventions (ambient OR temperature increased from 62-65°F to a standard of 68°F, use of warmed blankets during infant transfer from the OR field to a warmer) designed to decrease preterm hypothermia on term neonates delivered by scheduled cesarean section. Women were included if they were delivering a term (>37 week) singleton non-anomalous fetus by scheduled cesarean section. Our primary outcome was term NICU admission. Univariable analysis was utilized to assess significance.

#### Results:

We identified 1,280 term singleton live births before (Pre-intervention) and 1,411 (Post-intervention) after policy implementation. Neonates who were born in the Post-intervention period tended to be less likely to

be admitted to the NICU; though this did not reach statistical significance (7.97% Pre-Intervention vs. 6.17%- P value= 0.068). Maternal and fetal demographic information was unchanged between the two time periods with the exception of a slight increase in maternal BMI (Post intervention 33.82 vs. Pre-Intervention 33.21- P –Value=0.034). Maternal outcomes (hypothermia, blood loss, and postoperative infection) were all non-statistically significant, demonstrating no increase in maternal adverse outcomes for the mothers after implementation.

**Conclusions/Implications:** The use of increased ambient OR room temperature and warmed blankets for transfer from the OR field to a warmer was associated with a trend in decrease NICU admission at term. The mothers did not demonstrate adverse outcomes as a result of the interventions.

## SCI PST 2 - Scientific Poster Session 2

### Transcultural Self-Efficacy Perceptions in Nursing Students in Private and Public Higher Educational Groups

---

Wanda J. Franklin, PhD, RN, USA

#### Purpose

The purpose of this research is to explore the difference in transcultural self-efficacy between 2 different freshman student populations: a private liberal arts university and urban state institution. An additional purpose is to examine the differences in transcultural self-efficacy perceptions among Nursing faculty and the two nursing student groups.

#### Target Audience

The target audience of this presentation is nursing faculty, administration, and clinical mentors. Nursing students of the future will be caring for increasingly ethnically diverse patients. Healthcare outcomes are more favorable in settings where high quality and cultural competent care are provided. Cultural competence in nursing care is paramount.

#### Abstract

Learning objectives include: (1) The learner will be able to identify differences between freshman nursing student groups in transcultural self-efficacy perceptions (2) The learner will be able to identify differences between faculty and freshmen nursing student groups in transcultural self-efficacy perceptions. Using Bandura's Theory of Self-Efficacy (1986) and Jeffreys (2010) Cultural Competence and Confidence (CCC), the purpose of this research is to explore the difference in transcultural self-efficacy between 2 different freshman student populations: a private liberal arts university and urban state institution. An additional purpose is to examine the differences in transcultural self-efficacy perceptions among Nursing faculty and the two nursing student groups. A Meta-analysis of research scores on the transcultural self-efficacy test with different populations was also completed.

This cross sectional descriptive study examined the transcultural self-efficacy perceptions (cognitive, practical, and affective subsets) in a convenience sample of 59 freshman nursing students from a private liberal arts university and 56 freshman nursing students from public urban research and teaching state university.

Transcultural self-efficacy perceptions were measured using the Transcultural Self-Efficacy Tool (TSET) developed by Jefferys (2000). Reliability testing on study instrument was evaluated using Cronbach's alpha coefficient with an adequate score of  $<.70$ .

Using Independent Two Sample t-test, overall there were no statistically significant differences in the means in the two nursing student populations. Statistically significant differences were found in the Affective subscale. There was not enough statistical evidence to conclude significant differences between the two groups in the Cognitive or Practical subscales.

Faculty mean scores were higher than both nursing student group scores.

This study is one of the first to study the differences in transcultural self-efficacy perceptions in nursing students in different institutional settings. Further investigation into the importance of early introduction into a cultural efficacy focus in nursing education customized to location is implicated by this study. This study also suggests that clinical experience coupled with theory and the importance of faculty cultural efficacy in building student efficacy is also indicated.

### Female Genital Mutilation/Cutting: Global Health Implications and Evidence-Based Prevention Strategies

---

*Maura Waldron, BA, USA*

*Kate McMinimee, BS, USA*

*Katherine Shipley, BS, USA*

#### Purpose

The purpose of this presentation is to explore the cultural context of female genital mutilation/ cutting (FGM/C), effective prevention strategies for elimination of FGM/C, and the nursing role in caring for patients with FGM/C both within the United States and abroad.

#### Target Audience

The target audience of this presentation is nurses with an interest in vulnerable populations, specifically women affected by female genital mutilation/cutting (FGM/C) .

#### Abstract

Female Genital Mutilation/Cutting affects over 125 million females worldwide. Originally stemming from specific cultural, social, and religious beliefs, it involves the partial or total removal of the female external genitalia for non-medical reasons. Without any health benefits, FGM/C puts millions of women's health at risk. FGM/C violates human rights and its elimination is supported by WHO, UNICEF, and UNFPA. Changes in the Affordable Care Act and Immigration laws may increase the number of American providers treating these women. It is crucial more awareness be brought to this issue for the safest, most culturally competent care and to strengthen evidence-based efforts to end the practice worldwide.

### Qualitative Research in Teens with Asthma: Understanding Patterns of Symptoms and Self-Management

---

*Jennifer R. Mammen, MSN, RN, NP-C, USA*  
*Hyekyun Rhee, PhD, RN, PNP, USA*  
*Sally Norton, PhD, RN, FNAP, FPCN, FAAN, USA*  
*Arlene Butz, ScD, RN, USA*

#### Purpose

The purpose of this presentation is to describe teens' perceptions and experiences of asthma self-management, and patterns of asthma self-management behaviors.

#### Target Audience

The target audience of this presentation is researchers and clinicians providing care for children in areas of chronic disease self-management.

#### Abstract

**Background:** Self-management is a central component of controlling disease and preventing morbidity and mortality (CDC, 2011; Rand et al., 2012). Many teens have suboptimal asthma control, which is often attributed to poor self-management (Bruzzeese et al., 2012; Rhee, Belyea, Ciurzynski, & Brasch, 2009). Thus it becomes important to understand not only how teens self-manage their asthma, but their underlying process of rationales and responses (Mammen & Rhee, 2012). In this study we employed a combination of semi structured interviews, self-management voice-diaries, and card sorting techniques to map teens' unique patterns of symptoms and responses and facilitate in-depth discussion of their asthma self-management.

**Study Objectives:** To explore teens' experiences of asthma self-management across life-contexts, and to describe how teens manage their asthma and what is important to them.

**Design:** This study used a case-based qualitative-descriptive design with purposive and criterion-based sampling (well-controlled v. not-well-controlled teens; minority v. non-minority teens).

**Setting:** Teen-parent dyads were recruited from prior study subjects, the community, Emergency Department, and Pediatric Pulmonary Department of a large urban hospital in Rochester, NY.

**Participants:** A total of 14 teen-parent dyads, consisting of minority and non-minority teenagers (aged 13-17 years; n=14) with well-controlled or not well-controlled persistent asthma, and their parents (n=14), participated in the study.

**Methods:** Initial data were collected from teen/parent dyads using separate semi-structured interviews with each teen and parent. Next, teens completed a 2-week digital voice-diary on asthma self-management describing their daily asthma symptoms and experiences, responses, rationales, and thoughts related to their asthma on that day. Lastly a follow up open-ended interview with each teen, incorporating an event-response card sorting technique to map the teen's spectrums of asthma symptoms and associated self-management behaviors, was conducted to further explore experiences, perceptions, and patterns of asthma self-management. Data from recorded interviews were transcribed, verified, uploaded into ATLAS.ti, and analyzed using open, process, and pattern coding.

**Results:** Data indicate that teens have **symptom thresholds** for responding to asthma symptoms. Symptom thresholds are defined as the point at which asthma symptoms are considered important and require an active self-management response. Symptoms falling below a teen's threshold were considered low-level, unimportant, and required no response other than waiting. Symptom thresholds were specific to each individual and appeared to correspond with baseline level of symptoms. Teens with higher

frequency and severity of baseline asthma symptoms (i.e. not well-controlled) reported higher symptom thresholds (i.e. delayed response) for reacting to symptoms than teens with better-controlled asthma. The most common symptom threshold for teens in this study was the point at which asthma symptoms interfered with activities.

Second, teens with asthma felt that not all asthma symptoms were important. Symptoms that occurred on a regular basis (i.e. daily) were not viewed as serious and were referred to as “**normal symptoms.**” Normal symptoms were different for each teen and corresponded with baseline level of control. The poorly controlled teens in our study considered daily wheezing to be a normal symptom, whereas well-controlled teens did not. Because normal symptoms were not seen as serious, they were typically overlooked, ignored, forgotten, and were not reported to parents or healthcare providers. Only high-level and unusual symptoms exceeding the symptom threshold were recalled and reported.

Third, clinical definitions of controlled asthma did not correspond well with teens' understandings of controlled asthma. Having "controlled" asthma for a teen meant not having symptoms of asthma that exceeded their "normal" symptoms. Most teens in the study felt that their asthma was controlled as long they could get the symptoms to go away—either by waiting or by using a rescue inhaler. Well-controlled teens had lower symptom thresholds for perceiving asthma to be uncontrolled. Not-well-controlled teens accepted a higher level of symptom frequency within their paradigm of controlled asthma.

**Discussion:** Our data extend upon prior research, which indicate teens tend to underreport and ignore asthma symptoms, by suggesting that the threshold for reporting and responding to symptoms hinges upon teens' perception of the seriousness of symptoms and understanding of what is normal (Britto et al., 2011; Rhee, Belyea, & Elward, 2008). This means that teens with daily symptoms of asthma may report having no asthma symptoms because they have not exceeded their symptom threshold for perceived normal symptoms. Researchers and clinicians working with this population may need to probe more specifically into teen's asthma symptoms to understand which are likely to be overlooked and not reported. Identifying teen's unique sequences of symptoms and responses may assist clinicians and researchers in identifying specific areas of need and tailoring asthma education accordingly. Identification of symptom thresholds can contribute to better understanding of patients' perspectives and experiences, assist in developing targeted self-management interventions, and ultimately lead to improved health outcomes.

### Playing With Dolls: Recent Graduates' Perspective on the Efficacy of Nursing Simulation Laboratory Experiences

---

Holli Sowerby, EdD, MSN, RN, USA

#### Purpose

To help meet the need for clinical time schools of nursing are increasingly turning to high-fidelity simulation mannequins to substitute for clinical experience. By interviewing recent graduates about their experiences with high-fidelity simulation in nursing school, information was obtained that will allow evaluation of the effectiveness of the simulation experience.

#### Target Audience

The target audience of this presentation is nurse educators and those persons that are involved in simulation education.

#### Abstract

This project study addressed the recent graduates' perception of the efficacy of simulation in registered nursing education. It has become progressively more difficult to find suitable clinical placement for nursing students. To help meet this need, schools of nursing are increasingly turning to high-fidelity simulation mannequins to substitute for clinical experience. There is a lack of research that explores the recently graduated nurse's perceptions about the efficacy of simulation experiences. The conceptual framework for this study is the constructivist theory. This is a process of experience and reflection. It is a dynamic process that changes as the learner internalizes the experience. This study allowed the researcher to understand how recent graduates perceive the value of simulation experiences. Two research questions were identified: How do recent graduates of registered nurse (RN) education programs view the simulation lab experiences from nursing school? and In what ways do the perceptions of simulation experiences differ between associate degree RN program graduates and bachelors program RN graduates? A qualitative, case study research design was used to explore the perceptions of recently graduated RN's about their experience with simulation. By interviewing recent graduates about their experiences with high-fidelity simulation in nursing school, and documenting their perceptions about the efficacy of those simulation experiences, information was obtained that will allow schools of nursing to increase the effectiveness of the simulation experience or validate its applicability in the real world setting.

### Feasibility of Simulation in Orientation: A Pilot Study

---

*Karen M. O'Connell, PhD, MSN, BSN, ADN, RN, CEN, NEA-BC, USA*  
*Sherrill J. Smith, PhD, RN, CNL, CNE, USA*

#### Purpose

The purpose of this presentation is to disseminate the results of a study on the feasibility of using simulation scenarios as part of an orientation.

#### Target Audience

The target audience of this presentation is nurse educators working in the clinical areas.

#### Abstract

**Background:** Active duty military nurses transfer to new duty stations every three or four years. With each transfer, the nurse enters into a typical orientation period of six weeks. During this orientation, new nurses receive organizational and unit information while preceptors evaluate patient care skills. Most units utilize an orientation checklist and bedside skill proficiency is validated by direct observation. Decreased patient acuity and lengths of stay have resulted in limited availability of common patient types or procedures, especially in critical care units. Simulation allows observation of nursing skills in a shorter time than direct observation at the bedside; however, literature does not identify the best evaluation tool. The purpose of this study was to determine the feasibility of high-fidelity simulation in unit orientation of newly assigned nursing personnel, more specifically nurses assigned to the critical care unit. The research question examined is: What is the feasibility of the use of a simulated clinical shift as a part of the critical care unit orientation to assess the performance of incoming nursing personnel? The specific aims were to: 1) Determine appropriate simulation scenarios to address the high-risk, low-volume critical care situations and the most common patient types to be included in the performance assessment of newly assigned nurses; 2) Develop a performance evaluation tool based on the current critical care orientation checklist for use in evaluating the new nurse's performance using the simulation scenarios; 3) Determine the psychometric properties of the performance evaluation tool using simulation scenarios, and 4) Determine the usefulness of the simulation scenarios and performance evaluation tool to identify those nurses who do not meet performance standards.

Jeffries' (2005, 2007) Nursing Education Simulation Framework was developed to provide guidance to nurses in the design, implementation, and evaluation of simulation used in nursing education. This framework includes five major components: teacher factors, student factors, educational practices, simulation design characteristics, and outcomes. According to this framework, a properly designed simulation is a teaching strategy used in the teaching-learning process and affects the five described outcomes of satisfaction, self-confidence, critical thinking, knowledge, and performance (Jeffries, 2005). Extensive research has validated the use of simulation as an educational strategy for nursing students (Cant & Cooper, 2010) and newly graduated nurses (Ackermann, Kenny, & Walker, 2007; Olejniczak et al., 2010). Increases in satisfaction, self-confidence, critical thinking and knowledge have been reported in nursing students following a simulation experience (Birch et al., 2007; Bremner, Aduddell, Bennett, & VanGeest, 2006; Gibbons et al., 2002; O'Donnell et al., 2011; Swenty & Eggleston, 2011). Changes in performance following simulation for nursing students are less abundant in published reports (Alinier, Hunt, & Gordon, 2004; Grady et al., 2008; Pauly-O'Neill, 2009) with even fewer addressing performance in practicing nurses (Jones, Cason, & Mancini, 2002).

Using the Nursing Education Simulation Framework for evaluation, simulation becomes an evaluation tool instead of a teaching strategy. Teacher and student factors interact with education practices to produce the outcome of performance. For this study, a summative evaluation was performed – evaluating the learner's attainment of a goal, i.e. acceptable performance of patient care in a simulated critical care environment, to evaluate the nurse's readiness for providing care in a critical care environment.

**Methods:** A descriptive pilot study was conducted to determine the feasibility of simulation scenarios to evaluate performance. Scenarios addressing the most common types of patients and procedures seen in the critical care unit and an evaluation tool were created and tested with experienced critical care nurses and nurses with no critical care experience. Participants (n=7) were recruited from all registered nurses in a military treatment facility. Three independent raters timed and evaluated the participants as they completed three simulated patient care scenarios. Inter-rater reliability was determined by calculating Cohen's alpha. Difference in mean overall score and time to complete the scenarios was identified by t-tests.

**Results:** Inter-rater reliability for the evaluation tool was excellent (Cronbach's alpha = 0.95). Mean overall participant scores, grouped by self-report of critical care experience, ranged from 33.67 to 54.67 (possible score range: 11.00 to 55.00). A split in the overall mean scores was identified between those with and those without critical care experience. Mean time to complete the scenarios was 55.29 minutes (range: 38 to 82 minutes). There were no statistically significant differences in overall mean score ( $t(5) = 0.51$ ,  $p = 0.63$ ), nor time to complete the scenarios ( $t(5) = 1.55$ ,  $p = 0.18$ ) between the groups.

**Conclusion:** Simulation scenarios to evaluate new nurses are feasible in the military treatment facility. Although not time consuming for the participant, preparation and evaluation of the scenarios is personnel- and time-intensive. Although no statistically significant results were found, the split in overall mean scores may indicate a method to determine proficiency in critical care nursing. Findings from this study support the use of the created performance evaluation tool with simulation scenarios. Replication of this study with a larger, more diverse sample is recommended to further validate the evaluation tool and these findings. Successful results can be transferred to other departments within the medical center and to performance validation prior to deployment.

### Contraceptive Choices Application (App) Development

---

*Cathy Carlson, PhD, MS, BSN, RN, APN, FNP-BC, USA*  
*Donna J. Plonczynski, PhD, MS, BSN, APN, RN, USA*

#### Purpose

The purpose of this presentation is to describe the development of an application (app) using data that explores relationships among contraceptive choice and use with selected characteristics of clients from one Midwestern U.S. county health department's family planning clinic who are at high-risk for unintended pregnancies.

#### Target Audience

providers and educators in the fields of family care and women's health

#### Abstract

Background. Improved access to contraception and reduction of unmet need for family planning are key components to improve reproductive health of women. Voluntary family planning is one of the great advances in public health during the last century, with the greatest advancements developed during the last 35 years (Department of Reproductive Health, World Health Organization [WHO], 2010). Family planning saves the lives of women by allowing self-determination in the limitation of the number of births, spacing pregnancies, and avoidance of pregnancies in the very young and older women of childbearing age (Global Health Learning Center, 2007). During the years 1985-2005, almost 4 million additional maternal deaths would have occurred if the use of family planning had not improved (Global Health Learning Center). The majority of saved lives is attributed to fewer births and reduced mortality during the birthing process.

In 2012, the London Summit on Family Planning spurred international, national, and private organizations to expand access to voluntary family planning (Family Planning 2020). Despite advancements in reproductive health and voluntary family planning, over 200 million women who do not want to get pregnant do not have access to contraceptives and voluntary family planning knowledge and services (WHO, 2013). The lack of access results in over 75 million unintended pregnancies every year (Family Planning 2020). Approximately 40 percent of pregnancies in developing countries are unintended and, interestingly, 47 percent in developed countries (Engelman, 2011).

The cost of unintended pregnancies places the adolescent or woman at risk (U.S. Department of Health and Human Services [DHHS], 2014). These risks include delays in initiating prenatal care with untoward maternal and fetal outcomes. This population is less likely to breastfeed, with resultant risks on maternal-fetal bonding and childhood obesity and asthma, among others. These adolescents and women are more likely to develop depression and have an increased risk of physical abuse during pregnancy.

Adolescents are particularly vulnerable to unintended pregnancies. Among females younger than 20 years, slightly more than 80% of pregnancies were unintended (DHHS, 2014). And this proportion is even higher in those younger than 15 years, as this group has a 98% unintended pregnancy rate. Negative consequences are greater for adolescent mothers who are less likely to graduate high school (HS) or earn a General Education Development (GED) by age 30 years or earn a wage comparable to women who delay childbearing. Adolescent mothers are also twice as likely to receive Federal benefits and continue them twice as long.

Many barriers exist in having contraceptives more widely available and accessible. Barriers include cultural impediments as well as lack of funding, lack of products to meet women's needs, and lack of knowledge. In addition to public benefits which support women with unintended pregnancies, there are publicly funded clinics that provide family planning care. These clinics prevent nearly 1.5 million unintended pregnancies, nearly 400,000 of which would occur with adolescents (Guttmacher Institute,

2012). In the United States (U.S.), the Title X Family Planning program, enacted in 1970, is the Federal program that provides grants that ultimately provide individuals with “comprehensive family planning and related preventive health services” (DHHS, n.d.). Contraceptives, however, are one of the best investments a country can make for its future, delivering significant savings in healthcare costs. DHHS (n.d.) states that every dollar spent on contraceptive services in the U.S. saves approximately \$3.74 in costs related to pregnancy and delivery care and care to infants during their first year of life.

In order to reduce the unintended pregnancy rate, family planning efforts should address access to effective contraceptives to those at greatest risk (Finer & Zolna, 2011). Underserved, low-income adolescents and women of one Midwestern U.S. County are the target population for this project and presentation. This population is at high risk for unintended pregnancies along with premature births and other untoward pregnancy outcomes.

**Purpose.** The purpose of this presentation is to describe the development of an application (app) using data that explores relationships among contraceptive choice and use with selected characteristics of clients from one Midwestern U.S. county health department’s family planning clinic who are at high-risk for unintended pregnancies. This clinic is supported by Title X funds. Data will be used to improve client care by actively involving clients in identifying contraceptive methods that are tailored to the client’s risk factors and needs using medically accurate information and education. This tailored choice of contraceptives, including knowledge and access to long-acting reversible contraceptives (LARC), is anticipated to reduce the unintended pregnancy rate, which is high in this Midwestern County.

**Methods.** Results of a related study on the Midwestern family planning clinic will be used to develop an evidence-based app that will allow tailoring information on contraceptive choices for each client. Because the app will be developed based on data obtained from the clinic’s client charts, the information in the evidence-based app will be applicable to this high-risk for pregnancy population. iPads with security and tamper protection will be available in the waiting room of the family planning clinic for client use for those without the ability to download the app on their portable device. The app will be available at no cost for the clinic and its clients, but will be available for purchase at the app store. The app development began using storyboarding for the algorithm that included contraceptive choices. The content was drawn primarily from the United States Medical Eligibility Criteria for Contraceptive Use (USMEC) (Centers for Disease Control and Prevention, 2010) which was based upon the World Health Organization Medical Eligibility Criteria for Contraceptive Use (4<sup>th</sup> ed.) (WHO, 2010). The app will be user-friendly, bilingual, and provide tailored education on contraceptive choices.

**Results.** As the client narrows her options via interactive questions, the easy-to-use app will highlight the most suitable types of birth control for her, but also explain potential side effects and risks associated with each of her options. Clients who use the app will be better informed and already have a baseline knowledge about what characteristics of contraceptives are important to them when they see their health care provider (HCP). The HCP can then spend less time explaining birth control options and more time focused on a more narrow discussion tailored to the client’s particular options.

### Perceptions of Diabetes Self-Management Education and Support, Diabetes Self-Management Behavior, and Self- Reported Health in Persons Diagnosed with Type II Diabetes

---

*Tracy M. Towne, PhD, MSN, BSN, RN, USA*

#### Purpose

The purpose of this presentation is to share the results of a 2014 quantitative research study examining the relationship between self-management behaviors of individuals with type 2 diabetes and the perception of the education and support provided by healthcare providers.

#### Target Audience

The target audience for this presentation is healthcare providers who interact with patients with type 2 diabetes, and primarily those who assist in helping educate and support them through self-management. Nurses who work at the bedside, education, and administration will benefit from the results of the research.

#### Abstract

Diabetes has a physical and mental burden to those with the illness. Economically there is a significant impact to the United States' health care system. Education and support is the best way for health care providers (HCPs) to improve the health and well-being of those with type II diabetes. The purpose of this study was to explore the relationships among perceptions of the education/support provided by HCPs related to self-management behaviors and the overall health status in community dwelling adults with type II diabetes.

A cross-sectional, correlational design was used and the setting was initially in two Midwestern states, followed by online data collection. The sample was non-random, convenience (N=66). Participants in the study were community dwelling, 25 years or older, able to read/speak English, had a self-reported diagnosis of type II diabetes for three or more years, and were able to access a telephone or a computer with internet capabilities. Individuals were excluded if they were unable to recall ever receiving diabetes self-management education/support.

Nine quantitative instruments were used to collect data, along with researcher developed open-ended questions. Over the course of seven months data were collected by mail survey (four months) and then by online format (3 months). Quantitative data were analyzed with parametric statistics including multiple linear regression and text data were summarized. Text data summarized four main issues related to the perception of education/support: education as helpful, frustration with education/support, emotional aspect of diabetes, and need to be self-taught. Participants' perceptions of diabetes-related content received moderated the relationship between environmental barriers to self-management and performance of self-management behaviors. Persons with high barriers and perceptions of low content received reported lower performance of self-management behaviors. Higher perceived diabetes content needed was a significant predictor of poorer physical and mental health. Greater self-efficacy was associated with greater performance of self-management behaviors.

This study provides information about how persons' perceptions of diabetes education/support, especially how content needed and received impact self-management behaviors and health status of persons with type II diabetes. Additional research is recommended with a larger, more diverse sample using mixed methods to further the understanding of this phenomenon.

### Development of a School of Nursing Rubric

---

*Jessica L. Naber, PhD, MSN, RN, USA*

#### Purpose

The purpose of this presentation is to detail the necessary components of rubrics for written nursing assignments. The importance of using rubrics will be emphasized. Issues associated with developing and utilizing rubrics will be described, and several nursing rubrics will be critiqued.

#### Target Audience

The target audience of this presentation is nursing educators in an academic setting.

#### Abstract

Rubrics have been used as guides to establish and communicate standards to students when developing a paper or project. The standards set by the rubric assure course objectives are met and nursing standards of practice are integrated. This article will detail the necessary components of the rubric for written nursing assignments, both didactic and clinical. In addition, the importance of using rubrics will be emphasized. The issues associated with developing and utilizing rubrics in nursing education will be described and discussed. The development of a specific school of nursing rubric will be detailed, and four nursing rubrics will be critiqued.

### Becoming Aware of Compassionate Care through a Patient's Story: Reflections from First Year Nursing Students

---

*Stephanie M. Jeffers, PhD, MSN, BSN, RN, USA*  
*Marcus Engel, MS, USA*

#### Purpose

The purpose of this presentation is to discuss the results of a qualitative descriptive study exploring first year nursing students' perceptions of compassionate care and the role of a nurse while caring for patients.

#### Target Audience

The target audience of this presentation are nursing faculty teaching in either pre-licensure or graduate level degree programs.

#### Abstract

The purpose of this qualitative descriptive study was to understand how faculty could use literature to teach first year nursing students about compassionate care and the role of a nurse. The sample in this study were reflection letters written by first year nursing students to the author of a book, detailing his experiences following a catastrophic motor vehicle accident. Archival data was reviewed and thematic analysis was conducted by the researcher; three major themes emerged. The data was linked to Mezirow's Transformative Learning theory. Results of the study show that students' beliefs about the profession of nursing, the role of a nurse and their own education were transformed, in a positive manner. Additionally, literature as a teaching strategy was effective and beneficial to the students.

### InSHAPE: An Exercise and Nutrition Wellness Program for Individuals with Serious Mental Illness

---

Marsha L. Lesley, PhD, MLIS, BSN, RN, USA

#### Purpose

The purpose of this presentation is to describe the effectiveness of a physical fitness and nutrition health program called InSHAPE for individuals with serious mental illness and relationships between physical fitness, self-efficacy, stress, social support, smoking, sleep habits, and depression.

#### Target Audience

The target audience is psychiatric/mental health nurses, nurse academics, and all nurses who are interested in an integrated focus on both physical and mental health.

#### Abstract

The InSHAPE individualized health promotion program has been gaining national attention for its success in helping individuals with serious mental illness to improve physical fitness and nutrition health. A community mental health agency in mid-Michigan has been enrolling participants in the year-long program since December 2010 and has collected data on numerous physiological and psychological measures at several time points during the year. This study will report the findings and relationships between these repeated measures including physical assessment data such as blood pressure and heart rate before and after exercise, 6-minute walk test, and body mass index; and psychological assessments such as self-efficacy for physical activity and eating habits, experiences of stress and levels of depression. Smoking, sleep habits and patterns, and social support will also be analyzed. This study will add to the current body of knowledge about the InSHAPE program that has included a recent qualitative study published in *Journal of Psychosocial Nursing and Mental Health Services* that examined the sustainability of InSHAPE program fitness activities when participants complete the program. The nurse researcher has been actively involved as a therapeutic agent throughout the development and implementation of the InSHAPE program and during research activities in connection with it.

### Relationship Grandfather-Grandson, Strengths and Weaknesses in the Bond in Students of the Faculty of Nursing

---

*Gnalen Kourouma, BS, Mexico*  
*Lenda Sharon Ramírez-Pérez, RN, Mexico*  
*Karina Macías-Patiño, RN, Mexico*  
*Maria Magdalena Delabra-Salinas, MSN, RN, Mexico*  
*Maria Ascencion Tello, MSN, RN, Mexico*  
*Luis Cortez-González, MN, RN, Mexico*  
*María de los Ángeles Villarreal-Reyna, PhD, Mexico*  
*José Reboloso-Hernandez, RN, Mexico*

#### Purpose

The purpose of this presentation is to share information about inter generational relationship between nursing students and their grandparents.

#### Target Audience

The target audience of this presentation are family nurses and reserach nurses

#### Abstract

Intergenerational family relationships in the grandparent-grandchild relationship is an important aspect in society therefore it is significant to study the quality of this bond, since grandparents that have better relationships with their grandchildren, have less risks getting sick, which is important to the discipline of nursing, which is to preserve the health of the elderly.

The purpose of this study focuses on the factors involved in the relationship grandfather -grandson of the students of the Faculty of Nursing."Dr Santiago Valdés Galindo".

**Methodology:** The study is descriptive, for a sample of 170 nursing students. Sampling shall be stratified by grade level, the inclusion criteria are: Grandparents with which the grandchild has a greater relationship of cohabitation, adults 60 and over who are grandparents, grownup grandchildren aged 19-30 studying at the Faculty of Nursing and students that have both paternal and maternal grandparents. Exclusion criteria are: grandparents and grandchildren who do not meet the established age range, grandchildren who have maternal and paternal grandparents but live outside the city of Saltillo, Coahuila; and grandparents who scored 8-10 errors in the Pfeiffer scale. Elimination criteria are: grandparents who failed the test of Pfeiffer, grandparents or grandchildren who do not answer entirely the quiz used to apply the study and grandchildren that have both grandparents but ultimately failed to apply the quiz to both of them. 3 measuring instruments shall apply: the first unit of analysis will be a quiz for the grandchildren, this quiz measures the perception that grandchildren have of the relationship with their grandparents, it contains 22 multiple choice items except questions 6 and 14 which are open questions; The second instrument is the Pfeiffer, where the unit of analysis is the grandfather, it consists of 10 open questions items to determine the degree of cognition of the elderly; and finally a third instrument to be applied to the grandparents, 32 multiple choice items, except questions 10 and 14 which are open questions.

The Statistical Package for the Social Sciences (SPSS) version 21 will be used to perform the statistical analysis of each of the study variables. The information obtained will be processed and a correlational descriptive statistics will be performed.

## SCI PST 2 - Scientific Poster Session 2

### Medication Safety Simulation: A Comparison of Students' Knowledge, Perceptions and Comfort

---

*Bette A. Mariani, PhD, RN, USA*

#### Purpose

The purpose of this presentation is to disseminate the results of a study that was conducted to compare students' knowledge, perceptions, comfort, and skill following a medication safety enhanced program of simulation. A second purpose is to discuss the instrument development and psychometric testing for the study.

#### Target Audience

Nurse faculty, clinicians, and new graduates

#### Abstract

Background: Nurses have a major role in contributing to safe, quality patient care; however, student nurses and new graduates have deficiencies in skills, knowledge, and judgments related to safely administering medications. Simulation facilitates learning of skills, priority-setting, and decision-making. A review of the literature on simulation evaluation instruments revealed no valid and reliable instruments to measure knowledge and competency related specifically to safe medication administration.

Aim of the Study: The purpose of this medication safety simulation intervention study was to: 1) develop, conduct psychometric testing, and pilot test two new instruments to evaluate student knowledge (Medication Safety Knowledge Assessment–MKSA) and competency (Medication Safety Critical Element Competency Checklist-MSCEC) related to safe medication administration; and one revised instrument (Healthcare Professionals Patient Safety Assessment-HPPSA) to measure perceptions and comfort level about patient safety; 2) pilot test new/revised simulation scenarios with a medication safety focus; and 3) test the differences in scores on the MSKA, MSCEC, and HPPSA for junior level students who did and did not participated in safety enhanced medication simulations. The safety-enhanced simulations included the skill of giving medications to standardized patients, as well as knowing the significance of safe medication administration. These instruments and simulations can provide reliable and valid methods to assess outcomes of simulation on medication safety.

Sample and Setting: Junior-level undergraduate nursing students at a mid-size undergraduate nursing program in the Mid-Atlantic region.

Method: Following IRB approval, students were divided into intervention and control groups using a convenience sample of their clinical groups. On the first day of class, all students who consented to participate in the study completed the Medication Knowledge Safety Assessment (MSKA) pre-test and the Healthcare Professionals Patient Safety Assessment (HPPSA). The control group participated in the usual simulations and debriefing for the medical surgical class, while the intervention group participated in one additional medication administration simulation, as well as a simulation that was enhanced with additional medication safety. During the final clinical simulation of the semester, students' competency in medication administration and safety was rated using the Medication Safety Critical Element Checklist. Following all simulations for both groups, all students participated in the MSKA and HPPSA posttests. Reliability and validity of all instruments were determined.

Results: Data for the MSKA were analyzed based on a Knowledge Pass/Fail cut score of 21 correct answers or more to pass, with less than 21 correct answers as a failing score. The HPPSA scores were analyzed using paired t-tests and the MSCEC between groups scores were compared. Pearson correlations were also performed to determine the relationship between the MKSA, MSCEC, and HPPSA scores for the intervention and control groups. Study results will be reported.

Conclusions/Implications: Medication safety is a crucial aspect to ensuring patient safety. Evidence that supports the outcomes of simulation as an effective strategy to improve student knowledge, perceptions, comfort, and competency in medication administration is important to ensuring that new graduates are well-prepared to address issues related to medication safety.

### Knowledge, Attitude and Practice of Lebanese Women towards Breast Cancer, Breast Self-Examination and Mammography

---

*Myrna Abi Abdallah Doumit, PhD, MPH, BSN, RN, Lebanon*  
*Mary Arevian, BSN, MPH, RN,, Lebanon*  
*Souha Fares, PhD, Lebanon*

#### Purpose

to assess the knowledge, practices and attitudes of Lebanese women about breast self-examination( BSE), Clinical breast examination (CBE) mammography and breast cancer and to identify potential barriers using Champion's' Health Belief Model Scales.

#### Target Audience

Nurses,Physicians and any health care worker interested in health promotion and early detection of diseases.

#### Abstract

Background: Breast cancer is a major global health problem. It is the most frequent malignancy that causes deaths and cancer related morbidity in women. A comparable epidemiological profile applies to Lebanon where breast cancer is the most widespread type of cancer among Lebanese women. There is universal consensus that early detection of breast cancer offers the greatest chance of long-term survival.

Purpose: Our purpose was to assess the knowledge, practices and attitudes of Lebanese women about breast self-examination( BSE), Clinical breast examination (CBE) mammography and breast cancer and to identify potential barriers using Champion's' Health Belief Model Scales.

Method: Descriptive, cross sectional correlational study. We collected a national representative sample of 1200 Lebanese women who were chosen from the general Lebanese population using a proportional sampling technique. The mean age of the women was 53.59 years. Data collection was performed through a door-to-door survey using an interviewer- administered questionnaire using the Kish Grid approach. Data were analyzed using the Statistical Package for Social Statistics (SPSS).

Results showed that 83% of the women surveyed had heard of breast self-examination (BSE). But only 63.7% of those who heard of BSE have ever done BSE. When asked how many times during the past did you examine your breasts only 7.5 % had the correct answer. When asked about the clinical breast cancer exam 71.1% said that they know about it but only 48.9 % are planning to do it and 51.1% have ever done it. 72.3% feel good about doing the mammography. Mean belief scores follow: susceptibility of getting breast cancer (2.00); Seriousness of the disease ( 2.82); Barriers to BSE (1.88); confidence in doing BSE ( 3.06); health motivation (3.61); benefits and barriers to mammography (3.86 & 2.52 respectively)

Conclusion: Despite the low perceived barriers to BSE and Mammography and the high health motivation and confidence in doing BSE Lebanese women are not performing BSE regularly and following the right method.

Implications for practice: The results of this study will be used to develop culturally fit interventions to improve the responsiveness of Lebanese women to the breast cancer annual national screening campaign by determining the perceived barriers for BSE, CBE and mammography and by planning a culturally appropriate strategic approach to enhance women's compliance with screening measures.

## SCI PST 2 - Scientific Poster Session 2

### The Relationship between Personal Characteristics and Contraceptive Choices and Use over 5 Years

---

*Donna J. Plonczynski, PhD, MS, BSN, APN, RN, USA*

*Cathy Carlson, PhD, MS, BSN, RN, APN, FNP-BC, USA*

#### Purpose

The purpose of this presentation is to present the results of a research study which explores the characteristics of adolescents and women at high-risk for unintended pregnancies by 1) comparing the contraceptive choice and use for the years 2009 and 2014, and 2) exploring relationships among contraceptive choice and use.

#### Target Audience

The target audience for this presentation is nurses, advanced-practice registered nurses, and educators in the fields of family care, women's health, and men's health.

#### Abstract

**Background.** Unintended pregnancies have been identified as "among the most essential health status indicators in the field of reproductive health" (Finer & Zolna, 2011, p. 478). According to the Guttmacher Institute, of the 213 million worldwide pregnancies in 2012, a full 40% were unintended (Sedgh, Singh, & Hussain, 2014). Pregnancy outcomes for these women and adolescents result in abortion 50% of the time, while 13% experience a miscarriage, and 38% having an unplanned childbirth. There are numerous studies that associate unintended pregnancies with negative outcomes for the mother and child, including health, economic, social and psychological ones. The World Health Organization (WHO) has set worldwide goals to address health disparities, one of which addresses improvement in maternal health (2014). One component of that goal is to address the gap between desire for contraception and its access. This gap varied between regions and countries. For example, in Eastern Asia, the gap is only 4%, while it is 16% in Western Asia. In contrast, the rate in Oceania is 24.6% and Sub-Saharan Africa has a 25.1% rate of unmet family planning needs. Females between 15-49 years who are at high risk for unintended pregnancies generally have low-income and low educational attainment. In some countries, such as the United States, that risk is also higher in minority racial and some ethnic groups. Identifying characteristics for non-use, non-continuation of birth control and inconsistent or non-use of contraception in this growing population is postulated to better address the unintended pregnancy rate. Contraceptive choices have changed during this time and it is not known if contraceptive use has reflected this change.

**Purpose.** The purpose of this research project is to evaluate characteristics of adolescents and women at high-risk for unintended pregnancies by 1) comparing the contraceptive choice and use for the years 2009 and 2014, and 2) exploring relationships among contraceptive choice and use with selected characteristics of clients seeking family planning services.

**Methods.** A retrospective chart audit is being conducted on 300 randomly-selected records, half of which are from the year 2009 and the remaining from 2014. The characteristics derived from the chart audits were derived from the literature and from seven of the goals of Healthy People, 2020 (DHHS, 2010). Once data collection is completed, the data will be analyzed using descriptive statistics to answer research question #1, while race/ethnicity and age will be evaluated via t-test and ANOVA. Differences between the years 2009 and 2014 will be investigated with t-tests and Chi-square. To address question #2, gender will be analyzed by nonparametric statistics such as Chi-square, Mann-Whitney U test, and Pearson's product moment correlation according to the level of data obtained and the examination of the assumptions underlying the tests. Also, logistic regression will be used to explore relationships among variables.

**Results.** The results will influence the development of tailored interventions for adolescents and women at high risk for unintended pregnancy. Dissemination includes the development of a client-education application (app), which is already underway.

### Making It Work: Information Technology and Mobile Devices in Nursing Education

---

*Janet Raman, EdD, NP-C, RN, CEN, CNE, USA*

#### Purpose

The purpose of this presentation is to explore position statements on the implementation of technology, in particular mobile technology, in nursing education and examine how well this has been implemented. The benefits and drawbacks will be presented as well as suggestions to decrease the drawbacks to enhance nursing education.

#### Target Audience

The target audience of this presentation is nurse educators. Practicing nurses and nurse administrators may benefit as well.

#### Abstract

Information technology (IT) and mobile devices have become a part of most everyone's daily lives both personally and professionally. IT and mobile devices, such as cellular telephones, personal digital assistants (PDAs), and tablets, permit quick and easy access to vast amounts of information. With this in mind, it is understandable that international nursing organizations, including the International Council of Nurses (ICN) and Sigma Theta Tau Honor Society of Nursing (STTI), and many national nurses associations (NNAs), have written Position Statements calling for the integration of information technology into nursing curriculums since as far back as 1997.

Nursing programs have begun to follow the above-mentioned directives to incorporate information technology, and the use of mobile devices, in teaching nursing students how obtain and utilize up-to-date information necessary for patient care. This process has been found to enhance nursing student learning and facilitate the nursing students' preparation for evidence-based practice in the current healthcare environment. However, many drawbacks to the use of mobile technology including the high price of the devices, and the necessary applications, as well as IT issues, have emerged. Faculty resistance to learning and implementing mobile technology in the classroom, laboratory, and clinical environment has also been proven to be problematic. Further, many clinical facilities are not permitting nursing students to use their cellphones, personal digital assistants, or tablets in their institutions due to Health Insurance Portability and Accountability Act (HIPAA) concerns and other issues.

The challenge now is: how can nursing education make this work in classroom, laboratory, and clinical settings despite the obstacles?

Some of the current strategies to improve the utility of mobile devices in nursing education will be shared and ideas which may further enhance the integration of mobile information technology into nursing education will be discussed. Suggestions for future research in this area will be presented as well.

### The Last Ten Years: Nurse Practitioners in the Southern United States Employed in Medically Underserved Areas

---

*Thomas Kippenbrock, MSN, EdD, RN, USA*  
*Wen-Juo Lo, PhD, USA*  
*Ellen Odell, DNP, APRN, USA*  
*Bill Buron, PhD, APRN, FNP/GNP-BC, USA*

#### Purpose

The purpose of this presentation to gain a better understanding of nurse practitioners (NPs) working in the Southern U. S. and providing health care services to citizens in health professional shortage areas (HPSA) and rural regions during the past decade.

#### Target Audience

The target audience on this presentation is health care administrators planning and designing health care services to medically underserved areas. Also nursing academic administrators and nursing faculty recruiting potential NP students and selecting medically underserved areas for practica.

#### Abstract

**Background & Significance:** Collectively, the U.S. Southern states are some of the poorest, most rural, and socioeconomically deprived regions in the country. Related to these conditions are the poor healthcare outcomes such as higher morbidities, shorter life spans, and higher death rates. The South is home of many rural citizens and medically underserved areas. Despite national databases affiliated with the Bureau of Labor Statistics and the Health Resources and Services Administration (HRSA), knowledge is limited regarding the nurse practitioner (NP) workforce in rural and medically underserved areas of the country.

**Purpose:** The aim of this research is to gain a better understanding of the characteristics of NPs working in the Southern U. S. More specifically, the objectives are to examine and compare the demographic and descriptive characteristics (gender, race, income, practice specialty, and employer type) of NPs working in (a) health professional shortage areas (HPSA) versus non HPSA; and (b) rural versus urban areas during the past decade.

**Method:** A non-experimental quantitative methodology employing three data collection sources was used in the study. Over 1,500 NPs were surveyed both in 2000 and 2010 for demographics and descriptive information such as education, income, practice, employer, and workload. Other data sources included Health Resources and Services Administration that identified HPSAs and the U.S. Census Bureau used to distinguish urban and rural employment settings.

**Results:** The most dramatic shifts in NPs were older, more educated, and earned higher incomes; however, gender and race remained the same over the past decade. Hospital employment was the largest increase and the greatest decline was private practice settings. Family practice as a specialty increased slightly while no shift occurred in other specialties. More NPs worked in HPSAs; however, rural located employment declined.

**Discussion:** The findings of this study continue to suggest that NPs are an important workforce in the delivery of primary care services to rural and underserved populations of the Southern states, an area of the country associated with poor economic and health care outcomes. NPs are employed in HPSAs and close to half work in the rural areas. This workforce is consistent with NP history and traditional educational frameworks, focused on providing health care services to rural and underserved populations.

**Conclusions:** Despite three decades of attempting to diversify nursing student enrollment and increase the graduates of NP educational programs; racial diversity was almost non-existent within the NP

population over the past decade. The small minority of NP participants in this study is far below the number of Blacks and Hispanics living in the region as reported by the U.S. Census Bureau (Humos, Jones, & Ramirez, 2011; Rastogi, Johnson, Hoeffel, & Drewery, 2011; Ennis, Rios-Vargus, & Albert, 2011). There is evidence that provider-patient race concordance improves not only patient satisfaction but improves healthcare utilization and outcomes as well (Gornick, Eggers, Reilly, Mentnech, Fitterman, Kucken, Vladeck, 1996; Laviest & Nuru-Jeter, 2002, Laviest, Nuru-Jeter, & Jones, 2003). This evidence supports the need for continued efforts to increase the number of minority NP providers.

Implication for Nursing Practice: The U. S. continues to face a serious shortage of primary care clinicians at a time when demands for health care services are expected to rise, particularly in rural and underserved areas. NPs as primary care providers, if allowed to practice to the full extent of their licensure, could impact health care outcomes for Southern citizens. The National Center for Workforce Analysis (2013) projected a national primary care provider shortage of 6,400 FTE in 2020. Compared to the length and cost of physician education, the mobilization of a new NPs can occur more quickly at a relatively lower cost. In addition, NP education and practice typically builds on the expertise and experiences of seasoned registered nurses, who often represent a wide array of ethnic and cultural backgrounds. A renewed emphasis on educating more NPs to meet growing primary care demands would likely improve the diversity of healthcare providers. Furthermore, greater support for NP residencies (as encouraged in the IOM [2010] report) focused on rural and underserved areas may actually lead to improved care at a lower cost among these highly underserved and vulnerable populations.

## SCI PST 2 - Scientific Poster Session 2

### A Researcher's Experience with an Online Survey

---

*Malena King-Jones, PhD, MS, BS, RN, CNE, USA*

#### Purpose

The purpose of this presentation is to share the researcher's experience developing and utilizing an online survey to nurse faculty.

#### Target Audience

The target audience includes nurse researchers with an interest in online survey research tools and researching the nurse faculty population.

#### Abstract

It has been noted that there is an increase in the use of electronic survey tools in research (Allen & Roberts, 2010; Fan & Yan, 2010). Advantages and disadvantages of online survey research has been explored but not within nursing research. The purpose of this presentation is to share the researchers experience using an online survey tool to gather data from nurse faculty.

An online survey was sent to 302 Deans/Chairpersons and 39 (12.9%) Dean/Chairpersons responded that the survey would be emailed to 1237 nursing faculty. Nurse faculty responses varied by state and region. Of the potential 1237 nursing faculty 587 started the survey and 549 completed, navigating through to the end of the survey, yielding a survey response rate of approximately 47.4% and a survey completion rate of 93.5%.

Although the survey response rate was acceptable (Dillman, 2007); several barriers were noted while utilizing the online survey tool. Barriers encountered while administering the online survey included duplicating the institutional review board process at additional universities, regional convention attended by the deans/chairpersons, and a lack of cooperation by the faculty gatekeepers. Disadvantages noted during the process included email security and the inability to ensure participants' authenticity or quality of their responses. Advantages discovered during the process included a high response rate, cost effective, and time saving. Using an online survey tool to collect data also allowed the researcher to securely protect and store the data.

This presentation will explore the barriers encountered surveying nurse faculty with an online survey tool. The disadvantages of collecting data with an online survey tool and collecting data from the nurse faculty population will be presented. The advantages of utilizing an online survey tool and recommendations will be discussed. The researcher's experience will be shared in hopes of fostering further research interest in the area of online survey research.

## SCI PST 2 - Scientific Poster Session 2

### Quality of Life and Artistic Expression in College Students: Creation of Measurement Tool

---

*Patricia Diaz, PhD, MSN, RN, Colombia*

#### Purpose

The purpose of this presentation is recognize artistic expression as part of the quality of life and to create a reliable instrument for measuring the quality of life in people who develop artistic activities.

#### Target Audience

The target audience of researchers, nurses in the area of health promotion, policy makers, teachers and students.

#### Abstract

Introduction: initiative and artistic creativity of college students has been reflected through the development of strategies and artistic training workshops that seek to develop the skills and desire to express the different art forms: dance, theater, and singing. These groups have had great success and contributed to project the talent and develop strategies to reduce stress, improve lifestyle and achieve goals such as acting on behalf of the National University of Colombia in academic, cultural and artistic events internal and external order local, national and international. Artistic expression is recognized as an element that contributes to the quality of life and is essential to achieving optimal health states. However, the National University of Colombia does not have measurement tools that establish psychometric quality objectively the impact generated artistic practices in the quality of life of students.

The study of quality of life (QOL) currently has spread from an individualistic and epidemiological role a framework of broad and multidimensional conceptual reference. This construct is multidimensional and complex and involves objective aspects (such as the physical and material) and subjective as the perception-assessment of psychological well-being, social relational, personal, emotional and spiritual. Therefore, things CV is an agent of social change whose ultimate goal is to improve conditions and objective circumstances of life of individuals.

Objective The research study aims to create an instrument to measure from scientific research criteria, the impact of artistic practices in the quality of life of those who favor these forms of expression for their comprehensive training.

Methodology The project focuses on the psychometric perspective, it makes a methodological study essentially designed and development in different phase's first part about definition and structuring elements of the instrument, second part in order to establish psychometric assessment instrument we have two distinct moments to validate it. One in which 16 experts were consulted judges the content validity of the instrument and an application built in 150 students, half belonging to institutional artistic groups and the remaining percentage of students were conducted to not practice artistic expression as part of their life.

Results: We invite 150 students from the National University of Colombia to be the sample, aged between 17 and 27 years. The Instrument consists of five dimensions (social, physical, emotional, material and personal development) items are four-level Likert type. Validated by expert opinion, conducting a factor analysis with Varimax orthogonal rotation, and analysis of the items with the model of Classical Test Theory (TCT) for validation we use several strategies. Validation of judges by Kendall concordance coefficient for related samples indicate a high-level agreement (Kendall's W = 0.18); factorial analysis resulted in five interpretable factors that account for the welcome theoretical structure, and finally, after item analysis performed, the scale was reduced to 50 items (10 per dimension).

Conclusions: We have an instrument to measure quality of life in Young University with psychometric qualities.

The instrument GAI- UN will be used to recognize if there is difference in the quality of life in young people who develop artistic and cultural as part of their academic training activities.

## SCI PST 2 - Scientific Poster Session 2

### A Case Study of a Multi-Method Evaluation Design: Correctional Nurse Competency Program

---

*Deborah Shelton, PhD, MSN, BSN, RN, NE-BC, CCHP, FAAN, USA*

*Louise A. Reagan, PhD, MS, BS, RN, APRN, ANP-BC, USA*

#### Purpose

to examine a multi-method evaluation design highlighting four types of triangulation demonstrating the link between a staff education intervention and clinical nurse outcomes in prison settings. These strategies designed to assure rigor, and challenges of implementation are discussed. Few nurse education programs are linked to clinical outcomes.

#### Target Audience

Nurses interested in correctional nursing; competencies; or program evaluation design and outcomes.

#### Abstract

Background: In only a few studies have improved nurse-patient care outcomes associated with continuing education programs been assessed. Provided that professional development is among the most commonly used strategy to improve quality of patient care in health care settings, it is vital to test their efficacy, to identify their key components and to test their effects on direct patient outcomes.

Challenges exist in the design of studies to measure these effects. Situational and research factors contribute to the success of implementation of cost and burden conscious approaches to measurement which may impact sustainability. Triangulation, the use of more than one approach to the investigation of a research question in order to enhance confidence in the findings is essential to this process. The idea of triangulation has been extended beyond its conventional association with research methods and designs to include four forms: data triangulation; investigator triangulation; theoretical triangulation; and methodological triangulation.

Setting: A northeastern state correctional system comprised of 12 jails and prisons participated over 3 years. Four hundred forty-three nurses (RNs 288; LPNs 138; 17 APRNs; including per diem nurses) who participated worked in 12 facilities (2-jails; 10 prisons; 1-women's facility) serving over 18,000 incarcerated persons. Medical and psychiatric care is provided through a managed care contract. Institutional Review Board approval (# H13-307) was granted by the University of Connecticut Office for Research Compliance.

Methods: A case study approach is utilized to provide an example of the mixed methods design and implementation of a state-wide correctional nurse competency program aligning with the ANA Correctional Nurse Scope and Standards of Practice. This one of a kind competency program provided a unique mobile simulation learning laboratory and required that both workforce and organizational issues be addressed. Reliability and validity of clinical assessment tools adapted for the correctional health environment was a necessary step in this process. This followed competency definition, role clarification activities and needs assessments. Triangulation strategies were mapped for implementation on a timeline. Repeated measures of educational data, observational data, interviews and secondary data sources were utilized to examine the multi-level effects.

Results: All four forms of triangulation were utilized in addition to other research strategies to assure reliable and valid measurement. Multiple forms of data were sampled at different time points over a three-year period of time from the twelve facilities. Challenges of this case study research included need for repeat training, attention to data collection and quality, requests for supplemental data and support for performance of the research team. Attention to these challenges and the use of multiple forms of triangulation over time contributed to the validity of the findings for this state-wide project.

Significance: To date, no correctional nurse competency programming or evaluation measures or strategies for these programs have been tested or published in the US. Documentation of the efficacy of this HRSA (grant # D11HP22212) funded program provides the basis for replication.

### Teleporting Story: How Nurse Educators Use Digital Stories to Teach

---

*Melissa Schwartz Beck, PhD, MSN, BSN, RNC-OB, USA*

#### Purpose

The purpose of this presentation is to assist nurse educators with the implementation of digital stories in the classroom. The two issues addressed: 1) How nurse educators use digital stories to teach. 2) Benefits and recommendations for using digital stories to teach.

#### Target Audience

The target audience of this presentation is nursing faculty; however, material is applicable to anyone who wishes to engage an audience.

#### Abstract

The National League of Nursing calls for nurse educators to think beyond the 20<sup>th</sup> century pedagogy to explore new possibilities in nursing education that is research based. The concern for educators then is how to effectively incorporate new pedagogical tools that will engage, inspire, and better prepare future nurse graduates. This interactive presentation shares how 12 nurse educators from Europe and the United States have incorporated digital stories to teach both within and outside the classroom walls. Digital stories, the newest pedagogical tool on the narrative field, combines audio, text, picture and video to bring story to life. Data collected from this descriptive qualitative study suggest digital stories assist educators in making a point, better engages students in discussion, enhances information technology skills, and promotes reflection, empathy, and critical reasoning in undergraduate nursing students. The participants of this study provided a wealth of knowledge that could provide the needed portal to not only educate nursing students, but students and patients around the world.

### Students, Let's Communicate Together On-Line

---

*Kefiloe A. Maboe, PhD, MACur, BACur (Hons), BCur (Hons), BACur, RN, RM, South Africa*

#### Purpose

The purpose of this presentation is to determine how on-line interactive tools may be used to enhance students-to-students, students-to-educator, students-to study material and students-to- Open Distance Learning institution interactions

#### Target Audience

Then target audience of this presentation are educators, researchers, managers of education institutions, students and information technology specialists.

#### Abstract

Open Distance Learning (ODL) institutions have adopted on-line technology to facilitate teaching and learning and to enhance interaction between the students-to-students, students-to educator, students-to-study material and students-to-ODL. Students are encouraged by the university to interact on-line by using the discussion forum and electronic mails. On-line discussion forum are critical in ODL because it allows people who cannot physically attend the educational institution to interact with each other. The purpose of the study was to determine how on-line interactive tools may be used to enhance students-to-students, students-to educator, students-to-study material and students-to-ODL interactions. Probability random sampling was used. Data was collected from 410 registered second and third year Health Services Management students of an ODL institution in South Africa during the second semester in 2012. Only those students who are interacting on-line were requested to participate to the study. Most of the students were from 21 to above 50 years of age. Closed and open questionnaire was posted on-line. Eighty seven students responded to the questionnaire.

Data analysis was done quantitatively and descriptively. The findings indicated that 84.9% of students owned computers, and 100% owned cellular phones, but only 3.8% participated in the on-line discussion forum. Thus the majority of these students do not utilise the prescribed on-line interactive tools effectively nor communicating at all with peers by using emails and the discussion forum. Some of them indicated that they struggled with the utilisation of technology. Educators interacting minimally on-line, they were not supportive. Students do not receive the necessary feedback they require from the educators. Peers supported each other. The university systems were sometimes offline, which becomes worse during registration and assignment submission. Very few students benefitted from on-line interaction. Although students are aware of the benefits of using online technologies, they do not have the support from the institution to enable them to better their skills in using these technologies. The recommendations emanating from the study warrants various interventions of multiple stakeholders to resolve the students' challenges.

Keywords: On-line, students, ODL.

## SCI PST 2 - Scientific Poster Session 2

### Family Planning and the Adult with Congenital Heart Disease: A Narrative Inquiry

---

*Kathryn A. Osteen, PhD, MSN, BSN, RN, USA*

#### Purpose

The purpose of this presentation is to describe the personal narrative experience of adult women with CHD, of childbearing age, and their struggle with family planning options. Family planning decisions include any decision regarding contraception use, getting pregnant, and birthing.

#### Target Audience

The target audience of the presentation is nurse researchers, educators, administrators, and clinicians.

#### Abstract

**Background:** Cardiovascular congenital defects affect 1% of all infants born in the United States regardless of race (Hoffman & Kaplan, 2002; Xu, Kochanek, & Tejada-Vera, 2009). Cardiovascular congenital defects include both treatable or ultimately fatal structural, and functional heart conditions (Gilboa, Salemi, Nembhard, Fixler & Correa, 2010). Surgical advances in congenital heart disease (CHD) have effectively decreased the overall mortality of the CHD population by 24.1%, permitting infants with CHD to live a longer life and increase the possibility of childbearing (Gilboa et al., 2010; Warnes et al., 2008). The overall decrease in mortality has led to an increased prevalence of adults with CHD. Calculating the prevalence of CHD infants and the likelihood of the infant surviving into adulthood, there is an estimated one million adults living with some form of CHD in the United States (Hoffman, Kaplan, & Libertson, 2004). Current research focuses on adults with CHD and the physical risks associated with contraception, pregnancy, and childbirth. Family planning issues are not addressed consistently with this population (Sable et al., 2011). Family planning decisions include any decision regarding contraception use, getting pregnant, and birthing. The adult with CHD has specific concerns regarding family planning including pregnancy, surrogacy, adoption, or sterilization (Kovacs & Verstappen, 2011). The focus of this presentation will be to describe the personal narrative experience of adult women with CHD, of childbearing age, and their struggle with family planning options. Greater understanding of adult experiences with family planning will be useful in future educational efforts for the adult with CHD and their healthcare providers to enhance clinical patient outcomes.

**Methods:** Narrative inquiry, guided by the Roy adaptation model, was chosen for this study because it is appropriate to describe the reproductive decisions of adults with CHD. Eligible participants included adults between the ages of 18 and 49 diagnosed with mild, moderate, or severe CHD, living in the United States (US), and English speaking. A single in-depth, semi-structured interview was completed. After transcription of the interview, the researcher, and a consultant with qualitative experience performed structural and thematic analysis. Interviews continued until saturation of themes was obtained.

**Results:** The final sample included 17 adult females, between 24 and 41 years of age, living in 10 U.S. states. The majority of participants were White, married, and had severe types of CHD. The participants described a continuous struggle with family planning decision that occurred throughout their lives, from becoming sexually active to giving birth. Participants described experiences regarding several options for family planning including contraception, carrying a pregnancy, surrogacy, adoption, and sterilization.

**Conclusions:** The findings from the study support the need for more research regarding family planning and information communicated to the adult with CHD, and the effects of pregnancy on the adult with CHD. These individuals are emotionally attached to having a child. These women had concerns about social, familial, and spousal expectation even though they were afraid of the potential to have a decrease in physical functioning after pregnancy and childbirth. To maximize the health of the adult with CHD, family planning should be incorporated into primary care.

### Biostatistics Course in Doctor of Nursing Practice Programs in the United States

---

*Aliya Kuerban, PhD, RN, FNP, USA*

#### Purpose

The purpose of this presentation is to explore the regional differences in the Biostatistics courses in DNP programs in the United States.

#### Target Audience

DNP educators and program directors

#### Abstract

**Subject population:** All doctor of nursing practice (DNP) programs listed on American Association Colleges of Nursing (AACN) program directory of DNP website at the time of the research.

**Research design:** A quantitative content analysis of DNP programs' websites will be conducted.

**Instrument:** Since the proposed study will analyze website contents, no survey instrument is needed.

**Procedure:** All schools offering DNP programs listed on AACN's DNP program directory will be classified into four census regions: west, midwest, south, and northeast regions. 25 schools from each region will be randomly selected. This study will explore the regional differences in the following aspects: 1) At what point does the program provide the Biostatistics course, at the beginning of the curriculum or toward the midpoint of the curriculum? 2) The proportion of biostatistics course credits toward the total credits of the program requirement. 3) GRE requirement at admission and how that affects whether the Biostatistics course is given by the DNP program. 4) Graduate level statistics courses as a prerequisite at the time of admission and how that affects whether the Biostatistics course is given by the DNP program. 5) How DNP programs label their Biostatistics course.

### Evaluation of the Chinese Version of the Spirituality Index of Well-Being (SIWB) Scale in Taiwanese Elders

---

*Yi-Hui Lee, PhD, MBA, RN, USA*  
*Ali Salman, MD, PhD, ND, RN, Canada*  
*Tawna Cooksey-James, PhD, RN, CNE, USA*

#### Purpose

The purpose of this presentation is to provide information regarding the evaluation of a Chinese version of an instrument (the Spiritual Index of Well-Being) measuring spirituality in the population of Taiwanese elders in hope to enhance nurses' competency to care for culturally diverse population.

#### Target Audience

The target audience of this presentation is from nursing researchers and clinicians

#### Abstract

**Background:** Spiritual well-being has emerged as an important indicator of one's health outcomes. Nursing as a profession is concerned with holistic interventions to improve health and overall well-being. To evaluate the outcomes of the holistic nursing interventions, using valid and reliable instruments to assess spiritual wellbeing becomes necessary. However, there is a short of instruments for measuring spiritual wellbeing in Chinese population. While the Spirituality Index of Well-Being (SIWB, reviewed as a health-related quality of life measure, has been used in Western cultural population with good reported reliability and validity, little is known about the feasibility of using SIWB in Chinese population.

**Objectives:** The purpose of this study was to translate the Spirituality Index of Well-Being (SIWB) into a Chinese version and to validate it in Taiwanese elders living in communities.

**Methods:** This was a cross-sectional study with a convenience sample of 150 participants who were 65 year-old or older were recruited from a free-accessed, public seniors' activity center located at a metropolitan in southern Taiwan. The Spirituality Index of Well-Being (SIWB), a 12-items scale with possible total scores from 12 to 60, was translated into Chinese by using a forward- and back- translation method to ensure accuracy and semantic equivalence between the Chinese and the English versions. Procedures of forward translation and back translation followed the principles and considerations for translation and back-translations stated by Behling and Law (2000). Internal consistency, factor analysis, and correlation coefficient were conducted to evaluate the reliability and validity of the Chinese version of SIWB.

**Results:** The Chinese version of SIWB demonstrated high internal consistency (Cronbach's alpha of .95 for the scale and .92 for both subscales). Construct validity was supported by exploratory factor analysis which showed that two factors with 12 of 12 items loading above .68, explaining 74.1% of the variances. Total scale and subscale scores were also significantly correlated with the Chinese version of SF-v12 scale measuring quality of life and the Chinese version of CES-D scale measuring depression, indicating satisfactory convergent validity. The mean scores of the SIWB in Taiwanese elders was 42.56 (SD=10.92).

**Conclusion:** The psychometric properties indicate that the Chinese version of the SIWB is a valid and reliable instrument for future research. This instrument provides a feasible approach for assessing spiritual wellbeing in Taiwanese elders.

### An Evaluation of Student and Faculty Perception on the Use of Technology in the Undergraduate Nursing Education Program

---

*Kathleen Williamson, PhD, MSN, RN, USA*

#### Purpose

Share results of a study that looked at student and faculty perception of use and ease of use of technology. The presentation will share the results of a descriptive study and explore how using technology can be an indicator of using new technologies in innovative ways in nursing education.

#### Target Audience

Academic leaders, nurse educators, students, clinical educators

#### Abstract

Today, the amount of technology that is available to students and faculty is overwhelming. Providing a venue for students and faculty to access information and create innovative ways to present and explore content is necessary. It is essential to first determine that students and faculty value technology and the use of technology. The purpose of this study was to assess if students and faculty perceive technology as useful and ease of use in nursing education. This study used a survey design to collect data on the intent to use, usefulness and ease of use. The target population was a convenience sample of undergraduate nursing students and faculty. The results of the study will be shared. There were significant correlations found between the student's and faculty perceptions as they related to perceived usefulness and ease of use technology. The data provided insight into the student and faculty perceptions of how they perceive using technology in nursing school. The students' and faculty perception of intent to use, usefulness and ease of use is supported by the perception that technology would enhance the effectiveness of teaching and learning. The perception that technology is easy to use, thus increasing the usefulness in obtaining and utilizing technology in the classroom to engage the learner. This session will also explore the differences between students and faculty in the use of technology and will share examples of technology activities integrated into the nursing program.

## SCI PST 2 - Scientific Poster Session 2

### Seeing the Commercial Truck Driver as an Occupational Athlete

---

*Bryan Combs, MSN, MS, BS, CRNP, FNP-BC, CNL, ATC, USA*

#### Purpose

The purpose of this poster will be to educate the audience on musculoskeletal injuries seen in commercial truck drivers and will discuss the incident rates and days of work missed. It will summarize the state of the science and will show the need for future research in this unique population.

#### Target Audience

The target audience of this presentation is nurses who are interested in musculoskeletal disorders and the occupational health setting. Due to the lack of current research in this patient population it will also target individuals who are interested in creating and developing nursing research and new nursing knowledge.

#### Abstract

The National Institute for Occupational Safety created innovative research in the evaluation of common risk factors, health behaviors, and injury of occupational workers across the US. One of the largest sectors of their research involves the Transportation, Warehousing, and Utilities (TWU) Sector. The TWU sector accounts for 6.6% of the total workforce in the US. In recent years research of the TWU sector has concentrated on the health and injuries of the U.S. commercial driver. There are over 1.4 million truck drivers in America today and the trucking industry has some of the highest work-related injury claims of any of the industries in America.

The purpose of this poster will be to educate the audience on the most common musculoskeletal injuries seen in long haul truck drivers. It will discuss the incident rates of these musculoskeletal injuries and the length of work time lost. It will concentrate on the current state of the science and will elaborate the need for future research. This information will be utilized to help illustrate the need for creating new research and new nursing knowledge regarding this unique profession and the varying musculoskeletal injuries they endure. When the nurses that are interested in the fields of occupational health and orthopedics understand the state of the science of occupational musculoskeletal injuries within this workforce they will be able to see that there is a large gap in current research.

Current research shows that the long haul truck driver has higher rates of obesity, hypertension, and sleep apnea when compared to the general public. These are not conditions you would attribute to an athlete, however many of the musculoskeletal injuries seen in the long haul truck driver are similar to those seen in athletes. As the nurse researchers investigate the long haul truck driver it is important to not look at this population as an unhealthy overweight population but to see them as a patient population that has increased loads on their bodies similar to that of athletes. The objective of this poster is to educate nurse researchers on the unique patient population of the long haul truck driver and with this increased understanding they will be able to create and develop nursing research and new nursing knowledge that looks at this patient population from the unique perspective they deserve. The poster will also illustrate the need for future research in the prevention, evaluation, and treatment of musculoskeletal injuries of the occupational athlete, the long haul truck driver.

### Risk of Negligence in the Maternal Care of the Hospitalized Preterm Newborn

---

*Beatriz Villamizar-Carvajal, PhD, MSN, RN, Colombia*  
*Carolina Vargas-Porras, MSN, RN, Colombia*

#### Purpose

To emphasize the importance of encouraging the adoption of the maternal role during the hospitalization of preterm infants to decrease the risk of negligence in child care.

#### Target Audience

Healthcare personnel in contact with mothers of preterm infants.

#### Abstract

**INTRODUCTION:** There has been an increase in the incidence of preterm births worldwide, with Colombia not being an exception, not only due to the increase in the population, but as a result of a greater proportion of maternal and gestational problems resulting in deliveries before the end of pregnancy; the figure is significant, 18%, generating emotional and social impacts, and becoming a traumatic experience for mothers, who must deal with feelings of failure, guilt, and the loss of the illusion of having a perfect baby; all this, added to the physical-emotional separation of mother and baby after birth, which interferes with the emotional bonding process. Moreover, the stress associated with the separation from the newborn, long hospitalizations, and the concern for the wellbeing of the baby, often persists well beyond the first year of the child's life. Thus, mothers should develop a series of abilities, skills and capabilities in order to adopt their new role. When the adoption of the maternal role is deficient, the risk of negligence in child care emerges, characterized by the absence of basic care due to neglect or omission, which affects the neurodevelopment of the newborn baby. Negligence has a negative impact on children's development, and, unless remedial actions are taken, deficits accumulate and keep influencing negatively the subsequent development of the child. Therefore, healthcare personnel should be aware of and listen to the experiences of mothers and their parenting expectations to provide them with support throughout this process.

**MATERIALS AND METHODS:** This was a cross-sectional study conducted between March and September 2014. The study population was composed of mothers of preterm infants delivered at a University Hospital who were at the in-hospital setting, and mothers of preterm infants at the out-of-hospital setting in the city of Bucaramanga (Colombia). Inclusion criteria: -Mothers of hospitalized preterm infants, -mothers of preterm infants out of the hospital. Exclusion criteria: -teenage mothers, mothers with communication problems, -mothers with psychiatric problems. The Parenting Inventory for Adults and Adolescents (IPAA), a valid and reliable instrument, was used. This instrument assesses attitudes toward parenting that are considered as high risk of negligence in child care. The IPAA has 32 items, distributed in 4 dimensions: Expectations, with 0.61 reliability, empathy, 0.88 reliability; punishment, 0.76 reliability, and role reversion, 0.80 investment. The reliability of repeated measures for adults ranges between 0.54 and 0.80. Analysis guidelines were followed as per the IPAA instructions, by adding items and turning them into specific scores as established for adults, with the following interpretation: Extremely low score (1-2) and low score (3-4), equivalent to poor parenting behavior; average score (5-6) equivalent to standard parenting behavior, and high score (7-8) and extremely high score (9-10) equivalent to positive attitudes toward parenting. Finally, the mothers were categorized according to the scores in every dimension, thus determining the risk of negligence.

**RESULTS:** The sample included 115 mothers of preterm infants, 56 of whom were assessed at the in-hospital setting, and 59 at the out-of-hospital setting, after all of them had given their informed consent. The mean age of mothers was 26 years, most of them were housewives, with incomplete high-school and low income. The scores of mothers at the in-hospital setting were characterized by low figures as follows: - inadequate expectations toward children (48.2%), -lack of empathy for the needs of the child (51.7%), - belief in the value of physical punishment (48.2%) and -reversion of the mother-child role (55.3%). These

scores evidence an inadequate parenting behavior, with a high risk of negligence in child care. On the other hand, the scores of the mothers at the out-of-hospital setting were distributed as follows: - appropriate expectations toward children (49%), - empathy toward the needs of children (32%), - negative value ascribed to physical punishment (66.1%), - appropriate mother-child role (31%). These scores show appropriate parenting expectations among mothers of preterm infants at the out-of-hospital setting.

**CONCLUSION:** There are significant differences between in-hospital and out-of-hospital settings as to parenting expectations and the risk of negligence in child care. Long hospital stays should become a fertile ground for interdisciplinary interventions aimed at strengthening the maternal role among mothers of preterm babies.

### Results from a Longitudinal Nursing Specific Undergraduate Student Satisfaction Survey across a Canadian Collaborative Nursing Program

---

*Laurie Freeman-Gibb, PhD, ANP-BC, RN, Canada*

*Beverley L. Jones, MScN, MPA (Health Policy), BScN, BA (Life Sciences), RN, Canada*

*Janet E. Raiger, MN, RN, Canada*

*Selina Rehman, NP, MN, RN, Canada*

#### Purpose

The purpose of this presentation is to report out the unique results from a longitudinal undergraduate nursing survey on student satisfaction in a collaborative nursing program in Canada.

#### Target Audience

The target audience of this presentation is educational experts, researchers, faculty and students with an interest in improving nursing education.

#### Abstract

Results from a Longitudinal Nursing Specific Undergraduate Student Satisfaction Survey across a Canadian Collaborative Nursing Program

Student satisfaction has been associated with later professional attitudes, career commitment, retention in the field of nursing, and more engagement as alumni of our institutions<sup>1-4</sup>. Assessment of student satisfaction in nursing is complex in that we must assess in-class theory courses, clinical practice, and services provided by the faculty as a whole<sup>2</sup>. Evaluation of all aspects of nursing education is challenging, as most university and college based programs standardized evaluations do not fit well with the multiple domains within the nursing curriculum. This issue has been further compounded in Ontario Canada by the fact that many university and College nursing programs have engaged in collaborative partnerships, in which the curriculum may be delivered by both college and university faculty and at different sites throughout the program as educational partners. Currently, all of these collaborative sites use institution-specific, system-wide student assessment tools. These independent instruments vary widely and are not specific to nursing. Hence they do not adequately address the unique characteristics of nursing education.

Our research used the comprehensive Undergraduate Nursing Students' Academic Satisfaction Scale (UNSASS)<sup>2</sup>, and the Undergraduate Nursing Students' Academic Satisfaction Scale–Short Form (UNSASS-SF). We have assessed our cohort of students for two years using an electronic evaluation process and have conducted comparative analyses of satisfaction over time.

Initial results from this ongoing study suggest that nursing satisfaction may be multidimensional and site specific. Overall satisfaction with our program ranged from “satisfied” to “very satisfied” across all sites. The majority of our nursing students were Caucasian, without children, and most were working at least part time. Conflict, on many fronts, emerged as a singular issue that decreased satisfaction throughout all aspects of the program.

This presentation will discuss a) the results found using the UNSASS across multiple sites; b) the use of the UNSASS-SF; c) found major contributors of satisfaction amongst our students and d) concerning trends that are impacting on satisfaction across all sites.

### Accessing Rural Populations for Nursing Research: Challenges and Lessons Learned

---

*Kari Lynne Hickey, PhD, MS, BS, RN, USA*  
*Jeanette Rossetti, EdD, RN, USA*

#### Purpose

To describe experiences while recruiting participants for nursing research focused on rural populations

#### Target Audience

Those who conduct or plan to conduct nursing research with rural populations and clinicians who work in rural areas

#### Abstract

One fourth of the population of the United States lives in rural areas. It is known that those who reside in rural areas tend to have poorer health and less access to health care resources than those living in non-rural areas of the United States. Conducting nursing research in rural areas can be challenging for a number of reasons. This task can be especially challenging when it involves researching a sensitive topic such as adolescent suicide. Researchers will present their experiences of conducting nursing research with rural mental health practitioners who work with adolescents and their families. This poster will focus on lessons learned while conducting nursing research with rural populations; highlighting methodological issues encountered with rural populations, and present strategies to facilitate the process and reduce barriers to research with rural populations.

### Influence of Intrapersonal Characteristics on Nurses' Work Performance

---

*Nelouise Geyer, PhD, MCur, BCur, RN, RM, RPsyc, South Africa*  
*Siedine Coetzee, AUDHS, PhD, M Cur, B Cur,, RN, RM, South Africa*

#### Purpose

The purpose of this presentation is to share research done in South Africa on the influence of the interpersonal characteristics of professional nurses on their work performance.

#### Target Audience

The target audience of this presentation is faculty responsible for nursing education programs and unit managers in clinical services.

#### Abstract

**BACKGROUND:** Reports about poor nursing and midwifery care was on the increase with public media reporting only negative incidents. This is supported by the growth in numbers of nurses who are found guilty of poor nursing or midwifery care during professional conduct hearings at the South African Nursing Council. These reports are contradicted by anecdotal information provided by patients that have received good nursing or midwifery care in the same hospitals that reportedly provide poor care. The performance of nurses and other healthcare workers are influenced by physical and psycho-social work environment factors as well as individual nurse factors, such as intrapersonal characteristics. While there is a wide range of evidence available about the impact of the work environment on performance and productivity, little is known about the impact of practitioners' intrapersonal characteristics on their work performance and caring behaviours.

**OBJECTIVE:** To make predictions about the influence of intrapersonal characteristics of professional nurses' on their work performance and caring behaviours in order to improve the understanding of practitioners' own influence on their delivery of care.

**METHODS:** A quantitative, cross-sectional survey, predictive correlation model-testing design was used for this study. Data analysis was done with SPSS 21, AMOS and SAS.

**RESULTS:** The professional values of professional nurses were the only selected intrapersonal characteristic with a statistically significant (positive) relationship of practical importance with nurses' work performance and caring behaviours. While some of the other selected intrapersonal characteristics had statistically significant relationships, effect sizes were small making it not practically important. If nurses have high professional values as measured with the Nurses' Professional Values Scale - Revised (NPVS-R), NPVS-R as predictor for work performance as measured with the Six-Dimension Scale of Nursing Practice (6-DSNP) is two to three times that of any other predictor that can be added to the equation on a 10% level of significance.

**CONCLUSION:** Professional values influence the work performance and caring behaviours of nurses. Professional values can be developed in the classroom and through experience indicating that in service education or continuous professional development for nurses working in clinical services should not only concentrate on updating clinical skills, but should also provide opportunities to reflect and strengthen professional values. Recommendations are provided for professional nurses, practice, education, management and research.

### Main Factors for Creating a Nursing Curriculum Including Oriental Medicine and Challenges of Its Implementation: A Case Study of a Taiwan University

---

*Toshie Yamamoto, PhD, RN, PHN, Japan*  
*Shu Chun Chien, RN, PhD, Japan*  
*Fusako Kawabe, PhD, RN,, Japan*  
*Akiko Nagata, MN, RN, Japan*

#### Purpose

This presentation aims to exchange information about recent trend on Oriental medicine and nursing education, and to discuss how to utilize Oriental medicine in nursing education.

#### Target Audience

The target audience is researchers and educators with an interest in Oriental medicine and the utilization for nursing.

#### Abstract

**Background:** Prompted by a suggestion in the model core curriculum for medical education in 2001, all medical faculties and university hospitals in Japan have successively established courses in Oriental medicine and Oriental medicine departments, respectively. Conversely, there are no requisite courses at nursing universities teaching knowledge and skills in Oriental medicine; this subject holds a different position in the curriculum at each university. This indicates that nurses working in Oriental medicine departments have to engage in outpatient nursing without having acquired any knowledge or skills in Oriental medicine in their basic education courses. It's necessary to clarify worldwide knowledge and skills for nurses working at outpatient department in this field in order to effectively attend to patients and to develop a program for teaching them.

**Purpose:** This study is the third stage for creating a nursing model of Japanese Oriental Medicine. The first stage was to outline the trends in nursing research on the use of Oriental medicine in nursing in Japan. The second stage was to investigate participants were nurses and doctors who practice at the Japanese Oriental "Kampo" Medicine of university hospital with method of Focus group interview. On the third stage, purpose of this study was to inspect the nursing school which was the first one to develop their curriculum involved Traditional Chinese Medicine in Taiwan in order to acquire suggestions for creating a nursing model in Japan.

**Methods:** Four viewpoints were applying to inspection based on the first stage of literature review 142 papers from the Japan Medical Abstracts Society and the resulting of second stage of focus group interview as stated above. They were

- 1) The major history of developing curriculum involved Traditional Chinese Medicine.
- 2) The contents of curriculum design..
- 3) The education strategies to involve Traditional Chinese Medicine in clinical practice.
- 4) The evaluating method of the effectiveness of education.

**Results:** The nursing school is one department of China Medical University (CMU) which established in 1958 and located in Middle West of Taiwan. The characteristic of CMU was the only one University has Chinese Medicine School in Taiwan. The nursing school was a vocational nursing school before which established in 1966 and was raised to university status in 1975. The master course started since 2001.

In the past, students were taught the skills of acupuncture and moxibustion by doctors only. However, they could not to practice the skills in clinical setting because without doctor license. Taiwan government promoted the Traditional Chinese Medicine from 1900s due to the announcement "The Promotion and Development of Traditional Medicine" of WHO in 1978. Since then, Taiwan Health Ministry formulate the

course “ Chinese Medicine Nursing” include seven subjects, nine credits from that time. The subjects were:

1. Introduction of Chinese Medicine (2credits)
2. Introduction of Chinese Pharmacy (1credits)
3. Introduction of health food cuisine combined with medicinal herbs.(1credits)
4. Nursing of Chinese Medicine (2credits)
5. Nursing of acupuncture and moxibustion (2credits)
6. Nursing of wound care on the perspective of Chinese Medicine .(1credits)
7. Nursing clinical practice of Chinese Medicine .(1credits)

Before starting the course for the purpose of faculty development, nursing faculties visited the clinics of university hospitals in China twice and attended outpatient department every week through one year.

One representative faculty of five majority nursing courses was requested to be responsible for curriculum development, then shared the meeting information and forward the work with other faculties. Students were prepared to experience symptom control on patients applying method which had learned from the lectures. Meeting and questionnaires were implemented for the evaluation of the effectiveness of education.

**Conclusion:** From the inspection, experiences in the clinical practice were identified as an effective educational strategies.

However, the theoretical framework for intensive application of Chinese Medicine in nursing has not established. This is also an important issue for our progressing research.

### Contemplative Practices, Self-Efficacy and NCLEX Success

---

*Elizabeth Ann Fiske, PhD, MSN, BSN, RN, CNE, PCNS-BC, NNP- BC, USA*

#### Purpose

The purpose of this presentation is to discuss the relationships between contemplative practices, self-efficacy and NCLEX success in nursing students

#### Target Audience

The target audience of this presentation is primarily nurse educators; however, aspects of this presentation may be beneficial to all nurses.

#### Abstract

There are a myriad of factors affecting NCLEX-RN® success. Academic success does not always translate into a passing NCLEX-RN® score. The majority of research related to NCLEX-RN® success focuses on academic predictors, either prior to entering a nursing program or during the program. There is less research available about non-academic predictors of success on the exam; however, some research has identified a correlation between self-efficacy and NCLEX-RN® success. In this presentation findings from a study exploring the relationships between contemplative practices, self-efficacy and NCLEX-RN® success will be discussed.

Students enrolled in an elective NCLEX-RN® preparation course were invited to participate in the study. Student activities in the course included typical self-review of content from previous courses, practice taking NCLEX-RN® style questions and writing NCLEX style questions. In addition, contemplative activities were added in each class session to foster self-efficacy. Centering exercises and/or guided imagery were used at the beginning of every class to help students de-stress and to focus on class. Students created affirmation pages for each other by simple writing down a positive trait or supportive phrase on a page for each student in the class. Difficult concepts such as self-sovereignty were introduced to the class through storytelling. Practical suggestions for interviews and beginning practice were interjected through stories. Students were given journals and were encouraged to write about some specific topics, such as why they wanted to become a nurse, and also to document their thoughts as they prepared for program completion. Students created vision boards as a means to focus on what they wanted to achieve. Data collected in this study includes student documentation of review of content, self-identification of topics requiring remediation, and evaluation of contemplative exercises. The ten-item General Self-Efficacy Scale was administered at the beginning of the semester and will be re-administered at the end of the semester. NCLEX-RN® pass or fail information will be supplied through the North Carolina Board of Nursing Report sent to our program.

In this presentation I will briefly discuss each of the contemplative strategies used, student perceptions of these activities and whether they contributed to increased self-efficacy. I will also briefly discuss the relationship between self-efficacy and NCLEX-RN® success. I will provide suggestions for use of contemplative strategies in classroom and clinical settings.

### Main Factors for Creating a Nursing Curriculum Including Oriental Medicine and Challenges of Its Implementation: A Case Study of a Japanese University

---

*Fusako Kawabe, PhD, RN,, Japan*  
*Toshie Yamamoto, PhD, RN, PHN, Japan*  
*Shu Chun Chien, RN, PhD, Japan*  
*Akiko Nagata, MN, RN, Japan*

#### Purpose

This presentation aims to exchange information about recent trend on Oriental medicine and nursing education, and to discuss how to utilize Oriental medicine in nursing education.

#### Target Audience

The target audience is researchers and educators with an interest in Oriental medicine and the utilization for nursing.

#### Abstract

Background: Prompted by a suggestion in the model core curriculum for medical education in 2001, all medical faculties and university hospitals in Japan have successively established courses in Oriental medicine and Oriental medicine departments, respectively. Conversely, there are no requisite courses at nursing universities teaching knowledge and skills in Oriental medicine; this subject holds a different position in the curriculum at each university. This indicates that nurses working in Oriental medicine departments have to engage in outpatient nursing without having acquired any knowledge or skills in Oriental medicine in their basic education courses. It's necessary to clarify knowledge and skills for nurses working at outpatient department in this field in order to effectively attend to patients and to develop a program for teaching them.

Research Aims: For this study, the author visited one of the few universities in Japan that incorporates Oriental medicine into its nursing education curriculum and conducted interview surveys on (a) the details of creating the curriculum, (b) the practical content of the curriculum, and (c) the educational implementation system. This study aims to examine the main factors for creating a nursing curriculum that includes Oriental medicine, the current teaching content of the curriculum, and the challenges in implementing it, based on the interview surveys. The study also aims to obtain basic material for developing training programs for outpatient nurses.

Survey Participants: Two nursing faculty members (1 professor, 1 associate professor) who have been directly involved in creating a nursing curriculum that includes Oriental medicine at Public University A.

Overview of Public University A: A prefectural university, established in 2003, located in western Japan. The curriculum was revised in 2008 to include Oriental medicine.

#### Research Methods:

- 1) Survey participants were interviewed regarding the details of creating the curriculum, the current teaching content and system, and the challenges. Interviews were recorded with permission and then transcribed.
- 2) The discussions about (a) the details of creating the curriculum, (b) the teaching content and system related to Oriental medicine/nursing, and (c) its challenges were extracted from the transcriptions and included into respective descriptive materials.
- 3) The main factors for developing a nursing curriculum that includes Oriental medicine, the curriculum content, and the challenges of implementing it were examined based on the formulated descriptive materials.

#### Results:

1. Curriculum Creation Process: At the time when University A revised its curriculum, new nursing universities in Japan were being created at a rate of 10–20 programs per year. Furthermore, this exactly coincided with a drop in the 18-year old population and a situation in which the number of university applicants was fewer than the fixed university entrance quota. Even though it was a popular public university, it had to differentiate itself from other universities and more prominently market itself in order to attract the top students.

At this time, one of the interview participants was the undergraduate dean. In addition, University A also had two professors who believed that the Oriental medicine understanding of human beings and health care were essential to nursing practice, and moreover, it was necessary to have this at the core of nursing education. Furthermore, one of the nursing faculty members was a British priest who had a nursing license and had taken charge of a course titled Healing Theory after the university was established. Equipped with these human resources and with a conviction backed by personal medical treatment and nursing practice experience, the dean adopted an educational policy, unique to University A, of developing competence in practical care focused on a holistic understanding of human beings and natural healing power. The dean personally led the changes in the curriculum in line with these objectives. During that process, the university received cooperation from doctors at one of Japan's leading Oriental medicine hospitals, located near the university, as well as specialist nurses in Chinese medicine from a state university in China with which the university had formed a sister-school relationship several years before. With core efforts from the faculty members mentioned above, it was possible to incorporate several courses related to Oriental medicine into the curriculum.

The following three points were the main factors enabling the creation of a nursing curriculum that includes Oriental medicine:

- 1) The university's need to form its own distinguishing characteristics in order to attract top students in a social environment in which university seats outnumbered university applicants.
  - 2) The leadership of the undergraduate dean, who strongly believed that developing an understanding of human beings and care skills based on the principles of Oriental medicine was indispensable to nursing education.
  - 3) The presence of several faculty members with the same beliefs as that of the dean, and their ability to take action on specific class planning and management.
  - 4) The university's physical proximity to one of Japan's leading Oriental medicine hospitals.
2. Overview of Teaching Content Related to Oriental Medicine at University A  
University A currently has the following courses related to Oriental medicine.
    - 1) Holistic Human Theory (1<sup>st</sup> year course, required) 1 credit
    - 2) Healing Theory (1<sup>st</sup> year course, required) 1 credit
    - 3) Introduction to Oriental Medicine (2<sup>nd</sup> year course, required) 1 credit
    - 4) Healing Therapy (2<sup>nd</sup> year course, elective) 1 credit
    - 5) Oriental Nursing Practice (3<sup>rd</sup> year intensive course, elective) 1 credit

From the interviews with the faculty members in relation to 3) and 5) above, the author derived the following as challenges in continuing the curriculum.

- 1) Oriental medicine care techniques (massage, acupuncture, moxibustion, etc.) cannot be properly learned in a limited time period; therefore, it is difficult to utilize these in nursing practice.
- 2) Lectures by doctors are mainly derived from each doctor's knowledge of medical examinations and Chinese herbal medicine; such knowledge cannot be taught as a methodology related to nursing practice.
- 3) While inviting specialists in Chinese medicine from China requires finance, it is not very cost-effective because it is an elective course held during the summer break when there are fewer students. The finance is obtained through prefectural tax, and there is significant uncertainty about securing funding each year.

- 4) Two of the professors that led the creation of the curriculum have retired and the policies that were initially adopted are now no longer fully permeated throughout the entire faculty due to faculty turnover.

Discussion: In recent years, there has been a growing interest in Oriental medicine among clinical nurses, and many workshops on Oriental medicine have been held throughout the country. However, these have been one-off, sporadic workshops. Based on the results of this study, it would be difficult to acquire any knowledge to a level that could be utilized in nursing practice by only attending such a workshop.

Many of the challenges found in this study are attributable to the state of academic development in nursing. It is extremely important to identify how to link medical knowledge with nursing practice and how to construct methodologies to achieve this as well as to clarify and theorize the relationship between the principles of Oriental medicine and nursing practice.

### Inducements and Discouragements for Students Transitioning from Associate Degree to Baccalaureate Degree in Nursing: A National Study

---

*Karen Gorton, PhD, MS, MSN, BS, BSN, RN, ATC, USA*  
*Kathleen LaSala, PhD, RN, PNP, CNE, USA*

#### Purpose

to present national data related to both factors that enhance students returning for their BS/BSN and those that create barriers for students returning for their BS/BSN.

#### Target Audience

Nursing Educators working in both the operational/clinical setting and those within the academic setting.

#### Abstract

The call to educate more nurses at the baccalaureate level of education has been made (IOM, 2011). Accomplishing this requires innovative access and seamless progression to higher education levels for the associate degree nurse. Understanding the needs of the associate degree nurse should be in the forefront when addressing seamless academic progression. To further understand the needs of the RN to BS/BSN student population, a national study was undertaken to examine the actual items that are considered to be enhancements and barriers by the RN to BS/BSN student population currently.

This presentation seeks to not only present findings from a national study examining current enhancements and barriers for the RN to BS/BSN student, but to engage the participant in crafting creative solutions to address the findings. Findings from a national random sample for RN to BS/BSN students who completed the study tool will be presented. The tool contained multiple choice questions, ranking type questions and open ended questions which sought to better understand enhancements and barriers for the RN to BS/BSN student. The findings related to enhancements and barriers will be presented, along with potential interventions to address both enhancements and barriers will be presented. Additionally, participants in this collaborative presentation will be encouraged to provide feedback related to the proposed interventions, provide feedback and potentially provide alternative interventions.

### Critical Thinking Cards: Transforming Classroom Knowledge and Clinical Judgment

---

*Cindra S. Holland, DNP, RNC-OB, ACNS-BC, USA*  
*Deborah Ulrich, PhD, RN, USA*

#### Purpose

The purpose of this presentation is to discuss an innovative strategy to help students apply classroom content to various common scenarios in the clinical setting. Critical Thinking Cards are a valuable tool to incorporate active learning strategies to enhance critical thinking and clinical reasoning in the clinical arena.

#### Target Audience

Nurse educators

#### Abstract

**Introduction:** Critical thinking is an essential component for nursing students to become successful practitioners. It is vital for educators to help students learn to apply classroom content to the clinical setting (Benner, Sutphen, Leonard, & Day, 2010). This is a challenge for nurse educators. The purpose of this descriptive study was to develop an intervention that required students to use knowledge to solve clinical issues. Outcome measures included the intervention's effectiveness in helping students apply class content, as well as improve clinical judgment and critical thinking skills.

**Methods:** Faculty teaching in a junior level obstetrics course at a Midwestern university were presented with a deck of 116 Critical Thinking Cards to utilize as an intervention with students in the clinical setting. The cards were divided into four categories: Antepartum, Labor and Delivery, Postpartum, and Newborn and included questions that required students to use critical thinking to apply course content to various common scenarios. Two researcher created surveys were used to gather data from students (n=66) and faculty (n=4) regarding the effectiveness of the intervention.

**Results:** The vast majority of students stated that the activity helped them apply content from class and claimed the activity also helped them improve clinical judgment. Positive feedback was received from faculty who utilized Critical Thinking Cards as a teaching strategy during clinical. Faculty liked the variety of questions included in the deck and felt that the cards reinforced content from class.

**Discussion:** Critical thinking cards are a valuable tool that promotes multiple active learning skills. Faculty used the cards as springboards for individual and group discussion related to the content of the question on the card. Some faculty used the cards during "down time" in clinical, and others used them as post conference activities. Students seemed to enjoy the activity and felt it helped them improve clinical judgment.

**Conclusion:** Critical thinking cards incorporate active learning skills designed to enhance knowledge of course content and increase critical thinking skills. This creative teaching strategy resulted in positive outcomes for both students and faculty. More research is needed to determine how to best use the cards, what faculty characteristics tend to be associated with better learning outcomes, and how the cards work with students of different levels and in different clinical settings.

### Relationship between the Ability to Care and the Overload of Caregiver of People with Chronic Disease in Colombia

---

*Sonia Carreno-Moreno, RN, MSN, Colombia*

*Lorena Chaparro Diaz, BSN, PhD, Colombia*

*Gloria Mabel Carrillo Gonzalez, RN, MSN, Colombia*

*Beatriz Sanchez Herrera, RN, MSN, Colombia*

*Lucy Barrera Ortiz, RN, MSN, Colombia*

*Elizabeth Vargas Rosero, RN, MSc, Colombia*

#### Purpose

The purpose of this presentation is to show the relationship between caregiver burden and ability to care.

#### Target Audience

The target audience of this presentation is nurses who are interested in care for family caregivers of people with chronic disease.

#### Abstract

**BACKGROUND:** Chronic illness affects not only those who suffer it but also the family caregivers.<sup>1</sup> The family caregiver assumes various tasks for which in most cases he or she is not ready. To assume the new role generates overload associated with care.<sup>2,3</sup> It has been explored the relationship between overload and gender of the caregiver,<sup>4</sup> the time spent caring,<sup>5,6</sup> depressive symptoms<sup>7</sup> and social support,<sup>8,9</sup> but not yet explored the relationship between the overload and the caregiver ability to care.

**OBJECTIVE:** To determine the relationship between the variables caregiver overload and ability to care of family caregivers of people with chronic non transmissible disease (CNTD) and to determine this relationship in the Colombian regions (Amazon, Caribbean, Andean, Pacific).

**METHOD:** Study of quantitative, correlational approach. The sample consisted of 2,040 family caregivers of people with chronic disease in Colombia (200 from Amazon, 1,677 of the Andean region, 86 from the Caribbean region and 77 from the Pacific region). The statistic of choice to determine the relationship between the two variables was the Spearman Rho coefficient. The instruments used were the Zarit Overload Interview (1980),<sup>10</sup> which assesses the dimensions of impact, interpersonal, skills and expectations and the Care Skill Inventory proposed by Nkongho (1990),<sup>11</sup> which has the dimensions Knowledge, Courage and Patience. Participation in the study was voluntary, and informed consent process was performed.

**RESULTS:** A weak but statistically significant negative correlation ( $p < 0.01$ ) in Colombia (-0.219) and the Amazon (-0.289) and Pacific (-0.345) regions was found. In the Caribbean region (-0.483) a moderate and statistically significant negative correlation ( $p < 0.01$ ) was observed. In the Andean region (-0.043) ( $p = 0.079$ ) there is no relationship between the ability to care and the caregiver burden.

**CONCLUSION:** In Colombia and Amazon, Pacific and Caribbean regions, a relationship between the two variables is observed, suggesting that the greater the ability to care, the less the caregiver overload. This may be in connection with some associated cultural protective factors that have yet to be explored. Finding no relationship between the two variables in the Andean region, it is assumed that for this population these variables operate independently and that their comparative evaluation does not determine the improvement of the status of the caregiver.

### From Nursing Student to Registered Nurse: Development of Resilience and Professional Self

---

*Tammy D. Barbé, PhD, RN, CNE, USA*

#### Purpose

The purpose of this study is to investigate how professional development, professional values, and resilience of baccalaureate degree nurses evolve over time, by following individuals from entry into a nursing program until five years post-graduation.

#### Target Audience

The target audience of this presentation include nurses, nurse administrators, and nurse educators.

#### Abstract

Resilience is identified as the ability to successfully cope with or rebound from adversity. Individuals with higher levels of resilience are more adaptable to change than those less resilient. While resilience has been studied in numerous clinical populations, little is known about resilience in nursing students and nurses. Nursing requires a high-degree of self-giving. Nurses are often required to work in environments with inadequate staffing, critically ill patients, and need to make rapid life-changing decisions. They interact daily with patients and caregivers in distress. Higher resilience in nursing students may help them navigate the transition into the role of a practicing nurse and ameliorate the multiple stressors that may lead to decisions to leave the nursing workforce.

The purpose of this study is to investigate how professional development, professional values, and resilience of baccalaureate degree nurses evolve over time, by following individuals from entry into a nursing program until five years post-graduation. In addition, the changes in these variable over time will be examined with respect to race, to examine whether the experiences of students from racial minorities is different from students who are not from racial minorities.

A non-experimental, longitudinal study is in progress. Demographic variables collected for the sample include age, gender, race, ethnicity, marital status, any prior degrees, and experiences working in healthcare prior to or while in the baccalaureate program. Three validated questionnaires are administered at five points in time, upon program entry, at the end of the junior year, at graduation, at one year following graduation, and at five years following graduation. The Professional Development Self-Assessment Matrix (PDSAM) is administered to determine the level of professional development for each participant. Nurses Professional Values Scale- Revised (NPVS-R) is administered to measure professional nursing values. Resiliency is measured using the Resilience Scale (RS) developed by Wagnild and Young.

At this point in the study, participants were surveyed at program entry and again at the end of the junior year. Descriptive statistics were used to characterize the sample and examine individual items and subscales. Repeated measures ANOVA, one per variable, were conducted to determine whether there was a significant change over time from initial program admission to the end of junior year. This presentation will be a discussion of the first year findings.

### Sexuality in Sexual Partners of Colombian Women with Breast Cancer

---

*Luz Stella Bueno Robles, RN, Colombia*

#### Purpose

The purpose of this presentation is share the results of my dissertation as well as showing the experiences of sexual partners of women with breast cancer

#### Target Audience

The target audience of this presentation are caring nurses working women with breast cancer.

#### Abstract

Objectives: To describe the changes in the sexuality of the sexual partners since the beginning of the disease and the treatment of breast cancer by spouses.

Methodology: It was a qualitative approach, analysis of content, in which was involved by 41 sexual partners of women with breast cancer.

Results: The experience in sexual partners with respect to the changes of the sexuality of the sexual partners since the beginning of the disease and during the treatment of breast cancer in their partners allowed the construction of three categories: 1) causes and consequences of the alterations on sexuality and marital relations after the breast cancer by the spouse focused on feelings of fear, guilt and loss as a result of the suffering of women; 2) strategies for overcoming the disease and its effects "My wife is in the hands of God and what he decides is well, for my part I have always loved her and I always will". 3) Demands and support offered for women match with the perception that they have themselves about the support of their sexual partners: "I think I feel better now than before, we understand better and I can provide her my full support and confidence, as my love".

Conclusions: The sexual partners of women with breast cancer report changes in their sexuality as a result of the disease and treatments that generate positive or negative changes in their relationship with their spouse, so nursing must include actions of care that are aimed toward the physical, emotional and social welfare of them.

### Acupuncture and Menopausal Memory Changes in Women with Breast Cancer

---

*Elizabeth Cole Collins, PhD, RN, WHNP-BC, IBCLC, USA*

*L. Kathleen Sekula, PhD, RN, PMHCNS-BC, FAAN, USA*

*Susan M. Cohen, PhD, RN, CRNP, FAAN, USA*

#### Purpose

to examine the efficacy of acupuncture to improve the menopausal symptom of memory changes in breast cancer survivors.

#### Target Audience

nurse researchers, educators and clinicians interested in the study of complementary therapies for menopausal symptom relief, particularly in breast cancer survivors.

#### Abstract

Menopausal symptoms are a concern for peri- and postmenopausal women, and for women who have been treated for breast cancer. Changes in memory are a commonly reported menopausal symptom which can interfere with daily activities, occurring in women who experience natural menopause as well as in women who have an abrupt onset of menopause following treatment for breast cancer. Menopause hormone therapy may be contraindicated or unacceptable for many women, reinforcing the need for well-tolerated, non-hormonal treatments for menopausal symptoms. The purpose of this study was to examine the efficacy of acupuncture to improve the menopausal symptom of memory changes in breast cancer survivors, and was a secondary analysis of a placebo-controlled, randomized clinical trial. The Framework for Interactions between the Individual and the Environment was the conceptual framework that guided the study.

Subjects in the parent study were randomized to either the experimental group (symptom-specific acupuncture), control group (non-symptom-specific acupuncture), or enhanced usual care group (instruction on health-related topics). Each group received twelve intervention sessions over an 8-week period. Sixty subjects indicating a positive response to memory items on instruments at baseline were selected for this secondary analysis. The Daily Symptom Diary, Kupperman Index, and Menopause-Specific Quality of Life Questionnaire (MENQOL) measured frequency or severity of perceived memory changes at baseline, midpoint, and end of treatment.

Frequency distributions were used to summarize the data. There were no statistically significant results from the Daily Symptom Diary. Improvement in the enhanced usual care group compared to the acupuncture groups was seen on the Kupperman Index, and validity concerns for this instrument were reviewed. Analysis of the MENQOL data revealed more positive change in the acupuncture groups in improvement of memory than in the enhanced usual care group. These findings support the need for further exploration of targeted interventions such as acupuncture to improve memory difficulties for menopausal women and breast cancer survivors, particularly as advances are made in the understanding of the mechanisms of cognitive change. Acupuncture remains promising as a non-hormonal treatment for menopausal symptoms and merits further investigation.

### Storied Experiences of Managing Polypharmacy in Primary Care

---

*Johnanna Hernandez, PhD, MSN, RN, APRN, FNP-BC, USA*

#### Purpose

The purpose of this presentation is to explore nurse practitioner's storied experiences managing patient's with polypharmacy in primary care.

#### Target Audience

The target audience for this presentation is advanced practice nurses.

#### Abstract

Polypharmacy is a global epidemic. The World Health Organization (WHO) identifies polypharmacy, the irrational use of medications as a major global problem resulting in wasting of scarce resources and widespread health hazards. A qualitative study used narrative inquiry to explore understanding and meanings of the nurse practitioner's (NPs) professional experience in managing polypharmacy in primary care. In this study, seeking to understand meaning of NPs with a particular issue, temporality was a central feature. Using the three-dimensional narrative inquiry space during data analysis allowed the researcher to view the temporal aspect of the stored experiences as something that has happened over time and to organize the NPs experiences into temporally meaningful episodes. The personal/social interaction was also important as the co-dependency between the two contextualized all aspects of the NP's experience in their practice environments, or place. NP narratives revealed motives, experiences, and actions, and the way they interpret and assign meaning to them in relation to their NP role in managing polypharmacy. Thematic analysis of narratives revealed the complexities of managing polypharmacy and highlighted issues which must be addressed given one in five people will be over age 60 years by 2050, accounting for approximately half of the total growth of the world population.

### Findings from an Instrument Validation Study to Measure Perceived Competence and Confidence of Clinical Nurse Educators

---

*Van N. B. Nguyen, MN, BN, RN, Australia*  
*Maxine M. Duke, PhD, MEd, BAppSc (AdvNsg), Australia*  
*Helen Forbes, PhD, RN, Australia*  
*Mohamaddreza Mohebbi, PhD, ., Australia*

#### Purpose

The purpose of this presentation is to report findings from the second phase of a study to develop and validate an instrument to measure perceived competence and confidence of clinical nurse educators.

#### Target Audience

The target audience of this presentation is nurse educators, nurse researchers and policy makers.

#### Abstract

**Background:** The importance of the clinical component in nursing education has been well acknowledged. The transition of clinicians into the role of nurse educators is reported to be challenging, however, little is known about clinical nurse educator skill development after recruitment. This study has been conducted to develop and validate the instrument Clinical Nurse Educator Skill Acquisition Assessment (CNESAA). In phase one, the CNESAA was piloted and tested for reliability and validity. The instrument was modified according to exploratory factor analysis results. In this phase two, the conceptual model of CNESAA was tested again to validate the modifications made in phase one.

**Objective:** To test and validate the conceptual model of the CNESAA with 24 items and five subscales.

**Method:** Instrument validation method through confirmatory factor analysis, following the exploratory factor analysis that was conducted in phase one. Data were collected through surveys and analysed using IBM SPSS - AMOS software version 22.

**Participants:** 212 clinical nurse educators who were teaching nursing students at bachelor (4-year) and collegial (3-year) degrees of nursing in the current academic year (2014-2015).

**Settings:** 12 institutions across three main geographical regions in Vietnam participated in this phase two.

**Results:** Demographics: There were 155 (73.1%) females and 57 (26.9%) males. One hundred forty-eight participants had background in nursing (69.8%), 61 participants (28.8%) were physicians and the remaining (n=3, 1.4%) had background in other disciplines in health. The participants aged from 22 to 59, with a mean age of 33.69 (D=8.35) and had 8.15 years of experience (SD=7.43) on average in the role of a clinical nurse educator.

Confirmatory factor analysis: There was no missing data as a result of compulsory questions in the survey. The initial model of CNESAA suggested by explanatory factor analysis in the phase I with 24-item and five sub-scales has been tested. Model fitness was evaluated using minimum discrepancy statistic (CMIN/DF=2.261) with 236 degrees of freedom. High communalities for all 24 items were observed (.65-.88). High comparative fit index was achieved (CFI=.921). Goodness of Fit Index GFI was of .82, Root Mean Square Error of Approximation RMSEA of .077, Adjusted Goodness of Fit Index AGFI of .771. Although the GFI and AGFI were slightly below the threshold, the model does not suggest any cross-loadings between sub-scales and there were no significant standardised residual co-variances. As the purpose of this analysis was to test the conceptual model rather than seeking a model fit, these values are acceptable for a newly developed instrument. Average variance extracted AVE ranging from .56 to .68 (from standardised solution) for all sub-scales demonstrated convergent validity. Reliability was also established with high composite reliability for all sub-scales (CR=.79-.90).

**Conclusion:** The conceptual model of CNESAA developed and modified in phase one was validated. The instrument CNESAA is found to be reliable and valid to measure perceived competence and confidence of clinical nurse educators in the Vietnamese settings and potentially in similar contexts.

### The Synergic Effect of Resilience and Depression on Self-Care in Patients with Chronic Heart Failure

---

*Shan-Ying Wu, MSN, Taiwan*  
*Pei-Shan Tsai, PhD, RN, Taiwan*  
*Ling-Yin Chang, PhD, Taiwan*

#### Purpose

The purpose of this presentation is to present the relationship between resilience and self-care is moderated by severity of depressive symptoms.

#### Target Audience

The target audience is nurse/health care scientists, clinicians and educators.

#### Abstract

**Background:** Self-care behavior can improve the health and the prognosis in patients with chronic heart failure (CHF). Therefore, self-care behavior has not only been considered as CHF patients clinical care guidelines but also an important part of disease treatment. Both resilience and depression have been found to associate with self-care, however, the synergic effects of resilience and depression on self-care in patients with CHF remains unknown.

**Objectives:** This study aims to 1) examine the relationships among resilience, depression, and self-care in CHF patients, and 2) determine whether the relationship between resilience and self-care is moderated by severity of depressive symptoms.

**Methods:** 128 CHF inpatients and outpatients were recruited from Northern Taiwan hospitals. Participants' resilience, depression, and self-care were assessed using Resilience Scale, Beck Depression Inventory-II, and Self-care of Heart Failure Index, respectively. The multiple regression models were conducted in SAS software version 9.2 to determine the main and synergic effect of resilience and depression on self-care. All models controlled for confounders (i.e. age, gender, marriage state, education, co-morbidities, Body Mass Index, and weekly exercise).

**Results:** After adjustment for confounders, resilience was positively and significantly associated with both self-care maintenance ( $p < 0.01$ ) and self-care confidence ( $p < 0.01$ ). Depression was negatively and significantly associated with self-care confidence ( $p = 0.02$ ). Furthermore, depression moderated the relationship between resilience and self-care maintenance ( $b = 0.02$ ;  $p < 0.05$ ) but not between resilience and self-care confidence ( $b = -0.00$ ;  $p = 0.24$ ). Specifically, there is a stronger effect of resilience on self-care maintenance in CHF patients with low depression compared with those with high depression.

**Conclusion:** Resilience can improve self-care maintenance and self-care confidence in CHF patients. The positive effect of resilience on self-care maintenance also depends on severity of depressive symptoms. Interventions to improve self-care in CHF patients should consider both the effects of resilience and depression to enhance the effectivity.

### Exploring Mentorship in the Nursing Context

---

*Linda M. Ferguson, MN, PhD, RN, Canada*

*Olive Yonge, RN, PhD, Canada*

*Florence Myrick, RN, PhD, Canada*

*Noelle K. Rohatinsky, PhD, MN, BSN, RN, CMSN(C), Canada*

#### Purpose

The purpose of this presentation is to explore nurse's perceptions of mentorship in their clinical practice, from the perception of both those who mentor and those who are mentored.

#### Target Audience

The target audience of this presentation is nurses in clinical practice who facilitate the integration of new nurses into clinical practice settings, new nurses entering clinical practice, and nurse educators who prepare students for professional practice.

#### Abstract

Mentorship is a workplace learning strategy that is beneficial to the mentor, protege, and employing institution as a means of transmitting the tacit knowledge of the workplace. As a result of mentorship, newcomers are incorporated into existing communities of practice in the workplace. Using tools from the business context that has used mentorship for the protege's professional development extensively, we explored the concept of mentorship in the nursing context. After slight modification of the tools, we administered them to 357 participants in four health regions in two provinces in Western Canada. Both mentors and proteges were surveyed. Findings demonstrated that mentorship in nursing was an individual commitment that flourished in an organizational culture that encouraged mentoring relationships. As anticipated, proteges found the process of mentorship to be very valuable. Mentors identified benefits they experienced, which moderated their intentions to mentor in the future. From the qualitative part of the study of 26 nurses, we explored the perceptions of mentorship, mentoring cultures, and the process of mentorship of new nurses.

## SCI PST 2 - Scientific Poster Session 2

### The Impact of Flipped Classroom Teaching Strategies with Nursing Students

---

*Roxanne Hurley, MS, RN, USA*

*Stacie Olson, DNP, RN, PMHNP, USA*

#### Purpose

The purpose of this presentation is to report perceptions of students and faculty when using flipped classroom techniques in baccalaureate nursing courses and to identify if the flipped classroom technique increases learning outcomes by comparing content exam scores to past semester exam scores taught using the traditional lecture format.

#### Target Audience

The target audience of this presentation is nurse educators who primarily teach in baccalaureate nursing programs.

#### Abstract

**Problem:** The flipped classroom technique has been identified as a method to promote increased engagement of students in their learning and the development of critical thinking skills. Some studies have correlated increased grades to these techniques. However, limited nursing research has been conducted on the flipped classroom method and little data exists about student or faculty perceptions of the strategy at the university level. This research will enhance known information about effective teaching pedagogy for baccalaureate nursing students. The purpose of this study is to determine the perceptions of students and faculty when using flipped classroom techniques and to identify if the technique contributes to better student learning outcomes.

**Methodology:** Students enrolled in two undergraduate nursing courses at the University of North Dakota will be invited to voluntarily participate in the study. Students will be notified prior to class of the required prep work for the flipped classroom technique. During the class period, faculty will provide active learning and application scenarios for the students. Following the class, the students and faculty will complete an online survey about their experiences. The online forms will ask likert-type survey questions and open ended questions. At the end of the semester, content exam scores will be analyzed to determine learning outcomes.

**Analysis:** Quantitative data will be analyzed utilizing descriptive correlational non-parametric analysis and reported in aggregate form. Qualitative data will be used illustratively only. Learning outcomes will be analyzed using aggregate test score data of the class and will be compared to aggregate test score data from the prior semester class for the same content area.

**Implications for Clinical Practice:** It is imperative that nurse educators spend time discussing and investigating how to improve our teaching. In the rush to change our classrooms to a more engaged, interactive way to learn and develop critical thinking skills, are the student's learning the critical content knowledge necessary to become competent nurses? The benefits of research on the scholarship of teaching and the development of nursing knowledge and critical thinking skills will be discussed.

## SCI PST 2 - Scientific Poster Session 2

### Nursing Faculty and Nursing Students Experiences of Participating in International Exchange Programmes

---

*Margret Lepp, PhD, RN, RNT, Sweden*

#### Purpose

The purpose of this presentation is to highlight the use of international exchange programmes in nursing education and its impact on newly graduated nurses and share the Nursing faculty and nursing students experiences.

#### Target Audience

The target audience of this presentation is preceptors, clinical instructors/teachers, nurse educators, academics, nursing students and researchers in the field of nursing education in a global world.

#### Abstract

The aim of the study was to investigate whether International Study Experiences (ISE) during basic nursing education had an impact on newly graduated nurses as regards to self-reported competence. Moreover, a second aim was to explore what background factors that facilitated or constituted a hindrance for nursing students to choose to conduct part of their basic nursing education abroad. At 11 Universities/University Colleges (henceforth called Higher Education Institutions [HEIs]) in Sweden, 565 nursing students responded to the Nurse Professional Competence (NPC) Scale. Students with ISE rated their competence significantly higher on three NPC competence areas—“Legislation in nursing and safety planning”, “Leadership and development of nursing” and “Education and supervision of staff/students”.

Background factors that significantly seemed to enhance ISE were living alone, not having children or other commitments in relation to family, international focus at the HEI and previous international experience. Lack of financial means was reported to prevent students from choosing ISE. The study implies that several background factors are of importance whether students choose ISE or not. ISE during basic nursing education might result in better self-reported competence in leading and developing nursing care, including education of future nurses, and in providing safe care.

### The Use of Presence in the Nurse-Client Relationship

---

*Pamela Allyn Di Vito-Thomas, ADN, BSN, MS, PhD, RN, CNE, USA*  
*Cherrill Iona Stockmann, PhD, MSN(R), BSN, RN, CNE, USA*

#### Purpose

The purpose of this study was to describe how practicing, registered nurses across practice settings implement presence in the nurse-client relationship (NCR). Research findings will be used to build on prior research for nursing practice and for education.

#### Target Audience

The target audience of this presentation is practicing, registered nurses, nurse educators, and nursing students.

#### Abstract

The significance of presence to the nurse-client relationship (NCR) has been clearly established. Although understood as foundational to the NCR, presence has not been clearly delineated as a nursing intervention and has often been subsumed under other nursing phenomena, such as caring, empathy, and therapeutic use of self. Knowledge of this intervention is limited with regard to its use across clinical settings as well as to associated client outcomes. Levels of presence described with the use of this intervention suggest that presence can be learned. Without understanding grounded in the perceptions of nurses who have used presence as an intervention, nursing does not have a basis for its use in practice.

The purpose of this qualitative, descriptive study is to explore and describe how practicing, licensed registered nurses across practice settings implement presence to support client health outcomes through the NCR. Research findings will be used to build on prior research and to design educational programs for nurses. Research questions for this study considered the perceptions of the use of presence as an intervention in the NCR by practicing, licensed registered nurses. Focus group method using semi-structured guiding questions was used to collect data. Giorgi's Human Scientific Phenomenological Method was used to analyze the data.

### Timing Newborn Follow up Care in Low Income First Time Minority Mothers

---

Jean Hannan, PhD, ARNP, USA

#### Purpose

The purpose of this presentation with low income first time minority mothers was to examine the timing and barriers to receiving the first newborn follow up care.

#### Target Audience

The target audience of this presentation maternal child health and minority populations.

#### Abstract

**Background:** Due to shortened postpartum stays, the American Academy of Pediatrics (AAP) and the American College of Obstetricians and Gynecologists recommend that all infants receive follow-up care within 48 hours post-hospital discharge to prevent infant morbidity and mortality. However, studies indicate that many do not receive newborn follow up visit within 2 days after discharge especially low income mothers (O'Donnell, Trachtman, Islam & Racine, 2013, Shakib, Buchi, Smith, & Young, 2015; Pregnancy Risk Assessment Monitoring System, 2010). Receiving timely newborn follow up care is more difficult with the recent budget cuts to the healthcare system. For the 2015 House Budget, hospitals and health care systems are facing cuts approaching half a trillion dollars (Herman, 2014). These budget reductions are forcing hospitals to eliminate many health care services in the community, especially those in maternal child health (Abraham, 2011; Ferrara & Hunter, 2010; Kauffman, 2014).

**Objective:** The purpose of this study with low income first time minority mothers was to examine the mean timing and barriers to receiving the first newborn follow up care.

**Method:** This study is a secondary analysis of data from a randomized clinical trial that compared maternal health, infant health, and health care charges in two groups of mothers and newborns.

**Results:** 85 mothers (45 Intervention, 40 Control) have been enrolled. Mothers' ages range from 18-42 with a mean age of 25. The mothers' race/ethnicity includes 38 Hispanic, 46 Black (19 African American, 28 English-speaking Haitians) and 1 White non-Hispanic. The majority (n = 53; 64%) of the infants received late routine medical follow up visits post hospital discharge (M = 8 days post hospital discharge) ranging from 4 days posthospital discharge to 40 days posthospital discharge. Intervention group had a mean of 9 days for their routine medical follow up visits posthospital discharge compared to controls of 8 days for their routine medical follow up visits posthospital discharge. The majority mothers (68%) in the intervention group reported not receiving insurance coverage (Medicaid or private) as the primary barrier to receiving newborn follow up care.

**Discussion:** Study data provide a better understanding of the challenges encountered by first time mothers of full term infants and allow us to identify first time mothers who may need additional help in caring for their infant. With this understanding, healthcare providers can improve the care that first time mothers receive after they deliver their infant and to reduce infant morbidity, mortality subsequent health care costs.

### An Examination of Caring in One Associate Degree Nursing Program

---

*Deborah A. Ain, MS, RN, USA*  
*Sherrilyn Coffman, PhD, RN, USA*

#### Purpose

The purpose of this study was to examine to what extent the concept of caring has been incorporated into an associate degree nursing (ADN) program at one community college.

#### Target Audience

The target audience of this presentation is nurse educators, particularly those interested in incorporating caring into the curriculum.

#### Abstract

The importance of caring in nursing practice and nursing education is well documented. Several significant milestones have thrust caring into the forefront of nursing including Watson's theory of caring or caring science that emerged with the publication of *Nursing: The Philosophy and Science of Caring* in 1979. Caring science was described as a combination of scientific knowledge and humanistic values (Watson, 1979). She advocated for the use of caring science to transform nursing education and she called upon nursing to change its educational framework from the medical model to caring science. She claimed that the medical model was "not adequate for addressing the phenomenon of human care in nursing and human response to actual or potential health problems" (Watson, 1985, pp. 18-19). In 1986 the National League for Nursing (NLN) called for curriculum reform in nursing education (Tanner, 1990). Tanner claimed that one of the major themes of the curriculum revolution was "the centrality of caring" (p. 297).

Again, in 2005, the NLN called for transformation in nursing education. The endeavor to change nursing curricula continues today. Caring is a core value of nursing practice and one of the concepts used to define the competency of professional identity (NLN, 2010). While nursing identifies the importance of caring, the balance between humanism and science, or the art and science of nursing, is not always evident.

Studies have been conducted to describe caring and non-caring nursing behaviors, using both qualitative and quantitative research methodologies, from various perspectives including patients, nurses, and nursing students. Culture and gender have also been considered in studies. Five themes emerged from the exploratory study conducted by Begum and Slavin (2012) in Pakistan with senior nursing students. These themes included: (a) caring as a mothering relationship, (b) caring as a helping attitude, (c) caring as limit setting, (d) caring as communication, and (e) caring as a source of empowerment and development (p. 333). Tools have been developed to measuring caring. DiNapoli and Nelson (2010) conducted an exploratory and principal component factor analyses to develop a survey for measuring caritas. What emerged was a reliable 10-item caring factor survey. Each item represented one of the caritas processes.

In addition to research in nursing practice, research in nursing education has been conducted. Numerous articles have been published describing the transformation of nursing curricula and the addition of the concept of caring in nursing education. A study by Curtis and Jensen (2010) used confluent educative strategies to explore learning experience. The strategies included "reflective writing, reading, and discussing contemporary literature and films, along with clinical experiences, field trips, and guest lecturers" (p. 52). Four themes emerged "(a) challenging assumptions and gaining knowledge and insight, (b) developing caring and empathy, (c) moving to action, and (d) transformational learning" (pp. 50-51). With the emergence of high-fidelity simulation and its use in place of actual clinical practicums, caring in the simulation setting has been studied. Caring was explored in simulated emergency situations

by Eggenberger, Keller, and Locsin (2010) using focus group research. The study demonstrated that caring behavior could be valued and evaluated in simulated situations.

How well schools of nursing are incorporating caring into the curriculum continues to be unclear. The purpose of this study was to examine to what extent the concept of caring has been incorporated into an associate degree nursing (ADN) program at one community college. The research question was "How is the concept of caring incorporated in an associate degree nursing program at one community college?" The sub-questions include the following:

- How is caring defined?
- What terminology is used related to caring?
- How is caring represented in program documents?
- How is caring taught?
- How is caring assessed?

A holistic case study design was used to explore in-depth how the concept of caring was included in the curriculum of one associate degree nursing program in a community college located in southwestern United States (U.S.). Yin (2009) stated that a researcher "would use case study method because you wanted to understand a real-life phenomenon in depth" (p. 18). The single case-study was used because the case represents an everyday situation in this nursing program, while the holistic design was used to examine the global nature of the program (Yin, 2009, p. 50). Data was collected using a review of ADN program documents, informal interviews with nursing instructors, and formal group interviews with nursing students representing each semester of the 2-year program. The program documents reviewed include the mission, philosophy, values statements, educational learning outcomes, course syllabi, and clinical evaluation tools of the most recently completed semester of the ADN program. The documentation review included a computer search and reading to determine how and where caring was taught and how and where caring was assessed in nursing students. The findings were recorded on a data collection sheet. Following the documentation review, informal interviews were conducted with faculties representing the program and the courses to clarify and validate document review findings prior to interviewing students.

Ten formal group interviews were conducted with a total of 25 volunteer nursing students representing each of the 4 semesters between December 2013 and May 2014. Guiding questions were used during the interview:

- Tell me what caring means to you.
- How did you learn about caring?
- Have you taken any courses that taught you about caring? Can you give me an example?
- How and where did this occur?
- How has caring been assessed or evaluated in the courses you have taken? Can you give me an example?
- How and where did this occur?

The computer search for caring and similar terminology using the Microsoft office word search program was analyzed for where caring was represented in the ADN program. Comments made while reading the documents were analyzed to understand the context of the terminology, the teaching/learning strategies, and the assessment of caring in nursing students. The formal group interviews were recorded and transcribed verbatim. The transcriptions are being analyzed for themes and patterns using the Descriptive Coding method.

### The Mediating Effects of Fear of Falling on the Relationship between Muscle Strength and Depression of Community-Dwelling Older Women

---

*Young Mi Lim, RN, PhD, South Korea*

#### Purpose

The purpose of this presentation was to explore the mediating effect of fear of falling on the relationship between muscle strength and depression among community-dwelling older women.

#### Target Audience

The target audience of this presentation is community health nurse, and health professionals.

#### Abstract

Although there are many studies on the relationship between physical function and depression of older adults, few studies have identified whether muscle strength affects depression through fear of falling (whether a mediation exists), especially in older women. The purpose of the study was to explore the mediating effect of fear of falling on the relationship between muscle strength and depression among community-dwelling older women. Total sample was 163 Korean older women aged 60 and over in one small city. Instruments were Activities-specific Balance Confidence scale, Center of Epidemiologic Studies Depression Scale (CESD), and Hand Grip Strength test. Data were analyzed using multiple regressions proposed by Baron and Kenny (1986). First, muscle strength had a significant direct effect on depression ( $\beta = -.314, p < .05$ ). For the next step, muscle strength was correlated with fear of falling ( $\beta = -.467, p < .01$ ). In the third step, fear of falling completely mediated the relationship between muscle strength and depression ( $\beta = -.009, p > .01$ ). The results indicate that the indirect effect of the muscle strength on the depression through fear of falling was significant. The findings have implications that these relationships can guide health professionals to develop physical exercise intervention strategies to increase self-efficacy and personal control in order to prevent ultimately depression among older women. Health professionals should play a leading role in assisting older women who undergo low physical function to ensure they have emotional strength, as this can dramatically impact their depression.

### Investigation of the Stress Level and Potential Contributive Factors for Japanese College Nursing Students during the Period of Clinical Practicum

---

*Miwako Hoshi, PhD, RN, Japan*  
*Izumi Nakashima, BSN, RN, Japan*  
*Eri Mizoguchi, BSN, RN, Japan*  
*Hitomi Moriki, BSN, RN, Japan*

#### Purpose

The purpose of this presentation is to delineate the stress level of Japanese college nursing students and to detect the potential variables that might contribute to the increased level of stress while they are taking clinical practicum.

#### Target Audience

The target audience of this presentation is nursing educators, researchers and clinical instructors who are interested in assessing the level of stress and the relationship between such stress and one's psychological and biological factors of college nursing students during the period of clinical practicum.

#### Abstract

**Purpose:** Clinical practicum plays a crucial role in nursing education. However, it is indicated that students often experience great stress due to various tasks they have to carry out and fulfill as a nursing student in varied types of clinical environment. Purpose of this study was to examine the level of stress of Japanese college nursing students and to detect potential factors that might contribute to their increased level of stress during the period of clinical practicum. In addition, the relationship between students' level of stress and potential factors were examined. In this study, factors that contribute to students' stress primarily refer to his or her self-efficacy, career interests, interpersonal relationship in the clinical settings, clinical tasks, as well as demographic factors such as age, gender, and household status and so on.

**Methods:** A descriptive correlational research design was used in this study. A total of 137 college nursing students who are juniors and seniors was recruited from a national university located in southern Japan to participate in this study by using convenience sampling method. Participants were requested to complete a set of scales used to assess the level of stress and self-efficacy. The scales included the Clinical Practicum Stress Scale, a 24-item questionnaire, developed by the researcher to examine the stress resulted from interpersonal relationships, clinical tasks, and environmental situations, the Stress Checklist Short-Form (Imazu et al., 2006), the Coping Scale (Ozeki, 1993), and the Self-Efficacy Scale (Narita et al., 1995). Participants' demographic data such as age, gender, household status, engagement in clubs or part-time jobs, and initial career interests were also collected. Data analysis methods used in this study included descriptive statistics, Pearson correlation analyses, independent t-tests, and analyses of variance (ANOVAs). The Pearson correlation was used to examine the correlations among variables, whereas the t-tests and ANOVAs were utilized to evaluate group differences in the level of stress of participants with varied background variables.

**Results:** The results showed that variables including the interpersonal relationship in clinical settings, task fulfillment, and lack of confidence in carrying out the care result in a higher level of stress, while factors such as gender, age, household status, and engagement in clubs or part-time jobs were variables that less likely contribute to students' stress. With respect to the stress reactions, many students reported anxiety and psychosomatic symptoms during the period of clinical practicum. Nevertheless, the results revealed that students with a higher level of self-efficacy had a significant lower degree of anxiety and that students with consistent career interest in nursing showed a significantly lower level of stress. Furthermore, senior nursing students demonstrated significantly a higher level of stress than their junior peers.

**Conclusion:**The present study indicated that although college nursing students tend to express anxiety and demonstrate psychosomatic reactions to the stress during the period of clinical practicum, a higher level of perception of self-efficacy may result in a lower level of stress. In addition, it was found that many of the students have a stressful feeling toward interpersonal relationship in the clinical settings. Findings of this study indicated the importance of promoting nursing students' self-efficacy and ensuring them a warm clinical environment.

### Predictors of Success in Baccalaureate Nursing Curriculum

---

*Alex Sargsyan, DNP, MSN, MS, BSN, BS, RN, ANP, USA*

#### Purpose

The purpose of this presentation is to share the results of the evaluation of the predictors of success of students who are enrolled into the Bachelor of Nursing Science (BSN) curriculum. The information shared in this presentation may be utilized to refine the admission criteria for the BSN majors.

#### Target Audience

The target audience of this presentation includes nursing educators in university setting, nursing education administrators, clinical nursing educators, nurse recruiters, and other educators involved in preparation of BSN level nurses.

#### Abstract

This presentation is the reflection of an ongoing research effort to determine the best predictors for student success in a Bachelor of Science in Nursing (BSN) programs and potential for successful completion of the National Council Licensure Examination for Registered Nurses (NCLEX-RN). Healthcare arena is becoming more complex and it may be a challenging environment for a novice nurse. Students who were successful in their studies will be more apt to perform in the continuously evolving healthcare field. Therefore, it is important to determine student selection criteria that may affect future performance in a nursing program as well as future professional practice.

Preliminary results are suggestive that pre-nursing science GPA and performance on certain science nursing courses may be strong predictors of success in the undergraduate nursing curriculum and may correlate with high passing rates on licensure examination. In spite of the fact that some generalizations can be made about the predictors of success in nursing curriculum and on NCLEX-RN, each nursing program may consider working on refining its own admission criteria because of the possibility of significant variations among students in each program.

### Alcohol and School Violence in High School Students

---

*Francisco Rafael Guzman Facundo, PhD, Mexico*

*Lucio Rodriguez, MSP, Mexico*

*Maria Magdalena Alonso-Castillo, RN, Mexico*

*Karla Selene López García, RN, Mexico*

#### Purpose

The purpose of this presentation is to describe the relationship between alcohol consumption and school violence in high school students

#### Target Audience

The target audience of this presentation are nursing professors, students, and clinical nurses that work in the prevention and health promotion; in order to develop educational programs in alcohol prevention.

#### Abstract

Introduction: The consumption of alcohol is a serious public health problem in Mexico. Segments of the population most vulnerable to experience the negative effects of alcohol are teenagers. A behavior that shows related to alcohol consumption is the violence. The literature review has identified few studies on alcohol use and bullying in high school adolescent.

Objective: was to describe the relationship between alcohol consumption and school violence in high school students

Methods: The design was descriptive correlational random sampling was stratified by group, the sample size was obtained through the n 'Query Advisor 4.0, considering a medium effect for an alternative correlation of .30, the final sample was 255 students in the metropolitan area of Monterrey, México. The instruments used were the Questionnaire Disorders Identification to Alcohol Consumption (AUDIT) and the Scale Violent Conduct in the Classroom (ECDV).

Results and conclusions: A 77.3% of consumed alcohol at some time in life, 62.4% and 40.4% last year and month respectively. More reasonable consumption was found in women (18.5%) than men (10.3%), stressed that the most frequent violent behavior were insulting classmates (physical and verbal aggression) and insults and deceit teachers. Further violence was reported in men than in women. There is a positive relationship between the cups consumed on a typical day with violent behavior ( $r_s = .214$ ,  $p < .001$ ), also according to the score of drinking (AUDIT) a positive relationship with behavior violent ( $r_s = .314$ ,  $p < .001$ ). Finally significant difference was found by school violence for prevalence of alcohol consumption sometime in life ( $U = 3709.5$ ,  $p < .001$ ) in the last year ( $U = 5529.0$ ,  $p < .001$ ) and month ( $U = 5796.0$ ,  $p < .001$ ), emphasizing higher mean and median scores on violence on students who consume alcohol. The results of this study may in the future be the basis for the development of preventive nursing programs on violence and alcohol.

### A Remediation Model for Assessment Testing

---

*Tawna Cooksey-James, PhD, RN, CNE, USA*

*Ali Salman, MD, PhD, ND, RN, Canada*

*Yi-Hui Lee, PhD, MBA, RN, USA*

#### Purpose

The purpose of this presentation is to present a remediation model that can be used for assessment testing that has positive learning outcomes.

#### Target Audience

The target audience for this presentation includes nurse educators in the academic and clinical settings, and administrators who want to improve the learning outcomes for nursing students and registered nurses.

#### Abstract

**Purpose:** Reviewing an exam after it is taken is a valuable learning experience for nursing students and is linked to later exam successes. Developing a remediation plan that focuses on the assessment test can be a valuable learning method with successful testing outcomes that can carry over to NCLEX success. A remediation plan was developed and used by students to improve the outcomes of course and exit assessment testing and later NCLEX.

**Method:** A remediation plan was initiated from intense 1:1 meetings between faculty and graduating nursing students over a six-week period while completing exit assessment testing. This model was used by students and was associated with successful testing outcomes. Adjusting this remediation plan to use with course assessment testing was expected to yield similar outcomes. This remediation model was refined for use with course assessment testing during the fall semesters of 2013 and 2014 at a university setting for baccalaureate nursing students.

**Results:** The remediation model met with varied success dependent on student usage. When student usage increased, this remediation plan was associated with improved assessment testing outcomes.

**Recommendations:** Further examination of factors associated with student usage is needed. As this remediation plan takes 2-4 days to accomplish, it must be given to the student with timeline awareness.

### Assessment of Risk for Pressure Ulcers in Critical Patients: Nursing Practice and Reflections in the Context of Multidisciplinary Communication

---

*Josilene de Melo Buriti Vasconcelos, PhD, RN, RN, Brazil*  
*Maria Helena Larcher Caliri, PhD, RN, Brazil*

#### Purpose

The purpose of this presentation is present the results of research done in Brazil with the aims of Identifying on patient's records documentation of nursing actions related to PU risk assessment; Analyze the perception of members of multidisciplinary health team about risk assessment and the interdisciplinary communication process.

#### Target Audience

Nurses working in hospitals, managers and resarchers

#### Abstract

**INTRODUCTION:** Pressure ulcers (PU) constitute a serious problem, considered as an adverse result of healthcare that compromises patient safety; however, they are preventable in most cases. The incidence of PU stands out as an important indicator in the quality of care in hospitals, where the reference sector for calculation is the intensive care Unit, and its monitoring is the responsibility of nursing. Several risk factors have been reported in the literature because they are associated with the development of PU and, among them, are highlighted the general state of health: diabetes, stroke, multiple sclerosis, cognitive deficit, cardiopulmonary disease, malignancy, hemodynamic instability, peripheral vascular disease, malnutrition and dehydration; premature neonate; history of smoking; history of previous UP; increased length of stay; significant weight loss; extended time on stretchers; medications: sedatives, analgesics and anti-inflammatory drugs; and refusal of care (WOCN, 2010). Depending on the risk factors to which they are exposed, the patient may present greater or lesser vulnerability to the development of PU. However, for the risk assessment the international guidelines recommend the use of risk assessment scales, and highlight the Braden and Norton scales as the ones that have been most studied in the adult population, and are considered valid for PU risk prediction in a variety of healthcare facilities. In these scales, Braden's is the most utilized in Brazil, being applied in most cases by the nurses. The risk determination for developing PU through a specific scale must be associated with the clinical observation to evaluate other related factors that are not addressed in these tools. The results of this evaluation should provide the framework for the development of an individualized care plan, centered on the patient, which presupposes a collaboration process between the patient, family and healthcare professionals (REGISTERED NURSES ASSOCIATION OF ONTARIO, 2011). Based on these, the importance of risk assessment for PU is noted in view of establishing appropriate preventive measures; proper registration of this assessment in medical records it is paramount for facilitating team communication and ensuring appropriate care planning.

**OBJECTIVES:** Identifying on patient's records, documentation of nursing actions related to risk assessment for PU; Analyze the perception of members of multidisciplinary health team about risk assessment for pressure ulcers and the interdisciplinary communication process.

**METHODOLOGY:** Descriptive study, with quantitative and qualitative approach, carried out in the ICU of teaching hospital, in João Pessoa/PB, Brazil after approval by the ethics and Research Committee of the institution. Data collection was done initially by a review of 38 patient's records using a structured tool. After that a focus group was conducted with members of the ICU's multidisciplinary team to discuss the results regarding the risk assessment practice for PU and to identify the difficulties and strategies that could be used to improve this practice, considering it within the interdisciplinary communication process. Four focus groups were conducted, three of them with the nursing staff, and one with representatives from all of the ICU's health professionals. For analysis of the results, the descriptive statistics and content analysis technique proposed by Bardin were used.

**RESULTS:** The risk assessment for developing PU on admission was documented by the nurses in the medical records of 57.9% patients and all used the Braden Scale. Risk assessment was not documented by the nurses in any patient records on the days following admission. Analysis of discussions on the focal group produced a category “practice of pressure ulcer risk assessment” that originated three subcategories. The first subcategory called “risk assessment using the Braden Scale”, revealed that this scale is the risk assessment tool used in intensive care, and nurses are responsible for its implementation and they do the evaluation only at the time of patient’s admission, and that the results obtained are not used for the planning of care but for administrative purposes. The second subcategory “barriers to completion of the risk assessment for development of PU” identified the lack of knowledge to perform the risk assessment for PU with the Braden scale, ignorance of the professional standards for nursing practice and regulation and nurse’s responsibility for patient care. Nurses prioritize bureaucratic activities over the actions of direct care with the patient, overwork and complain of fatigue due to long working hours in different hospitals. The statements from the nurses have reinforced the importance of subsequent evaluations, as it is presented on international PU prevention guidelines. In the third subcategory- “strategies for assessing the risk for development of PU” it was evident that the Braden scale should be used as a standard tool for PU risk assessment and that the nurses could continue to apply it daily and document the obtained scores on patients chart. Also, they emphasized that the results of the total score and sub-scores should be known by the other members of multidisciplinary team and be used to plan the preventive measures. However all professionals should be educated about the importance of the tool and trained on how to use the Braden scale also have enough time during their work to do the assessment and to plan the adequate care. In this context, it is important to highlight that, considering the multiple causes of PU, each member of the multidisciplinary team has a responsibility for its prevention, and needs to observe the standards of their professional practice as well as to document properly their actions. However, despite the studies that show that prevention of PU goes beyond nursing actions, it was perceived that nurses continue to be responsible for its occurrence and, therefore, its prevention. Regarding the second category “documentation of evaluations in the patient records” there are two subcategories. The first – “the importance and practice of documentation”, where the nurses showed the importance of the documentation related to the risk assessment; however, they recognized that there was underreporting of those in the ICU. The nutritionist stressed the importance of nursing records as a source of information to support the nutritional interventions, so once again the importance of the nursing notes as a source of communication tool between team members. Nevertheless, the physician valued not the risk assessment, but the documentation about characteristics of the wound when present, recognizing that there are gaps in the record of the occurrence of these, and that sometimes the nursing professionals do the documentation but the other members of the team do not value the information received. The second subcategory- “strategies for improving the documentation” highlighted the need to design an appropriate form to be included on patient’s chart in order to document the risk assessment and for monitoring the skin conditions during hospitalization.

**CONCLUSION:** The results of this study shows that in order to improve the quality of care in the setting where the study was done it is necessary to use strategies to modify working conditions as well as to educate professionals about how to use the Braden scale do the PU risk assessment and to use the results of evaluation to do the planning of preventive care in a multidisciplinary perspective. It is necessary also to focus on how to increase the documentation of professionals actions on patient’s records as a way to improve team communication and to prevent PU.

### Utilizing Music Therapy as an Intervention to Decrease Anxiety in Respiratory Compromised Patients

---

*Jenifer Bantle-Felt, BSN, RN, USA*  
*Cathy Mielke, MS, CNS, RN, APRN, USA*  
*Sunnimpha Abcejo, MSN, RN, USA*

#### Purpose

The purpose of this research study is to examine the effectiveness of music therapy as an intervention to decrease anxiety in respiratory compromised patients.

#### Target Audience

The target audience of this poster includes nurses and providers caring for patients that suffer from anxiety. Although this research focused on respiratory compromised patients requiring some form of alternative ventilation or oxygenation device, the benefits of music therapy may be generalizable to all hospitalized patients.

#### Abstract

**Purpose-** Many patients in the Respiratory Care Unit (RCU) have suffered respiratory failure and as a result require mechanical ventilation, BiPAP or other oxygen delivery devices. These lifesaving interventions are commonly associated with high levels of anxiety. This anxiety may interfere with ventilator liberation, sleep and participation in therapy. The purpose of this study is to examine the effectiveness of music therapy as an intervention to decrease anxiety in RCU patients.

**Background-** Because uncontrolled anxiety can have devastating results, healthcare providers depend on the use of sedative medications to alleviate the symptoms of anxiety. However, these medications have potential risks and adverse effects that may further complicate and lengthen patients' recovery. In light of the potentially damaging effects of sedative medications, nurses are exploring effective and alternative interventions, such as music to decrease anxiety and promote patient healing.

**Methods-** A quasi-experimental pretest-posttest design was used in this study involving 29 adult RCU patients selected by convenience sampling. The participants received the music therapy session with preferred music selection via headphones for 30 minutes. State anxiety levels were obtained utilizing a 100mm visual analog scale and physiological indicators of anxiety such as blood pressure, heart rate, respiratory rate and oxygen saturation where measured immediately before and after the music therapy intervention. Patient satisfaction was measured with a yes/no survey regarding enjoyment of the music session. Data was analyzed for statistical significance using a two-tailed paired T-test.

**Results-** The study found patients (n=29) who listened to a 30 minute music session showed statistically significant decreases in physiological indicators of anxiety such as systolic blood pressure (p= 0.0003), mean blood pressure (p= 0.04), heart rate (p= 0.0006), and respiratory rate (p= .0001). There were no significant differences with diastolic blood pressure (p= 0.17) and oxygen saturation (p= 0.531) when comparing the pre and post-test assessment. The study concluded a mean 27 point reduction of patient state anxiety levels on a 0-100 visual analog scale as well as 96.6% patient satisfaction rate.

**Conclusion-** The statistically significant values that were measured (systolic and mean blood pressure, respiratory rate and heart rate) after music therapy were indicative of a decrease in the physiological responses to anxiety. As a subjective measurement, a decrease in patient's perception of anxiety as well as satisfaction with the intervention was evident with music therapy. This study found music therapy to be an effective tool to assist in the reduction of anxiety in patients in the RCU and indicate a benefit of implementing music therapy into the daily patient care plan with continued evaluation.

### Stress and Coping Strategies among Undergraduate Nursing Students in University of Calabar, Nigeria

---

*P. E. Samson-Akpan, PhD, MPH, BSc, RN/RM, Registered Nurse Educator, FWACN, Nigeria*

*Mildred E. John, PhD, BSc, RN, RM, RNE, FWACN, Nigeria*

*Olaide Bamidele Edet, BSc, MPH, PhD, RN, RM, RNE, FWACN, Nigeria*

*Regina E. Ella, PhD, MEd, BSc, RN, RM, FWACN, Nigeria*

#### Purpose

the purpose of this presentation is to highlight the stress that undergraduate nursing students experience so that all stakeholders will collaboratively design programmes that will reduce stress, health educate and encourage the students to utilize other healthy coping strategies to enhance health promotion.

#### Target Audience

The target audience of this presentation include Nurse Educators; Clinical Instructors, principals of nursing schools and Head of Departments, Policy Makers, Parents, Students, Nursing and Midwifery Board Members, Nurse Clinicians.

#### Abstract

**Background:** Stress commonly occurs among health workers and medical students including undergraduate nursing students (Amr et al. 2011; Rajesh Kumar, 2011; Shamar & Kaur, 2011; Eswi, Radi & Youssri, 2013). Different kinds of stressors affect students such as the pressure of academics with the responsibility to succeed, not knowing the future outcome and inability to integrate into the system. Students grapple with social, emotional, physical and family problems which may interfere with academic performance (Shamar & Kaur, 2011). A high level of stress can cause physical and mental health problems, reduced self-esteem and result in low academic achievement. Studies within and outside the country have examined stress among medical students, radiography students (Ugwu & Ugwumba, 2013); diploma nursing students (Rajesh Kumar, 2011; Shamar & Kaur, 2011), undergraduate nursing students in Egypt (Amr et al. 2011) but there is no study in Nigeria addressing undergraduate nursing students' stress. Therefore, the main aim of the study was to assess the level of stress and the coping strategies used by the undergraduate nursing students in the University of Calabar, Nigeria.

**Method:** A descriptive study was undertaken in the Department of Nursing Science, University of Calabar, Calabar, Nigeria. The study population consisted of all nursing students in the department. A purposive sampling technique was used to select a sample of 154 students in the third to fifth year of study in the Bachelor of Nursing Science Degree Programme. The instrument for data collection was a Perceived Stress Scale (PSS) developed by Cohen, Kamarek, & Mermelstein, (1983) and Nursing Students Coping Orientation for Problems (NUSCOPE) modified from Adolescent Coping Orientation for Problem Experiences (ACOPE). ACOPE was developed by Patterson and McCubbin (1987). PSS which has 14 items on Likert Scale was modified by the researchers to ensure that it was sensitive to the needs of the students. The items were increased from 14 to 15; and the instrument has a content validity index of 0.87 and a test retest reliability coefficient of 0.78. NUSCOPE content validity index was 0.80 while a test retest reliability of the instrument was 0.82. Data collection was done face to face by the researchers. Data analysis was done using SPSS version 20. Statistical analysis utilised descriptive statistics, Independent t test and One-way analysis of variance. Ethical approval was given by Cross River State Ministry of Health Ethical Committee.

**Results:** The mean age of the respondents was 28.91+7.61; majority were females 136(88.3%); mostly admitted through University Matriculation Examination 88 (57.1%) while 63 (40.9%) were Direct Entry Students. The mean of perceived stress within the last one month was 39.15+7.13 while the respondents 101(65.6%) experienced moderate stress and 52 (33.8%) had high or severe stress. The findings of this study is supported by Amr et al. (2011); Rajesh Kumar (2011); Shamar & Kaur, (2011). The most commonly used coping strategies were: seeking diversion 27.73+4.27; self-reliance 18.05+3.43; avoiding

17.71+3.90 while the least commonly used was being humorous 4.07+1.63. These results are also in consonance with the findings of Rajesh Kumar (2011). However, there was no significant statistical difference in gender with regards to stress ( $p < 0.05$ ). One way analysis of variance showed that there was a significant difference in mode of entry, level of students and the level of total stress ( $p < 0.05$ ).

**Conclusion:** It was concluded that majority of the respondents suffered from stress, therefore, there is need for stakeholders to design programmes that will reduce stress, health educate and encourage the students to utilize other healthy coping strategies to enhance health promotion.

### Reliability and Validity of the Face, Legs, Activity, Cry, Consolability Behavioral Scale in Assessment of Acute Pain in Healthy Newborn Infants

---

*Cynthia Anderson Elverson, PhD, RN, NNP-BC, USA*

#### Purpose

The purpose of this poster presentation is to disseminate the results of a reliability and validity study of the Face, Legs, Activity, Cry, Consolability (FLACC) Behavioral Scale in acute pain assessment in healthy newborn infants.

#### Target Audience

The target audience of this presentation is composed of nurses who care for healthy newborn infants and researchers who study pain.

#### Abstract

The Face, Legs, Activity, Cry, Consolability (FLACC) Behavioral Scale was originally developed and evaluated for post-operative pain assessment in children between two months and seven years of age. Multiple pain assessment scales have been validated for use under a variety of clinical situations for different pediatric age groups. However, nursing care and electronic documentation could be simplified if a single pain assessment scale could be used on pediatric units and the newborn nursery. However, there is limited evidence of reliability and validity for use in healthy newborn infants. The purpose of the study was to evaluate the reliability and validity of the FLACC Behavioral Scale when used in clinical care of healthy newborn infants during the first few days of life.

Four observers were trained to achieve acceptable intra-rater and inter-rater reliability on the FLACC Behavioral Scale and the Neonatal Facial Coding System (NFCS) which is another behavioral pain scale. Direct observations were performed before, during, and after routine heel puncture in 47 healthy newborn infants (370 FLACC Behavioral Scale scores). Audiotaped crying behavior was coded by the researcher who was masked to FLACC and NFCS scores. Inter-rater reliability will be determined with intra-class correlation coefficients, and internal consistency will be determined with KR20 form of Cronbach's alpha. No test-retest or intra-rater reliability will be calculated due to the direct observation aspect of the research study, however this corresponds with clinical use of pain assessments. Construct validity will be determined by comparison of scores before, during, and after heel puncture, with the expectation that scores will be highest during heel puncture. In addition, construct validity will be determined with correlation between FLACC and NFCS scores at each observation and the correlation between percent crying and mean FLACC score during the entire heel puncture. The range of scores reported during acute pain (heel puncture) will be evaluated to determine whether the FLACC Behavioral Scale has ceiling or floor effects that would limit utility in measuring pain.

The results of this study will provide evidence of reliability and validity of the FLACC Behavioral Scale for acute pain assessment in healthy newborn infants. Nurses can use this evidence when making decisions about a choice of acute pain assessment tool to use in clinical practice and research.

### Exam Integrity: The Webcam Effect

---

*Irene Salinas, MSN, RN, USA*

*Laura L. Opton, DHSc, RN, CNE, USA*

#### Purpose

The purpose of this presentation is to describe a retrospective study looking at the impact of webcam usage as a component of remote proctoring during online quizzes taken at home.

#### Target Audience

The target audience of this presentation is undergraduate and graduate nursing faculty.

#### Abstract

Cheating is a concern in any academic discipline, and especially so in one leading to licensure and impacting patient safety. As recent studies show an escalation in students declaring they have cheated, faculty have been increasingly focused on ways to deter this behavior. The upsurge in availability of online education has only increased concerns about cheating.

Due to issues surrounding academic integrity in online programs, a descriptive correlational design study was implemented in an online pharmacology course required for accelerated second degree BSN students. The purpose of the study was to determine if the utilization of a webcam during on demand proctoring for online quizzes would impact student scores and time to test. The objectives of the study were to 1) compare student scores on proctored versus non-proctored quizzes and 2) compare time to test on proctored versus non-proctored quizzes.

To implement the study, the researchers selected Software Secure's remote proctoring system, which is used by over 300 institutions of higher education across the nation. The service selected included on-demand web proctoring, in which students were recorded using a webcam during the online quizzes. The recording was reviewed by Software Secure, and reports of any violations of academic integrity or suspicious behavior were provided to the course facilitator. Faculty were also able to personally view each student's recording.

One hundred forty-six students participated in the study over two semesters at six different sites. The results revealed a significant difference in the scores and time to test in proctored versus non-proctored quizzes when using a webcam. A serendipitous revelation during the study included identification of advantages and disadvantages of using a webcam to proctor online quizzes. The primary disadvantage to faculty was the time required to set up the proctoring service and align it with the school's online learning platform; whereas, the primary disadvantage to students was related to technology and computer requirements. The major advantage to faculty was exam security; while, the key advantage to students was an even playing field.

### Student Learning Experiences in a RN-BSN Capstone Course

---

*Cheryle G. Levitt, PhD, MSN, BSN, RN, USA*

*Katherine E. Quartuccio, DNP, MSN/ED, BSN, RN, USA*

*Elizabeth L. Pratt, MS, BS, AS, RN, RNC-OB, CNE, USA*

#### Purpose

The purpose of this presentation is to share results from student focus groups that discussed with faculty their senior capstone course learning experience in an online RN-BSN program. Students reported, shared, and reflected on their experience in the capstone course, and provided suggestions that will be integrated into program assessment.

#### Target Audience

The target audience of this presentation are nursing educators and clinical preceptors who work with baccalaureate level students. The capstone course unites didactic and clinical components of nursing education, and this study can promote a deeper understanding and appreciation of the student's learning experience.

#### Abstract

**Purpose and Background:** Nursing capstone courses provide an opportunity for senior students to integrate their liberal education with nursing knowledge in a meaningful educational experience that results in higher level understanding, expanded knowledge base and clinical skills, and a sense of growth and accomplishment (Rebeschi & Aronson, 2009). In anticipation of graduation, the capstone course enables a one-on-one precepted experience that can help the student transition into the graduate nursing role, practice leadership activities, and provides program and student assessment and evaluation opportunities.

In an online RN-BSN program in upstate New York, the capstone course is a comprehensive, accelerated, and intensive seven-week class and clinical experience that completes the nursing course sequence. It builds upon prior learning, incorporates critical thinking and reasoning skills, reflection, and fosters independence in practice as students develop their own individual projects in healthcare settings for a 45-hour guided practicum, conducted over seven weeks. Facilitated by a clinical preceptor and course faculty, students create learning objectives, activities, and plan evidence of their accomplishments by designing an individual learning contract to map out the experience. Weekly, students assess how they met their objectives, evaluate outcomes, have guided reflection, and submit evidence of work products. Student presentations and a final analysis of their learning contract completion, using audio screen capture, culminates the course.

While student learning outcomes are achieved, students often approach the capstone with concern and anxiety over the unknown (Kerr, Hemmings, & Kay, 2013). Data from course evaluations, student-faculty communications, and anecdotal reporting indicate student's concern and stress when planning their individual practicum projects and feelings of being overwhelmed by the intensity and expectations of the course. Faculty engage individually with students and provide support, but there remains perceived student stress.

In order to provide a more positive learning experience, this study is collecting data on student's experiences, perspectives, reflections, and suggestions for how the RN-BSN capstone course experience can be improved. The data will become part of the annual program assessment process and will have direct impact on course revisions and improvements.

**Methods:** The study design is a retrospective qualitative, using content analysis. Following informed consent, student demographic data are collected by e-survey. Focus groups of 3-5 students, who have successfully completed the capstone course, are facilitated by the co-investigator, who are faculty

currently teaching the course. The anticipated sample is 9-20 students, until data saturation is reached. The groups meet for one hour, via a virtual web conferencing platform, using audio and video components, and interviews are recorded for subsequent analysis of transcripts. Using a semi-structured interview guide, topics include student's experiences in the procedures, course assignments, methods, and procedures of the course, and ideas and suggestions for possible course revisions.

**Results:** The study is currently in progress, and will continue until data saturation is reached. Data will be analyzed by the co-investigators, who will independently review and analyze transcripts from the focus group sessions. Tentative categories, using step-by-step deduction, will be developed. Categories will be coded and revised until they can be reduced to main categories, using formative and summative checks for reliability. Data verification will occur with students, as needed. Finally, themes will emerge that describe the student experience. Data will include student feedback on experiences with specific assignments, course procedures upon entering and throughout the course, and concrete suggestions for course improvements, both in content, course delivery methods, and faculty and preceptor facilitation. Results will be integrated into the annual program assessment, and will contribute directly to course revisions.

**Conclusions:** The capstone experience enables students to practice independently (Jukkala, Greenwood, Motes, & Block, 2013), yet there is concern over student feedback on their anxiety and unfamiliarity with the independent nature of project planning. Consistent with outcomes for student success and satisfaction in their accomplishments, this study can help to provide insights into how to improve the course experience and contribute to student success. Incorporating student's feedback, experiences, and perspectives into program assessment provides a richer and more comprehensive foundation upon which to improve the teaching and learning process, positively impacting the student's practicum experience and transition to professional practice.

### Implementing Interprofessional Education: How Appropriate Is the Learning Experience for Nursing Students?

---

*Antoinette Du Preez, PhD, MCur, BSocSc (Nsg) (Hons), RN, RM, AdM, NE, NA, South Africa*  
*Ronel Pretorius, PhD, RN, RM, South Africa*  
*Belinda Scrooby, PhD, MCur, BCur, RN, South Africa*

#### Purpose

The purpose of this presentation is to report on the appropriateness of Interprofessional Education learning experience in developing interprofessional skills among a nursing population in a non-medical school after conducting an interprofessional collaborator assessment rubric

#### Target Audience

Educators, leaders in health care interested in understanding the appropriateness of IPE learning experience in developing interprofessional skills among a nursing population in a non-medical school.

#### Abstract

**Background:** Interprofessional education (IPE) is characterised by joining together two or more professions in an attempt to create a learning opportunity and cultivate collaborative practice among the students of the different professions. With this it is expected that students will exhibit more skills in the execution of healthcare tasks, be able to function more effectively in a team and ultimately contribute to improved health outcomes for patients through quality care. IPE is traditionally reported on from a medical school perspective. The context of this study is that of a non-medical institution and includes the training of students in seven different disciplines.

**Purpose:** In this study the researchers conducted an interprofessional collaborator assessment rubric in order to report on the appropriateness of IPE learning experience in developing interprofessional skills among a nursing population in a non-medical school.

**Target audience:** Educators, leaders in health care interested in understanding the appropriateness of IPE learning experience in developing interprofessional skills among a nursing population in a non-medical school.

**Target Group(s):** Academics

**Keywords:** interprofessional education, nursing students

### Student DIY Grading of Online DQs: An Adult Learning Approach

---

*Laura Marie Schwarz, DNP, RN, CNE, USA*

*Nancyruth Leibold, EdD, MSN, RN, PHN, LSN, CNE, USA*

#### Purpose

to describe the theory behind, methodology for and results of a multisite study that sought to determine learner perspectives of discussion self-grading in the online environment.

#### Target Audience

nursing educators who teach in the online environment.

#### Abstract

Faculty who teach online courses often find that it is difficult and time consuming to both accurately and constructively grade every discussion for every student in the online course room. Furthermore, students sometimes do not apply the instructions or grading rubric for their discussions. Students also may not read instructor feedback or may not use the feedback to remediate. Student self-grading of online discussions with the employment of a detailed grading rubric may be a more accurate, effective, efficient and instructionally sound means of grading discussions. It empowers students and is learner-focused rather than instructor focused. Utilizing rubrics for self-assessment aids learners in both their ability to self-assess and improve their performance (Panadero & Jonsson, 2013). Discussion self-grading employs andragogy (the theory of how adults learn and which is in contrast to pedagogy, the theory of how children learn), reflection and introspection. The theory of Andragogy substantiates engaging adult learners in self-assessments such as online discussion self-grading. In his classic work *Andragogy in Action* (1984), Knowles' adult learning premise postulates that adult learners 1) are self-motivated and self-directed; 2) want to have control over their own learning; 3) feel responsible for their own learning; 4) are internally motivated; 5) need to know why learning is important to them; and 6) learn from each other. Empowering adult learners to be in command of grading their discussion participation supports andragogy in that it allows the student to autonomously take control of their own learning through use of self-motivation, self-direction, being responsible for their own learning, and use of internal motivation. Self-grading takes the focus off the instructor telling the student what they need to do, and instead places that focus on the student. In addition to incorporating andragogy, discussion self-grading uses self-reflection, a conduit for adult learners to reflect on what they have learned, reflect on practice, and provides introspection, or observing one's own thoughts and feelings (Bonnel, 2012). Involving adult learners in evaluation of their performance serves to facilitate internal motivation and allows them to have control over their learning. Is however student-self-grading of online discussions accurate? What are students' perceptions of grading their own discussions? This presentation will discuss the theory and benefits of self-grading for both online students and faculty, articulate the methodology for implementing it, and discuss the findings from a multisite study that garnered perceptions of students who graded their own online discussions.

### The Neurobehavioral Effects of Consuming Dietary Tryptophan

---

*Glenda Lindseth, PhD, RN, FADA, FAAN, USA*  
*Thomas Petros, PhD, USA*

#### Purpose

The purpose of this study is to examine the effects of dietary tryptophan on sleep, depression, and mood in a population of depressed participants.

#### Target Audience

Psychiatric nurses, researchers, and individuals with a special interest in nutrition.

#### Abstract

Tryptophan, an essential amino acid, serves as a precursor to serotonin synthesis with the rate of synthesis dependent on tryptophan concentrations in the brain (Fernstrom, 2013). Because serotonin is involved in the regulation of mood, low brain serotonin levels may contribute to increased depression. However, tryptophan is obtained through the diet because it cannot be synthesized by the body (Soh & Walter, 2011). Therefore, some have questioned if dietary consumption of tryptophan can affect behavior in depressed, vulnerable individuals. Sleep has also been implicated to have a relationship with tryptophan which may in turn have an effect on levels of depression. Therefore, the purpose of this study is to examine the effects of dietary tryptophan on sleep, depression, and mood in a population of depressed participants.

Based on Pender's Health Promotion Model and using a randomized crossover study design, 36 participants with depression will be examined for differences in sleep, depression, and mood after consuming a high tryptophan diet, a low tryptophan diet and a control diet for a week each. The order of the sessions will be counterbalanced across the control and dietary treatment groups. A two-week washout period is planned between the diets. Study measures will include Demographics, weighed Tryptophan food Intakes, the Positive and Negative Affect Schedule, Zung's Self-Rating Depression Scale, the Sternberg Item Recognition Test, the Actiwatch Sleep Watch, and Serotonin and Cortisol Laboratory tests. A repeated measures ANOVA will be used to calculate differences between sleep, depression, and mood scores resulting from the consumption of the two tryptophan diets and the control diet. Further post hoc analysis of significant results will follow.

Benefits of this study include determining whether ingestion of functional foods, such as high tryptophan foods, may provide significant mental and physiologic benefits to vulnerable depressed individuals. The impact of these results may have a positive effect for the general population as well.

### Intent, Behavioral Control and Drug Use in Adolescents

---

*Jesica Guadalupe Ahumada, MSN, RN, Mexico*

#### Purpose

The purpose of this presentation is to present the results of the research related to drug use and adolescents

#### Target Audience

The target audience for this presentation are the professional community area, students, academics and responsible for promoting healthy behaviors

#### Abstract

**INTRODUCTION:** The drug phenomenon has become one of the issues of greatest concern in Mexico for its sustained growth and reported in the last three national household surveys (2002, 2008 and 2011) in individuals of all ages, especially teenagers. The health consequences of drug abuse are increasingly complex and severe. The inability to withstand adolescent drug use when faced with social pressures that facilitate consumption is called behavioral control, a concept that has proven to be a predictor of the behavior. A theory that helps in the understanding of health promoting behaviors and / or protective avoidance and risk limitation is the theory of Nola J. Pender.

**OBJECTIVES:** To verify the relationship of behavioral control over drug use among adolescents in school, under the hypothesis: Teenagers who have consumed any drugs show significantly higher scores on behavioral control than those who have not consumed.

**METHODOLOGY:** descriptive correlational study in 443 adolescents in the metropolitan area of Monterrey, NL The Adolescent Survey instrument for Drug Control and Behavioral applied.

**RESULTS AND CONCLUSIONS:** The results showed that 7.2% (IC95%; 4.8-9.6) of adolescents reported having used drugs at least once in life, emphasizing like most consumed drug marijuana (6.1% [IC95%:3.8-8.3]). The situations perceived as facilitators of consumption were believe to know the effects of drugs, drug very easily, having money and attend events where drugs are consumed. Test Mann-Whitney ( $U=1482.0$ ,  $p<.001$ ) showed that adolescents who have used drugs have significantly higher scores (Mean = 22.96, Mdn = 15.54), low behavioral control that adolescents who have not been used drugs (Mean = 2.47, Mdn = 1.00). Behavioral control was intended effect on drug use ( $R^2= 34\%$ ) and explains their effect on drug use once in life ( $R^2=27\%$ ).

### Denial or Decay?: An Oral Health Educational Program for Caregivers of Preschool Children

---

Audrey P. Miller, PhD, MSN Ed, ARNP, PPCNP-BC, USA  
Gabiella M. Riccio, BSN, RN, USA

#### Purpose

To examine the effects of an oral health educational program on knowledge and behavior-specific cognitions and affect in caregivers of children ages two to five years-old.

#### Target Audience

Pediatric Nurses, Pediatricians, Educators, and Researchers in preventive health.

#### Abstract

**Background:** Oral health care is the primary preventive method of tooth decay (caries or cavities) and infection in children below the age of five. Nonetheless, many children still suffer with multiple infectious tooth decay, unnecessary sedative extractions, and tooth loss; resulting in pain, nutritional concerns, and speech delays. The gap in the literature as it relates to caregiver knowledge towards oral health for their young children and the effects that preventive oral health care can contribute to a child's healthy lifestyle are deficient.

**Aims:** To examine the effects of an oral health educational program on knowledge and behavior-specific cognitions and affect in caregivers of children ages two to five years-old.

**Methods:** Descriptive quasi-experimental study utilizing a pre-test post-test method, with a convenience sample of 425 Head Start (HS) caregivers from seven program sites in South Florida. The HS enrolled, English speaking family, attended one of 18 oral health educational programs. Research questions addressed the relationship between the oral health educational program and prior related behavior, personal factors, behavior-specific cognitions and affect, knowledge, and intent. Caregivers completed the demographic survey and oral health behavior questionnaire, a knowledge pre-test, then viewed a 16-minute video designed by Colgate®, and completed another knowledge post-test.

**Results:** There was an overall significant effect on caregivers' prior related behaviors,  $r = .43$ ,  $p$  (two-tailed)  $< .01$ ; behavior-specific cognitions and affect,  $r = .43$ ,  $p$  (two-tailed)  $< .01$ ; intention to provide oral health care for their children,  $r = .27$ ,  $p$  (two-tailed)  $< .01$ ; and post-test for knowledge of oral health care ( $M = 60.57$ ,  $SE = .30$ ) compared to pre-test for knowledge ( $M = 59.03$ ,  $SE = .26$ ),  $t(399) = -6.35$ ,  $p < .01$ ,  $r = .30$ ).

**Conclusions:** Educational program have a positive impact on caregivers to increase knowledge and intent to perform preventive oral health-promoting behaviors in this underserved population. Nursing practice will implement educational programs for caregivers and the opportunity to affect governmental policy that supports oral health care services for young children, as indicated by Healthy People 2020.

### Topical Therapy for Chronic Wounds: Contributions of a Distance Learning Module for the Knowledge of Nursing Students

---

*Soraia Assad Nasbine Rabeh, PhD, MSN, RN, Brazil*

*Paula Cristina Nogueira, PhD, MSN, RN, Brazil*

*Margareth Yuri Miyazaki, MSN, RN, Brazil*

*Márcia Beatriz Berzoti Gonçalves, MSN, RN, Brazil*

#### Purpose

To present the results of a study done in Brazil related to assessment of the performance of nursing students in a knowledge test before and after their participation in a distance learning module on topical therapy for chronic wounds using a Virtual Learning Environment (VLE Moodle).

#### Target Audience

Nurses from all settings of practice, nursing students as well as researchers.

#### Abstract

**BACKGROUND:** Assistance for people with chronic wounds is directly related to nursing professionals and, in recent decades, it has been a challenge, due to technological advances and increased knowledge on the subject, that requires constant updating to enable effective action and safety. To meet the need for this new professional profile, many higher education institutions are implementing changes by making use of teaching and learning with active methods, which include the Internet as a tool for information access and sharing of educational resources<sup>(1)</sup>.

**OBJECTIVES:** This study aimed to assess the performance of nursing students in a knowledge test before and after their participation in a distance learning module on topical therapy for chronic wounds using a Virtual Learning Environment (VLE Moodle).

**METHODS:** This is a quasi-experimental (pre and post-test) study with a quantitative analysis. The study's participants were 37 students from the last year of a Nursing Undergraduate Course, in a public university in Ribeirao Preto, Brazil. The study was conducted in three phases: application of the pre-test, implementation of the intervention in the VLE Moodle and application of the Post-test. The questions used in the pre and post-test were based on the WOCN (Wound, Ostomy and Continence Nursing Society)<sup>(2,3)</sup> and NPUAP (National Pressure Ulcer Advisory Panel)<sup>(5)</sup> guidelines. The implementation of the intervention was done as a course entitled "Topical therapy for chronic wounds" by VLE Moodle. Data were analyzed by comparing the performances obtained by the students in the pre and post-test. The Statistical Package for Social Sciences (SPSS) version 18.0 was used for data analysis. The Student t test was used to compare the averages of the pre and post-test. The study was submitted to and approved by an Ethics Research Committee. Data were collected after the study's objectives were clarified and the participants consented by signing free and informed consent forms.

**RESULTS:** Concerning the participants, 95% of them were female with mean age of 23.16 years. There was a statistically significant increase in the mean number of correct answers obtained in the knowledge test after the intervention in all domains and items assessed in the test. In the performance test of knowledge about the domain Systemic Evaluation of Patients (etiology and pathophysiology of wound, skin assessment and risk factors), participants showed an increase on their score from 65% to 79%, on the pre for the post-test. As for items related to Topical Therapy for Chronic Wounds (wound assessment and decision on topical therapy), the average percentage of total correct answers was 52% in the pre-test, and 68% at post-test.

**CONCLUSIONS:** The use of the VLE Moodle may constitute a support strategy to strengthen and broaden the access of nursing undergraduates to knowledge on relevant themes for the nursing care.

### Exploring Effects of a Cultural Immersion Experience on Health Care Students Cultural Competence

---

*Stacie Olson, DNP, APRN, PMHNP-BC, RN, NP, USA*  
*Joni Tweeten, RN, MS, MPH, RN APHN-BC, USA*

#### Purpose

The purpose of this presentation is to explore the impact of an international cultural immersion experience on health care student's cultural competency. Outcomes hope to support the immersion experience being a course in the curriculum with an interdisciplinary approach to health care.

#### Target Audience

The target audience of this presentation is nursing educators interested in creative ways to promote cultural competency for health care students in their curriculum.

#### Abstract

**Problem:** Health care providers are expected to be prepared to provide culturally sensitive care to the US's increasingly diverse population. Baccalaureate education can be full of essential content which can limit the available culturally diverse experiences for students. Not all students at this university have clinical experiences that expose them to various diverse cultures, especially living in the Midwest, where there are limitations to access diverse populations. There are many studies that support immersion experiences in international countries to prepare health care students to increase cultural competence. Many studies demonstrate health care students developing a change in knowledge, values, communication skills, and development of a more culturally focused health care practice. The purpose of this study is to explore the impact of an international cultural immersion experience on health care student's cultural competency.

**Methodology:** Students enrolled in undergraduate and graduate social work or nursing courses at the University Of North Dakota will be invited to voluntarily participate in the study. Students will be asked to consent to participate prior to the immersion experience in Guatemala over spring break week. An email with a link to the consent on an online survey tool in which each student can click 'agree' to consent to proceed with the qualitative survey questions.

Qualitative question data will be collected about student's perceptions of cultural competency and knowledge. Qualitative data will be collected pre-immersion, 1-2 weeks post immersion, and about 2-3 months post immersion experience. The qualitative questions will take about 20-30 minutes to complete.

Students who have consented to participate in this study will also be asked to complete the paper/pencil Inventory for assessing the process of cultural competence among healthcare professionals-student version (IAPCC-SV) survey pre-immersion, 1-2 weeks post immersion, and about 2-3 months post immersion experience. The IAPCC-SV survey tool consists of 20 4-point Likert-type scale survey questions which take 10-15 minutes to complete.

Students will be provided a journal from the researchers prior to going on the immersion experience and encouraged to document their personal reflections about the culture and their experiences while in the immersion experience each day. With permission from students, journals will be reviewed upon return from the immersion experience for common themes in cultural knowledge and competency.

**Analysis:** Quantitative data will be reported in aggregate form using descriptive correlational non-parametric analysis. Qualitative data will be used illustratively only. Researchers will analyze qualitative survey questions and journals to construct comparison for common themes.

**Implications for Practice:** It is important for educators to spend time teaching about cultural competence in the health care fields. Health care providers are expected to be prepared to provide culturally sensitive care to the U.S.'s increasingly diverse population in various health care settings. With limited access to diverse populations for experiences, it is important for educators to look for alternative ways to provide cultural encounters for students to learn about the importance of providing cultural competent care. International immersion experiences can support learning about cultural competency and be a regular part of a curriculum for students in the health care fields.

### Sexual Sensation Seeking and Situational Influences among Men Who Have Sex with Men from Northern Mexico: A Pilot Study

---

Carolina Valdez Montero, MCE, RN, Mexico

#### Purpose

determine the relationship of sexual sensation seeking and situational influences (places to meet potential sex partners) among men who have sex with men (MSM).

#### Target Audience

group interested in sexual identities and HIV

#### Abstract

**Introduction:** Sexually Transmitted Infections (STIs) such as the Human Immunodeficiency Virus (HIV) and Acquired Immune Deficiency Syndrome (AIDS) are considered one of the most devastating epidemics in recent decades and has caused many problems of social, economic and public health. It is estimated that over 34 million people worldwide living with HIV still primarily affected marginalized populations and those excluded due to their sexual practices, which contributes to the epidemic from spreading (World Health Organization [WHO], 2012). The National Center for Prevention and Control of HIV/AIDS (Censida, 2009) notes that in Mexico there are currently 220,000 people living with HIV, of which 60% of those affected are men who have sex with men and women. Men who have sex with men (MSM) represent the largest group of people living with HIV in Mexico. There are several factors that may be causing the infection continue. The sexual sensation seeking is a psychological factor associated with risky sexual practices. Some authors suggest that MSM who seek sexual feelings are associated with drug and/or alcohol consumption, more sexual activity and receptive anal sex without a condom (Matarelli, 2013). However it is important to consider situational influences (places) where MSM can find potential sex partners. Therefore the purpose of this paper is to determine the relationship of sexual sensation seeking and situational influences (places to meet potential sex partners) among men who have sex with men (MSM).

**Methods:** A cross methodology was used, including 30 MSM over 18 years in the metropolitan area of Monterrey, Nuevo Leon, Mexico. The average age of participants was 26 years with an age range of 20-40. Data were collected using the instrument of Sexual Sensation Seeking Scale and Situational Influences on MSM Scale. The instruments were applied through the SurveyMonkey website for online surveys. For the selection of participants used Respondent Driven Sampling (RDS).

**Findings:** Also, 42.5% of participants reported identifying as gay and this may be due to their economic status and 32.5% identified themselves as homosexual, 15% as bisexual an equally relevant data. Only 2.5% identified themselves as transgender, transvestite and MSM, the latter may not be identified as such because it is a relatively new term and is used to encompass in the epidemiology of HIV. In relation to STIs 14.3% reported having or having had gonorrhea. The study showed that sexual sensation seeking had positively related to situational influences (places to meet potential sex partners); bars/nightclubs ( $r = .604, p < .01$ ), porn movies ( $r = .446, p < .05$ ), internet cabins ( $r = .410, p < .05$ ), restroom ( $r = .512, p < .01$ ) and sex parties ( $r = .430, p < .05$ ).

**Conclusions:** The results of this pilot study suggest increasing the number of participants. Also, the relationship between the sexual sensation seeking and places to meet potential sex partners allow us to suggest short interventions in those sites frequency of MSM. These results highlights the need for further research in this population considered vulnerable.

## SCI PST 2 - Scientific Poster Session 2

### Being There: Undergraduate Nursing Students' Perceptions of Nursing Presence

*Carol Toliuszis Kostovich, PhD, RN, USA*  
*Jeanne Van Denack, MSN, RN, USA*

#### Purpose

The purpose of this study is to explore undergraduate nursing students' perceptions of nursing presence during a medical-surgical clinical rotation.

#### Target Audience

The target audience of this presentation is nurse educators teaching in a school of nursing.

#### Abstract

**Purpose:** The purpose of this study was to explore undergraduate nursing students' perceptions of nursing presence during a medical-surgical clinical rotation.

**Significance/Rationale:** Nursing presence is defined as the physical and emotional availability of the registered nurse to the patient. Technological advancements coupled with an emerging nursing workforce comprised of a technology-dependent millennial generation could potentially threaten the emotional connection between nurse and patient. Few studies have explored nursing presence from a student perspective.

**Methods and Analysis:** The phenomenon of nursing presence was presented during an undergraduate junior level medical-surgical nursing theory course. Thirty-two students enrolled in this course participated in the study. On the last day of the semester, students responded in writing to 4 open-ended questions asking about their observations of nursing presence during their clinical rotation. Data were coded by two nurse researchers, first separately, then collaboratively. The 12 items from the Presence of Nursing Scale-RN "Being With" subscale, representing the emotional connection between nurse and patient, served as the codebook to guide the analysis.

**Results:** Narrative comments by students represented all 12 items on the "Being With" subscale. Some elements of "being with" the patient were described frequently, while other elements were expressed less frequently.

**Conclusions:** Junior-level undergraduate nursing students are able to recognize and recount their experiences of nursing presence during a medical-surgical clinical rotation.

**Implications:** Teaching undergraduate nursing students to recognize nursing presence can serve as the foundation for teaching patient-centered nursing care delivery. Other methodologies for introducing this phenomenon to students, including simulation, should be explored.

### Knowledge of Chronic Renal Disease in Adults with Hemodialysis

---

*Juana Mercedes Gutierrez Valverde, DSN, MSN, RN, Mexico*

*Deycer Gomez Hernandez, MSN, BN, RN, Mexico*

*Jose Alfredo Pimentel Jaimes, MSN, BN, RN, Mexico*

*Milton Carlos Guevara-Valtier, MSN, BN, RN, Mexico*

*Esther C. Gallegos, PhD, FAAN, Mexico*

#### Purpose

1) The purpose of this presentation is to present a general panorama of knowledge of people with hemodialysis on basic aspects of Chronic renal failure. 2) The purpose of this presentation is to discuss the similarities with others.

#### Target Audience

The target audience of this presentation are clinical nurses, students and professors.

#### Abstract

**Introduction:** Chronic renal failure (CRF) is a complex disease in which life is compromised and is associated with the quality of this, hospitalizations and high mortality. Globally there is an alarming and progressive increase in the number of patients with this disease, 90% of people who have it do not know. In Mexico an estimated incidence of patients with CRF 377 cases per million inhabitants. By 2025 a significant increase in the IRC, in states like Chiapas, Quintana Roo and Guerrero, this increase is mainly due to unfavorable conditions of access to treatment of diabetes and hypertension are the main cause diseases IRC projects. In Mexico for dialysis treatment is a health problem that has significant social and economic implications, 72% of patients with CKD are on the agenda of peritoneal dialysis (PD); unlike other countries like Japan and USA where less than 4% of patients are in DP and the rest on hemodialysis. About 80% of patient treatment is covered by the Mexican Social Security Institute with an annual growth of 11%; however, it is important to mention that there per patient receiving treatment surrogates one dies without access to this. In the state of Chiapas 542 deaths were registered by IRC, of these 273 were females, however, does not exist in the state an official register of patients in treatment hemodialysis

**Objective:** To know the different types of knowledge about the chronic renal failure in patients in hemodialysis.

**Methodolgy:** Descriptive correlational study was conducted in n= 54 patients with hemodialysis in a hospital

**Results:** The average of age was M = 55.02 years (SD = 13.16; 24-38), 51.9% were male. The marital status 66.7% (36) reported having a partner and others without a partner. For the years of formal education the average was M = 9.39 years (SD = 5.36; 0-19) found that 31.6% attended a technical or professional career, 25.9% (14) to the sixth grade, and the rest secondary level. The average time of hemodialysis participants reported having at the time of the interview was M = 3.85 years (SD = 3.07; 1-12). The knowledge that participants had about their disease was finding that 46% of participants had low general knowledge of the disease. Also, the knowledge of the participants was evaluated in three dimensions: knowledge dimension of Chronic Renal Failure, Knowledge and Knowledge Treatment of complications. It was noted that in the first two dimensions participants have low knowledge, while in the third dimension participants reported having an average knowledge of complications related to the disease

## SCI PST 2 - Scientific Poster Session 2

### Scoping Review: Medication Adherence in Type 2 Diabetes

---

*Cheryl Moseley Conway, MSN, RN-BC, NE-BC, USA*

#### Purpose

The purpose of this presentation is to share information from a scoping review on medication adherence in type 2 diabetes using the Social Ecological Model.

#### Target Audience

The target audience of this presentation is educators, nurses, and clinicians.

#### Abstract

In 2010, the most recent years for which national prevalence data are available, diabetes affects 25.8 million people, approximately 8.3% of the U.S. population (CDC, 2011). Logden, Lamb, & Carroll (2010) indicate that in 2007-2008 approximately 30% of the U.S. population is obese which has a correlation to diabetes and other chronic health conditions. There are 18.8 million people diagnosed with diabetes and approximately 7.0 million people undiagnosed (CDC, 2011). More than 90% of those diabetes cases are type 2 or adult onset diabetes (Seppa, 2011). In 2010, there were an estimated 688,000 North Carolina adult residents with diabetes (CDC, 2010). The highest prevalence of diabetes exists in the South, western Appalachians, and costal Carolinas (CDC, 2009). Diabetes lowers life expectancy by up to 15 years, increases the risk of heart disease, and is the leading cause of kidney failure, lower limb amputation, and adult-onset blindness (CDC, 2008). In 2007, the estimated financial cost of diabetes in the United States.

The Social Ecological Model (SEM) provides a framework for multilevel factors affecting health behaviors and impacting health behavior change, as well as a theoretical framework for the interactions between persons and groups (Stokol, 1995). Over the past twenty years, there has been an increasing focus upon disease prevention and changing individual health behaviors to avoid chronic diseases (McLeroy et al., 1988). Health promotion programs have led to community-driven efforts to promote fitness, health eating habits, and non-smoking campaigns (McLeroy et al., 1988). The Social Ecological Model (SEM) conceptual framework is determined by the following: intrapersonal factors; interpersonal processes; institutional factors; community factors; and, public policy (McLeroy, et al., 1988). The Conceptual Model – Social Ecological Model (SEM): Medication adherence and type 2 diabetes, as described by SEM will be included in the poster, if accepted.

**Results of Literature Synthesis:** The SEM for health promotion addresses the individual and social environmental factors for interventions (McLeroy, Bibeau, Steckler, & Glanz, 1998). SEM is defined by: intrapersonal factors, interpersonal processes, institutional factors, community factors, and public policy. Medication adherence and type 2 diabetes primarily had interventions within the intrapersonal and interpersonal domains, as discussed in the following sections.

**Intrapersonal factors:** SEM includes “intrapersonal factors include the individual’s characteristics such as, knowledge, attitudes, self-concept, skills, and etcetera” (McLeroy et al., 1998, p. 355). Additionally, developmental history of the individual is included (McLeroy et al., 1998).

Bains & Egede (2011) conducted a survey of one hundred twenty-five adults with diabetes from a primary care clinic to complete a validated survey assessing health literacy, diabetes knowledge, and self-care. The authors reported that health literacy was independently associated with diabetes knowledge but not associated with glycemic control (Bains & Egede (2011). The authors also found that health literacy did not have a direct correlation to glycemic control, but suggest there is possibly an influence through diabetes knowledge (Bains & Egede, 2011). Cohen et al. (2010) found a strong association between medication adherence, as measured by medication possession ratio, for oral glycemic lowering agents

(OGLA) and A1C control among insured diabetes patients with poorly controlled A1C, especially those taking two or more OGLA.

Hernandez-Tejada et al. (2012) found an association between diabetes empowerment and increased medication adherence, increased knowledge, and effective self-care behaviors for participants with type 2 diabetes. Hill-Briggs, et al. (2007) found a correlation among higher Diabetes-related Problem Solving (DPSS) scores being related to better medication adherence and more frequent self-monitoring of blood glucose. DPSS scores above the mean were also associated with better A1C levels (Hill-Briggs et al. 2007).

In their study of diabetes health beliefs among the Lumbee Indians living in rural Southeastern North Carolina, Jacobs, Kemppanen, Taylor, & Hadsell (2014) found that study participants did not hold strong beliefs about their ability to understand the nature of diabetes as a chronic disease (Jacobs, Kemppanen, Taylor, & Hadsell, 2014). The authors also discussed participant's beliefs about ability to control symptoms and lower confidence in efficacy of treatments (Jacobs, Kemppanen, Taylor, & Hadsell, 2014). Parchman, Zeber, & Palmer (2010) conducted an observational study and found that participatory decision making during primary care encounters by patients with type 2 diabetes resulted in improvements in A1C levels and improved medication adherence. Piette, Heisler, Harand, & Juip (2010) sought to understand the differences between African American and White participants in diabetes patient's medication related beliefs and adherence problems due to cost concerns. The authors found that significant number of diabetes patients endorsed negative beliefs about their medications including: doctors would prescribe fewer medications if they spent more time with patients; most prescriptions were addictive; and negative beliefs were consistently more common among African-American than White patients (Piette, Heisler, Harand, & Juip, 2010).

Powell, Hill, & Clancy (2007) used the Rapid Estimate of Adult Literacy in Medicine (REALM) literacy instrument prior to completing the Diabetes Health Belief Model (DHBM) scale and Diabetes Knowledge Test (DKT) to 68 eligible participants. The participants were recruited from a general internal medicine clinic that cared for low-income, medically underserved population (Powell, Hill, & Clancy, 2007). There was no significant association between the DHBM scale score and literacy level (Powell, Hill, & Clancy, 2007). Ruelas, Roybal, Lu, Goldman, & Peters (2009) conducted a randomized, prospective study in an underserved, Latino area to establish a disease-management program to determine effectiveness. The results included an overall decrease in A1C by 1% and medication adherence was the strongest predictor (Ruelas, Roybal, Lu, Goldman, & Peters, 2009). Knowledge scores also increased in the group that reached the target A1C score (Ruelas, Roybal, Lu, Goldman, & Peters, 2009). Sarkar, Fisher, & Schillinger (2006) performed a randomized, prospective, observational study in which patients enrolled in the type 2 diabetes program and were measuring self-efficacy, health literacy, and self-management behaviors. The study participants were ethnically diverse and 52% had limited health literacy (Sarkar, Fisher, & Schillinger, 2006). Self-efficacy was associated with self-management behaviors across race/ethnicity and health literacy levels (Sarkar, Fisher, & Schillinger, 2006). Walker et al. (2006) conducted a randomized controlled primary prevention study for type 2 diabetes in the continental U.S. and Hawaii. Participants included 2,155 adults with impaired glucose tolerance that were randomly assigned to a metformin treatment arm or placebo treatment arm.

**Interpersonal factors:** McLeroy, Bibeau, Steckler, & Glanz (1998) describe interpersonal factors of SEM as "formal and informal social networks and social support systems including the family, work group, and friendship networks" (p. 355). These relationships can have an impact upon health behaviors in people with type 2 diabetes.

Mayberry & Osborn (2012) conducted a mixed methods study and used focus group session to evaluate perceptions of family members' self-care knowledge, perceptions of family members' diabetes-specific supportive and non-supportive behaviors, and participant's diabetes medication adherence and glycemic control. The results indicated that family members who perform more nonsupportive behaviors reported less adherence to diabetes medications, which was associated with less glycemic control (Mayberry & Osborn, 2012). However, there was no association between family members who performed more

diabetes-specific supportive behaviors and medication adherence or glycemic control (Mayberry & Osborn, 2012).

**Institutional processes:** A third level of SEM focuses upon institutional processes. This level includes such processes as how organizations support behavior changes, the importance of health promotion activities for behavior change; the importance of organizational support (McLeroy, Bibeau, Steckler, & Glanz, 1998). Institutional processes include formal and informal rules and regulations for operation (McLeroy, Bibeau, Steckler, & Glanz, 1998).

While no studies directly addressed institutional processes, there are study outcomes that impact organizations such as public health. Type 2 diabetes, a chronic disease, impacts healthcare costs and this issue is impacting financial decisions.

**Community factors:** A fourth level of SEM is community factors which includes “relationships among organizations, institutions, and informal networks within defined boundaries” (McLeroy, Bibeau, Steckler, & Glanz, 1998, p. 355). Community can have multiple meanings including mediating structures that embrace families; relationships among organizations such as volunteer agencies; and, community defined in geographical and community terms (McLeroy, Bibeau, Steckler, & Glanz, 1998).

There are direct and indirect community impacts from type 2 diabetes. Ruelas, Roybal, Lu, Goldman, & Peters, 2009, discuss the establishment of a disease-management program in an underserved, Latino area to determine effectiveness of diabetes interventions is an example of community support. The community impact of this program reaches far beyond the participant. Additionally, Mayberry & Osborn (2012) conducted a study about family support and non-support of diabetes-related behaviors. While this study relates to intrapersonal factors, it also applies to the community factors due to the significant contributions of the discussions created within the community. As the participant and family discuss diabetes and new knowledge, there is more opportunity for others to learn.

**Public policy:** The final level of SEM is public policy which includes local, state, national laws and policies (McLeroy, Bibeau, Steckler, & Glanz, 1998). The use of public policy has a potential to protect the health of the community through regulatory policies and laws (McLeroy, Bibeau, Steckler, & Glanz, 1998).

### Facebook Use, Self-Esteem and Alcohol Consumption in Adolescents

---

*Mario Enrique Gamez, MSN, RN, Mexico*

#### Purpose

The purpose of this presentation is disseminate knowledge generated through the support of a nursing model.

#### Target Audience

The target audience of this presentation is for academics, students and researchers in the area of health.

#### Abstract

The use of new technologies such as electronic social networks have changed the way we relate to other people, daily life and even leisure activities. An increasing amount of time young people and teenagers spend online social networks like Facebook, which has aroused considerable concern about the influence of the use of Facebook in risky behaviors such as the consumption of alcohol. Alcohol consumption is a public health problem with serious health consequences, particularly in adolescents who are vulnerable to damage in their development and integrity. High self-esteem has been presented as a protective factor for the onset of drinking. The theoretical perspective that allowed me to support the objective of this study was Neuman Systems Model. The aim of this study was to describe the relationship of the use of Facebook and the level of self-esteem with alcohol consumption in adolescents. The study design was descriptive correlational, for this report, a preliminary sample consisted of 47 high school students aged between 14 and 19 years was considered. The results showed that most teens use Facebook every day with an average of two hours, the use of Facebook was related to alcohol consumption, just as little more than half said that the use of Facebook has affected their friends to consume alcohol. We also found that most teens had low self esteem, low self-esteem likewise related to alcohol consumption in adolescents where more than half of the sample was classified as hazardous drinking and harmful use.

### Caring for the Nurse in the Hospital Environment

---

*Tanya F. Lott, MSN, BSN, RN-BC, USA*

*Elizabeth T. Clerico, MSN, BSN, RN, CGRN, USA*

#### Objectives

Describe the purpose of the Caring Work Environment Survey© and the domains that are measured.

#### Purpose

to disseminate original nursing research findings as part of the New Knowledge, Innovations, and Improvement (NK) Magnet component and to encourage discussion with other nurses from around the world as to how to better care for nurses within the hospital environment.

#### Target Audience

any RN but specifically those RNs working in the clinical setting.

#### Abstract

Nurses at this Magnet hospital adopted Jean Watson's Theory of Caring as their foundational theory of practice. The Nursing Research Council (NRC) wanted to investigate nurses' perceptions of the hospital environment as caring and the degree to which nurses felt cared for within the hospital environment. The Caring Factor Scale© was modified from reflecting patients' perceptions of being cared for by providers to measure nurses' perception of feeling cared for within the hospital work environment.

The BSSF Caring Work Environment Survey© is administered electronically each year to all RNs in this healthcare system. It consists of 12 questions that measure four domains: physical needs, spiritual needs, intellectual stimulation and authentic relationships. Additional questions related to demographics and caring initiatives that the nurse has participated in vary slightly from year to year. Participation is voluntary and confidential. The overall mean caring score is calculated and item analysis is completed to provide comparison of the domains and comparison of responses among different demographics.

Overall, the nurses feel cared for within the work environment. Questions relating to spiritual needs and intellectual stimulation score highest; physical needs score lowest. In 2012, the NRC questioned: Is there a difference in caring scores for nurses who take breaks as compared to those who do not? Two survey questions relating to breaks were added. Nurses who always or usually take breaks had significantly higher mean caring scores than those who take breaks less frequently or never ( $p < .01$ ). Nurses who take an uninterrupted 30-minute break had significantly higher mean caring scores than those whose break gets interrupted ( $p < .01$ ).

ANA Code of Ethics states that healthcare workers have a moral obligation to care for themselves so they can care for others effectively. Taking breaks, and the benefits of breaks both for the nurse and for the patient, was promoted in 2013. Analysis of the 2013 survey results demonstrated that nurses who take breaks have higher scores and perceive their environment as more caring; those who don't take breaks have lower scores and perceive their work environment as less caring. These results indicated that interventions during 2013 were effective and nurses associate taking breaks with a more caring environment. The research team plans to:

- Continue to identify: 1 ) barriers to nurses taking breaks; and 2 ) strategies to allow nurses to take breaks.
- Promote the importance of nurse self-care and care of others on the healthcare team, including breaks, and the subsequent benefits that this will have on patient care and patient outcomes.
- Re-administer the BSSF Caring Work Environment Survey© at annual intervals to evaluate caring initiatives over time that affect the nurses' perception of feeling cared for within the hospital environment.

The nurses share a vision of caring and the survey allows them to be engaged in a scientific approach to strengthen caring among nurses with the ultimate goal of improving patient outcomes.

### Magnet® Facility Nurses: Pursuing a Baccalaureate Degree in Nursing

---

*Elizabeth J. Winokur, PhD, MSN, BSN, RN, CEN, USA*

*Dana N. Rutledge, PhD, RN, USA*

*Amy D. Hayes, MSN, BSN, ADN, RN, PCCN, USA*

#### Purpose

To describe results from a 2014 descriptive study that suggests that peer/leadership support play a larger role in facilitating BSN completion than previously reported, and that Magnet culture influences decision making. The study aimed to describe factors that influence nurse pursuit of baccalaureate education when employed by a Magnet® organization.

#### Target Audience

Practicing nurses, nurse administrators, and nurse educators interested in understanding more about factors influencing and supporting associate degree and diploma nurses pursuing further nursing education. Another audience is nurses interested in the potential impact of Magnet culture on school re-entry of associate degree and diploma nurses.

#### Abstract

**Background:** In Future of Nursing (2011), the Institute of Medicine (IOM) concluded that nurses should be prepared at the baccalaureate level. Magnet organizations are encouraged to meet the IOM goal of 80% nurses with a BSN by 2020. Aiken's recent comments (2014) on the value of employing a predominately BSN workforce in hospitals underline the benefits in decreasing lengths of stay and readmission rates (cost savings), as well as improved patient mortality. With ~60% BSN-prepared nurses, our twice Magnet-accredited hospital is working toward this goal. Little is known about the effect of Magnet status on employed nurses considering or returning to school.

**Method:** In February 2014, a 15-item online survey (14 multiple choice, 1 open-ended) was sent to hospital nurses to assess factors that motivate RNs to pursue a BSN. Descriptive statistics for multiple choice items and thematic analysis for open-ended responses were completed.

**Results:** A 20% response rate (N = 191) was achieved. Most respondents already had a BSN/MSN or were currently enrolled but had entered nursing as associate degree/diploma graduates. "Encouragement from other nurses" was the most frequently selected factor facilitating return to school/graduating. Impeding factors included personal factors (e.g., finances) and the belief that the BSN would not enhance competence. Of nurses who returned to school, 20% reported that the 80% Magnet goal was a catalyst in deciding. Of nurses not intending to obtain further education (15%), most perceived lack of value in obtaining a BSN.

**Discussion:** Our findings supported our literature-driven conceptual framework, which posits that employed nurse motivation to return and stay in school is influenced by individual nurse characteristics along with organizational and academic program influences. The three types of influencing factors (individual nurse, employing organization, and academic program characteristics) appear to drive nurses to return to and stay in school. Factors can serve as both positive and negative facilitators; for example, older age may serve as a positive influence (perception of fewer family or financial responsibilities) while serving as a barrier (why bother to get further education when I will not be working much longer). At the individual nurse level, in aggregate, these factors influence nurse motivation to pursue further education. Additionally, perceived personal effort, self-efficacy, and how well the influencing factors or facilitators address specific individual nurse barriers can further modify motivation. The perception of feasible amounts of personal effort, as nurses described in our qualitative data, seem to strongly influence whether a nurse either returns to school, or once enrolled, continues enrollment. Of interest is the contrasting idea that nurses reported being paralyzed when they perceived the effort required to attain a baccalaureate degree was too much; thus, they did not return to school. Peer support was noted as

highly important to nurses in our sample. As seen in Warren and Mills work (2009), the degree to which varying facilitators actually work is that they contradict or act against individual nurse, organizational, or academic factors.

**Implications:** Findings suggest that peer/leadership support play a larger role in facilitating BSN completion more than previously reported, and that Magnet culture influences decision making. Additional investigation is required to understand factors hindering nurses from returning to school and facilitators to staying in school.

### Developing a Culture of Inquiry through Nursing Research: A New Hospitals' 3-Year Journey to Magnet® Designation

---

*Denise Harris, MSN, MBA, RN, NEA-BC, USA*  
*Tanya Marie Cohn, PhD, MEd, RN, USA*

#### Purpose

The purpose of this presentation is to describe how a new, non-replacement hospital, took the 3-year journey of Magnet® designation regarding the development of a culture of inquiry through nursing research. In addition, the presentation will showcase the research activities of the nurses.

#### Target Audience

The target audience of this presentation is direct patient care nurses, nurse leaders, hospital administrators, and nurse researchers.

#### Abstract

Background: The American Nurses Credential Center (ANCC) Magnet Recognition Program® and its key components are considered a driving force for building professional practice environments that are healthy and supportive of nurses (Sherman & Pross, 2010). Magnet® designation helps to promote nursing professional development, resulting in positive work environments and increased nurse satisfaction (Renter & Thallas, 2014). Part of professional development is the engagement of nurses in a culture of nursing inquiry which is showcased in the New Knowledge and Innovation, and Improvements portions of the Magnet® designation application. When developing a culture of nursing inquiry through a nursing research program it is important to keep nursing research visible through its integration into nursing staff meetings and organization meetings (Steele-Moses, 2010). In addition, the initiation and utilization of a nursing research council, with a clearly defined purpose, along with a step by step process for obtaining approval for research is essential for sustaining a productive nursing research program (Steele-Moses, 2010).

Objective: The overall objective was to create a culture of nursing inquiry through the development of a strong nursing research program. Secondary objectives included: (1) developing inter professional research lead by clinical staff; and (2) providing exemplar nursing research to support Magnet® designation in three years.

Implementation: From the conception of West Kendall Baptist Hospital (WKBH), a non-replacement hospital which opened in 2011, a culture of inquiry through nursing research was created by employing a Nurse Scientist to develop the program from the ground up. The Nurse Scientist was added as a standing voting member of the Nurse Governance Council which further anchored WKBH's support in recognizing the value of research and assisted in hardwiring the culture of inquiry. Not only did this include the Nurse Scientist's consistent outreach during staff meetings and membership on hospitals councils, but also the development of an inter professional Evidence-based Practice (EBP)/Research Council. The purpose of the council is to support evidence-based nursing and allied health practice while providing a forum for the facilitative review process of all WKBH research protocols. Therefore, during monthly council meetings the Nurse Scientist and EBP/Research Nurse Educator provide mini research educational sessions to the direct patient care nurses and allied health professionals with the expectation that they will disseminate to their respected units/ departments to assist in supporting and maintaining the culture of inquiry. In addition, the council is tasked with reviewing all nursing and allied health research based on four components: clinical significance, professional significance, logistics, and human protection in research. This focused review format helps all council members, especially those with less research experience but strong clinical expertise, to successfully participate and provide essential clinical input. This facilitative review helps to expedite the Institutional Review Board (IRB) approval resulting in

more active studies progressing toward answering important clinical questions. Furthermore, once the research studies are complete, the Nurse Scientist continues to support the nursing and allied health research studies through the dissemination process. For example, the Nurse Scientist maintains an ongoing abstract book for all research studies so that researchers can easily adapt their abstracts for submission to conferences. Finally, the Nurse Scientist assists the research team in navigating through the publication process and team writing.

**Outcomes:** During the first year of opening there were 9 active research studies that included WKBH nurses as Principal Investigators (PIs) or members of the research team. One of these studies is assessing the effects of nighttime use of earplugs on delirium onset and sleep perception of patients in the Intensive Care Unit (ICU) which is funded by the Neuroscience Nursing Foundation and the PI is a direct patient care nurse working in the ICU. By the end of 2014, there were 23 active research studies that include WKBH nurses as PIs or members of the research team. Of these studies a second grant was awarded to a Medical/Surgical direct patient care nurse from the Academy of Medical/Surgical nurses for the first PI-initiated randomized controlled trial assessing the impact of 4% sodium bicarbonate additive during intravenous Potassium Chloride replacement on pain and incidence of phlebitis. In addition, to the development of research there have been over 30 accepted abstracts for posters or podium presentations at local, national, and international conferences. There have also been 3 publications in peer-reviewed journals.

**Implications:** Developing and implementing a culture of inquiry through a nursing research program can be successful and sustainable in the clinical setting by integrating the concept into staff and organizational meetings along with the utilization of an EBP/Research council. In addition, having a Nurse Scientist assists with the management of the research program along with promoting direct patient care nurses in developing research through research mentorship.

### Success with the High 5 Initiative through Patient and Family Engagement

---

*Elizabeth 'Libby' Rosen, PhD, BSN, RN, IBCLC, USA*

#### Purpose

The purpose of this presentation is to have the participant be able to identify engagement strategies nurses can use to help patients achieve their goals for breastfeeding and to have the participant be able to describe evidence-based practices which encourage and sustain breastmilk feeding, and improve overall health care outcomes.

#### Target Audience

The target audience of this presentation is hospital maternal/child nurses, healthcare administrators, nursing educators and health care practitioners who are working to achieve the perinatal core measures for exclusive breastmilk feeding and increase their understanding of ways to effectively improve breastfeeding outcomes and improve the health of the community.

#### Abstract

The "High 5 for Mom & Baby: Hospital care that supports breastfeeding" is an initiative supported by the United Methodist Health Ministry Fund. This Kansas organization modeled their program after similar state wide initiatives. Utilizing evidence-based practice, this initiative has been shared with over 70% of the delivering hospitals in the State of Kansas which account for 93.4% of the babies born in the state. The five practices include: assuring immediate and sustained skin-to-skin contact between mother and baby after birth, giving newborn infants no food or drink other than breast milk unless medically indicated, practicing rooming-in, giving no pacifiers or artificial nipples to breastfeeding infants, and providing mothers options for breastfeeding support upon discharge. These strategies are for medically stable term infants to improve initiation, duration, and exclusivity of breastfeeding. Bartick and Reinhold (2010) stated that we could save lives and more than 13 billion dollars in health care related expenses if 90% of new families breastfed exclusively for the first 6 months of the infants life. Reducing barriers to successful breastfeeding in the hospital increases the duration and exclusivity of breastfeeding overall (AAP, 2012; DHHS, 2011). There are adapted practices that are applicable to the NIC and pediatric units and a handout to address those populations will be provided. A barrier to successful implementation identified early in the process was family education. To successfully implement these practices, patient and family understanding is essential. Hospitals have identified and implemented strategies to meet this challenge, including handouts, texting programs, community wide education, television spots and billboards. During hospital stays having "common questions" cards and scripts for staff to practice responses has improved consistent messaging with new parents. Having a follow up clinic that is open and free to the public after discharge has been essential to meeting the needs of new families having breastfeeding challenges. The High 5 for Mom and Baby task force guided the change process and assisted the team in dealing with provider resistance as they adapted usual routines to accommodate skin to skin in the first hour of life and rooming in. Clinics and outpatient offices also needed education to be equipped to explain to families about the program and to adapt visitation and goals for the hospital stay. Webinars sharing information on skin to skin during cesarean birth and vaginal birth have provided essential strategies to assist work flow. Other webinar topics have included rooming in and implementing quiet time for hospital maternity units. Finally, through family-centered prenatal education, community-wide education and collaboration, in-hospital bedside patient education, and utilization of a Breastfeeding follow-up clinic, engagement of patients and families can be accomplished. Patient and their families will understand the importance of the High 5 practices to assist them in achieving their goals for breastfeeding and improving their infant and family's health.

### Filling the Gaps: How “Super Utilizers” Received Care through a Hospital-School of Nursing Partnership

---

*Della J. Anderson, MSN, MBA, RN, USA*

#### Purpose

The purpose of this presentation is to share how our Continuum of Care Department, Emergency Department (ED), and an affiliated School of Nursing implemented an innovative collaboration through a student coach model to decrease non-emergent ED visits.

#### Target Audience

Nursing Educators (Leadership, Community Health, Med Surg), Hospital CEO, Physicians, Nurses, Clinic Nurse Managers, Hospital senior management, Quality Improvement Directors, Other-Case Management/Social Work Hospital Setting

#### Abstract

**Purpose:** Our Emergency Department (ED) was experiencing increased visits by a patient population referred to as “Super Utilizers.” The Continuum of Care department recognized an opportunity for innovative collaboration with the Emergency Department (ED) and an affiliated School of Nursing. A zero cost model program was created using Camden Model/Spectrum Health/Colorado Mental Health Model of Care as the basis. We determined these patients returned because of challenges in access to a primary care; inability to pay for healthcare services; lack of health education; or desire for social interaction. Most ED patients do not return after treatment. However, these patients received repetitive care that often included costly testing.

**Methods:** By partnering with the school, students became health coaches to assist with “gaps” in care. Student pairs were assigned one patient and a prepaid telephone for 24/7 access; then given medical history, information about community resources and health insurance/benefits to provide support. The ED notified students when a patient visited and follow-up was completed in the ED or by telephone the next day. Students proactively contacted the patient to discuss appropriate ED usage, emotional support, and follow-up care.

**Results:** The initial program assisted 21 patients who had made 710 visits and total patient charges of \$2.45 million during the previous year. Program results projected a decrease to 510 visits and total charges of \$1.76 million annually.

**Implications:** This unique partnership meant “Super Utilizers” received a more appropriate level of care, students received hands-on health management training, and the ED experienced a decrease in non-emergent visits.

## A 05 - Called to Promote Global Nursing Excellence

### Called to Promote Nursing Excellence as Transformational Leaders

---

*Sharon R. Redding, EdD, MN, BSN, RN, CNE, USA*

#### Purpose

The purpose of this presentation is to explore innovation strategies to promote excellence in global nursing.

#### Target Audience

The target audience of this presentation is nurses interested in collaborative experiences.

#### Abstract

American nurse educators share their experiences as volunteer nurse educators representing Project HOPE. This organization's mission is to achieve sustainable advances in health care by implementing health education programs. Project HOPE partners with host nation health officials in select locations to provide human resource talent for improving academic and technical skills. The American nurse educators are recruited for their expertise in nursing education as well as one educator having certification as a wound care ostomy clinical nurse specialist to work with Chinese nursing faculty at Wuhan HOPE School of Nursing where they teach undergraduate courses in health assessment and nursing. Additionally, they instruct in a research readings course at the graduate level. They are involved in clinical practicum activities, organize seminars, and are guest lecturers at other hospitals in large population centers. They are involved in continuing nursing education offered at various academic institutions in Wuhan, surrounding communities and other cities in China. Another activity is teaching "medical" English to health professionals who will be going abroad for residency and advanced health education and training programs. The American wound care ostomy clinical nurse specialist consults with a certified ostomy and wound care nurse specialist in Wuhan, reviewing evidenced based practices and health education strategies. The American nurse educators assist faculty to prepare research for publication in international nursing and health care journals. They work with faculty in meeting the criteria for establishing an Honor Society of Sigma Theta Tau International Nursing Honor Society, which is the first Honor Society in mainland China.

Wuhan HOPE School of Nursing was established by Project HOPE in 2002 to serve as a model for nursing education in China. Using the expertise of seasoned American volunteer nurse educators, nursing simulation was integrated into the curriculum. Chinese nurse educators traveled to the United States to learn the use of manikins, develop scenarios and organize a simulation lab. The Wuhan Chinese educators have since taken this training to a higher level and present nursing simulation workshops on a regular basis to Chinese nurse educators from other Chinese universities. American nurse educators continue to promote simulation teaching, integration of simulation in continuing education programs and use of the simulation lab by nursing personnel from area hospitals for purposes of orientation and education. Wuhan HOPE School of Nursing offers the baccalaureate program in English and the Han Chinese dialect. The expectation is that students who complete the English language program will then enter the graduate program which is offered only in English. Because of the international emphasis in nursing education at Wuhan HOPE, nursing students take advantage of increased opportunities for study abroad programs. Nursing faculty members pursue educational opportunities, conferences and seminars that promote their understanding of research and trends in nursing education.

American nurse educators work closely with Chinese nursing faculty to promote improved understanding of current trends in nursing education and clinical practice. Seminars in curriculum planning, test writing, and select teaching strategies are offered. Chinese faculty members ask the American educators for assistance in improving the organization of the concept-based curriculum so a review of current nursing literature is conducted. Both formal and informal discussions of evidence-based practices are held on a regular basis. Textbook resources are reviewed to determine those that are most appropriate for the

Wuhan HOPE nursing program of study. Frequent discussions of the role of the clinical instructor and best practices in clinical teaching are held with nursing administrators and faculty. This assists in the planning process for Project HOPE personnel in seeking future volunteer nurse educators to meet the specific needs of the Wuhan HOPE nursing program.

### **Called to Promote Nursing Excellence as Global Educators**

---

*Mary Kay Smid, EdD, MSN, BSN, RN, USA*

#### Purpose

The purpose of this presentation is to describe the use of interactive and concept based teaching educational materials that can be adapted to diverse health care environments.

#### Target Audience

The target audience of this audience is nurses interested in collaborative global teaching projects.

#### Abstract

An American nurse educator spends a semester as a visiting professor at Wuhan HOPE School of Nursing in Wuhan, Hubei Province, China under the auspices of Project HOPE. Activities include helping to strengthen the Wuhan baccalaureate and masters' in nursing programs and creating an environment in the classroom and clinical settings to enhance achievement of desired cognitive, affective and psychomotor outcomes. This American nurse educator in the role of an affiliate faculty teams with a nursing faculty member at a private women's college in the Midwest United States, who is preparing to teach a nursing education methodologies course at the master's level. Learning outcomes are developed which allow both educators to integrate diverse teaching strategies while taking advantage of technology and resources that are multidimensional and add richness to the learning experience in both areas of the world.

Prior to leaving for China, the American nurse educator presents an overview of the upcoming semester abroad to the American MSN students. The Midwest nurse educator, as the course facilitator, explores possible projects which support the MSN course outcomes of distance learning, technology and cultural consideration with the use of problem-based learning. Upon arrival in Wuhan, the American nurse educator consults with the Chinese nursing faculty to identify course content the American nurse educator will focus on, which includes maternal-newborn concepts. The American nurse educator presents an introduction from China to the American MSN students using the Skype audio/video conferencing program. The American and Midwest nurse educators then discuss options and propose that three MSN student groups develop materials for use in the American and Chinese classrooms. Various technologies are explored and tested to insure that the materials can be viewed in the Wuhan classroom. The project includes a video presentation, a PowerPoint on the selected content area and the development of a clinical teaching guide. Topics are chosen which support the Wuhan concept based curriculum strand of "the expanding family": newborn assessment, postpartum assessment and assessment of deep vein thrombosis (DVT). The American MSN students begin a literature review which addresses the issues of Chinese environmental health, community resources and social welfare and the role of nursing in Chinese health care settings. The American nurse educator shares this with the Chinese nurse educators and proposes that the Chinese students work as groups on other selected topics. Chinese nursing faculty believe this is a valuable approach and various topics are chosen. Faculty in both programs develop learning objectives, identify evaluation criteria, and develop guidelines for the nursing students' projects. Chinese nursing faculty post this assignment on the Chinese Blackboard nursing course site.

Using cloud technology, the American MSN students complete their projects and submit them for review. The American and Midwest nurse educators suggest changes in the projects related to language and terminology as well as the use of culturally sensitive images for the presentations. After final editing,

the projects are shared with Chinese faculty. The American nurse educator integrates the American MSN students' PowerPoint presentations into the Chinese classroom teaching, and shares the videos and clinical teaching guides with the Chinese nursing students. The Chinese students' group projects are also presented which included bathing the newborn and umbilical cord care, neonatal jaundice, characteristics of the normal newborn, home care after cesarean birth, prenatal health promotion and education and breastfeeding. Chinese nursing students develop a short PowerPoint presentation on the topic and a clinical teaching guide (in the Han Chinese dialect, with one copy translated into English). The American MSN students review the projects with interest to see how much of the teaching they develop is being incorporated. A common booklet cover is distributed to the American MSN and Chinese students and the American and Chinese teaching guides are included. The American and Midwest nurse educators discuss the "take-away" messages learned as a result of implementing the project as well as its application to other global nursing settings. The American nurse educator describes working with the Chinese faculty to develop test questions based on the content provided by the American MSN students.

### **Called to Promote Nursing Excellence as Facilitators of Service Learning**

---

*Linda Rice, MS, RN, CWOCN, USA*

#### Purpose

The purpose of this presentation is to describe the role of nurse educators as facilitators of service learning.

#### Target Audience

The target audience of this presentation is nurses interested in international service learning efforts.

#### Abstract

Experienced American nurse educators discuss their experiences living in and learning about the Chinese culture. They were in residence in Hubei Province, China from February through July 2014, living in Wuhan, a city of 12 million people in the central region. This city is the Chinese center of high-speed railway transportation, automobile, computer and electronic manufacturing. Wuhan is located on the Yangtze River and has a rich cultural history. The educators share their integration as visiting professors of nursing into Wuhan HOPE School of Nursing, their adaptation to the Chinese culture, and their personal learning. This includes visiting historic sites such as the Yellow Crane Tower in Wuhan, the Terracotta Warriors of Xi'an and the Great Wall of China, near Beijing. The educators reflect on clinical teaching activities in and touring Chinese hospitals, clinics, health centers, and community centers. They share the day-to-day experiences of observing health care, medical and nursing practices. Living in a densely populated city results in learning to overcome the challenges of using transportation systems, shopping for personal items, and obtaining required resources. Other issues that are shared include the effects of pollutants, in the air and water, and how this is integrated into the daily living routine and work setting. The educators were teaching in a nursing program that was presented in English, but lived in a community where the Han oral and written Chinese dialect is used. This is a challenge when using transportation and business services.

Cultural learning focuses on the role of Chinese nurses in diverse health care settings and the community perspective of the nursing professional. Chinese nurses are limited in their opportunities to practice what they learn in the classroom. In most health care environments, the focus of the Chinese nurse is on medication administration with patients and families accepting only teaching by the Chinese physician. Patients and families have limited understanding of the nursing role and their expectations are that nurses are there to work under the direction of the physicians. Nurses are not viewed by the Chinese as individuals in leadership roles, as providers of client education, or in a direct hands-on role for routine day to day care. Patients and families expect nurses to administer medication according to their preferences, rather than following established guidelines. New graduates are expected to be competent at performing

nursing skills by passing national and hospital based exams as part of their nursing registration. New graduates seeking employment must meet hospital hiring requirements of height and personal appearance, and have lengthy orientation periods before being assigned to a specific unit in a permanent full-time position. The expectation is that the nurse will work the assigned hours, and accept the directives of nursing administration. There are opportunities for assuming additional responsibilities with graduate education and time in the position. There has been increasing incidents of violence against doctors and nurses perpetrated by dissatisfied patients. Much of this violence results from patients' lack of understanding of Chinese health care financing and insurance, the increasing distrust of pharmaceutical and health care industries as more incidents of product contamination and profiteering emerge, and the increasing government burden in providing health care to the world's largest population. The American nurse educators discuss their perspectives on the diversity of nursing practice observed in hospitals, hygiene and sanitation standards, equipment being used, organizational practices, standards of care, the use of computer and other electronic resources, and the limited availability of community health services.

The American nurse educators discuss the nature of their experience from the service learning perspective. The educators supported nursing students who were providing health promotion activities at the only geriatric residential care facility in Wuhan. The educators obtained a Sigma Theta Tau, Gamma Pi At-Large service grant to assist the Chinese students to purchase supplies and equipment to offer health education classes, exercise programs, and other activities at this geriatric center. The educators worked with a videography company in writing and developing a video about the nursing students' service learning project which was used for a major grant application by the Chinese nursing faculty at Wuhan HOPE School of Nursing. This grant would support community nursing practicum activities resulting from the opening of the new rehabilitation center at Wuhan HOPE School of Nursing. The American educators worked with Chinese nursing faculty in writing, filming and narrating a video which will be used for a future grant application for another community service project. A third video the American educators assisted with was a commemorative project celebrating the founding of the Wuhan HOPE School of Nursing. This was shared at a medical center/university convocation, the dedication of a memorial to a donor to the Wuhan HOPE School of Nursing and the opening of the rehabilitation center.

## A 06 - Working Together to Provide Greater Interprofessional Opportunities for Education and Research in a Simulation Environment

### Standardized Patients Providing Clinical Learning Opportunities for Learners across the Continuum

---

*Miriam E. Bar-on, MD, USA*

#### Purpose

The purpose of this presentation is to familiarize participants in the use of Standardized Patient (SP) programs and understand the educational rationale for their implementation. Participants will have the opportunity to engage in thinking about learning and evaluation opportunities to use the SP program.

#### Target Audience

The target audience of this presentation is individuals who are interested in learning about an SP program, potential use of an SP program and the rationale behind implementing one.

#### Abstract

An integral component of the Clinical Simulation Center of Las Vegas is the standardized patient (SP) program. This program is housed in the 12 room standardized patient hall and provides both formative assessment and summative evaluation for medical students, residents and nursing students – undergraduate and graduate.

The SP program was developed by the University of Nevada School of Medicine (UNSOM) under the direction of an SP educator. This individual initially worked with the directors of the Clinical Reasoning in Medicine (CRIM) course to design and replicate a high-stakes examination for the third year medical students. This examination is given statewide twice a year at the end of the primary care semester. After this initial success, the SP program began to participate in formative educational events. Standardized patients are used routinely as part of the learning process in CRIM. In addition, the SPs are incorporated into an informed consent exercise for the UNSOM residents and for a variety of remediation activities.

Based on the success of the SP program at the medical school, the University of Nevada – Las Vegas (UNLV) School of Nursing faculty believed that incorporating standardized patients in nursing education and evaluation would be beneficial. They worked closely with UNSOM faculty to extend their established SP program to Nurse Practitioner (NP) students. Initially, we offered an optional pilot program for 4 local NP students. This was reviewed well by faculty and participating students. Currently NP students have high-stakes examinations at the end of each clinical course. This allows faculty to evaluate students more fairly as they see the same types of patients. Once this program was established, faculty teaching UNLV BSN psychiatric course desired to use SP as part of their clinical orientation to psychiatric nursing in a formative educational experience. Cases focusing on bipolar disorder, paranoid schizophrenia, and anxiety were developed, piloted, and implemented during the first year of the program. Feedback from nursing students was overwhelmingly positive with students asking for more cases. Consequently, a post-traumatic stress disorder was developed and implemented. After these experiences in a safe environment, students feel more comfortable in psychiatric settings.

As the SP program expands, other demands for SP learning events increase. Standardized patients were used in an inter-professional activity demonstrating the challenges of dealing with geriatric patients and recently incorporated in a multiple mini interview program as part of the application process to medical school. The potential for this program is limitless however, funding constraints impose boundaries.

## **Overview and Introduction to the Clinical Simulation Center of Las Vegas**

---

*Carolyn B. Yucha, PhD, MSN, BSN, RN, CNE, USA*

Purpose

The purpose of this presentation is to provide participants an overview on the development and administrative structure of the Clinical Simulation Center of Las Vegas.

Target Audience

The target audience of this presentation is participants interested in the elements necessary for developing a collaborative simulation center.

Abstract

Simulation based education is costly and time intensive at a time when resources are difficult to secure. As a result, Deans from the University of Nevada Las Vegas School of Nursing, Nevada State College School of Nursing and the University of Nevada School of Medicine pooled their resources to design and operate a collaborative simulation center. Established in 2009, this was a major undertaking requiring close to one year to design and build. Recently, the Clinical Simulation Center of Las Vegas (CSCLV) celebrated its fifth year of operation, successfully achieving simulation-based education for students (nursing and medical) and residents (medical and surgical). It is a highly successful collaboration that provided 7,500 hours of student and resident learning activities in the last academic year.

This symposium will provide a brief overview of the CSCLV, its structure, staffing, and funding. Two other presentations will provide information on initiatives that have emerged from these disciplines sharing a simulation center. The first is a standardized patient program initiated by the medical school and subsequently adopted by one of the nursing schools for evaluation of Nurse Practitioner students. The second presentation focuses on the promotion and development of inter-professional education and research in the CSC and will describe some of the ongoing educational research being conducted.

A long term collaboration will necessarily be tested by changes in leadership. While the CSCLV has had the benefit of a very stable and collaborative leadership team, it is inevitable that change will occur. In the past year, one of the establishing deans retired and was replaced by a dean, new to the role. This has created challenges as he has been integrated into an ongoing system. The final presentation will focus on strategies to maintain an effective center in the face of changes in leadership. Together, these presentations will describe the multiplicative advantages of a collaborative simulation. In addition, challenges for sustaining this productive team will be discussed.

## **Inter-Professional Education and Research in a Collaborative Simulation Center**

---

*Jessica Doolen, PhD, MSN, BSN, ADN, APRN-C, CNE, USA*

Purpose

The purpose of this presentation is to offer insight on how to facilitate inter-professional education in simulation. Simulation programs and simulation centers across the globe may find these suggestions

helpful. The development of any simulation program is facilitated with international networking on "how to and how not to"

### Target Audience

The target audience for this presentation are international, national, and local simulation educators with small simulation laboratories to large simulation centers nationally and internationally.

### Abstract

Since 1972 the Institute of Medicine (IOM) has addressed the importance of educating healthcare students together to purposely prepare them for collaborative professional practice. Collaborative professional practice begins with academia and has been linked to a safer patient centered healthcare system (Inter-professional Education Collaborative Expert Panel, 2011). Over this last decade the IOM (IOM, 1999; 2003; 2004; 2006) and the World Health Organization (2010) have highlighted the importance of educating health professional students together to decrease medical errors and increase patient safety (IOM, 1999; 2003; 2004; 2006). A multi-institutional collaborative simulation center provides a variety of opportunities for inter-professional education (IPE) and research. This presentation describes the development of IPE and research at a collaborative simulation center. Topics include: 1) how IPE faculty were trained in simulation based learning, 2) the genesis of an IPE research trajectory in a collaborative simulation center and, 3) how faculty obtained funding for IPE research.

To advance IPE education at the center each of the three collaborating schools attended simulation training provided by a consultant group. During the first three month training period there were three days of didactic sessions followed by interactive workshops. Both faculty and simulation technicians participated in the training (Baily, Bar-on, Yucha, Snyder, 2012). As an example, after a didactic session in the lecture hall faculty divided up into groups of eight. Each group worked together and developed, piloted, and debriefed their IPE scenarios. The simulation technicians also participated in the interactive training in the simulation control hall. Training continued by phone conference and with face to face workshops. The training was successful and well appreciated by faculty (Baily, Bar-on, Yucha, Snyder, 2012). Consequently, two day training sessions are offered every semester and are identical to the original consultants' training program. Working closely together and becoming friends enabled faculty to network ideas for teaching and research. As an example, collaborative code research led to incorporating mock codes into simulation curriculum for the school of medicine and a school of nursing. The nurse practitioner program participates with the surgical technician for the school of medicine to teach a basic suturing class. And the standardized patient program is incorporated into an undergraduate psychiatric course and for objective structured clinical exams for the nurse practitioner program.

**Research:** During the first year the CSCLV was open the advisory board offered grant awards for inter-professional research (IP). The School of Nursing designated \$5000 from its discretionary funds to support one research grant, with a Nursing faculty member as the principle investigator. The School of Medicine obtained \$5000 from the school of medicine's IDeA Network of Biomedical Research Excellence grant to support a second research grant with a school of medicine faculty member as the principle investigator. Both grants required that the other discipline be included as co-investigators and that the project involve students from both institutions. Grant application process was developed and grants were reviewed by a subset of the Advisory Committee. Examples of IP research were: from 2010 to 2012 the Measurement of Acquisition of Crisis Resource Management Skills Using Simulated Emergency Codes, and Incorporating Simulation and Interactive Response System in a Pediatric Nursing Course were successfully completed. In 2013 two IPE teams completed two additional research studies, Simulating Teamwork and Observation for Procedural Safety and: the Effect of Collaborative Simulation Training for Pediatric Residents and Nursing Students on Team Work Skills in Patient Care.

We have had success and we have experienced barriers to IPE and to complete IP research. Scheduling is harder for the medical school because residents are providing medical care for patients. Also, nurses outnumber residents making it difficult for all nursing students to participate in research studies. And there are differences in the nursing and medical model that requires negotiating especially in debrief. Lessons learned will be shared with the audience.

## Contact

[jessica.doolen@unlv.edu](mailto:jessica.doolen@unlv.edu)

## **Continuity in the Face of Changing Leadership**

---

*Neal S. Rosenberg, PhD, MSN, BSN, BA (Hons), RN, USA*

### Purpose

The purpose of this presentation is to highlight strategies to nurture the growth and success of new nursing educational leaders via a strong succession plan developed between the administrator mentor and mentee.

### Target Audience

The target audience of this presentation is experienced and novice nursing educational leaders in the academic and clinical communities.

### Abstract

During the growing number of transitions in nursing leadership, it is imperative that experienced nurse leaders are well poised to successfully nurture and facilitate the succession of their important roles to new nursing leaders. This is the case in Southern Nevada where the nursing leadership in the Clinical Simulation Center – Las Vegas (CSCLV) has begun. The transition of deanships, experienced faculty and support staff is inevitable. The thoughtful and thorough planning from expert to novice and subsequent development to expert is instrumental to the success of all stakeholders.

The CSCLV leadership structure includes three deans; two from schools of nursing and one from a school of medicine. The CSCLV opened its doors in 2009 under the guidance and leadership of three experienced deans. In the summer of 2014, CSCLV began the first major transition of leadership as one nursing dean retired and a novice-nursing dean was appointed. Entering an established system can be very challenging and might be even more so if existing leadership is stable and the unit is functioning well. This presentation will discuss the strategies, barriers, strengths and limitations of the current transition as it relates to the overall health of the CSCLV and the nursing community in Southern Nevada.

The heuristic nature of this discussion will explore the perception of transition, inclusion and next steps by the existing deans and the new dean as they navigate the path of successful transitions in a fast-paced and growing shared simulation center. The strength of informal and formal mentoring is emphasized between the two nursing deans. The role of mentor and mentee at the academic leadership level is scant in the literature. This presentation lends to sharing stories of success and challenges, both structural and political, in busy academic settings from sister institutions. The strategic planning, sharing of knowledge and patient guidance from expert to novice are explored in this session.

## B 05 - Bridging the Practice/Research Chasm

### Bridging the Practice/Research Chasm

---

*Rebekah Powers, DNP, RN-BC, CMSRN, CSPHA, USA*  
*Carol Boswell, EdD, RN, CNE, ANEF, USA*

#### Purpose

The purpose of this presentation is to set the stage for the three CIT projects to be presented by frontline staff members showcasing their advancement.

#### Target Audience

The target audience of this presentation is frontline nurses and managers who are interested in challenging their units to advance health care.

#### Abstract

The literature repeatedly affirms that the time period for translating research findings into the practice arena requires approximately 17 years. Recent studies have identified the presence of a research mentor as the key to overcoming identified barriers to both generating clinically based evidence and incorporating that evidence into practice. While widespread agreement that this time lag must be reduced is supported, substantive change on this issue has yet to occur -- despite repeated recommendations for increased collaboration between researchers and practitioners. Indeed, collaborations between academic and practice settings benefit both parties in fostering clinical nurses' research skills, contributing to innovations in patient care and nursing practice and enriching nursing research. The Care Innovation and Transformation (CIT) initiative, which is a program sponsored by AONE, supports innovative change, culture evolution, and implementation of health care reform. Using the conceptual framework of Situational Approach to Leadership, this symposium provides examples of how the CIT concepts have successfully supported clinical nursing research teams in acute care settings. All examples include a description of the clinical problem addressed, the nature of the research team addressing the problem, the style of support employed within the collaborative role, and how the results of the project were used to inform practice changes. This model provides a structure for clinical nurses in developing the skills and confidence to evaluate and implement evidence into the practice setting in a timely manner.

### Effective Nursing Work Flow: Making a Difference

---

*Ausrine Buzick, ADN, RN, USA*  
*Stephanie Lanes, ADN, RN, USA*  
*Estella Contreras, LVN, USA*

#### Purpose

The purpose of this presentation is to demonstrate how an effective decision making model can be used by frontline nurses to improve the workplace environment and benefit the patients.

#### Target Audience

The target audience of this presentation is frontline nurses and managers who are interested in challenging their units to advance health care.

#### Abstract

Efficiency of spaces are linked to less interruption to nurses work flow, shorter travel time and distance resulting in the staff being able to accomplish assigned tasks and increased face time with

patients. A growing body of research focusing on spatial flow of clinical units suggests that equipment organization and location are key factors in achieving clinical efficiency.

Objective: The project's objective was to demonstrate how a properly sized sling placed in a patient's room could benefit patient's safety, decrease nurse's time spent looking for proper equipment and increase nurse's productivity.

Methods: The initial stage of the project was to study the medical unit layout and identify the areas for sling rack placements. Slings were conventionally located on the top of linen carts in the clean utility rooms. Sling racks were moved to the hallway and placed in close proximity to bariatric rooms. The criteria for sling placement in the patient's rooms was established based on the assessment of patient population. Factors guiding the assessment included level of assistance required, patient's functional status, safety and comfort.

Four main guidelines were used to determine sling placement: 1) score of mobility test and/or Hendrich scale, 2) neurovascular/musculoskeletal status, 3) bariatric patients, 4) total care patients.

Results: Safe Patient Handling team's internal monthly audits revealed the increase in compliance of proper sling placement and usage. Four month audit data was used in the study. Easy access to equipment was directly correlated with frequency of its usage.

Conclusion: The benefits of easy access to slings include: 1) saved time for locating the necessary equipment, 2) increased nurse-patient face time 3) increased utilization of proper equipment 4) reduced number of patient fall, injuries incidents. The project revealed the need to eliminate unnecessary complexity in equipment organization and location. It proved that functional efficiency is closely linked to economic efficiency.

## **Avoiding Delays for Surgery: It is Important**

---

*Susana Dominguez, BSN, ADN, RN, USA*  
*Arculana Robles, RN, BSN, USA*

#### Purpose

The purpose of this presentation is to showcase the work done through a CIT project with frontline nurses to advance their problem solving abilities while addressing critical challenges confronted.

#### Target Audience

The target audience of this presentation is frontline nurses and managers who are interested in challenging their units to advance health care.

#### Abstract

Problem: No physician pre-operative orders and day of surgery orders was identified as a critical challenge. Absent physician orders was causing delays in surgical start times due to lack of operative consent and incorrect or missing pre-operative testing needed by the physician.

Aim: The aim for the CIT project was to find a solution to prevent patients from arriving to their pre-operative appointment without any orders. One physician showed interest in participating in the project to prevent delays in his surgery start times. A group of nurses from the pre-operative center and same day

surgery met with physician to find a solution to the problem. During this meeting, the data collected was presented to the doctor.

Method: Data was collected to determine how many patients from his office presented to pre-op without orders and still went to surgery. The physician then passed the collection of data back to his staff. The solution was that all patients would have orders inputted in the electronic medical record at the time of their appointment with the physician. It was also decided by the physician that all patients would be seen one day prior to their pre-operative appointment to aid in this process.

Results: Data was collected after the implementation of the new guidelines. A dramatic decrease in patients arriving with no orders was noticed. The physician saw a total of 26 patients during the data collection period and 6 patients, or 24%, arrived with no pre-operative orders. After the solution was implemented, only 1 patient out of 18, or 6%, arrived with no pre-operative orders resulting in a positive test of change.

Conclusion/Recommendation: Since the process worked well with this physician, the process is being implemented with other offices to hopefully yield the same positive results.

## **Effective Communication Using Huddles**

---

*Andreanna Sookhi, ADN, RN, USA*  
*Deborah D'Agostino, BSN, RN, USA*  
*Sharon McGowen, BSN, RN, USA*

#### Purpose

The purpose of this presentation is to show the work that can be done to advance frontline nurses as they strive to improve the care provided on a medical unit.

#### Target Audience

The target audience of this presentation is frontline nurses and managers who are interested in challenging their units to advance health care.

#### Abstract

Problem: Information such as process changes and unit metrics found within the HCAHPS scores not being shared consistently to all team members on the post surgical unit was identified as a challenge.

A team of staff nurses worked together to discover a way to communicate. The team goal was to identify: a way to communicate that did not interrupt the workflow of the day, the staff preferred method of communication, and the best time in the work day to communicate along with how much time is required to effectively communicate key information. The team surveyed the staff members and found the preferred method of communication was verbal. It was also determined that the staff wanted communication to occur during the middle of the shift.

Huddles were scheduled to occur at 1030. The same information would be included for several days so all staff would hear it. In addition, the unit clerk would send a text message to staff to remind them of huddle time.

Results: After implementing huddles, staff were surveyed. 86% of staff who completed the survey voiced that sharing information had improved. 98% stated they know more about expected trends on the unit (HCAHPS). 50% of staff agree shift huddles at 1030 and 2230 can easily be incorporated into workflow.

Plan for further implementation is to create a binder for those who are off the unit to review upon their return to work.

## **B 06 - Dimensions of Care Coordination Clinical Reasoning: Systems Thinking, Value Network Analysis and Health Analytics**

### **Care Coordination Clinical Reasoning Model for Advanced Practice Nurses**

---

*RuthAnne Kuiper, PhD, MN, BSN, RN, CNE, ANEF, USA*

#### Purpose

The purpose of this presentation is to describe the Care Coordination Clinical Reasoning model of complexity and systems thinking, and value network analysis that teaches advanced practice nursing students the management of patient problems across health care contexts. Model worksheets support learning strategies and habits of mind for future practice.

#### Target Audience

The target audience of this presentation is clinical educators who guide and mentor advanced practice graduate nursing students as they learn to manage patient problems, interventions and outcomes. The CCCR model is designed to help students recognize practice issues that involve interdependent health care provider role relationships.

#### Abstract

In the current health care arena, practice has shifted to include systems thinking and value network analysis to determine priority patient health care issues that interface with interdependent health care provider roles and relationships. The major focus of current health care practice is interest in identification and achievement of patient health outcomes. To function effectively in this arena, nurses need outcome specification skills. The role of case manager and care coordinator is becoming essential for meeting patient health care outcomes. Advanced practice nurses such as nurse practitioners in these roles require additional clinical reasoning skill sets and ways of thinking to manage cases on a day to day basis if they are to practice to the full extent of their education (IOM, 2003).

To expand the nursing process and include activities related to interprofessional collaboration, we propose a Care Coordination Clinical Reasoning framework that includes the OPT model of clinical reasoning and the CCCR systems model to thoroughly think and reason through patient and family cases to achieve outcomes across health care services. Clinical reasoning for case management includes care coordination competencies to address essential patient and family needs. The core competencies suggested by the Institute of Medicine include providing patient-centered care, working in interdisciplinary teams, employing evidence-based practice, applying quality improvement, and using informatics (IOM, 2003). These competencies are embedded in the AACN (2011) essentials for advanced practice nurse education and therefore important to the care coordination model we propose. These essential care coordination needs are; conducting a needs assessment, initiating medical care services and testing, evaluating capacity, resources and skills, developing an individualized plan of care, coaching and educating the patient and family, monitoring plan of care and safety, promoting self-management, and team collaboration.

Introduction to the Care Coordination Clinical Reasoning (CCCR) systems model web shows the essential care coordination practice issues and organizes thinking to focus on the priority needs within health care systems. The CCCR systems model then describes the care coordination practice issues and determines interventions, outcomes and the values for each essential need. This process involves individual-systems thinking, team-systems thinking and organizational-systems thinking to thoroughly and efficiently manage all aspects of patient and family cases.

### **Future Think: Clinical Reasoning, Care Coordination and Health Analytics**

---

*Daniel J. Pesut, RN, PhD, PMHCNS-BC, FAAN, USA*

#### Purpose

The purpose of this presentation relates to the care coordination clinical reasoning model for nursing practice and emerging trends associated with health analytics and big data. Nursing knowledge classification systems, electronic health records and the role of health analytics will be related to the creation of future nursing process models.

#### Target Audience

The target audience of this presentation is nurse educators who teach clinical reasoning with attention to the impact and influence of standardized nursing knowledge classifications and electronic health records.

#### Abstract

This presentation will relate the care coordination clinical reasoning model to professional nursing practice and emerging trends associated with health analytics and big data. As the nursing profession develops and grapples with how best to master the use of standardized language the emergence of health analytics and big data -- providers have to grapple with how health analytics can support the future of care coordination clinical reasoning. In this presentation six generations of the nursing process from 1950 to 2050 will be defined and described. The value of nursing knowledge classification systems and electronic health records will be emphasized and the role of health analytics in the creation of future nursing process models will be defined. Four types of analytics: descriptive, comparative, prescriptive and predictive will be defined and discussed. The impact and influence of health analytics on the evolution and transformations of nursing process and the clinical reasoning skills needed for contemporary and future practice will be deliberated. Nurse educators who teach clinical reasoning to advanced practice nurses will find this information important in order to promote and influence standards for nursing knowledge classifications and electronic health records.

## **Unfolding Case Study Exemplifying Care Coordination with Advance Practice Nursing**

---

*Tamatha Arms, DNP, MSN, BSN, ADN, RN, PMHNP-BC, NP-C, USA*

#### Purpose

The purpose of this presentation is to unfold a developing case study commonly seen by nurse practitioner students in the primary care office setting. The case study shows nurse practitioners using nursing process to assess, develop, implement, and evaluate an individualized plan of care and coordinate care across healthcare systems.

#### Target Audience

The target audience of this presentation is graduate nurse clinical educators who teach advanced practice nursing students.

#### Abstract

The development, progression and evolution of the nursing process which begins with a foundation for patient problem management also parallels with dynamic thinking processes. The third generation of nursing process or the Outcome-Present State – Test (OPT) emphasized clinical reasoning that was reflective, creative and outcome specific given a client's story. However, healthcare practice has yet shifted again to a focus on care coordination, systems thinking, value network and analysis to determine priority patient healthcare issues that interface with interdependent health care provider roles and relationships.

The authors propose a Care Coordination Clinical Reasoning model that includes structure, content and process to guide the novice practitioner through individual-systems thinking, team-systems thinking and organizational-systems thinking. The Care Coordination Clinical Reasoning (CCCR) systems model web shows essential care coordination practice issues and organizes thinking to focus on the priority needs within health care systems. This framework utilizes standardized languages that are used to communicate between and among interprofessional health care providers. For example, the Care coordination reasoning web organizes thinking to focus on priority health problems associated with ICD-9/ICD-10 medical diagnosis codes and aligns these with domains of nursing diagnoses.

The purpose of this presentation is to display an example of an unfolding case study commonly seen by nurse practitioner students in the primary care office setting. This case study will show how the nurse practitioner uses the nursing process to assess, develop, implement, and evaluate an individualized plan of care with management and coordination across health care contexts. A new care coordination clinical reasoning systems model will show the use of team and organizational-systems thinking to achieve health outcomes. The participants will be engaged in an actual case development with the model worksheets for practice with care coordination essentials. The target audience of this presentation is graduate nurse clinical educators who teach advanced practice nursing students with a care coordination model.

## **C 05 - CONNECTS: Capacity Optimized Neural Network Extending Clinical, Theory, and Skills**

### **CONNECTS: Building Capacity for Building Skills**

---

*Kathleen Williamson, PhD, MSN, RN, USA*

#### Purpose

Describe CONNECTS, which is a program that builds Capacity while Optimizing the Neural Network at Extending Clinical, Theory and Skills for students and faculty in the pre-licensure nursing education program. It combines the optimization of space, utilizing supportive technology while extending clinical opportunities and linking clinical, theory and skills.

#### Target Audience

Nurse Educators, clinical educators, Simulation center directors, Nurse Educator Administrators

#### Abstract

CONNECTS, is a program that builds Capacity while Optimizing the Neural Network at Extending Clinical, Theory and Skills for students and faculty in the pre-licensure nursing education program. It combines the optimization of space, utilizing supportive technology, while extending clinical opportunities, and linking clinical, theory and skills. The school of nursing's reliance in using the simulation center is due to patient care areas shrinking, the increased use of acute care simulations and in scheduling all partners; the center is almost at maximum capacity. This presentation will share how the simulation center increased its capacity and trained faculty in developing scenarios and educational lesson plans in using simulation and technology in more strategic ways. Presented will be how when faculty create interactive simulation experiences along with expanding capacity can promote student and program success.

#### Contact

[kathleen.williamson@mwsu.edu](mailto:kathleen.williamson@mwsu.edu)

### **CONNECTS: Simulation as an Instrument**

---

*Melody Chandler, MSN, RN, USA*

#### Purpose

Describe the operations of a free-standing simulation center that provides nursing education/competency validation using high-fidelity patient simulation and skills training to a regional consortium partnership consisting of three separate institutions and ways to build capacity.

#### Target Audience

Nurse Educators, Clinical Educators, Simulation Center Directors, Nurse Educator Administrators

#### Abstract

Using simulation in nursing education has become a common teaching/learning milieu that most educational and healthcare entities have subscribed to in providing training and validation of clinical competence of participants. With ever-shrinking clinical opportunities and increases in nursing school enrollment, a significant challenge is for those educational centers to investigate innovative ways in which to increase capacity without compromising the quality of their offerings.

Creating a regional consortium, The Regional Simulation Center (RSC), has proven effective in combining and conserving resources while providing a shared environment for nursing education. The RSC provides high-fidelity simulations and skills training to a broad variety of participants in a fully staffed facility. The goal of the RSC is to continually be progressive and improve upon its offerings to create

optimal learning environments with superior learning experiences for the participants. Development includes seeking out innovative ways to connect theory, technology and skills within the center.

Learners from multiple, diverse educational settings, that may have never had a clinical experience, to seasoned healthcare professionals, who may have spent years in acute care settings, utilize the RSC. The RSC strives to create meaningful learning experiences based on specific learner objectives to increase the likelihood of these connections. Another effort is made aesthetically to provide clinical experiences that appear as real as what a participant would experience in a true clinical setting. Partnering with the local, regional hospital, the consortium has access to all of the current practice changes as well as medical supplies that tend to be ever-changing in the clinical setting. When learners transition back and forth throughout the semester from the clinical setting of the hospital to the RSC, it fosters more confidence in the learners since they have the opportunity to practice with familiar, similar equipment in both environments.

Over the past 10 years the RSC has experienced a tremendous increase in utilization which has forced it to seek out innovative ways to increase its capacity. Advances in technology with barcode scanning systems, bedside charting and electronic medical records have also created a learning gap and a need for increasing utilization of technological advances in the RSC. CONNECT is a program that strives to bridge this gap.

#### Contact

[melody.chandler@mwsu.edu](mailto:melody.chandler@mwsu.edu)

## **CONNECTS: Making the Connection**

---

*Robin Lockhart, RN, MSN, USA*

#### Purpose

The purpose of this presentation is to share ideas for linking course content and clinical experiences to enrich the students' understanding of the course content and their development of clinical skills. Additionally, to share how technologies can assist the educator to communicate and measure those linkages.

#### Target Audience

The target audience for this presentation is nurse educators who are struggling to ensure student retention of content or concepts in courses that include clinical skills. Academic administrators also will find the presentation useful in measuring student learning outcomes and reporting these outcomes.

#### Abstract

Retention of nursing students is an issue for many nursing programs. The most common cause of attrition is poor academic performance. Nursing continues to increase in complexity, leaving students to struggle within content- and concept-laden courses. As a practice discipline, nursing has a rich source of clinical experiences to enhance learning ensuring connections between content and practice. However, frequently students fail to understand the linkages between content and their clinical experiences. The CONNECT program links content, clinical skills and clinical reasoning in an interactive manner. It uses simulations and classroom technologies to plan, deliver, and evaluate student learning. The program was created to expand the use of the simulation center. However in the planning for this expansion, we realized we had the opportunity to connect classroom and simulation in a more fluid manner than had been previously implemented. We actively share content and concepts being taught in the classroom with students completing simulation experiences. Additionally, simulations completed are shared with students in the classroom. Classroom technologies available enhance the ability to link content, clinical skills, clinical reasoning and student learning evaluation. This presentation addresses these linkages.

## D 04 - Practice and Academics Partnering to Improve Patient and Student Outcomes

### Exemplar Unit Initiative Framework: Engaging Faculty and Staff to Improve Patient and Student Outcomes

---

*Dana Tschannen, PhD, RN, USA*  
*Leah Shever, PhD, RN, USA*

#### Purpose

to provide an overview of an initiative aimed to fully actualize an Academic Service Partnership through a microsystem (i.e. unit) level approach. This approach will focus on deeply embedding clinical faculty on their respective unit and creating partnerships with unit leadership through the implementation of specific structure and process components.

#### Target Audience

The target audience of this presentation includes academic leads, faculty, nursing staff, and students. The project described provides an exemplary example of how faculty, staff, and students can work collaboratively to improve patient outcome.

#### Abstract

In an effort to fully explicate the academic service partnership between the University of Michigan School of Nursing and University of Michigan Health System, three pilot units were chosen to participate in the exemplar unit initiative (EUI). Work done previously in the partnership had made advances in student experiences but had not achieved improved patient outcomes. Objectives of the EUI included: (1) provide structure for improved communication and integration between clinical leadership and clinical faculty; (2) create an environment for a robust, mutually beneficial partnership aimed at improving patient care quality; and (3) ensure alignment with unit-specific goals and effective resource use to reach goals. Common goals included providing evidenced-based care and improving patient outcomes (e.g. falls, satisfaction with pain). These goals were attained through the implementation of specific EUI central and unit-level structure and process components.

**EUI Intervention:** An EUI leadership team—Associate Dean for Clinical Practice, Director of Research and Innovation, and lead faculty—created the EUI intervention. The microsystem intervention was based on the Donabedian's Quality Outcomes Model, which incorporates structure, process, and outcome into a linear model for understanding care quality (Table 1).<sup>1</sup>

The structural component activities included consistent meetings for both unit and larger EUI teams. Teams met locally on the unit and then all local teams met with the central leadership team. This ensured opportunities for all members of the initiative to discuss (1) progress towards attaining goals; (2) changes needed in processes to achieve goals; (3) current state of the intervention and (4) problem-solve as needed.

Additionally, the embedded faculty was expected to become an active member of the unit-based shared governance committee, providing leadership in an area aligned with their clinical expertise. Other ways that faculty became more embedded and a part of the unit team included meeting with nursing unit leadership, rounding on staff/students, providing expert consultation, problem-solving with staff on student issues, and generally being more visible on the unit.

Process component activities provided guidance towards unit-specific area of focus and implementation strategies. Specifically, each microsystem/unit team identified a quality indicator goal and a professional practice model goal. Upon mutually identifying the goals, the team created an action plan (e.g. objective, key action steps, accountable person(s), and due dates). Another process component included rounding

on the units by the EUI leadership team to understand the dynamics of the EUI and progress towards unit-specific goal attainment.

Outcomes of the EUI were evaluated on an ongoing basis, including determination if the EUI intervention was actualized and identification of improvements in the microsystem unit quality and model of care goal. It was expected that patient care would be improved; student learning would be maximized as students were engaged in work around improving a specific quality indicator, and staff/students would be active members of the team.

The EUI components were developed to provide guidance to the units, realizing each unit would individualize the intervention to align with the uniqueness of their respective microsystem. The initiative occurred over a 12-month timeframe, with specific touch points throughout the intervention to ensure progress towards reaching the EUI goals.

**EUI Evaluation:** A primary aspect of the evaluation was determining the actualization of each of the EUI components. Each EUI components was reviewed to determine if the structure and processes were met/not met.

**Central Structure & Process Components.** All of the central structure and process component activities were successfully implemented. All members of the EUI—including the EUI leadership team, nurse managers, directors, and faculty—met monthly during the intervention. Additional members of the unit leadership team (e.g. CNS, unit-based committee lead) were asked to join the meeting very early on in the intervention, as it became clear they were needed to ensure intervention success. All members were highly engaged in the discussions, providing opportunities for reflection and learning from others. Quality indicators chosen by the units included patient satisfaction with instructions for home, patient satisfaction with pain, and falls; professional practice model goals included self-care efficacy and patient story—both critical elements in the health system’s nursing model of care.

Rounding by EUI leadership began approximately four months after implementation of the EUI. Observations from the rounds included significant engagement of students, staff, and unit leadership in attaining the quality and model of care goal. Staff members articulated goals of the intervention, describing ways in which students were assisting with attaining those goals. Staff mentors reported students being more prepared and helpful to their practice. Faculty on the unit were identified as ‘one of them’, a valued member of the team. Additional process components, identified in a monthly meeting, included an individual meeting with each microsystem team and central leaders to gain clarity around quality metrics.

**Unit-based Structure and Process Components.** Each of the unit based structure and process components were implemented, although the manner in which they were implemented varied across units. For example, the embedded faculty was asked to communicate with the staff nurse mentors the general learning expectations for each level of learner on the unit. One faculty member held ‘open houses’ for staff, providing an opportunity for the staff nurses to hear about learning expectations, as well as provide an avenue to give initiative feedback. Another faculty created and disseminated YouTube videos in collaboration with her students, outlining the student goals for the week throughout the semester.

Another unit-based component was to ensure embedded faculty were actively engaged in the unit-based committee (UBC). All of the embedded faculty were members of the UBC and were involved in staff meetings. In one unit, the embedded faculty provided educational training to staff around skin/wound assessment and treatment. The additional components were achieved by all three pilot units. The faculty and unit leadership met both formally and informally throughout the intervention to review progress towards the goals, communicate initiatives at the school of nursing and health system, and evaluate current status of the EUI.

**Outcomes.** Unit teams embraced each of the model components, operationalizing each structure and process in alignment with the unit environment. Unit leadership, faculty, staff, and students all described

benefits of the EUI. As noted above, staff regarded the faculty as ‘part of the team’, feeling very confident in reporting any concerns they have related to student education. Students described improvements in their confidence levels around patient interviewing—a component of most unit action plans—as well as feeling engaged and ‘valued’ for the work they did towards improving quality.

A second factor in determining the success of the EUI was to identify attainment of the two goals (e.g. quality goal, model of care goal) set forth by the respective units. In all three units, patient and/or student outcomes improved during the intervention. Specific findings will be discussed in the remaining presentations within this symposium.

**Conclusion:** Evaluation of the EUI provided evidence that we were successfully able to embed faculty into a clinical unit, further strengthening the academic partnership. Many of the activities described by the unit teams portrayed that of a successful academic partnership, including frequent communication/open dialogue; appropriate allocation of shared resources; shared vision/goals/mission; trust, respect, and commitment.<sup>2</sup> Unit leadership, faculty, nurse mentors, and students all clearly identified the positive impact of the EUI on education and practice. Embedded faculty were completely integrated into the unit team, being seen as a valued team members, which led to trust, collaboration, ability to problem-solve, and open dialogue related to feedback on the initiative. Additionally, students were actively engaged in an initiative aimed at improving patient care. Staff members saw students as ‘value-added’ as they saw the impact their work had on improving clinical practice and outcomes.

This model is mutually beneficial—impacting patient outcomes while developing staff and students in a collaborative team environment. This model will impact practice in the future by fostering nurses who not only have been trained around world-class clinical standards, but also how theory and research are applied in clinical practice. Using this approach, the next generation of nurses will become strong leaders who can facilitate the advancement of nursing science.

Table 1: EUI Structure and Process Components

<b>Central / System Processes</b>
EUI lead and unit teams meet monthly to discuss unit activities, improvements in care, and actualization of EUI components.
A quality area of focus and one Patient Care Model goal is mutually identified.
An action plan is developed based on the unit goals.
EUI lead team rounds to understand dynamics of the CEI, and progress toward improving the QI area.
Additional process components implemented based on unit needs.
<b>Unit-based Structures</b>
EUI lead and unit teams meet to determine unit priorities.
The embedded faculty is an engaged member of the unit-based committee.
The embedded faculty communicates with the nurse mentors the student learning expectations.
Students review their daily learning goals with their mentor and faculty.
The nurse manager seeks opportunities to embed faculty on the unit.

The nurse manager communicates to faculty major unit initiatives/priorities.
--

The unit team problem-solves as issues arise related to students, mentors, action plan.
---

The nurse manager shares QI data with faculty as appropriate.

## **Impact of a Student and Faculty Collaboration on Patient Satisfaction with Pain Management**

---

*Mary Lynn Parker, MS, RN, USA*

*Jole' L. Mowry, MS, BSN, ADN, RN, USA*

#### Purpose

The purpose of this presentation is to provide an example of a clinical unit initiative.

#### Target Audience

All--Faculty, Students, Clinical Staff

#### Abstract

##### **Objectives:**

1. Describe collaborative interventions used to improve orthopedic patient satisfaction with pain management
2. Discuss methods used to develop BSN student knowledge regarding pain assessment and management

**Background:** Undermanaged post-operative pain is one of the biggest challenges for orthopedic patients, their families and nurses (Pasero and McCaffery, 2007). These patients can experience high pain levels and do not always perceive their pain needs are being heard or met which can lead to decreased satisfaction. Despite advances in pain management, nurses and practitioners receive very little formal education (Cordts, et. al.,2011) in analgesic and non-analgesic therapy for hospitalized orthopedic patients.

The orthopedic unit was chosen as one of three pilot units for the UM Hospital and School of Nursing (SON) Exemplar Unit Initiative (EUI). Over the past year, this unit noted a gradual decline in Press Ganey scores related to patient satisfaction with pain management. Therefore, "Improving patient satisfaction with pain management" was identified as the project focus. The group also wanted to facilitate student knowledge with patient pain assessment and management and strengthen the interaction between the nurse mentor and the student.

##### **Purpose:**

The purpose of the EUI collaboration between the Orthopedic unit and the School of Nursing was to:

1. Improve orthopedic patients satisfaction with pain management
2. Increase nursing students' knowledge in pain assessment and management
3. Improve staff nurse engagement and communication with students

**Process:** A method to increase student nurse involvement in patient pain assessment and management was developed. An in-depth interview survey "Improving Patient Pain Satisfaction" was designed to be completed by the BSN nursing students.

The goals of this intervention were to:

1. Provide structure for improved communication between patients and nursing

2. Integrate a framework for clinical education
3. Define mutually beneficial partnerships to improve patient care
4. Improve student clinical experience through well-defined goals and responsibilities
5. Increase student involvement and understanding of quality and evidence based practice

**Summary:** Over a nine month period, the EUI intervention was implemented in an acute care orthopedic unit. BSN sophomore students conducted patient pain management interview surveys, performed patient pain assessments, and wrote the patients' current pain score and pain 'goal for the day' score on the patients' whiteboard. These focused interventions were in addition to the students' direct patient care responsibilities with their assigned staff nurse mentor and attending post-clinical conferences with the embedded clinical faculty.

BSN students completed a Pain Management and Communication Pre and Post-Survey to assess individual and aggregate knowledge. Students were surveyed on the first day of clinical—prior to pain management education and on the last day of clinical. Two forums for orthopedic staff nurse mentors were held to provide feedback related to the EUI intervention, mentor role clarification and suggestions for student and mentor improvements.

Data was collected on the following:

1. Patient whiteboard pain goals
2. Student "Pain Management and Communication" pre- and post- surveys
3. "Improving patient pain satisfaction" surveys
4. Press Ganey patient satisfaction scores

The SON clinical faculty obtained whiteboard pain goal data (key process measure) and scored the students' Pain Management and Communication Pre- and Post-Surveys (student outcomes). Patient pain management interview survey data was reviewed by the unit's Clinical Nurse Specialist then entered into a spreadsheet by a SN assistant (key process measure). The Press Ganey Patient Satisfaction scores were obtained from the unit's Clinical Nurse Manager (patient outcomes).

**Findings: Patient Outcome Measures:** Press Ganey survey scores improved for five items in June 2014 vs. baseline June 2013:

2. How well was your pain controlled? (score 88.2; improved 3.8 points)
3. Caregivers response to concerns/complaints? (score 86; improved 4.0 points)
4. Staff worked together to care for you? (score 89.9; improved 2.5 points)
5. Attention to special/personal needs? (score 88.8; improved 1.2 points)
6. Nurses attitude toward requests? (score 90.8; improved 1.3 points)

**Key Process Measures:**

2. Acceptable pain goal documented on patient's whiteboard (55.5%)
3. Patient interviews completed by BSN students ( N=176)
4. Number of times whiteboard documentation complete compared to number of patient interviews completed (54.5%)
5. Number of times patients' acceptable pain goal for the day was met (55.3%)

**Student Outcomes from Pain Management & Communication Survey:**

- Knowledge at baseline (pre-intervention survey) 60.8% N=31
- Knowledge attained (post-intervention survey) 67.1% N=31

**Staff outcomes—Qualitative results:** BSN students reported the nurse mentors increasingly asked and discussed pain goals and pain management with the patient. More patient education opportunities were noted and some changes in analgesic medication regimes occurred. Staff nurse mentors listened to students' information related to patients' pain concerns and addressed issues in a timely manner. Staff mentors' forums were held the second month of the interventions and staff commented that students needed more education about patients' realistic pain goals—especially those with chronic pain history. The staff mentors were surveyed in the sixth month of the interventions and demonstrated 100%

of mentors were aware the students were interviewing patients about their pain satisfaction (n=4). Seventy-five percent of mentors reported the student's interview with the patient 'Sometimes' or 'Usually' improved that patient's satisfaction with their pain management (n=4). When asked whether the student wrote the patient's pain goal on the whiteboard, mentors responded equally among 'Rarely', 'Sometimes', 'Usually' and 'Always' (n=4).

**Conclusion:** Since implementing this project, we have seen the following:

- Improved student nurse knowledge in listening to the patient's story and performing a pain assessment
- Patients perceived increased collaboration and attentiveness to their individual needs
- Clinical staff nurse mentors were more engaged in student learning
- Increased student engagement in improving patient outcomes and experiences were noted by both nursing staff and students
- Improved Press Ganey patient satisfaction scores in five key areas r/t pain management

In summary, the EUI collaborative relationship and intervention was perceived as very valuable to patients, nursing staff and BSN students despite the time requirements. School of Nursing and Health System leaders were very pleased with the process and patient satisfaction outcomes. The group will continue to work improving patient satisfaction with pain management and increasing student and staff knowledge in providing safe and effective pain measures. This project is being repeated on the orthopedic/trauma unit within the hospital.

### **Student Assessment and Fall Evaluation (S.A.F.E. Team): A Collaborative Initiative in an Academic-Service Partnership to Improve Patient Safety**

---

*Ann K. Gosselin, DNP, RN, USA*

*Inga Vitins, BSN, RN, USA*

*Julie Grunawalt, MS, RN, GCNS-BC, USA*

*Winnie Wood, MSN, RN, CNS, USA*

*Sandra Kendziora, BSN, RN, USA*

#### Purpose

The purpose of this presentation is to describe the Exemplar Unit Initiative (EUI) at the University of Michigan Health System on a medical-surgical unit, and illustrate the collaborative academic-service partnership through a fall prevention pilot.

#### Target Audience

The target audience of this presentation is registered nurses, nurse educators, nursing leadership, and nursing students.

#### Abstract

**Background:** Academic-service partnerships (ASP) are becoming more prevalent in the United States, and while there is no perfect model for this partnership the urgency for health care institutions to establish collaborative relationships for scholarly practice is evident. An ASP is a structural linkage between

universities and service entities whose primary goal is to share one vision through collaboration and improving patient care quality with innovative processes or interventions.<sup>[1]</sup> One such partnership exists at the University of Michigan Health System where the Clinical Excellence Initiative (CEI) has been implemented since 2009. In the last year three units were chosen within this partnership to pilot an exemplar unit initiative (EUI). An exemplar unit is one that provides an integrated structure for clinical and academic leadership that is mutually beneficial and works towards common goals using quality measures and implementation processes.

**Purpose:** The purpose of this presentation is to describe and illustrate the innovative processes implemented through fall prevention pilot program on one of the three units chosen for the EUI.

**Methods:** A leadership team was chosen from the selected EUI that consisted of an embedded faculty member, unit leadership, and clinical nurse specialist. The leadership team met monthly with the guidance of the ASP leadership where it was decided to implement a process that impacted the quality of care and practice on the unit using the undergraduate baccalaureate nursing students as part of the process. Using the current quality data provided by unit leadership, patient falls was identified as a priority quality indicator. Past and current fall prevention practices on the unit were discussed and a logic model for the implementation of a fall prevention pilot was developed based on resources available. A literature search was conducted by a staff nurse with faculty assistance to evaluate the best evidence for a fall prevention program on a medical surgical unit. The current literature suggests that a multimodal individualized patient approach to fall prevention was the most successful way to address inpatient fallers. Oliver et al (2010)<sup>[2]</sup>, identified consistent risk factors for patient fallers to have: experienced a recent fall, muscle weakness, behavioral disturbance, agitation, confusion, urinary incontinence or frequency, drugs, and hypotensive episodes or syncope. Short term and long term goals were identified for pilot program and included: the reduction of the current fall rate on the unit (falls per 1000 days), identification of specific risk factors for the EUI patient population, collaborative development of a multimodal fall prevention plan specifically for the EUI patient population, and development and implementation of an interactive fall prevention process for student learning and promotion of safe collaborative patient care. The Student Assessment and Fall Evaluation (S.A.F.E.) team was developed with staff nurse consultation and nursing leadership approval. Implementation of the S.A.F.E. team included: data collection from the risk pro management system to identify past fallers and possible risk factors, icon sign development and placement for each patient room to clearly and quickly identify a patient's specific risk factors, nursing student rounding (in addition to nurse rounding) once a week to gather patient stories and identify current patient risk factors, elimination of the immediate environmental risk factors for the patient, promotion of immediate patient protolieting, the provision of in time patient/visitor fall prevention education, and student-charge nurse collaboration to address identified patients at highest risk to fall. Process outcomes measured included: completed patient interviews, compliance to bedside posters, environment of care attention, provision of protolieting, and provision of patient education. The pilot is ongoing and starts each semester with a new group of nursing students; however, the fall data is from the past year (2014) and the student confidence levels are from the past two semesters (8 months total).

**Results:** The overall fall rate for the EUI unit did not show an immediate reduction from the previous year; however, the overall fall rate for the unit has been on a downward trend. A large increase was noticed in student confidence levels (N=24 pre & N=20 post) through a pre and post survey in regards to their interviewing skills and identification of patients individualized risk factors as well as a patient's overall risk to fall. Individual interviews with the nursing staff (N =5) identified a better understanding of individualized characteristics for the fallers on the EUI unit after reviewing the cleaned risk pro data sets to include the demographics of mean age of patient fallers, % of male to female fallers, time of day for falls, and patient story (identified risk factors).

**Conclusion:** Implementing a student driven interactive fall prevention pilot on a medical surgical unit has its challenges, however, the overall experience of its implementation has been overwhelmingly positive for both sides of the partnership. Although the immediate impact on the fall rate has not been realized the process will be continually monitored and developed to meet the needs of the patient population, clinical practicing staff, and learning needs of the students. This is a dynamic process and as we learn more about the EUI units' patient population through the patient stories and demographics more opportunities

will come into play to fine tune the fall prevention program and promote safer patient care through the use of evidence based multimodal fall interventions.

## D 05 - Clinicians Using Standardized Clinical Data to Inform Practice and Influence Health Policy Directions

### Standardizing the Collection of Clinical Outcomes to Support Evidence-Based Practice

---

*Peggy Ann White, MN, BA, RN, Canada*

#### Purpose

describe the background and intent of the C-HOBIC initiative.

#### Target Audience

Staff nurses, nurse managers, executives, decision-makers.

#### Abstract

Measuring and improving the quality of health care delivery is one of the most critical challenges facing health care clinicians and decision-makers. In the Canadian province of Ontario, a task force recommended the capture of information reflecting nurses' contributions to patient care; specifically, clinical outcomes. The Health Outcomes for Better Information and Care (HOBIC) initiative was established to identify nursing-sensitive outcomes and processes for their capture in electronic health records and subsequent extraction to centralized databases.

HOBIC introduced a systematic structured language to patient assessments for a suite of evidence-based clinical outcomes: functional status, readiness for discharge, symptoms (pain, nausea, fatigue, dyspnea), safety outcomes (falls, pressure ulcers. This information is abstracted with ADT (admission, discharge, transfer) information, to a real time database that, as of January 2015 houses over 1,000,000 assessments from more than 185 organizations across Ontario.

This presentation will describe the background to this initiative and the approach to collecting this dataset at the point of care. One of the key goals of this work is to engage nurses and nurse leaders in realizing the benefits of standardized clinical outcomes information to inform quality patient care. Through the electronic collection of the standardized clinical outcomes at the point of care, nurses, nurse executives, researchers and policy makers are provided with real time information. Examples of how nurses and leaders in health care organizations are using the HOBIC information to assess performance within units and organizations to facilitate quality patient care will be presented.

As part of this initiative, researchers have access to an aggregate database of standardized clinical information. Current efforts are focused on linking this dataset with other datasets, and exploring the ability of this suite of standardized clinical information to predict the need for alternate level of care status and length of stay for patients that are admitted to acute care. Initial research findings have been shared with clinicians, challenging them to think about their practice with a goal of better preparing patients to manage their self care on discharge from acute care.

To advance clinical practice it is essential that data be collected in a format that allows for sharing of data between clinicians, within organizations and across clinical borders to facilitate transitions and support quality patient care. Collection of data in a standardized format and the active engagement of clinicians is and will continue to be essential to transforming healthcare in Canada. With an increasing focus on professional and financial accountability it is important that nurses are able to demonstrate the impact of their practice on patient outcomes within the healthcare system. This initiative is leading the way by providing nurses with evidence-based information to evaluate the impact of their practice.

## Evaluating the Use of C-HOBIC and the C-HOBIC Transition Synoptic Report

---

Lynn M. Nagle, PhD, MScN, BN, RN, Canada

### Purpose

provide a summary of the evaluation activities associated with the use of C-HOBIC and the Transitional Synoptic Report. Findings and implications of evaluation activities will be reported and discussed in terms of health policy directions.

### Target Audience

Staff nurses, managers, nurse executives, nurse informaticians, and decision makers.

### Abstract

**Purpose/Objective:** Electronic health records (EHRs) offer the opportunity to improve patient outcomes across the continuum of care. Fundamental to achieving these improvements is the use of standardized clinical data to measure and compare clinical outcomes across care settings. The Canadian Health Outcomes for Better Information and Care (C-HOBIC) encompasses a suite of standardized outcomes including: a) functional status, b) symptom management (dyspnea, nausea, pain, fatigue), c) continence, d) risk for falls and skin breakdown, and e) readiness for discharge. The acute care admission and discharge assessments of these outcomes has been captured numerically and graphically in a Transition Synoptic Report (TSR) designed for sharing with clinicians in post-acute discharge sectors. The TSR provides a summary of the acute care admission and discharge C-HOBIC information. By comparing the clinical outcomes between admission and discharge, health care providers (HCPs) can plan for appropriate care and the resources needed for ongoing patient care. The components of these evaluation efforts included online surveys, focus groups, and senior nursing leader interviews. The evaluation questions focused on their perceptions of the C-HOBIC measures and TSR usability, utility and value to clinical practice. Evaluations have been conducted to understand clinician use and perceptions of the impact and value of the outcome measures and a TSR. In this presentation, the results of the evaluations and recommendations for future directions will be provided.

**Findings/Results:** Evaluations have been completed in 2 provincial jurisdictions, specifically engaging acute care and home care clinicians. In this presentation, the C-HOBIC and TSR post-implementation evaluation findings will be presented and discussed. Implications for future implementations of C-HOBIC and the TSR will be addressed.

**Conclusion:** The importance of adopting clinical data standards to facilitate the consistent measuring, monitoring, and reporting of clinical outcomes cannot be underestimated. Standardizing patient assessments within and between care settings has the potential to demonstrate the collective impact of various providers, interventions, and supports on patient outcomes, system costs, and overall use of the healthcare system. The value of using a graphic and numeric representation to share clinical outcomes in the form of a TSR between care settings is yet to be fully understood. Our initial implementation and evaluation activities provide insights to inform future use.

This initiative was sponsored and managed by the Canadian Nurses Association, and funded with contributions from Canada Health Infoway and participating provincial partners.

## Advancing Clinical Data Standards in Canada

---

Kathryn J. Hannah, PhD, MScN, BScN, RN, FAAMI, Canada

### Purpose

Describe the significance of adopting clinical data standards for nursing practice and the relationship of C-HOBIC to ICNP v.2.0 and SNOMED-CT.

#### Target Audience

Staff nurses, managers, and executives, decision-makers.

#### Abstract

The collection, reporting and use of standardized data offers the opportunity to transform healthcare, however, for the most part the standardized data collected to date is predominantly comprised of performance indicators. The uptake and use of standardized clinical data continues to present a challenge in healthcare. Canadian Health Outcomes for Better Information and Care (C-HOBIC) is an initiative of the Canadian Nurses Association (CNA) that is leading the way with the collection of standardized clinical outcomes reflective of nursing practice in Canada. Building on groundbreaking work in Ontario, C-HOBIC introduces systematic structured patient assessments that are documented in standardized clinical terminology across the health care system. The use of standardized clinical terminology to document the assessments enables them to be abstracted into jurisdictional EHRs and anonymized for use in national databases. Thus patients' clinical outcomes information is available to clinicians through the EHR but also for healthcare executives, policy makers and researchers by way of aggregated and anonymized population data. The C-HOBIC dataset is a Canada Approved Standard.

Work is now underway to advance the collection of this dataset across Canada. With funding from Canada Health Infoway and participating provincial partners, pilot projects were undertaken to demonstrate the feasibility and value of collecting this dataset in different settings and jurisdictions across Canada. The lessons learned from this work are informing future implementations in Canada. To support the inclusion of this assessment data in electronic health records (EHRs) as they are being implemented, the C-HOBIC dataset has been mapped to both ICNP® V2 and SNOMED CT. Because SNOMED CT is the clinical terminology recommended for use in EHRs in Canada this will have far-reaching impact on the uptake of these clinical outcomes in jurisdictions and care settings across Canada.

The approaches to enabling adoption through the development and implementation of the C-HOBIC dataset will be examined with a focus on the opportunities for outcomes data to support evidence based care, improve clinical patient outcomes, inform policy making and enhance health system effectiveness. The strategies for advancing the uptake of the C-HOBIC dataset in healthcare settings across Canada will be discussed.

The importance of adopting clinical data standards to facilitate the consistent measuring, monitoring, and reporting of clinical outcomes cannot be underestimated. Standardizing patient assessments has the potential to demonstrate the collective impact of various providers, interventions, and supports on patient outcomes, system costs, and overall use of the healthcare system.

## F 05 - The Wonders of Concept Mapping as Learning Tool

### Using Concept Maps as Reflective Activity

---

*Gisela H. Van Rensburg, D Litt et Phil, MA Cur; BA Cur(Hons); BA Cur, General nurse (RN), Midwife, Community nurse, Psychiatric nurse, Nurse educator, Nurse manager and Orthopaedic nurse, South Africa*

#### Purpose

provide the basic characteristics or criteria of a concept map. The findings of a case study on postgraduate group supervision will be discussed and value of using concept maps will be highlighted.

#### Target Audience

Nurse educators, postgraduate supervisors and preceptors

#### Abstract

The dynamic relationship between student learning, pedagogy and context necessitate innovative strategies in teaching and learning. These strategies suggest an integrative approach to ensure quality teaching and learning. Innovative strategies refer to strategies that meet needs in a more effective manner by approaching practices differently or developing new strategies. The outcome of innovative strategies is to achieve 'growth' in the teaching and learning process.

Concept mapping provides a visual presentation of meaningful relationships between concepts in the form of propositions (two or more topics linked by verbs that describe the relationship between them). It creates an avenue for expression in a creative manner and represents a person's own interpretation of ideas in a diagrammatic form, allowing the person to organise information based on knowledge, insight, understanding and experiences within a given context.

Concept mapping was used as a reflective activity in a specific case study on postgraduate group supervision. The findings provided significant insights into the use of concept maps as learning tools and reflective activities in that it allowed for critical reflection and assisted in addressing identity issues and hidden assumptions.

### Developing Critical Thinking Skills through Concept Mapping

---

*Yvonne Botma, PhD, MSocSci, HonnSocSci, BSocSci, RN, RM, FANSA, South Africa*

#### Purpose

The purpose of this presentation is to develop critical thinking skills by using concept mapping as a learning tool

#### Target Audience

all preceptors and nurse educators

#### Abstract

Concept mapping provides a visual presentation of meaningful relationships between concepts in the form of schemes. Competence in nursing is based on the ability to integrate knowledge in order to identify the problem or shortcomings and understand the related theory to the problem. Evidence of competence further lies in the application of the integrated knowledge in a practical event or situation in a real life setting or simulation. A competent practitioner therefore has the ability to think critically.

In using concept maps, critical thinking skills are developed through the graphic presentation of the following:

- the central issues and assumptions in the argument
- declarative knowledge and information from a wide range of sources
- different arguments, claims and evidence
- important relationships and evidence-based interpretations
- valid and reliable evidence
- inferences drawn from the evidence
- conceptualisation of decisions and solutions to problems

Contact

[botmay@ufs.ac.za](mailto:botmay@ufs.ac.za)

## **The Value of Concept Maps in Theory-Practice Integration**

---

*Lizeth Roets, PhD, MSocSc, BSocSc, PhD, MSocSc, BSocSc, South Africa*

Purpose

to provide the audience with information on what and how the concept maps should be assessed and make recommendations on the use of concept mapping as a learning and teaching tool.

Target Audience

Nurse educators, postgraduate research supervisors, preceptors

Abstract

Concept mapping enables the educator, preceptor and student to make 'connections' between concepts, theory and practice and different experiences. It stimulates creative thinking through freely associated connections between concepts, thus stimulating independent learning.

Although concept mapping proved to be an effective learning and teaching tool, supervisors of postgraduate students need to reflect on what is portrayed in the concept maps in order to assess whether evidence of theory and practice integration are represented in the concept maps. Thus the cyclic process should provide evidence of this.

To prevent that concept mapping is just another tool in research supervisory practices, the supervisor needs to reflect on the content and implications of the concept maps provided. In order to improve and contribute to evidence-based supervisory practice narrative reflections on the concept maps and the meaning thereof is an important aspect in this cyclic teaching process.

## G 05 - QSENizing the Practice Setting: A Three-Part Presentation, Applying the QSEN Framework to Practice

### Innovation in Practice: A QSEN Framework for Redesigning a Clinical Advancement Program for Nurses

---

*Kathleen A. Bradley, DNP, RN, NEA-BC, USA*

#### Purpose

Describe the use of a competency framework for transforming a clinical advancement program for practicing nurses. A 12-step process for building a comprehensive clinical ladder will highlight application of IOM recommendations and the strategic addition of leadership as a distinct competency characteristic needed for nursing practice.

#### Target Audience

Academic or practice leaders interested in translating the quality safety work of Quality Safety Education for Nurses from the academic setting to the practice environment.

#### Abstract

The Institute of Medicine recommendations to address quality and safety provided the spark for the Quality Safety Education for Nurses (QSEN) movement. This spark has also been felt within the practice setting. QSEN now serves as the cornerstone for building competency-based practice focusing on the six domains of nursing practice.

Healthcare reform is a driving force in the practice setting. Nursing executives value competency as the driver of quality, patient safety and cost of care. Improving nursing competency and advancing the profession are the goals of a clinical advancement program.

This presentation will describe how a large academic healthcare system used QSEN competencies to redesign a clinical advancement program for registered nurses. A twelve step process was used to build a competency-focused, clinical advancement program, or clinical ladder.

The first step was recognition and support from nursing leaders, the Nursing Credentialing Review Board (NCRB) and human resources. Step two was involvement of nurses at all levels in subcommittees to lead the design and process work. Step three was completion of literature review and benchmarking for current clinical ladders in healthcare. Step four was drafting the ladder in a categorized, competency-focused framework or "QSENizing" the design. Of note, graduate level competencies were used for higher levels within the ladder and an additional leadership competency was added. Step five was redesigning the process for applications and credentialing within the NCRB. Step six was to gain approval of the new ladder and process through various decision-making committees. Step seven was the completion of a comprehensive market evaluation for compensation practices with the new ladder. Step eight was building an education plan for rollout. Step nine was building the infrastructure for the electronic submission process of credentialing through portfolios. Step ten was educating leadership and nursing staff on the competency focused clinical ladder. Step eleven was building professional portfolios for over 500 nurses and step twelve was building new registered nurse job descriptions based on the clinical ladder.

Using QSEN as the framework helped to define the domains of nursing practice and now serves to provide definitions of higher levels of nursing professionalism within the practice setting.

# **Innovation in Practice: A QSEN Framework for Redesigning a Clinical Advancement Program for Nurses and Strategies to Grow and Sustain a Competency Assessment Model Utilizing the Quality Safety Education for Nurses (QSEN) in the Clinical Setting**

---

*Nicki M. Shonka, MS, RN-BC, CPN, USA*

## Purpose

The second presentation discusses the process of integrating, expanding, and sustaining a clinical competency assessment model utilizing the QSEN framework. A four phased approach for building a comprehensive competency tool will be illustrated. The presentation highlights the pearls and pitfalls of implementing an innovative standardized approach to measuring competency.

## Target Audience

Academic or practice leaders and educators interested in translating the quality safety work of Quality Safety Education for Nurses from the academic setting to the practice environment.

## Abstract

The Institute of Medicine recommendations to address quality and safety provided the spark for the Quality Safety Education for Nurses (QSEN) movement. This spark has also been felt within the practice setting. QSEN now serves as the cornerstone for building competency-based practice focusing on the six domains of nursing practice.

Healthcare reform is a driving force in the practice setting. Nursing executives value competency as the driver of quality, patient safety and cost of care. Improving nursing competency and advancing the profession are the goals of a clinical advancement program.

This presentation will describe how a large academic healthcare system used QSEN competencies to redesign a clinical advancement program for registered nurses. A twelve step process was used to build a competency-focused, clinical advancement program, or clinical ladder.

The first step was recognition and support from nursing leaders, the Nursing Credentialing Review Board (NCRB) and human resources. Step two was involvement of nurses at all levels in subcommittees to lead the design and process work. Step three was completion of literature review and benchmarking for current clinical ladders in healthcare. Step four was drafting the ladder in a categorized, competency-focused framework or "QSENizing" the design. Of note, graduate level competencies were used for higher levels within the ladder and an additional leadership competency was added. Step five was redesigning the process for applications and credentialing within the NCRB. Step six was to gain approval of the new ladder and process through various decision-making committees. Step seven was the completion of a comprehensive market evaluation for compensation practices with the new ladder. Step eight was building an education plan for rollout. Step nine was building the infrastructure for the electronic submission process of credentialing through portfolios. Step ten was educating leadership and nursing staff on the competency focused clinical ladder. Step eleven was building professional portfolios for over 500 nurses and step twelve was building new registered nurse job descriptions based on the clinical ladder.

Using QSEN as the framework helped to define the domains of nursing practice and now serves to provide definitions of higher levels of nursing professionalism within the practice setting.

In the practice setting, a comprehensive measurement of competency assessment is essential in initial orientation and ongoing education of clinical staff. This presentation will describe how a large academic healthcare system integrated, expanded, and sustained a clinical competency assessment model utilizing the Quality Safety Education for Nurses (QSEN) framework. As the Institute of Medicine (IOM) identified criteria for nursing to provide safe quality patient care, it became apparent the use of a traditional skills

checklist was not an accurate measurement of competency. This shifted the thought process from measuring skills to a more comprehensive approach including knowledge, skills and attitudes.

A review of the literature was completed and QSEN provided the framework for the competency assessment model. In 2011, the basic competency assessment tool utilizing the six Institute of Medicine (IOM) criteria was developed. The new competency assessment tool included sections for learner self-assessment, method of instruction and validation of competency. This became the basic nursing competency assessment for all newly hired nurses. Phase two was the development of what is now a three tiered comprehensive competency assessment process that includes knowledge, skills and attitudes specific to patient populations. A formative evaluation was conducted with preceptors and new hires, which identified a knowledge gap about QSEN, as well as utilization of the new competency assessment tool. Phase three introduced the expansion of the competency tool to disciplines outside of nursing. Phase four was the creation of the sustainability process including a three year revision cycle.

The introduction of this innovative competency assessment process was a significant cultural change for the organization and presented many challenges including educational deficits. Ongoing education continues on QSEN, defining competency, and standardizing criteria across all three competency tiers to build on strengths of this model. Over the past four years this competency assessment work has flourished from a basic nursing assessment tool into an inter-professional framework. This work will continue to expand as we explore new opportunities.

## **Strategies to Grow and Sustain a Competency Assessment Model Utilizing the Quality Safety Education for Nurses (QSEN) in the Clinical Setting**

---

*Ciara Culhane, MS, RN-BC, CPN, USA*

#### Purpose

The second presentation discusses the process of integrating, expanding, and sustaining a clinical competency assessment model utilizing the QSEN framework. A four phased approach for building a comprehensive competency tool will be illustrated. The presentation highlights the pearls and pitfalls of implementing an innovative standardized approach to measuring competency.

#### Target Audience

Academic or practice leaders interested in translating the quality safety work of Quality Safety Education for Nurses from the academic setting to the practice environment.

#### Abstract

In the practice setting, a comprehensive measurement of competency assessment is essential in initial orientation and ongoing education of clinical staff. This presentation will describe how a large academic healthcare system integrated, expanded, and sustained a clinical competency assessment model utilizing the Quality Safety Education for Nurses (QSEN) framework. As the Institute of Medicine (IOM) identified criteria for nursing to provide safe quality patient care, it became apparent the use of a traditional skills checklist was not an accurate measurement of competency. This shifted the thought process from measuring skills to a more comprehensive approach including knowledge, skills and attitudes.

A review of the literature was completed and QSEN provided the framework for the competency assessment model. In 2011, the basic competency assessment tool utilizing the six Institute of Medicine (IOM) criteria was developed. The new competency assessment tool included sections for learner self-assessment, method of instruction and validation of competency. This became the basic nursing competency assessment for all newly hired nurses. Phase two was the development of what is now a three tiered comprehensive competency assessment process that includes knowledge, skills and attitudes specific to patient populations. A formative evaluation was conducted with preceptors and new

hires, which identified a knowledge gap about QSEN, as well as utilization of the new competency assessment tool. Phase three introduced the expansion of the competency tool to disciplines outside of nursing. Phase four was the creation of the sustainability process including a three year revision cycle.

The introduction of this innovative competency assessment process was a significant cultural change for the organization and presented many challenges including educational deficits. Ongoing education continues on QSEN, defining competency, and standardizing criteria across all three competency tiers to build on strengths of this model. Over the past four years this competency assessment work has flourished from a basic nursing assessment tool into an inter-professional framework. This work will continue to expand as we explore new opportunities.

## **How to Excel at Evaluating a New Graduate Nurse Residency Evidence-Based Practice Program**

---

*Donnya E. Mogensen, MS, RN-BC, USA*

#### Purpose

This presentation discusses tool development, implementation, evaluation and program changes of the Evidence Based Practice (EBP) component within a one-year nurse graduate residency program. This evaluation tool assesses the knowledge, skills and attitudes of new graduate nurse over three separate time points related to integration of EBP into practice.

#### Target Audience

Academic or practice leaders interested in translating the quality safety work of Quality Safety Education for Nurses from the academic setting to the practice environment. Additional target audience includes clinical educators and leaders interesting in expansion of new graduate nurse residency programs.

#### Abstract

Evidence Based Practice (EBP) is an integral part of nursing and needs to be included in any program that transitions new nurses into practice. New Graduate Nurse Residency Programs (NGNRP) are designed to build knowledge, skills and attitudes of new nurses during this transition. The NGNRP in this example is a year-long program featuring three distinct components; classroom learning, clinical precepted experience and an EBP project. The EBP component is designed to ignite the spirit of inquiry and advance best practices. The EBP component includes classroom EBP curriculum, a hands-on EBP project and outcome measurement of the assimilation of evidence into practice. This presentation will focus on how a large academic healthcare system developed an innovative method to evaluate the EBP components within the NGNRP.

Currently, individual classes in the NGNRP are evaluated using a level one evaluation of objectives. Anecdotal evidence indicated residents gained knowledge of EBP, but were not always comfortable with the process of integrating evidence into practice. As a means of measuring the new graduate nurses transition in knowledge, skills, and attitudes related to EBP it was determined that a more summative program evaluation was needed. After a search of the literature no evaluation tool was discovered measuring EBP knowledge, skills and attitudes in the new graduate nurse population.

An innovative program evaluation tool was developed to evaluate the effectiveness of the didactic content and project completion of the EBP component within the NGNRP. Quality Safety Education for Nurses (QSEN) competencies related to EBP were used as a reference during the development of the thirty question Likert scale tool. In addition, questions reflect separate categories of knowledge, skills and attitudes of the new graduate nurse around EBP competencies. EBP surveys are distributed at the beginning of the residency and re-evaluated at 6 months and one year.

This tool was originally designed as a program evaluation tool. Initial data indicates residents value EBP but lack knowledge and skills related to EBP models. Based on this initial data, program curriculum has been modified to encompass more details around EBP steps. Further application of this tool will be discussed.

## H 05 - Innovative Use of Technology to Change Nursing Practice

### Using SMART Technology to Measure Nursing Practice at the Organization, Unit, and Individual Levels

---

*Jeanine Rundquist, DNP, RN, NEA-BC, USA*

#### Purpose

The purpose of this presentation is to demonstrate how the use of the electronic auditing tool resulted in improvement in efficiency and effectiveness of the observational auditing process resulting in significant improvement in PIVIE, CLABSI, and HAPU bundle compliance.

#### Target Audience

The target audience of this presentation is nurse leaders, clinical nurses and/or quality/safety professionals.

#### Abstract

When implementing changes in nursing practice, it is important to audit for compliance with the change. Within quality and process improvement methodology, observational audits are considered the 'gold standard' because observing the practice in its natural setting is more reliable than documentation or self-report. As one large, academic pediatric organization was implementing standard care bundles to reduce preventable harm to patients, the inter-professional leaders of this work knew it was imperative to conduct observational audits.

Historically, conducting observational audits was both time and cost-prohibitive. The auditors needed at least basic clinical acumen in the focus of the audits, as well as training to ensure inter-rater reliability. Audits were on paper and thus needed entry into a spreadsheet or software package for analysis. Information necessary from the electronic medical record was pulled manually through chart audits, or by running electronic reports that then needed validation. With the large number of audits needed for the preventable harm initiative, the team brainstormed alternatives to this traditional method of auditing.

In creating a plan to make bundle compliance audits more efficient and effective, various software applications were evaluated. The inter-professional team decided to use software that was designed for research but transferrable to quality and safety. "Data were collected and managed using REDCap electronic data capture tools hosted at our organization. REDCap (Research Electronic Data Capture) is a secure, web-based application designed to support data capture for research studies, providing 1) an intuitive interface for validated data entry; 2) audit trails for tracking data manipulation and export procedures; 3) automated export procedures for seamless data downloads to common statistical packages; and 4) procedures for importing data from external sources" (Harris et al, 2009).

REDCap provided this organization the opportunity to create audit surveys accessible through iPads and iPhones as well as at computer stations throughout the organization. This greatly improved efficiency as the data was directly entered into the database at the time of the audit rather than on paper to be entered at a later date. REDCap was also able to automatically populate fields from the electronic medical record into the audit thereby reducing time and increasing reliability of the data. Finally, the REDCap database could interface with the quality dashboard providing real-time data reporting. Overall, adoption of this technology improved effectiveness – time spent on just-in-time education and coaching rather than completing paper audits.

REDCap audit surveys were built for all the preventable harm teams. After implementing REDCap for auditing in the three pilot teams (peripheral intravenous catheter infiltrates/extravasations (PIVIE), central line associated blood stream infections (CLABSI), and hospital-acquire pressure ulcers (HAPU)) the auditors reported ease of use, shorter time needed to conduct an audit, and more time to do just-in-time teaching and coaching on the bundle elements. Each audit team could also access the reports to see the bundle compliance data for their unit and as a whole hospital in real time. The unit auditor could then

focus education on any element lagging and/or design other interventions to improve the overall compliance. Each bundle has three to six elements so compliance for each element was reported as well as the all-or-none compliance. All-or-none compliance means that every element in the bundle was completed.

This presentation will demonstrate how the use of the electronic auditing tool resulted in improvement in efficiency and effectiveness of the observational auditing process resulting in significant improvement in PIVIE, CLABSI, and HAPU bundle compliance.

## **Dashboards and Data: Supporting Strategy through Transparency of Metrics**

---

*Diedre Bricker, MSN, RN, CRRN, USA*

Purpose

The purpose of this presentation is to teach the audience how to build a nursing quality dashboard and describe the utilization of the quality metrics.

Target Audience

The target audience of this presentation is nurse executives, leaders and quality/safety professionals.

Abstract

The Triple Aim was developed by the Institute for Healthcare Improvement (IHI) and encompasses three aims in improving healthcare performance: 1) improving the patient experience of care, 2) the health of populations, and 3) reducing the per capita cost of healthcare (IHI, 2014).

Nursing performance metrics are often static and provided in summary reports monthly or quarterly. Analysis of these metrics is 'after the fact' and offers no pro-active opportunities. Using an innovative graphical software program, Tableau, a dynamic nursing quality dashboard was created with real-time metrics, end-of-month, end-of-quarter, and nationally benchmarked metrics. The nursing dashboard contains performance metrics important to the operations of a nursing unit, including quality and safety, finance, and personnel indicators.

The nursing quality dashboards are posted on the internal Intranet site for easy access. The dashboard has a dynamic table of contents for each unit where the nursing staff and leaders can navigate through all available performance metrics. It is possible to drill-down on performance metrics by type (i.e. pressure ulcers, infections, nurse satisfaction, patient satisfaction), date and in some cases, cause of the issue. Both process measures and outcomes measures are provided for quality improvement initiatives.

The individual preventable harm work teams utilize the dashboards for analysis of compliance with standard patient care, as well as the outcome of their improvement efforts. Nursing leaders utilize the real-time information to adjust resources to support the patient experience, the continuum of care and positive patient outcomes. Nursing leaders have the opportunity to use the performance metrics throughout the month to understand both process and outcomes metrics for priority initiatives. Balancing the quality and safety outcomes with financial targets enables a triple aim perspective of nursing practice. This perspective is essential for elevating the role of the nursing leaders by providing them with unit, service-line, or organizational metrics in an easy-to-view manner, critical for successful analytics and action planning. Examples will be provided of utilization of the nursing dashboard and data driven decision-making.

## Got Projects? An Innovative Use of Technology to Approve and Track Nursing Projects

---

*Kathleen A. Bradley, DNP, RN, NEA-BC, USA*

### Purpose

The purpose of this presentation is to describe how to build an electronic project tracking process and mentoring program for nursing projects.

### Target Audience

The target audience for this presentation is nurse leaders and project managers.

### Abstract

Supporting a Magnet culture includes mentoring the next generation of nurse scientists. Using a triad approach to monitoring, mentoring, and tracking nursing projects enables the growth of nursing involvement in research, quality improvement and application of evidence based practice.

SharePoint is team collaboration software from Microsoft Office. In our organization, SharePoint was introduced as a document sharing option for departments, committees and work teams. At first, the Nursing Division utilized SharePoint as intended for committee/council sites, but soon realized its potential to meet other needs of the Division. Through collaboration with information technology, nursing designed and built an electronic approval and tracking process for nursing projects.

This unique use of SharePoint has provided the opportunity to not only approve and track nursing projects electronically, but design a step-by-step process for conducting projects and receive mentoring from internal experts along the way. A Nursing Project Review Board (NPRB) consisting of quality experts and nurse scientists was developed to oversee this new process. The nurse submits the project in the form of PICO (problem, intervention, comparison, outcome), estimates the time necessary to complete the project and electronically submits the project to the manager for approval. After manager approval, it routes to the NPRB. The NPRB determines the type of project (research, quality, evidence-based practice, program evaluation), assigns a mentor and ensures the design/methodology is sound before final approval. The project lead automatically receives quarterly update reminders to inform the NPRB of progress. Also embedded within the system are resources to assist the lead through each step of the project including workshops, library resources, article critique forms, and biostatistician contacts.

Since its inception in early 2014, 65 projects have been submitted. A database is automatically created with all the projects and posted on the intranet so anyone can view the current project list; this transparency results in reduction of work duplication. This innovative approach allows an organization to support nursing involvement in projects and improvement in mentoring and tracking nurses' professional work.

# **Evidence-Based Symposia**

---

## **A 10 - Collaboration between Nursing Faculty and Instructional Designers Enhances Affective Learning Leading to Improved Knowledge Transfer of Evidence-Based Practice for Professional Nurses in a Graduate Education Program**

### **Effective Pedagogy Using Affective Learning Strategies Empowers Learners to Translate EBP Knowledge for Practice**

---

*Patricia Bicknell, EdD, MSN, BSN, RN, APRN, ACNS-BC, CNL, USA*

#### Purpose

The purpose of this presentation describes a collaborative approach between faculty and instructional designers to develop affective learning strategies for Graduate EBP education. Multimedia instruction helps students develop self-efficacy and confidence. This strategy is intended to reduce cognitive load, improve transition, and implementation of research models from theory to practice.

#### Target Audience

The target audience of this presentation is academic and clinical leaders concerned with the adoption, translation and sustainability of Evidence-based practice.

#### Abstract

The first part of the symposium focuses on theoretical outcomes from the use of affective learning strategies. Nursing education is often focused on the cognitive domain of learning; acquisition of new skills, and higher -level thinking are used to promote healthcare quality and safety, and are important outcomes of educating professional nurses in graduate coursework. While these same outcomes apply to teaching and learning goals for Evidence-based Practice (EBP) education, integration of teaching strategies in the affective domain are designed to motivate professionals to integrate and sustain a way of nursing practice known to improve care for patients and families. Learning in the affective domain for EBP puts the primary emphasis on discovery of meaning, capturing the essence of the practice, and perceptions of empowerment of nurses' ability to be successful innovators. Interprofessional collaboration with Instructional Designers assist faculty to develop innovative curricular elements to achieve these goals. Using Roger's Model of Diffusion as a framework, faculty and Instructional Designers plan interactive learning modules using visual art, and multimedia pedagogy. This allows students to not only build competence, but also confidence, with the process. Persuasion, decision-making and implementation are built on non-threatening formats for learning and practice. Implementation of the process allows students to internalize and value their new learning in the course. Outcomes demonstrate that this translates into knowledge transfer for clinical practice.

## **Interactive Instructional Design Strategies for Online Nursing Education**

---

*Nicholas Charles Gogno, MS, BA, USA*

#### Purpose

The purpose of this presentation is to present successful, online teaching and learning strategies designed to guide practicing nurses to evidence-based solutions in the field that improve patient outcomes.

#### Target Audience

Practicing Nurses, Nursing Faculty, Nursing Students, Instructional Designers

### Abstract

This portion of the symposium will present successful, online teaching and learning strategies designed to guide practicing nurses to evidence-based solutions in the field that improve patient outcomes. To overcome negative student emotions that may translate into reluctance to use research in practice, course designers created interactive, self-paced learning objects to instruct practicing nurses in the application of the Iowa Model and the Rogers' Diffusion of Innovations Theory. Research by Reilly, Gallagher-Lepak, and Killion (2012) points out that students may feel trepidation given the large volume of required readings in nursing education and desire more of an overview and clearly understandable materials that present content in new ways. Concept maps (ie - visual and text representations) of each research model help demonstrate complex concepts and improve student learning (Pilcher, 2011). By using cognitive maps, graphic art and multimedia, the learning objects featured in this symposium help reduce the cognitive load and negative emotions of students learning research models for the first time and allows them to move more quickly to the applying the model in their practice. The learning objects used were largely self-paced, self-directed, and included graphics, theory and case studies. These features support learners' individual learning preferences and achievement of learning objectives (Cottrell & Donaldson, 2013).

## **Empowering Nurses to Implement Evidence-Based Practice through Instructional Design**

---

*Priscilla C. O'Connor, PhD, MS (Nsg), BSN, RN, PMHCNS-BC, USA*

### Purpose

The purpose of this presentation is to demonstrate how staff nurses were empowered to apply the Iowa Model and the Rogers' model to their clinical practice.

### Target Audience

The target audience of this presentation is staff nurses who are members of evidence-based practice and faculty who teach evidence-based practice courses.

### Abstract

Staff nurses have been mandated to conduct and use research in their practice as part of a Magnet application. However, many nurses are reluctant to begin the process, because they are not familiar with the abstract nature of the research process, let alone, the application of research into practice (Shivnan, 2013). In fact the word, research, can cause nurses to experience anxiety at the very term. Those same nurses may have extensive clinical experience and can identify patient problems without difficulty. The challenge for nurses who do have research experience and evidence-based practice skills is to identify methods to merge the clinical experience of staff nurses with research and evidence-based practice skills. Empowering nurses can lead to their ability to merge research and evidence based practice (Huddleston, 2014). This presentation is an example of how staff nurses were empowered to apply the Iowa Model and the Rogers model into their clinical nursing practice (Schmidt & Brown, 2015). Through collaboration with

an instructional designer, learning objects were created to convert the abstract nature of research and evidence based practice into a concrete form for relaxed learning of the process.

## **B 10 - Publishing Evidence for Impact on Practice**

### **Leading the Development of Nursing Practice and Policy through Successful Publication**

---

*Ian J. Norman, PhD, MSc, BA, RN, FAAN, FRCN, United Kingdom*

#### Purpose

The purpose of the presentation is to provide the audience with information which will improve the quality of their published outputs and draw out their implications for nursing practice and policy.

#### Target Audience

The target audience of this presentation is professional nurses, midwives and other healthcare professionals who write or are thinking about writing for publication and healthcare students who are undertaking research as part of their professional development.

#### Abstract

Publication of research findings may be regarded as a moral duty – after all what good is research if it does not inform the evidence base of professional nursing? Yet a substantial amount of health related research remains unpublished and much more virtually unread. A survey of 635 completed clinical trials funded by the National Institutes for Health (NIH) found that less than half the results were published within 30 months of completion and a third of results remain unpublished 51 months following completion (Ross et al 2012).

In this presentation the editor-in-chief of a leading academic nursing journal will highlight reasons for non-publication of nursing research and share their 'top-tips' for researchers about how to improve their chances of publishing research findings in high impact journals and ensure that those findings will be used by practitioners and researchers.

### **Maximizing the Impact of Your Publications in an Open Access Environment**

---

*Peter Griffiths, PhD, United Kingdom*

#### Purpose

The purpose of this presentation is to increase the audience's understanding of debates within academic healthcare care publishing about the merits of different forms of publication and the use of social media to disseminate research findings and increase the likelihood of them informing nursing policy and clinical practice.

#### Target Audience

The target audience of this presentation is professional nurses, midwives and other healthcare professionals who write or are thinking about writing for publication and healthcare students who are undertaking research as part of their professional development.

#### Abstract

The pressure on nursing scholars to publish their research findings has never been greater. Publications bring scholars and their employing institutions recognition, raise the likelihood of further research funding

and are the pathway to a successful academic career. However, publishing practices and the publishing environment are changing. Whereas frequency of publication was once the main criterion for academic success (Norman & Griffiths 2008) the emphasis today is on producing fewer papers, but ones that are highly used and cited and published in high impact journals. Added to this the long and sometimes heated debate about the merits or otherwise of open access publishing (Griffiths 2014) of research findings seems to have been superseded by a commitment of major funding bodies internationally to open access publication as a requirement of research funding (HEFC 2014).

So what implications do all these changes in publication practices have for nursing scholars and the evidence based of nursing practice? Is open access publication really a good thing and what do we know about its impact on nursing practice and scholarship? And what is the role of social media in the dissemination of research outputs? These questions will be addressed in a presentation by led by the executive editor of a leading academic nursing journal followed by discussion with the audience.

## **Examining the Trends of Nursing Evidence-Based Research and the Measurements of Quality**

---

*Sarah J. Davies, BA, United Kingdom*

#### Purpose

The purpose of this presentation is to increase the audience's understanding of trends in academic nursing publishing, the ways in which the quality of published papers in nursing and healthcare are assessed and to a critical awareness of the use and potential abuse of publication metrics.

#### Target Audience

The target audience of this presentation is professional nurses, midwives and other healthcare professionals who write or are thinking about writing for publication and healthcare leaders and managers who are interested in increasing the reputation of their organisation through contributing to the evidence base of nursing practice.

#### Abstract

It will have been demonstrated earlier in the symposium how the pressures of increasing demand of research output, and the changing publishing landscape, has resulted in a boom period for nursing publications. In this paper a senior publisher of Elsevier academic nursing journals will examine the analytical tools employed by the research community to measure the 'impact' of this output (McKenna 2015). She will also take a look at new channels of dissemination and their potential effect on the evaluation of the clinical/community use of the evidence-based research.

The presentation will: (1) examine the trends of publication output in nursing over the last decade, using tools such as term maps and journal citation maps to demonstrate the changing landscape of nursing evidence-based publication; (2) provide an overview of the measurements used to assess nursing publications and their perceived "value" to the research community; and (3) consider some of the new

channels available to disseminate, share and measure the clinical relevance and impact of the published evidence – looking at new technologies and new tools (Elsevier 2014).

## C 09 - Practices of Reflective Leaders

### Practices of Reflective Leaders: Being Thrust into Leadership

---

*Patricia K. Young, PhD, RN, USA*

#### Purpose

The purpose of this presentation is to describe an interpretive phenomenological study of the experiences of becoming a nurse faculty leader and explicate themes (findings) related to the particular experience of being thrust into leadership.

#### Target Audience

The target audience of this presentation is nurse educators and administrators.

#### Abstract

This presentation describes a multi-year interpretive phenomenological study of the experiences of becoming a nurse faculty leader and explicates themes (findings) related to the particular experience of being thrust into leadership. How the practice of reflection underpins the work is also highlighted.

Researchers interviewed 23 self-identified nurse faculty leaders from across the United States about their experiences of becoming a leader, whether leadership occurred in the classroom, among colleagues, within their institution, or more broadly in academe. Interviews were tape-recorded, transcribed, and the written texts were analyzed hermeneutically by a research team for themes (common shared experiences or practices). Hermeneutic analysis is a reiterative process of reading the text (data), writing an interpretation, and then rereading and rewriting as understanding is reshaped by continued reflective dwelling in the narrative data. Researchers engaged in reflection through reading the data, writing interpretations, and then reading the interpretations generated by research team members and dialogue with the team.

One theme was further explored through data obtained two years after the initial interviews by re-interviewing six of the original participants and conducting two focus-group discussions among seven members of the research team, focusing on the experience of taking risks as a nurse faculty leader. This recorded and transcribed data was then analysed hermeneutically. Last, to further explore another theme, three members of the research team formed a focus group to dialogue about the experience of reflecting in leadership decision-making. This dialogue was recorded, transcribed, and analyzed hermeneutically. In total, 30 nurse faculty leaders participated in 39 interviews. Findings include four main themes and many sub-themes—all practices of becoming a nurse faculty leader—that illuminate practical knowledge about developing as a leader in nursing education.

One common experience of participants was being thrust into leadership. This occurred when taking on something new and succeeding or simply by enacting ways of being. In addition, building in a pause for reflection was an effective practice when educators found themselves facing the situation of being asked to take on a new assignment and were feeling leadership being thrust upon them. Acknowledging and identifying one's feelings in response to a situation was another small but significant act of being thrust into leadership.

Exemplars with explications of these four practices as well as questions designed for personal reflection on one's own leadership capacity will be offered to encourage introspection on leadership practices and challenge nurse educators to consider areas for growth and development as a leader.

[patricia.young@mnsu.edu](mailto:patricia.young@mnsu.edu)

### Practices of Reflective Leaders: Taking Risks

---

*Karen Pardue, PhD, MS, BS, RN, CNE, ANEF, USA*

### Purpose

The purpose of this presentation is to examine the nursing leadership practices associated with the experience of risk taking.

### Target Audience

The target audience of this presentation is academic and administrative nursing faculty.

### Abstract

Stories of becoming a nurse faculty leader reveal the common experience of risk taking. This is not to imply that nurse leaders are risky about what they do, but to acknowledge that risk taking is an everyday occurrence in leadership. Faculty narratives help us to understand and identify the art and complexity of taking risks. The aim of this presentation is to examine leadership practices associated with risk taking.

Faculty identify themselves as leaders when they take risks with their teaching by trying something new with students. Whether motivated by boredom, educational reform, or a desire to exercise creativity, moving out of one's comfort zone feels risky because by doing so you open yourself to the possibility of failure. Moreover, teachers who lead educational change may be perceived by other faculty as disrupting the status quo, resulting in colleague resistance to their ideas. Leaders additionally describe how, in championing new approaches, they commonly enact the practice of speaking up. Reflection and rehearsal are essential activities for trying something new and speaking up.

A common leadership practice associated with risk taking involves doing your homework. The process of engaging in homework is demanding, but the investment worthwhile, as well-executed homework enhances likelihood for risk taking success. A deliberate praxis of homework involves weighing the costs and the benefits of a decision. This involves careful consideration as to the pros and cons of a given situation. Homework also entails learning the context, as every leadership decision takes place within the nuances of an organizational climate. Lastly, homework involves cultivating relationships as building community serves to unite and energize people. Collective action mitigates risk, as liability is subsequently distributed across all members of the organization.

Nurse leaders additionally describe risk taking in response to the desire to do the right thing. The underpinning for doing the right thing often stems from a sense of responsibility on the part of the leader. Narratives from nurse leaders reveal a deep personal responsibility to successfully execute their role. Additionally, they describe taking risks and doing the right thing in response to enacting their vision. This means leaders feel compelled to act based upon their individual vision and passion. Finally, doing the right thing is grounded in being true to a core self and following one's own values. Knowing one's values provides a strong foundation for leadership which supports the experience of risk taking.

Stories from nurse leaders highlight risk taking may result in failure. Being willing to fail reveals a less explored aspect of nursing leadership. Willingness to fail describes the disposition of being open to the possibilities which are realized through failure. Leaders who are willing to fail develop a culture supportive of experimentation. A climate of experimentation is characterized by curiosity; an environment where greater emphasis is placed on the testing process itself and less on the actual outcome. Learning lessons from failure reveals an important practice for being willing to fail. Examining adversity provides opportunity for personal, professional, and organizational growth. A final practice which supports being willing to fail is engagement in hard work. The experience of risk taking and failure may generate added leadership work, as more time and effort may be needed to "work out the kinks".

This workshop will provide opportunities for participants to engage with exemplars illustrative of leadership risk taking, and apply the described practices to their own leadership experiences. Reflective questions will additionally be posed designed to encourage participants' growth and introspection as nurse leaders.

## **Practices of Reflective Leaders: Facing Challenges and Advancing Reform**

---

*Sara Horton-Deutsch, PhD, MS, BSN, RN, ANEF, FAAN, USA*

### Purpose

The purpose of this presentation is to illuminate the practices of facing challenges and advancing reform among nurse faculty leaders.

### Target Audience

The target audience for this presentation is nurse educators and academic administrators.

### Abstract

This presentation describes the common shared experiences of becoming a nurse faculty leader through facing challenges and advancing reform. These experiences were common for many nurse leaders as they sought to advance their careers by taking on new positions and responsibilities. These themes along with several sub-themes will be explored through description and story. Finally, participants will be asked to reflect on their own experiences of facing challenges and advancing reform.

One common experience of participants was facing challenges. Reflecting, persevering through difficulties, and learning to relate to others in new ways represent how nurse faculty faced challenges while becoming a leader. Engaging in self-discovery through reflection was effective practices that lead to self- and other-awareness and more caring relational interactions where people were open to learning from one another and consider ways to make the greatest impact. In addition, listening attentively was an effective practice for cultivating a deeper dialogue and understanding while vicariously building relationships. Practices of reflecting and persevering while facing challenges lead to a transformation where leaders ultimately learned to relate to others in new ways. These practices supported leadership development by facilitating self-exploration, thoughtful interactions with self and others, and values clarification.

Another common experience of participants was advancing reform. A number of intentional practices favorably supported leadership development for advancing reform. Being involved with others cultivated relationships and generated energy in discovering new and unconventional ways for nurse educators and practitioners to work together. During this process of being involved with others, leaders discovered the importance of remaining authentic or true to their core values and beliefs. In addition, reform was additionally supported by the leadership practice of creating environments for change. This involved cultivating climates receptive to fresh ideas and innovative approaches, and then adopting change in small, manageable steps.

Stories of how nurse leaders faced challenges and advanced reform through earnest engagement with others will be threaded throughout this presentation. Implications of these practices will be considered. Finally, questions to facilitate participants' reflection on their own leadership practices will be offered as a way to highlight the value of reflection as an intentional strategy for leadership development.

## D 09 - Integrating Evidence-Based Practice and Process Improvement Models to Decrease Catheter-Associated Urinary Tract Infection

### Evidence-Based Practice Change to Prevent CAUTI: A Team-Based Approach

---

*Catherine M. Riedel, MSN, RN, ACNS-BC, CCNS, CCRN, USA*

#### Purpose

This presentation describes how a team, composed of clinical educators and a CNS, applied the ARCC, Lean Six Sigma, and PDSA models to implement CAUTI prevention practice changes. In addition, the team will share their experiences with establishing process and outcomes measures to communicate progress toward goal achievement.

#### Target Audience

The target audience is nurses involved in planning, implementing, and sustaining evidence-based practice change. Advanced practice nurses, nurse educators, administrators, and bedside nurses will be able to apply this presentation to practice.

#### Abstract

CAUTI prevention is largely based on nursing awareness regarding best practices in catheter care and timely removal of the catheter. Nursing practice change is accomplished through development of a safety culture template for change using the Michigan Keystone Project four E's: engage, educate, execute, and evaluate.

A team of clinical educators and a clinical nurse specialist assembled to reduce hospital-wide CAUTI rates. The team contained representatives from every hospital nursing specialty. Key components of the Evidence-Based Advancing Research and Clinical Practice Through Close Collaboration (ARCC) Model, Lean Six Sigma concepts, and the Plan-Do-Study-Act cycle were integrated to develop a practice change model to improve care quality. The steps of identifying and implementing evidence-based CAUTI prevention practice changes will be discussed, and methods use to engage and educate team members and nursing staff will be highlighted.

An important component of executing and evaluating practice change is setting clear process and outcomes measures and creating a sustainability plan after initial goals are achieved. The process for establishing both process and outcomes measures for CAUTI prevention will be discussed. Specifically, the value of clinical educational and compliance audits will be emphasized as a method to sustain practice change, promote continued nursing staff engagement, and provide continuous educational opportunities at the bedside.

## **Preventing Catheter-Associated Urinary Tract Infection in the Emergency Department: Tales from the Front Door**

---

*Nancy A. Hagerman, BSN, RN, CEN, USA*

### Purpose

This presentation describes how an emergency department (ED) nurse educator and staff champion partnered to improve ED CAUTI prevention practices. CAUTI prevention strategies included introduction of new urinary catheter products, limiting catheter insertion to appropriate patients, and education regarding alternatives to urinary catheters and use of a bladder scan protocol.

### Target Audience

The target audience is nurses involved in planning, implementing, and sustaining evidence-based practice change. Advanced practice nurses, nurse educators, administrators, and bedside nurses will be able to apply this presentation to practice.

### Abstract

Catheter associated urinary tract infection (CAUTI) prevention begins when the patient enters the healthcare system. Emergency Department nursing staff does not typically envision themselves participating in CAUTI prevention except during urinary catheter placement by using strict sterile technique. The Emergency Department staff led by the Clinical Educator and a staff nurse champion joined the CAUTI prevention effort at our hospital by educating staff regarding CAUTI prevention practices and trialing a new indwelling urinary catheter kit which contained CAUTI prevention products, including a large orange sticker placed on the drainage collection bag indicating date and time of insertion. Staff feedback was positive, and the recommendation was made to use the new kit throughout the hospital. The Emergency Department Clinical Educator participated in policy development for a new indwelling urinary catheter paradigm: reduction of placement indications, increased use of bladder scanning and straight catheter bladder decompression, and nurse driven protocols for discontinuation. The Emergency Department Clinical Educator also developed an education program and badge cards for patient care technicians who had previously never been allowed to participate in indwelling urinary catheter management and emptying. In addition, all nursing staff were re-educated regarding use of the bladder scanner and straight catheter protocol and techniques for bladder decompression. The Emergency Department demonstrated that they are key participants in a hospital-wide CAUTI prevention effort.

## **Accidental Late Adaptor: Onboarding Surgical Services to a Developed Catheter-Associated Urinary Tract Infection Prevention Protocol**

---

*Jodi Pelkey, BSN, RN, USA*

### Purpose

This presentation will address barriers to improving urinary catheter care in the OR, urinary catheter equipment evaluation processes, and methods to decrease urinary catheter use in selected populations.

Ultimately, this presentation will highlight OR culture change, increasing awareness that care in the OR impacts patient outcomes throughout the hospital stay.

#### Target Audience

The target audience is nurses involved in planning, implementing, and sustaining evidence-based practice change. Advanced practice nurses, nurse educators, administrators, and bedside nurses will be able to apply this presentation to practice.

#### Abstract

The lack of a unit-based educator for a period of time in surgical services fueled the development of a nursing staff knowledge deficit regarding a hospital-wide evidence-based CAUTI prevention protocol. The operating room nurse educator identified the need for a change in nursing workflow due to the introduction of an improved indwelling urinary catheter kit. Though staff had completed an online learning module, they were unsure of how to implement the care measures necessary to prevent CAUTI. In addition to assessing urinary catheter maintenance practice knowledge deficits among staff, the operating room educator encountered staff resistance to practice change. During evaluation of urinary catheter care processes, the operating room nurse educator and management team discovered that the pre-assembled surgical packs were not sufficiently stocked to meet the hospital-wide CAUTI prevention protocol. While evaluating the pre-assembled kit contents, discussion was initiated as to the necessity of including indwelling urinary catheters for each procedure using pre-assembled kits. This presentation will address common barriers to improving urinary catheter care in the operating room, the process for urinary catheter equipment evaluation, and methods to decrease urinary catheter use in selected populations. Ultimately, this presentation will highlight operating room culture change, with a heightened awareness that care in the operating room directly impacts patient outcomes throughout the hospital stay.

## **Diverse Educational Initiatives to Prevent Catheter-Associated Urinary Tract Infection in Critical Care**

---

*Erika L. Simon, MSN-ED, RN, CCRN, USA*

#### Purpose

This presentation describes how diverse education methods in the critical care setting impacted CAUTI prevention strategies. Key educational activities included educational bedside audits, dialogue with nursing staff, and immediate care correction. In addition, a skills lab session was completed reviewing common catheter care deficits specific to the critical care units.

#### Target Audience

The target audience is nurses involved in planning, implementing, and sustaining evidence-based practice change. Advanced practice nurses, nurse educators, administrators, and bedside nurses will be able to apply this presentation to practice.

#### Abstract

Critical care units demonstrate the highest prevalence of Catheter Associated Urinary Tract Infection (CAUTI) and greatly impact acceptance of catheter use within a facility (Elpern et. al, 2009). The Critical Care department at Flagstaff Medical Center (FMC) encompasses an intensive care unit (20 beds), cardiovascular intensive care unit (11 beds) and step-down unit (18 beds). Changing the culture of urinary

catheter care among these units is challenging in regards to re-focusing nurses to think critically about the current state of catheter use, evidence-based catheter indications, and situations that potentiate the development of a CAUTI. Addressing education for staff started with catheter kit standardization and standards of care education. Weekly audits and bedside education were provided directly to staff based on the physical presentation of the catheter and patient condition. A hands-on, interactive approach elicited open-ended questions and assessment of nurse understanding of best practice. Evaluation of initial audits of staff performance pointed to clear deficits and need for further education. Common themes for improvement included defining a “dependent loop”, how to use sheeting clips, ensuring securement devices were applied for optimal drainage, prevention of further harm, and the importance of the maintenance phase (i.e. peri-care, use of graduated cylinders, prevention of catheters from touching the floor, keeping drainage bags out of the bed, awareness of catheter days). After assessing these educational needs, nurses in critical care were provided a 30-45 minutes hands-on, skills lab station over a period of 3 months to review appropriate catheter care, techniques and discuss CAUTI prevention specific to the assessed deficits. In combination with skills-lab education and continuing CAUTI audits, education has been adapted specifically to audited performance.

## **Preventing Catheter-Associated Urinary Tract Infections in Medical-Surgical/Telemetry Units: Five Units, Five Cultures, One Goal**

---

*Shannon Campbell, MSN, RN, PCCN, USA*

### Purpose

This presentation describes CAUTI prevention practice changes on five Medical-Surgical/Telemetry (MST) units that work as one cohort. It will highlight the MST educators' efforts in establishing process and outcomes measures, changing nursing culture regarding urinary catheter care, and communicating progress toward the goal of decreasing CAUTI rates.

### Target Audience

The target audience is nurses involved in planning, implementing, and sustaining evidence-based practice change. Advanced practice nurses, nurse educators, administrators, and bedside nurses will be able to apply this presentation to practice.

### Abstract

Flagstaff Medical Center's (FMC) effort to combat CAUTI in its Medical/Surgical-Telemetry (MST) units is as multifaceted as the five units themselves. Each unit is tasked with being able to care for any patient ordered to be MST status. One of the biggest obstacles all these units faced is the historical view that there must be a physician order to remove the catheter (Fakih et al., 2014). This has been a primary issue on the orthopedic surgery specialty unit. The unit is well-known as having a unique culture. The nurses were aware that the facility has a nurse-driven urinary catheter removal protocol but were driven by the history of pulling the catheters when the physician ordered removal. The other units' nurses knew the CAUTI prevention evidence but their biggest obstacle was providing task-driven care. The nurses often would wait until the end of the shift to discontinue the catheter because toileting patients increased nursing workload. The educators' initial approach was staff education regarding CAUTI complications and reinforcement of the nurse-driven urinary catheter removal policy. The real change did not occur until the nursing staff were shown the “so what factor”. Productivity is a main factor in the hospital's short term

incentive program, which is a yearly bonus focused on goals set by administration for each fiscal year. Nurses were shown each CAUTI has the potential to cost the hospital over \$2700 dollars per episode and decrease productivity (Gokula et al., 2012). In addition to emphasizing the financial impact of CAUTI, peer to peer education through educational audits was the final positive change to decrease CAUTI rates (Meehan & Beinlich, 2014).

## **E 09 - Shining the Light on Senior Services: Driving Excellence through Leading Practices**

### **Making Senior Care a System Priority**

---

*Ann Marie T. Brooks, PhD, MSN, MBA, BSN, RN, FAAN, FACHE, FNAP, USA*

#### Purpose

The purpose of this presentation is to describe and discuss how a five hospital system maximized its culture of safety program to focus on the geriatric population. Discussion of the structures, processes and measures of success for the interprofessional team will be presented.

#### Target Audience

The target audience are conference attendees who are interested in applying leading practices to the geriatric population within their inpatient model of care.

#### Abstract

Aligning a model of geriatric care with the system strategic plan and priorities is an expectation for nursing and physician leaders and provides an opportunity for ongoing interprofessional partnership and integration of practice education and research. This presentation will focus on how a nurse leader within a five hospital system in partnership with other leaders was able to influence and advocate for establishment of a commitment to expansion of geriatric services at the system level. Discussion of the challenges, innovative strategies and resources needed for development of a geriatric service line will be provided.

### **Building a Culture of Geriatric Excellence: One Hospital's Experience**

---

*Louise Laufer Hummel, MSN, RN, RN-BC, CEN, USA*

#### Purpose

The purpose of this presentation is to demonstrate how nurse educators optimize geriatric excellence through Gerontological certification and the Geriatric Resource Nurse Model utilizing NICHE principles for care of the elderly. This has led to care in a manner that is geriatrically sensitive, safe, knowledge driven and underscored by quality.

#### Target Audience

The target audience of this presentation is nurse educators and nurse leaders looking to strengthen their nursing workforce, who are caring for a geriatric population, through certification and education opportunities.

#### Abstract

Building a culture of geriatric excellence: Educational Innovations

It is well known that an acute care hospitalization can be a pivotal event in the life of an older person. Within our hospital, the average daily inpatient census is seventy (70%) over the age of 65. As the American population ages, so does the need to care for acute and chronic conditions effecting the geriatric population.

Through the leadership of the hospital's nursing vice president, it was determined that there was a need to have nurses with expertise in gerontological nursing practice.

Key stakeholders were chosen to focus on geriatric education, certification, and evidence based practices to provide superior geriatric care. These individuals formed geriatric work groups.

At the forefront was gerontological registered nurse certification. Within a three year period of time, the hospital was successfully able to have 63 registered nurses certified in gerontology. These nurses have been instrumental in leading geriatric work groups that are tackling challenges in providing excellence in geriatric care. These workgroups are focused on: dermal defense and wound care, early mobility and early ambulation practices, medication management, reduction in falls and aging sensitive care initiatives. They provide continuing education opportunities through lunch and learn events, community program offerings, Pit Stop education, computer based learning and innovations in content presentation and testing using technology.

The collaboration of these certified gerontology nurses has taken another step as they meet monthly with a physician Geriatrician champion and RN Geriatric Service Line Manager co-leading them. This inter-professional group has led to sharing of best practices within all of the nursing units, continuous learning utilizing the Nurses Improving Care for Healthsystem Elders Geriatric Resource Model of nursing practice, and the encouragement of more eligible registered nurses to become certified with hospital based gerontology certification review courses available to them.

Through continuing education, nurses working primarily with geriatric adults and their families, have been able to incorporate gerontological competencies to assess, implement, maintain and evaluate care to meet their specialized needs.

The hospital has also had two mentor/mentee dyads successfully complete the Sigma Theta Tau International (STTI) Geriatric Nurse Leadership Academy (GNLA). Each dyad piloted a geriatric initiative on their nursing unit that was later implemented throughout the acute inpatient care areas of the hospital where geriatric patients are treated. Through education innovations the gerontological nurses have transformed the delivery of care to patients over 65 years of age in manner that is geriatrically sensitive, knowledge driven and underscored by quality.

## **Leading Practices in Geriatric Care: Building a Dermal Defense Team Makes a Difference!**

---

*DeSales Foster, DNP, MSN, BSN, RN, CWOCN, CRNP, GNP-BC, USA*

#### Purpose

The purpose of this presentation is to describe methods of building and retaining a hospital dermal defense team to keep our patients safe by reducing hospital-acquired pressure ulcers, skin tears, and catheter-associated urinary tract infections. This will include methods to engage staff, using evidence-based practice and research.

#### Target Audience

The target audience for this presentation is caregivers, administrators, and staff who have special interest in geriatric patient care.

#### Abstract

The task of building and maintaining a dermal defense team requires commitment from all hospital units and administration. This commitment begins with the creation of a champion role. Each unit in the hospital has a nurse champion who represents the unit and each champion performs monthly prevalence studies, educates staff, and communicates findings via email and poster presentations. Education of champions starts with NDNQI pressure ulcer education using the four modules to teach staff how to perform a prevalence study. Once this education was complete the staff rounds with the dermal defense

team (DDT) leader to review skills by doing an inter-rater reliability test. This education was so successful the nursing administration approved this education for all nursing staff. This led to nursing and ancillary staff acceptance of accountability for vigilant effort to reduce pressure ulcers. Monthly continuing education is provided for the DDT and the team disseminates this information to the unit staff. Quality care is maintained with team effort of nurses and patient care technicians (PCT). Many units have both a nurse and a PCT champion on the DDT. Leading successful dermal defense teams happen when the interest of the team members is held. This interest is sparked by having a dermal day each spring. The DDT members have an opportunity to share their knowledge by creating posters using evidence-based practice guidelines. The posters are presented to staff and continuing education is provided. Each DDT member has an opportunity to shine and this keeps the team alive. Each team member is held accountable for keeping the unit staff up to date on all new dermal products and if a unit-acquired pressure ulcer occurs, team members discuss with colleagues to prevent this from occurring again.

## G 09 - VHA Wellness Model of Health: Helping Veterans be Mission Ready for Life

### VHA Wellness Model of Health: Helping Veterans be Mission Ready for Life

---

*Sheron L. Salyer, DNSc, RNC, RNC-OB, FACCE, CHRC, USA*

#### Purpose

The purpose of this presentation is to describe how one VHA healthcare system uses the VHA Office of Patient Center Care (OPCC) wellness model to conduct literature reviews; identify evidence based practice (EBP) strategies to change practice & use pre-existing data to evaluate changes made to enhance clinical care.

#### Target Audience

The target audience includes VHA employees making the transition to a personalized, proactive, patient driven model of care; individuals interested in learning how the theoretical framework can help integrate evidence based changes in the clinical setting; and clinicians interested in seeing how pre-existing data is used to evaluate practice changes.

#### Abstract

The Veterans Health Administration (VHA) mission honors Veterans by providing exceptional healthcare that improves their health and well-being. As Veterans' needs change, a healthcare system must be open to expanding beyond an illness focus to center on what is important to Veterans and the health care outcomes they desire. This symposium describes the theoretical framework developed by the VHA Office of Patient Center Care (OPCC) to guide our transformation into a personalized, proactive, patient driven model of care.

We reports how one VHA healthcare system uses the model to conduct literature reviews identifying evidence based practice (EBP) strategies to guide practice changes as well as developing methods to evaluate the success of changes made to enhance clinical care.

Literature reviews include:

1. EBP strategies to change the dialogue between Veterans and their care providers in clinical settings
2. PCC changes in the physical surroundings designed to generate healing environments
  - a. Ambient lighting use within inpatient mental health clinical settings
  - b. Physical design changes in the emergency department to promote PCC

Findings for each literature review will be presented independently – describing methodology used to locate published research studies and evaluate the combined level of evidence available to support EBP changes. Lastly, we explore how existing VHA data can be used to evaluate EBP changes. EBP tables summarizing findings and identifying outcomes measured in each study will also be shared. The EBP tables are then used to establish baseline measures prior to implementing changes with reassessment six months after changes have been implemented.

As more soldiers transition out of the military, demands for Veteran healthcare will increase with unique service related risks. It will be critical for VHA healthcare to continue to make theory driven changes to better meet their unique needs.

## **Mission Ready: Use of Ambient Lighting in Creating a Healing Environment for an Inpatient Psychiatric Unit**

---

*Mekeesha McClure, MSN, RN, ANP-BC, USA*

*Sheron L. Salyer, DNSc, RNC, RNC-OB, FACCE, CHRC, USA*

### Purpose

The purpose of this presentation is to gain insight into current evidence on human reaction to lighting on an inpatient psychiatric unit. Opportunities exist to offer environmental changes to the psychiatric unit. This review's objective is to determine if a positive relationship exists between lighting, circadian rhythm, and patient's mood.

### Target Audience

The target audience of this presentation is clinical staff working on the Psychiatric unit, academic participants who want to learn about an environmental impact on human behavior from evidence based research and other supportive staff interested in patient-centered change on the psychiatric unit.

### Abstract

**Purpose:** To gain insight into current level of evidence on human reaction to lighting on an inpatient psychiatric unit. As the environmental design of the psychiatric unit evolves to maintain safety of the patients and staff, opportunities exist to offer evidence based physical changes. One of the opportunities to create healing environments uses ambient lighting to influence mood and circadian rhythms. Creating a less rigid sterile environment on the psychiatric unit has been a norm to encourage treatment participation. The objective of this literature review is to determine if a positive relationship exists between controlled lighting on the psychiatric unit, circadian rhythm, and patient's mood.

**Method:** This presentation describes the use of the VHA wellness model to guide the methodology used to identify evidence based ambient lighting strategies to promote a healing environment. Databases were searched utilizing key words: ambient lighting, circadian rhythm, psychiatry, psychiatric disorders, mental illness, and environmental design. The search identified 29 articles for review with 3 additional articles obtained from the reference lists of reviewed articles. Eighteen of the reviewed articles were relevant to this review. Ten research articles and eight non-research articles are summarized in an evidence-based table. One systematic review with meta-analysis was noted, 4 quasi-experimental designs, and five descriptive/exploratory designs were included in the evidence table. Eight non-research designs were included and consisted of literature reviews, systematic reviews of non-experimental designs, and expert opinions. The evidence table was used to identify evidence based changes and develop evaluation plans using VHA existing data to provide objective outcome measures to evaluate the success as changes are made to meet the unique need for Veterans requiring inpatient psychiatric care.

**Conclusion:** Research on ambient lighting's impact on psychiatric units is limited. Overall, current data does suggest benefit from ambient lighting however the significance over control groups was minimal.

## **Mission Ready: Changing the Physical ED Environment**

---

*Donna Diogo, ADN, AAS, RN, USA*

*Sheron L. Salyer, DNSc, RNC, RNC-OB, FACCE, CHRC, USA*

### Purpose

The purpose of this presentation is to share the research evidence surrounding physical changes the Veterans Health Administration (VHA) is making in the Emergency Department (ED) environment to improve staff and patient satisfaction in providing holistic, patient-centered care (PCC).

### Target Audience

The target audience of this presentation is clinical staff who work in the Emergency Department (ED), academic participants who want to learn about synthesizing themes from evidence based research and administrative staff who would support a change in the physical ED environment to be holistic and patient-centered.

### Abstract

**Purpose:** The Veterans Health Administration VHA Wellness Model of Health identifies 8 critical components of health that expand on traditional problem based care to identify the Veterans' unique healthcare needs. In an effort to provide holistic, patient-centered care (PCC) in the Emergency Department (ED), it is important to consider the physical environment in which staff performs their job, and the role the environment plays in the patient and patient's family ED experience. This presentation looks at the professional literature as it relates to the physical surroundings component of this wellness model.

**Relevance:** A literature search was performed to answer the clinical question "Do evidence-based, patient-friendly environmental surroundings (interventions) in the ED produce different or better outcomes for patients when compared to the traditional ED environment?" To address this question, the Johns Hopkins Research and Non-Research evaluation tools were used to evaluate articles retrieved from the CINAHL and Medline databases and articles identified from reference lists of reviewed articles. Once evaluated, a table of evidence was created synthesizing results, identifying outcomes measured, and evaluating the level of evidence offered. Out of 59 articles initially reviewed, 21 were found to have evidence related to the PICO question. Ten articles were identified as research studies, with one quasi-experimental design and nine descriptive or observational designs. Non-research studies included concept analysis, quality improvement projects, and expert opinions. Common themes emerged in the findings, outcomes, and recommendations, which will be presented.

**Importance:** It is important to identify what evidence exists in the professional literature, and to determine the combined level of evidence available to support practice changes. The findings from this literature review indicate that more research is needed to help clinicians understand the impact physical changes in the ED that encourage a healing environment can have on clinical care.

## **Mission Ready: Changing the Dialogue between Veterans and Their Care Teams in the Clinical Setting**

---

*Pamela J. Laut, MSN, RN, USA*

*Sheron L. Salyer, DNSc, RNC, RNC-OB, FACCE, CHRC, USA*

### Purpose

The purpose of this presentation is to describe how the VHA model of care was used to guide a literature review to identify evidence based strategies designed to promote collaborative relationships in the clinical setting.

### Target Audience

The target audience of this presentation is Veterans receiving healthcare at one of the VHA healthcare systems; Patient Aligned Care Teams (PACT) and other health professions employed by VHA; health professionals interested in learning how the VHA model of care was used to integrate evidence based strategies into the clinical setting.

### Abstract

**Purpose:** To gain insight into current level of evidence on human reaction to lighting on an inpatient psychiatric unit. As the environmental design of the psychiatric unit evolves to maintain safety of the

patients and staff, opportunities exist to offer evidence based physical changes to create healing environments using ambient lighting to influence mood and circadian rhythms. Creating a least rigidly sterile environment on the psychiatric unit has been a norm to encourage treatment participation. The objective of this literature review is to determine if a positive relationship exists between controlled lighting on the psychiatric unit, circadian rhythm, and patient's mood.

Method: This presentation describes the use of the VHA wellness model to guide the methodology used to identify evidence based ambient lighting strategies to promote a healing environment. Databases were searched utilizing key words: ambient lighting, circadian rhythm, psychiatry, psychiatric disorders, mental illness, and environmental design. The search identified 29 articles for review with 3 additional articles obtained from the reference lists from reviewed articles. Eighteen of the reviewed articles were relevant to this review. Ten research articles and eight non-research articles are summarized in an evidence-based table. One systematic review with meta-analysis was noted, 4 quasi-experimental designs, and five descriptive/exploratory designs were included in the evidence table. Eight non-research designs were included and consisted of literature reviews, systematic reviews of non-experimental designs, and expert opinions. The evidence table was used to identify evidence based changes and develop evaluation plans using VHA existing data to provide objective outcomes measures to evaluate success as changes are made to meet the unique need for Veterans requiring inpatient psychiatric care.

Conclusion: Research on ambient lighting's impact on psychiatric units is limited. Overall, current data does suggest benefit from ambient lighting however the significance over control groups was minimal.

## **A 14 - Connecting and Engaging STTI Members Regionally to Advance World Health and Celebrate Nursing Excellence**

### **STTI Region 14: Connecting and Engaging Members Locally and Globally**

---

*Teresa Torsney, MS, RN-BC, USA*  
*Jacqueline Cassagnol, MSN, RN, PMC, USA*  
*Ronn M. Callada, MS, BS, RN, ANP, USA*  
*Kirstin Patragnoni-Sauter, MSN, APN, FNP-BC, USA*

#### Purpose

The purpose of this presentation is to describe how the STTI Region 14 Coordinator and Chapters incorporated STTI Mission and the 2013 President Call to Action in their events and activities.

#### Target Audience

The target audience of this presentation are nurse educators, nurse leaders, nurse researchers, nursing students, all clinicians, and/or anyone who is interested and engaged in the improvement of global healthcare;

#### Abstract

The purpose of this presentation is to describe how the Sigma Theta Tau International (STTI) Region 14 Coordinator and Chapters incorporated STTI Mission and the 2013 Presidential Call to Action in their events and activities. The mission of STTI is to advance world health and celebrate nursing excellence in scholarship, leadership, and service. The 2013 STTI Presidential Call to Action challenged the organization and its members to "serve locally, transform regionally, and lead globally" incorporating themes of Servant Leadership, Connectedness, Transformation and Gratitude. This presentation will describe how the Region 14 Coordinator disseminated information to chapter leaders in New York and New Jersey, and encouraged them to incorporate the mission and the call to action by making them potential themes for their 2014 events. Through electronic mail, "The Circle" on the STTI website, Skype, teleconferences and phone calls, the Region 14 Coordinator was able to engage the region chapter leaders and support them as they created educational and social opportunities for the members at large. The Region 14 Coordinator also created different work groups, such a Planning Committee and Communication Committee to help in chapter endeavors. Region 14 Chapters actively incorporated the themes into their event planning for the year 2014. The STTI Mission and Call to Action were made the basis of the Region 14 Biennial Conference to give all members an opportunity to engage in the topic. The Region 14 Coordinator and Chapters were effective. Region 14 members incorporated the STTI Mission into their events and activities. The call to action also incited many members to start or continue service projects to communities locally, regionally and globally. Examples of chapter initiatives that included these themes were presented at the Founder's Day event of the New Jersey Consortium, the Long Island Consortium in New York, and in the Region 14 Biennial Conference. The initiatives included but were not limited to: service and medical missions to Haiti and Dominican Republic, educational opportunities for Haiti and Tanzania, and networking workshop for Region 14 members encouraging connectedness. Outcomes of these initiatives will be discussed.

### **Providing Health Education and Disaster Preparedness Training in the USA and Haiti: A Global Collaboration**

---

*Jacqueline Cassagnol, MSN, RN, PMC, USA*

#### Purpose

The purpose of this presentation is to describe how a STTI Region 14 member collaborated with STTI members and nurse leaders to provide health education and disaster preparedness training in the USA and Haiti.

#### Target Audience

The target audience of this presentation are nurse educators, nurse leaders, nurse researchers, nursing students, all clinicians, and/or anyone who is interested and engaged in the improvement of global healthcare;

#### Abstract

The purpose of this presentation is to describe how a Sigma Theta Tau International (STTI) Region 14 member collaborated with STTI members and nurse leaders to provide health education and disaster preparedness training in the USA and Haiti. The STTI Region 14 member initiated community health projects and disaster preparedness projects in the United States of America (USA) and Haiti, in collaboration with STTI members and nurse leaders. From 2012 to 2014, over 15 projects were initiated in New York, USA and Leogane, Haiti. The projects were conducted through Worldwide Community First Responder, Inc. (WCFR), a non-profit organization based in New York with a mission to prevent deaths worldwide through education and training. Projects in Haiti were supported by a grant from Haitian American Nurses Association (HANA) in Florida, and engaged the Faculté des Sciences Infirmières de Léogâne (FSIL), a nursing school in Haiti. STTI members and nurse leaders from different levels of leadership collaborated in the projects. The community health projects consisted of conducting community health assessments through surveys; analyzing data collected and recommending interventions to improve community health. The disaster preparedness projects consisted of community risk and vulnerability assessments for disasters; developing disaster preparedness plans including first response and first aid training. The projects were evaluated through pre and post questionnaires given to the participants on community health and disaster preparedness. The results were very positive. The community health projects engaged participants in promoting healthy lifestyles in their community. The disaster preparedness projects engaged participants in making their community safer, better prepared, and more resilient to disasters. The STTI Region 14 member connected and engaged STTI members and nurse leaders in providing health education and disaster preparedness training locally, regionally, and globally. The collaboration between STTI members and nurse leaders has proven to be beneficial for all stakeholders. The goals of the projects are: to improve the quality of pre-hospital care; and to lessen the adverse medical effects created by natural disasters. The importance of these collaborations between STTI members and nurse leaders to advance world health and celebrate nursing excellence will be discussed.

### **Hybrid FNP Education in Haiti: A Global Collaboration**

---

*Steven Baumann, PhD, MS, MSN, BSN, RN, USA*  
*Joanna F. Hofmann, EdD, ANP/GNP-BC, RN,, USA*  
*Jacqueline Cassagnol, MSN, RN, PMC, USA*

#### Purpose

The purpose of this presentation is to describe how STTI Region 14 members and nurse leaders developed and operated two FNP Master's Degree programs in Haiti.

#### Target Audience

The target audience of this program are advanced practice nurses, nurse educators and nursing leaders interested in developing sustainable international collaborations to raise the level of nursing and improve the health in very low resource countries.

#### Abstract

The purpose of this presentation is to describe how Sigma Theta Tau International (STTI) Region 14 members and nurse leaders developed and operated two Family Nurse Practitioner (FNP) Master's Degree programs in Haiti. The significance of this program is great as there is a huge need in Haiti for quality prenatal care, newborn care and graduate nursing education. 70% of Haitians live on less than \$2 a day. Haiti is one of the poorest countries in the world and has one of the highest infant and maternal mortality rates. It, also, has a dire shortage of nurses and physicians, and an outdated and poorly staffed nursing education system. The project, Promoting Health in Haiti (PHH), a non-profit organization was founded by STTI Region 14 members and nurse leaders to help with the problem. The project involved partnering with the Episcopal University of Haiti (UNEPH); the Faculté des Sciences Infirmières de Léogâne (FSIL) in Leogane; and with Hunter College in New York. PHH is offering the first Master's FNP program in Haiti. PHH is now moving ahead with a second FNP program to be offered in partnership with the University of Haiti. It is hoped that since FNPs have been known to provide quality primary care in the USA that by increasing the number of FNPs in Haiti, there will be increased access to quality primary care, prenatal care, and newborn care in Haiti with the result that high infant and maternal mortality rate in Haiti will be reduced. Developing clinical competencies of the students is being systematically assessed for ongoing program improvement. Currently, 18 students are enrolled and each has completed the first year of the program. The tuition is \$100 a month for a 36 month program. Several students receive scholarship assistance or work/study aid from PHH. The outcomes and lessons learned so far are that even a small amount of tuition is a burden for most of the students who are supporting families. Many students are not accustomed to deadlines and expectations of a rigorous graduate program. A more formal program evaluation using focus groups is planned for May of 2015 at the first FNP program. The implications of the work of PHH with the support of Region 14 members and the close work with the Minister of Health and nursing leaders in Haiti will be studied to formalize the role of FNPs in Haiti and to create sustainable FNP programs in leading private and public universities in Haiti. Discussion and planning are also underway to assist other schools to open similar programs in other very low resource countries.

## A 15 - Perspectives on Global Learning and Relational Diplomacy

### Application and Evaluation of a Global Learning Rubric

---

*Mary Riner, PhD, RN, USA*

#### Purpose

The purpose of this presentation is to describe and apply the Global Values Rubric to assessing student learning in study abroad programs.

#### Target Audience

The target audience of this presentation is leaders of study abroad programs

#### Abstract

The state of knowledge continues to evolve in terms of best practices for global learning under the broad rubric of internationalizing the curriculum. Educators can benefit from the use of peer reviewed tools in designing curricula, courses, and learning experiences for global learning experiences. Use of the Global Learning Value Rubric provides a means to develop curricula plans for comprehensive integration of global learning into nursing curriculum, define specific objectives for a range of learning experiences, and to assess student progression in developing global perspectives. The rubric can be used to develop common language and a research agenda around global learning in nursing and interdisciplinary disciplines.

### Gaining Perspectives and Global Awareness through Collaborative Online Learning (COIL)

---

*Teddie Potter, PhD, MS, RN, USA*

#### Purpose

To introduce the audience to a new global learning philosophy and methodology that can enhance the global perspective of all nursing students.

#### Target Audience

Nursing educators and nursing students.

#### Abstract

Global learning in higher education has transitioned from being an opportunity for the privileged few to a core competency for all students. Collaborative Online International Learning (COIL) offers all students an opportunity to interact directly with students and faculty from a distant global culture. This is especially important for students who might otherwise not be able to travel abroad due to finances, different physical abilities, or family obligations. Just as the rewards of COIL are numerous so are the challenges including language, time zones, technology, and different levels of comfort with online learning. This presentation will discuss the rewards and challenges of a newly created COIL course in the Doctor of Nursing Practice in Health Innovation and Leadership. The COIL course required many modifications in order to be successful but the outcome is that our students are prepared to lead global health care both at home and abroad.

## United Planet: Principles and Strategies Global Learning and Relational Diplomacy

---

*Dave Santulli, MA, CPA, USA*

### Purpose

None

### Target Audience

Non

### Abstract

The vision of United Planet is to create a world in which all people understand, respect, and support one another and the mission is to foster cross-cultural understanding and address shared challenges to unite the world in a community beyond borders. United Planet's community immersion programs help nursing students and professionals master and contribute nursing skills, and enhance their understanding of relational diplomacy. This session will describe and discuss key principles and strategies for planning, implementing and evaluating successful global learning experiences.

1. Explain the concept of relational diplomacy in the context of the vision, mission and goals of United Planet Programs.
2. Discuss principles and strategies that support the success of global learning experiences.

## B 16 - Promoting Global Nursing Education through Ongoing Engagement

### Enhancing Leadership in a Chinese Nursing Program

---

*Linda Rice, MS, RN, CWOCN, USA*

#### Purpose

The purpose of this presentation is to share the activities of an expert volunteer American nurse educator in China during a collaborative semester-long experience with Chinese nurse educators in a baccalaureate nursing program.

#### Target Audience

The target audience is nurse educators and administrators interested in activities that promote global nursing education through volunteer teaching experiences.

#### Abstract

To make high quality health care available around the globe, American organizations such as Project HOPE provide training, technical assistance and expert mentoring to build capacity at all levels of the health care system. This includes offering assistance from a pool of professional health volunteers to supplement human resources. In partnering with public and private sectors, HOPE uses a model that teaches health professionals to continually enhance their expertise and improve knowledge. Expert American nurse educators address the pressing need for Chinese nurse educators which has come about since 1998 when reform began in the world's largest health professional education system. The need to strengthen nursing faculty, update curricular content, and emphasize ethical professionalism has been challenged by narrow technical training and admission of students who do not express an interest in nursing as their first career choice. This reform has been affected by international collaboration and involvement with Chinese nursing in China and abroad, the determination of Chinese leaders to evolve nursing as a unique and ethical profession and the needs of the population for the development of the profession.

Leadership activities by American nurse educator volunteers involve undergraduate and graduate teaching, role-modeling of effective teaching and evaluation strategies, curriculum and program planning, and offering faculty development and education programs. Critical discussion of integration of Western teaching methods and transfer of Western style teaching requires a high degree of cultural sensitivity on the part of American nurse educator volunteers.

Leadership exchanges occur as Chinese educators learn about and take advantage of opportunities to enhance their learning. Exposure to the use of interactive technologies and internet resources, access to professional nursing organizations and conferences and integration of research findings are areas that elevate professional standards. The leadership exchanges also occur at the clinical practice level, as American nurse educator volunteers promote enhanced cooperation with Chinese nurses in leadership positions in hospitals and community agencies. An example is assuming responsibility as the clinical instructor of nursing students and pairing with nurses at the clinical site. This addresses a Chinese concern about ensuring nurse accountability for conduct and practice.

The opportunity to work side by side, on a daily basis, allows for formal and informal discussion. This is identified as one of the key components in leadership development. When mentoring is continuous, in depth, and over an extended period, the momentum of change is enhanced. As Chinese nurse educators are exposed to increasing number of American nurse educators they learn to recognize how to use this expertise in a more mature manner. This places the collaborative assistance provider in the position of needing to be receptive to the changing relationship. Ongoing dialogue about outcomes becomes critical.

## **Being a Leader in Chinese Nursing Education**

---

*Qian Liu, BSN, MSN, RN, China*

### Purpose

The purpose of this presentation is to discuss the adaptation process of a Chinese nurse educator assuming a leadership position in a Chinese baccalaureate nursing program.

### Target Audience

The target audience of this presentation is nurse educators and leaders interesting in global initiatives to promote nursing education.

### Abstract

Chinese educators discuss the evolution of an international cooperation program at Wuhan HOPE School of Nursing, Wuhan, China. They reflect on the adoption of a concept-based curriculum being taught in English and a Chinese dialect, integration of nursing simulation as a teaching strategy, the development of a nursing simulation lab, the opening of a comprehensive rehabilitation center at the School of Nursing and the changing role of Chinese nurse educators in this program. They review the personal and professional growth that has occurred as young faculty members, influenced by Western thinking, have moved into leadership positions by virtue of interest, motivation and expectations of nursing administrators. They discuss their concerns about the differing perspectives of traditionally trained mature nurse educators and those who have received enhanced educational opportunities and interacted with nurse educators from other countries. They discuss the differences in the backgrounds of nurse leaders in health care practice and those in education settings. They review the current Chinese perspective of the nursing profession and the changing health care culture. They discuss their concerns about the need for nurses to assume larger roles in the community, enhanced independent practice, and health education. The economic reality of low nursing salaries, the changing dynamic of financing the Chinese health care system and the lack of understanding of Chinese people about nursing's role are challenges in educating future nurse leaders.

Two Chinese educators share their personal perspectives in fulfilling full-time nurse educator positions and balancing the Chinese cultural expectations of advancing their education within the context of the role of a Chinese woman as a wife and mother. There is also the looming concern of expectation of the role of the health care provider in meeting the demands of Chinese patients and the threat of violence and intimidation. Balancing the practice of traditional Chinese medicine with new advances in health care and technology has resulted in public distrust of an unregulated pharmaceutical industry which raises the tension between providers and patients. The need for Chinese people to assume greater financial responsibility for their health care has also resulted in the widespread assumption that direct care providers, specifically physicians and nurses, are reaping financial benefits by providing specific treatments and practices. The result is a lack of continuity in the provision of care.

## **Using Teaching and Knowledge to Improve Health of Chinese People**

---

*Bingxiang Yang, BSN, MSN, RN, China*

### Purpose

The purpose of this presentation is describe efforts to integrate nursing research findings in Chinese practice settings based on collaborative activities with American expert nurse educators.

### Target Audience

The target audience of this presentation is nurse educators and leaders interested in collaboration efforts to promote global nursing education.

### Abstract

Chinese educators relate the importance of integration of nursing research findings in practice settings. Examples include using established protocols for insertion of intravenous catheters, handwashing practice at the point-of-care, use of safety devices to prevent accidental injury, and teaching patients to assume increased responsibility for monitoring their chronic illness. Inconsistencies exist in the availability of supplies and equipment to maintain standards which further compromises outcomes of care.

The stigma of mental illness in the Chinese culture is widespread. Many students enter nursing education programs with no interest in working within a mental health setting due to this cultural belief. A lack of community mental health services adds to the difficulty of educating students about the role of nurses in mental health care. This same situation exists related to the provision of geriatric long-term care and hospice programs. Chinese nurse educators have limited opportunities to integrate clinical experiences for students in these areas that can promote a change in students' perceptions. The use of the only geriatric long-term care facility in Wuhan as a clinical practicum site for health assessment is an example of one way to change students' perceptions. Inviting nurses who have opened the only hospice facility in Wuhan as guest lecturers in the students' classroom is another example. The upcoming integrating of the comprehensive rehabilitation center and the 5 community clinics affiliated with this center will be another opportunity to enhance student learning.

Chinese nurse educators discuss their experiences in working with a diverse group of volunteer educators. In helping to interview, select and orient the volunteer educators who will be at Wuhan HOPE School of Nursing, Chinese nurse educator leaders establish priorities and focus the outcomes of the experience for themselves and the American volunteers. This allows for diversity in this collaborative exchange process. Chinese educators discuss changes they have integrated as a result of collaboration: improved test item writing, refinement of the strands of the undergraduate nursing curriculum, use of case studies, integration of evidence-based research findings in classroom presentations, as well as other approaches.

## C 15 - RNs in Transition: From Concept to Practice

### Residency Foundations: Organizational Support and Enculturation

---

*Larissa Africa, MBA, BSN, RN, USA*

#### Purpose

The purpose of this presentation is to provide participants with the foundations of developing a standardized, evidence-based residency program calling on organizational leadership and collaboration.

#### Target Audience

The target audience for this presentation includes nursing professional development staff, academic practice partners, clinical practitioners, and nursing leadership who are vested in providing safe practice environments for RNs in transition.

#### Abstract

The goal of every residency is to provide RNs in transition with a standardized, evidence-based program that contributes to an environment of excellence for nursing practice (Shinners, Ashlock & Brooks, 2014). Before an organization considers a residency program, needs and readiness to change assessments must be completed. During this time key stakeholders come together to identify their roles within the residency as well as the purpose, goals, and perceived challenges. It is critical to the success of the program that organizational leadership commits to providing the support needed to initiate and sustain a residency program. Leadership also provides direction and guidance throughout the course of the residency ensuring identified competencies and educational activities are relevant to the needs of the organization as well as advocating for fiscal, material, and personnel resources (ANCC, 2014).

This session uses case study to provide an exemplar where a large 7 facility health system implemented the residency to address critical concerns of high vacancy rates, turnover, and lack of preceptor and mentor pools (Shinners, Ashlock & Brooks, 2014). It provides participants with strategies to enculturate all stakeholders regarding organizational mission, vision and values and how they are assimilated into practice.

Using ANCC Magnet and Practice Transition Accreditation Program (PTAP) models, presenters will describe how the structure of a residency program supports a healthy work environment where RNs are provided with the tools and experiences to focus on professional development and quality care while transitioning to their role.

#### Contact

[lafrica@versant.org](mailto:lafrica@versant.org)

### Residency Development, Design, and Implementation

---

*Tammy Franqueiro, BS, BSN, RN, RN-BC, USA*

#### Purpose

The purpose of this presentation is to provide participants with the knowledge and skills to develop organization and unit specific competencies and curricula. It identifies residency stakeholders who are responsible for Resident support and the education needed to develop their roles.

#### Target Audience

The target audience for this presentation includes nursing professional development staff, academic practice partners, clinical practitioners, and nursing leadership who are vested in providing safe practice environments for RNs in transition.

### Abstract

This session provides an overview of processes, models, and effective design principles that were foundational in developing a successful residency program. In 1999, the residency development team used a DACUM process for initial role delineation. The results, along with Benner's (1984) Novice to Expert framework, provided the initial structure of the program. Presenters will describe how core and specialty competencies and supporting curricula have been identified and developed. As a competency-based program, the Competency Outcomes Performance Assessment (COPA) Model is used as a framework to identify and develop essential competencies needed for clinical practice. These competencies are then organized into categories and performance criteria using Quality & Safety Education for Nurses (Cronenwett, Sherwood, & Gelmon, 2009) as a framework and statement of objective. To ensure currency and relevance competency and curricula development also rely on national professional nursing organization scope and standards of practice.

The education and development of the interprofessional team is another key aspect of the residency described in this section. Subject matter experts, preceptors, mentors and debriefers are critical to the long term success of the program and have their own unique learning needs. The presentation will outline the education and support needed for these roles.

Lastly, a description of practice-based learning will depict tools and strategies used to support the residents learning experiences at the point of care for it is when working directly with patients and their families that learning takes place (Benner, Hooper-Kyriakidis, & Stannard, 2011).

Both initial and ongoing competency management are important aspects of the program. For residency stakeholders having the tools, support, and resources they need to support learning is essential for professional role development and the provision of safe patient-centered care.

### Contact

[tfrankeiro@versant.org](mailto:tfrankeiro@versant.org)

## **Residency Sustainability: Professional Development and Program Outcomes**

---

*Jean S. Shinnors, PhD, RN-BC, USA*

### Purpose

The purpose of this presentation is to provide participants with potential professional development opportunities the residency offers stakeholders. It also discusses program outcomes and their role in residency evaluation and sustainability.

### Target Audience

The target audience for this presentation includes nursing professional development staff, academic practice partners, clinical practitioners, and nursing leadership who are vested in providing safe practice environments for RNs in transition.

### Abstract

This session provides participants with an overview of professional development opportunities created by a well designed and implemented residency and an overview of potential program metrics and outcomes.

NPD Scope & Standards of Practice (2010) state that nursing professional development is “the process of pursuing activities to enhance professional competence and role performance” with the ultimate outcome of “the provision of safe, quality care.” A recognized benefit of the residency is the provision of professional development opportunities for multiple stakeholders—not only the Resident, but other RNs and members of the interprofessional team who participate in the residency. Opportunities discussed include continuing education, certification, and support for academic progression.

To measure the success of a program it is necessary to include an ongoing evaluation process to analyze the impact and overall effectiveness in fulfilling program goals and objectives (Oermann, & Gaberson, 2013). Over the years residency programs have consistently demonstrated a positive effect on work and nurse satisfaction, competence, and retention (Ulrich, Krozek, Early, Africa, & Carman, 2010; Goode, Lynn, McElroy, Bednash, & Murray, 2013). Part of this session describes how an organization selects relevant outcome measurements that align the metric with the goals of the residency. Session participants will be provided with a tool to identify outcomes based on program goals and objectives. Outcome results will then provide insight into the overall impact of the program while showcasing successes, and providing guidance for change or revision.

Stakeholder engagement in the residency is a key component to ensuring sustainability. Participation in personal and professional development activities and working with program outcomes affect not only the Resident, but the unit, the organization, nursing as a profession and of most value, the patients which we serve.

## C 22 - Million Hearts®: The Bridge between Academia, Practice, and Community

### Million Hearts: An Evidence-Based Method for Improving Population Health

---

*Bernadette Mazurek Melnyk, PhD, RN, CPNP/PMHNP, FAANP, FNAP, FAAN, USA*

#### Purpose

The purpose of this presentation is to provide an overview of the Million Hearts initiative, its associated evidence based deliverables, and describe a nationwide partnership for promoting cardiovascular health within individual communities.

#### Target Audience

The target audience of this presentation is nursing faculty, bedside nurses, advanced practice nurses, or anyone interested in cardiovascular health.

#### Abstract

**Purpose:** Million Hearts is a national initiative to prevent 1 million heart attacks and strokes by 2017, empower and educate Americans to make healthy choices, and to target care by focusing on the “ABCs.” Appropriate aspirin therapy, blood pressure control, cholesterol management, smoking cessation, and stress management or the “ABCs” are the foundation of the initiative.

**Methods:** The Ohio State University College of Nursing has founded the National Interprofessional Education and Practice Consortium to Advance Million Hearts (NIEPCAMH) and has developed an online educational program to educate students, faculty and community members on cardiovascular disease prevention with the goal of them screening and educating people in their communities. Nursing students, interprofessional students, and community nurses are being educated on how to complete evidence based, accurate and focused Million Hearts screenings through an easy 4 step process. The assessments include biometrics (blood pressure, height, weight, body mass index, waist circumference), cholesterol, smoking, and stress screenings. Million Hearts screenings include patient education on normal and abnormal values and counseling/motivational interviewing on individualized preventive lifestyle modifications.

**Results:** Over 100 organizations are participating. Over 4,000 people have accessed the educational program and over 30,000 people have been screened.

**Conclusions:** This Million Hearts educational screening model takes a proactive approach to preventing cardiovascular disease in the community and allows health professions’ students to have a hands-on learning experience in promoting population health.

[Melnyk.15@osu.edu](mailto:Melnyk.15@osu.edu)

### 30,000 People: What We Have Learned about Population Health

---

*Kate E. Gawlik, MS, RN, ANP, USA*

#### Purpose

The purpose of this presentation is to review the results of a population health assessment and discuss implications for cardiovascular health promotion.

#### Target Audience

The target audience of this presentation is community nurses, nursing faculty, and primary care / cardiovascular advanced practice nurses.

### Abstract

**Purpose:** The Million Hearts® educational program revolves around users completing ten cardiovascular screenings in the community. The Million Hearts® screenings are meant to identify individuals with cardiovascular pre-disease, uncontrolled disease, and risk factors for the development of disease.

**Methods:** Screenings are a 10 step process based on the evidence based "ABCs" of care. De-identified data is collected on participants during Million Hearts® screenings and entered by users into the educational program via Checkbox® survey.

**Results:** Results from participants' screenings during the first 2 years of data collection indicate: (a) 51% had an abnormal blood pressure, (b) 45% were either overweight or obese, (c) 27% identified themselves as either a smoker or social smoker, (d) those with a Body Mass Index (BMI) of 25 or greater are more likely to have pre-hypertension, stage I, or stage II hypertension than those with a BMI under 25; (e) those who smoke are more likely to have pre-hypertension, stage I, or stage II hypertension than those who do not smoke; (f) Blacks, Latinos, and American Indians had higher rates of stage I and stage II hypertension than Caucasians; (g) Blacks, Latinos, and American Indians were more likely to be referred to a health care provider than Caucasians and Asian Americans; (h) 37% of participants were referred for follow-up with a health care provider and (i) 75% received counseling on their biometrics.

**Conclusions:** Significant opportunities exist in which to target blood pressure, smoking and obesity through lifestyle modifications. Increasing the rates of referrals and counseling are needed in order to ensure participants are provided with the tools and resources to improve and optimize their cardiovascular health.

### Contact

[gawlik.2@osu.edu](mailto:gawlik.2@osu.edu)

## **Advancing Million Hearts through Community Partnerships and Outreach**

---

*Margaret C. Graham, PhD, FNP, PNP, FAANP, FAAN, USA*

### Purpose

The purpose of this presentation is to provide examples of community engagement through use of the Million Hearts platform.

### Target Audience

The target audience of this presentation is nurses, advanced practice nurses, nursing faculty, and anyone interested in cardiovascular outreach/engagement.

### Abstract

**Purpose:** The Million Hearts® initiative aims to increase awareness about heart disease prevention and to empower patients to take control of their heart health. The goals of this session are to provide examples for nursing and interprofessional colleges of Million Hearts outreach and engagement opportunities and to provide an overview of a 3 class community course designed for participants who screen positive.

**Methods:** The Ohio State University is currently participating in several Million Hearts community outreach activities include engaging local congregations, participating in community health fairs and corporate screenings, and initiating the Wellness On Wheels (WOW) Tour. WOW is a three city bus tour conducted by an interprofessional team of students and faculty focused on doing Million Hearts screenings and education. The Ohio State University College of Nursing is also partnering with OSU Extension to bring Million Hearts screenings and educational classes to rural Ohio. OSU Extension, in collaboration with the College of Nursing, has developed a curriculum centered around the "ABCs" that will provide further information on how to reduce cardiovascular modifiable risk factors and help people make healthy behavior changes. The curriculum centers around hands-on education such as food

preparation and sample tastings, how to monitor blood pressure, and stress reduction methods. Nursing students conduct the initial screenings and the Extension educators teach the classes.

**Findings:** There are endless possibilities to advancing Million Hearts® through community outreach. Community engagement and screenings are beneficial and well received by the community.

**Implications:** Colleges of Nursing can find many ways to engage the community and their students in Million Hearts® while contributing to national health promotion initiatives.

[graham.548@osu.edu](mailto:graham.548@osu.edu)

## **D 14 - Improving Institutional and Student Outcomes by Transformation to a Culture of Care**

### **Transforming an Educational Culture through a Model of Care**

---

*Susan L. Groenwald, PhD, MSN, BSN, RN, ANEF, FAAN, USA*

#### Purpose

The purpose of this presentation is to articulate the need for a caring culture in nursing education to enhance student success, and to describe the process one institution used to transform the college to a culture of care that led to improved student and institutional outcomes.

#### Target Audience

The target audience of this presentation is current and future academic leaders.

#### Abstract

A recent Gallup poll revealed that a primary factor in an individual's success in school and the workplace was having a faculty member who cared about them as a person; yet only 22 percent of those surveyed reported receiving such support in college. At many educational institutions, students are left on their own to figure out how to persevere and are expected to be self-sufficient. Though this environment works for some students, particularly at elite institutions, many college students feel lost, lonely, confused, inadequate and anxious.

To make matters worse, negative cultures at some institutions are discouraging graduates from becoming educators. At the January 2015 AACN Doctoral Forum, researchers reported a common theme across five studies funded by RWJF that evaluated DNP and PHD preparation: The majority of students in both programs do not want an academic career because of the negative cultures they experienced while pursuing their education.

At the institution that is the focus of this symposium, there exists a belief that if we take extraordinary care of our students, they are more likely to be successful – motivated instead of pushed down, encouraged instead of berated. We believe that if we model the kinds of values and behaviors we want in extraordinary nurses, students are more likely to develop those important values and behaviors. From these beliefs a model of student success was developed with three elements of care as the underpinning: care of self, care of students, and care of faculty/staff.

The presenter is the institutional president who led the transformation of the institution to a culture of care and service so that it would be part of the organization's DNA. The presenter will describe the steps in the transformational process and provide examples of specific initiatives focused on the care of faculty and students including specific results of those initiatives.

### **Care for Faculty: Promoting Faculty Excellence to Improve Student Outcomes and Faculty Engagement**

---

*W Richard Cowling, BSN, MS, PhD, RN, APRN-BC, AHN-BC, FAAN, USA*

#### Purpose

The purpose of this presentation is to describe and demonstrate the implementation of a master instruction program used for faculty development and pedagogical practices founded in a philosophy of care for faculty and students.

### Target Audience

The target audience for this presentation is academic leaders who wish to adopt innovative faculty engagement strategies that can measurably improve student learning.

### Abstract

Key components of the care model for student success are care for colleagues and care for students. The model begins with engaged, caring colleagues because care reflects the culture and provides the foundation for care of students.

The literature indicates that key factors in student engagement in learning are student perceptions of the quality of instruction and interactions with faculty in the classroom. As part of a larger initiative to inculcate care throughout the institution, we established a goal that faculty in the classroom (both online and onsite) would meet a set of expectations and exhibit behaviors that exemplify a “master level instructor”. A task force developed expectations of a “master instructor” using concepts from the book, “What the Best College Teachers Do” by Ken Bain, to develop criteria for teaching and learning. This presentation describes how academic leadership operationalized the larger institutional philosophy of care into faculty teaching practices and faculty development and support, as well as the positive impact the initiative had on faculty and student engagement. Preliminary results of program evaluation, lessons learned, and future plans will also be presented.

## **Care for Students: Improving Student Success Using a Model of Care**

---

*Mary Judith Yoho, PhD, MSN, BSN, RN, CNE, USA*

### Purpose

The purpose of this presentation is to describe the challenges presented in moving an intensive program from pilot to national implementation and present strategies academic leaders have employed to mitigate those challenges. Preliminary outcomes of the student success model will be discussed.

### Target Audience

The target audience of this presentation is nurse educators, academic leaders, and healthcare leaders.

### Abstract

Care for students is a primary component of the organization’s philosophy of service excellence. Care for students will facilitate their academic success, retention, and foster positive NCLEX-RN pass rates. In 2014, a small pilot that exemplified care for students was launched in a single-site baccalaureate program to identify students at risk and provide students with individualized academic and coaching support. Preliminary findings were so encouraging that academic leadership pushed to broaden the program and launch it nationwide to over 16 baccalaureate campuses. The broadened program includes identification of both academic and psychosocial potential barriers to success, comprehensive assessment of student progress, and individualized student support and coaching provided by collaborating national and campus-based teams. This presentation will discuss the challenges presented in moving an intensive program from pilot to national implementation and present strategies academic leaders have employed to mitigate those challenges. Preliminary outcomes of the student success model will also be provided.

## **D 15 - Leveraging an Attitude of Gratitude: Innovative Strategies in Improving Health and Wellness, Enhancing Workforce Engagement and Participation in Professional Organizations**

### **An Attitude of Gratitude Program: Shining the Light on the Work Environment**

---

*Ann Marie T. Brooks, PhD, MSN, MBA, BSN, RN, FAAN, FACHE, FNAP, USA*

#### Purpose

The purpose of this presentation is to discuss and share an innovative approach that can be applied in any work setting to improve communication, teamwork and interdisciplinary collaboration.

#### Target Audience

The target audience are all STTI members who are interested in improving recognition, teamwork and outcomes within their areas of influence.

#### Abstract

Building and sustaining a culture of safety, quality and accountability is a challenge in healthcare. Engagement data from national organizations oftentimes use questions about recognition and demonstrate that retention of staff is directly related to various types of recognition especially from their direct supervisor and those in authority. This program focuses on developing and implementing a simple yet straightforward program that encourage employees at all levels to recognize others for their work. This unique session started out as part of our Schwartz Rounds program to begin the new year. Based on positive feedback from the first year, we repeated the Attitude of Gratitude Program again a year later with a remarkable increase in participation and overwhelming positive feedback. Fostering a positive work environment requires continual improvement and this one approach to recognition has added value to teamwork and the patient experience.

#### Contact

[annmariebrooks@hotmail.com](mailto:annmariebrooks@hotmail.com)

### **Attitudes of Gratitude: Innovative Strategies in Improving Health and Wellness**

---

*Sharon M. Weinstein, MS, RN, CRNI, FACW, FAAN, USA*

#### Purpose

to document the effect of an attitude of gratitude on employee health and well-being. Research has shown that those who adopt an attitude of gratitude as a permanent state of mind experience significant health benefits and contribute to a healthier work environment.

#### Target Audience

The target audience includes all nurses across all care settings. The presentation is aimed at creating a dialogue about attitudes of gratitude and health, well-being and mindset that can be used to enhance the overall work environment and staff morale.

#### Abstract

Your attitude plays a large role in determining whether you can feel grateful in spite of life's challenges. According to gratitude researcher Robert Emmons, gratitude is just happiness that we recognize after-the-fact to have been caused by the kindness of others. Gratitude doesn't just make us happier; it is happiness in and of itself! According to Emmons, gratitude is defined by your attitude towards both the outside world and yourself. He suggests that those who are more aware of the positives in their lives tend to focus their attention outside of themselves. One of the most significant changes in today's healthcare

system involves the workforce, where career opportunities abound and work roles are evolving. The ability to fully engage a current and growing workforce across systems is a challenge at all levels of the organization. Building a culture of gratitude in the workplace is not easy, but research tells us that an attitude of gratitude is a **good health choice as well as a good management choice**. Gratitude may actually be the key to happiness and can contribute to a healthier mind, body, and spirit. Gratitude is a nutrient for one's health, and it contributes to a happier, healthier work environment. The benefits of gratitude go beyond a sense of self-worth, self-efficacy, and trust between employees. By practicing gratitude, we are celebrating what brings us joy, directs our actions, and influences our outcomes. One of the many benefits to expressing gratitude consistently and freely is that it fosters an environment where people experience a greater sense of purpose. It is an innovative, visible demonstration of how we can all make a difference and the benefits are far-reaching. Practicing gratitude can increase work satisfaction and happiness in general, strengthen the immune system, lower blood pressure, relax the body, increase energy levels, facilitate healthy sleep, foster better interpersonal relationships and become an integral part of an employee health and wellness program. The simple act of acknowledging things to be grateful for can influence our thoughts, action and mood. As an organization, the ability to foster an attitude of gratitude across the system can have a significant impact on the work environment. The presenter will share the evidence base related to attitudes of gratitude and health outcomes. She will address innovations related to mindfulness, engagement, journaling and positivity through a gratitude exercise.

### **An Attitude of Gratitude: A Secret for Success**

---

*Mary Alexander, MA, BS, RN, CRNI, CAE, FAAN, USA*

#### Purpose

The purpose of this presentation is to share how a professional organization has used an Attitude of Gratitude process to motivate members to participate in various events and activities.

#### Target Audience

The target audience of this presentation are STTI attendees who are interested in recruiting and retaining their professional organization members.

#### Abstract

As nurses transition through their professional careers, with many specializing within their practice, involvement with a nursing association is an important aspect of their professional development. In an age when there is competition for one's time, talent and money, how are professional nursing organizations to survive? Fostering an attitude of gratitude philosophy can impact the level of member engagement. Remaining true to the organization's mission while ensuring relevance and creating value are key elements needed to build sustainable capacity for success. Effective approaches need to be implemented in order to create momentum, engage volunteer leaders, and build organizational sustainability. This presentation will share strategies that have led one specialty nursing organization to experience years of success.

### Choosing Wisely: The Role of Nurse Leaders in Reducing Unnecessary Healthcare

---

*Pamela J. Bradshaw, MSN, MBA, RN, NEA-BC, CCRN, USA*

#### Purpose

The purpose of this presentation is to educate participants about the Choosing Wisely® campaign in an effort to improve nursing practice, patient-centered care delivery, quality of care, and safety.

#### Target Audience

The target audience of this presentation is nurse leaders and direct care nurses.

#### Abstract

The Choosing Wisely® campaign is an initiative of the American Board of Internal Medicine (ABIM) that is focused on improving communication between providers and patients. The campaign began in April 2012 with the goal of promoting communication that would help patients choose care that is supported by evidence, does not duplicate tests or procedures that have already been completed, does not cause harm and is truly needed to guide care ([choosingwisely.org](http://choosingwisely.org), n.d.). The ABIM Foundation challenged medical organizations to develop a list focused on their specialty. Currently, there are 58 health care provider organizations that have released a list of tests or procedures to consider and an addition ten organizations that plan to release a list in 2014 (ABIM Foundation, n.d.). There are 14 consumer groups that have collaborated with Consumer Reports that are supporting the Choosing Wisely® campaign, including AARP and the Leapfrog Group (ABIM Foundation, n.d.).

In a 2014 study funded by the Robert Wood Johnson Foundation and conducted by PerryUndem Research/Communication (2014), only one in five physicians were aware of the Choosing Wisely® campaign. In the same survey, three of four physicians indicated that a provider ordering unnecessary medical tests and procedures is a serious problem and more than half believe they are in the best position to address the problem (PerryUndem Research/Communication, 2014).

The American Academy of Nursing (AAN) was invited to participate in the Choosing Wisely® campaign to develop recommendations specific to the role of nursing. AAN is leading the nursing profession's recommendations and plays a critical role in the education of nurses nationwide regarding the recommendations ([choosingwisely.org](http://choosingwisely.org), n.d.). Texas has been selected to be the pilot state for

implementing nursing considerations for the Choosing Wisely® campaign. The first five nursing recommendations were released in October 2014 and include considerations regarding fetal monitoring, mobility for older adult patients, restraints, waking for routine care, and urinary catheters (AAN, 2014). AAN is working with multiple specialty organizations to develop additional nursing related recommendations.

Until AAN became involved with the Choosing Wisely® campaign, nursing did not actively participate with any of the recommendations. ABIM included AAN with the intent to broaden the campaign beyond just physicians and to include a wider array of healthcare providers, including advance practice nurses and registered nurses. Currently there are over 192,000 nurse practitioners (aanp.org, 2014) and approximately 2.7 million registered nurses (hrsa.gov, 2013) compared with approximately 894,000 active physicians in the United States (kff.org, 2014). Given that there are significantly more nurses than physicians, it is clear that nursing needs to be involved in discussions and decisions that impact health care consumers.

In October 2014, Texas was selected as the lead pilot state to implement the nursing components of the Choosing Wisely® campaign. The campaign will be implemented in two phases. Phase one of the pilot project is focused on the development of toolkits to educate advance practice nurses and registered nurses about the Choosing Wisely® campaign and to develop tools that evaluate the effectiveness of the education provided.

Phase two of the pilot project will be launched in collaboration with the national Campaign for Action: Future of Nursing led by AARP and the Robert Wood Johnson Foundation (RWJF). The Choosing Wisely® Campaign aligns with the goals of the Campaign for Action in that both campaigns are focused on changing healthcare in the 21st century (RWJF.org, n.d.). State action coalitions engaged in the Campaign for Action will be selected to participate in phase two. During phase two, the Choosing Wisely® campaign will be launched in the selected states.

The leaders of the pilot project have partnered with the Texas Commission on Nursing Workforce Studies (TCNWS). The TCNWS conducts studies in various health care settings each year, focusing on nurse staffing. This collaboration partners multiple organizations to determine the effectiveness of education provided as part of the Choosing Wisely® campaign. A modified version of the PerryUndem survey was developed and administered online during phase two of the pilot project. The goal of the survey is to measure baseline and progress of awareness and adoption of Choosing Wisely® recommendations by nurses.

As nurse leaders, it is our responsibility to understand and support adoption of evidence based recommendations. Most of the initial recommendations for nursing can be implemented by educating nurses at the bedside. Support from nursing leadership will encourage rapid adoption, resulting in improved outcomes for patients. Tools are available to assist leaders with education, including guidelines with explanation of the recommendation and supporting evidence. Collaboration with other health care professionals will enhance adoption.

## **Choosing Wisely®: Building a Statewide Pilot Program**

---

*Lisa J. Woodward, DNP, RN, CENP, USA*

#### Purpose

inform nursing leaders on how to build a coalition of key diverse stakeholders, including development of a steering committee and charter.

#### Target Audience

nursing leaders, both academic and administrative.

#### Abstract

Choosing Wisely®, an initiative of the American Board of Internal Medicine (ABIM) Foundation, released its first list of “Things Providers and Patients Should Question” in 2012. This campaign works with different organizations and specialties and is designed to spark conversations between providers and patients to ensure that the right care is delivered at the right time. Consumer Reports concurrently has developed and disseminated patient materials to assist in engaging in conversations with their health care provider, empowering them to ask questions about appropriate testing and procedures. To date, the Choosing Wisely® campaign has engaged nearly 100 national and state medical and nursing specialty societies, regional health collaboratives and consumer organizations, identifying over 300 tests and procedures that have been described as overused and inappropriate.

The American Academy of Nursing (AAN) announced in October 2014 their collaboration with the ABIM and release of their first five nursing focused statements. Texas was selected by the AAN to pilot the nursing initiative in 2015. The Texas model will then be replicated nationally.

The Texas Choosing Wisely® campaign is being funded in part by the Promise of Nursing for Texas Grant Program administered by the Foundation of the National Student Nurses' Association. Funding for the grant program was contributed by several hospitals and health care agencies in the Texas area, by Johnson & Johnson, and by national companies with an interest in supporting nursing education. The funds were raised at gala fundraising event sponsored by Johnson & Johnson.

As part of this initiative in Texas, the Texas Team Advancing Health through Nursing selected a core team that worked to build a coalition by seeking out a diverse group of stakeholders. The core team also developed a charter to guide and support the newly developed steering committee. This coalition and charter were developed and implemented to support the dissemination of the Choosing Wisely® information to all Texans, including healthcare providers and organizations, patients and families, payers, and policy makers.

### **Leading the Adoption of Choosing Wisely Recommendations into Practice: Drawing on Principles from EBP**

---

*Kathleen R. Stevens, RN, MS, EdD, ANEF, FAAN, RN, MS, EdD, ANEF, FAAN, USA*

#### Purpose

The purpose of this presentation is to equip nurse leaders with strategies to produce necessary change in adopting Choosing Wisely recommendations.

#### Target Audience

The target audience of this presentation are nurses in clinical, academic, and administrative leadership positions.

#### Abstract

Higher-quality care is a national goal for nurse leaders and is expressed by the National Quality Strategy to achieve better care for individuals, better health for populations, and greater value (lower per capita costs). The importance of choosing care that is supported by evidence (EBP) was raised to new heights in the IOM Quality Chasm and Future of Nursing reports. The new Choosing Wisely initiative examines the “flip-side” of evidence-based practice (EBP), that is, removing from practice those approaches for which there is evidence of ineffectiveness or harm. Unnecessary and ineffective procedures and interventions add to cost while desired health outcomes are not reached, eroding the value of care.

The Choosing Wisely campaign generates evidence-based recommendations to help providers and consumers engage in conversations to make informed decisions and avoid unnecessary and ineffective care. Such decisions are enacted by the healthcare team, with nurses playing a vital role. Many times ineffective clinical approaches are embedded in common practice, so targeted change initiatives are needed to remove them.

One Future of Nursing recommendation urges nurses to lead interprofessional teams to change care in achieving safety and quality. Just as nurse leaders employ principles to promote adoption of best practices, they can also draw on principles to remove useless practices from daily care. Practical principles can be derived from a number of sources commonly used in promoting adoption of best practices. These include principles of change management, team leadership, creating a sense of urgency, and empowering through capacity building. The new concept of “implementation” is defined as “the use of strategies to adopt and integrate evidence-based health interventions and change practice patterns within specific settings” (NIH, 2013, no pagination). Strategies include embedding change champions in care settings, garnering buy-in from executive and frontline nurses, and managing organizational culture. Additional strategies include promoting public awareness and engagement of patients and families, engaging policy agents in supporting these changes, and tracking the practices changes accomplished by the Choosing Wisely campaign.

## F 14 - Transforming Liberia's Nursing Work Force through Pioneering Graduate Nursing Education, Leadership Development, with Exemplars from the International Ebola Response

### Experiences in Nursing, Nursing Education and Leadership in Liberia Before Ebola and Beyond

---

*Harriette N. S. Mundaye, CM, RN-BSN, MSN-Ed, FWACN, RN, Liberia*  
*Edwin Beyan, BSc, MSN, RN, Liberia*

#### Purpose

The purpose of this presentation is to provide their experiences as nurse educators and leaders in Liberia. Both graduated in the first cohort of the MSN program. They share their experiences as nurse educators prior to attending the program and how the program transformed them and shaped their futures.

#### Target Audience

The target audience for the presentation is nurses who are interested in nursing education and nursing leadership in international contexts and the experiences of nurses in low resource countries.

#### Abstract

Nursing experiences in Liberia have been fraught with challenges because of the lack of infrastructure made worse by the civil war. Edwin's first years as a nurse at the John F. Kennedy Memorial Hospital, we were providing delicate nursing care, such as inserting naso-gastric tubes and administering blood transfusions without electricity, we just used candle and flashlight. We could work for months without pay; so nurses did not go to work on time and those on shift could not wait after their shift to turn over. There was a lack of drugs and medical supplies to provide nursing care to the patient. We knew what to do, but we lacked the resources to implement, so the patients just stayed in bed; some developing decubitus ulcers while others died slowly. I also had the experience of providing nursing care to patients in mass casualty situations during the civil war. We were providing nursing care to people with multiple injuries, most of them non-survivable. It was very agonizing to see your fellow men in this kind of situation. Walsh (2010) notes in her dissertation research, "the Liberian nurses' describe the frustration with the lack of supplies, equipment and wages."

Despite all of these challenges, being a nurse in Liberia was a dream come true for Harriette. I wanted to be a compassionate person who could make others healthier. Being a nurse was wonderful, then I thought I could do more and share my knowledge with others and be a teacher. I found myself in the classroom helping to prepare nursing pupils and realized that I was not prepared or trained as an educator to take on my new role. I was provided with the opportunity to attend a few workshops that actually helped with the classroom management and developing session plans.

Harriette and Edwin were fortunate that they both met Dr. Edna Johnson, a retired nursing professor from the United States who was working as a missionary in Liberia. Both Edwin and Harriette talked with her about their desire to attend a master's in nursing program and she told them about the Master's in Nursing Education program that would begin at Mother Patern College of Health Sciences in Monrovia in 2010. The program had received funding from USAID and World Learning that would provide scholarships to cover the cost of tuition and books. The students had to apply and be accepted to attend, their school of nursing needed to allow them to take a leave of absence with a contract to return for a defined time period. In addition, for a student like Harriette who lived in a rural area many miles from Monrovia, she had to leave her family for the 15 months duration of the program.

Critical thinking and evidence-based nursing are the two key words that came to light for Edwin, Harriette and their classmates in the MSN program. Today, it's clear to us that nurses should be critical thinkers when providing nursing care and when interacting with clients. Nurses should be involved in research so

as to provide evidence-based nursing care. Attending the MSN program greatly changed our thinking and understanding of educating nursing pupils, focusing on clinical teaching and student centered approach, rather than the old medical or traditional model of training. During the program it became clear that nursing is a distinct profession and competent nurse leaders are the best people to take charge of nursing education and leadership. As graduates of the MSN program we now have the education to work with the Liberian Board of Nursing and Midwifery to improve nursing education in Liberia.

During the Ebola outbreak all of Edwin and Harriette's job related activities were forcibly shut down by the Government due to the closure of the schools. Because of our roles as educators and as nurses we were sought out to provide health prevention education and training, as well as leadership during this crisis. Harriette participated in training mid-level health workers on Infection Prevention Control in Lofa County. I delivered the best of MSN education and the organizers of the training did like every presentation and methods of teaching and wanted me to join their organization as a full employee, but I refused because I was committed to her calling. Likewise, Edwin was given the position to supervise the National Catholic Ebola Infection Prevention and Control training workshops in the Monrovia archdiocese and Gbarnga diocese. As a training supervisor, I needed to know a lot about Ebola transmission and prevention of Ebola. My experience was that most of health care providers who got infected did so because of lack of previous knowledge about Ebola transmission. Up to 400 health care providers, according to report from the Infection Prevention Control Taskforce meetings got infected and half of that number died. At the initial most of the health care providers used standard precautions rather than the extended precautions. Additionally, some got infected with the Ebola virus while giving home-based treatment [without personal protective equipment] when their working areas were shut down because of Ebola. At the community level I realized that people got infected because of disbelief and mistrust in Ministry of Health and Social Welfare. These experiences also led me to potential career opportunities and I am now working as the Coordinator for the MSN program at Mother Patern College of Health Sciences in addition to taking on many other important duties there.

The experiences of Harriette and Edwin are reflective of the transformation of the graduates of the MSN program. They also highlight some of the findings of Curry, Taylor, Chen and Bradley (2012) who interviewed 17 health care leaders from four sub-Saharan African countries, including Liberia. One of their key findings was having a value-based vision for improving the future of the country, which these experiences reflect. Another finding was tending to relationships, which these experiences also highlight. The value of higher education and leadership development in transforming nursing cannot be underestimated.

## **Transforming the Nursing Workforce through Leadership Growth**

---

*Magdeline C. Aagard, BAN, MBA, EdD, RN, PHN, USA*

#### Purpose

The purpose of this presentation is to describe the complexities of leadership in the cultural context of Liberia and how this was taken into consideration in the development of a culturally relevant leadership curriculum.

#### Target Audience

The target audience for the presentation is nurse educators, nurse leaders and other nurses interested in global nursing.

#### Abstract

Leadership is considered a critical attribute in the enhancement and transformation of the nursing workforce of Liberia. As part of this leadership transformation, the Master's of Science in Nursing Education (MSN) program was created and delivered at the Mother Patern College of Health Sciences in

Monrovia, Liberia. The program was designed to create leaders through higher education in nursing, as well as specific leadership curricula, followed by practica and mentoring at the student's home Liberian nursing educational institution.

Looking to develop a culturally contextual leadership curriculum for the MSN program, the author looked to the literature and her experience in designing other culturally contextual and leadership curricula. Beginning with international leadership literature, surprisingly, there is a dearth of literature on the topic of international nursing leadership. What comes up in literature searches in CINHALL and PROQUEST are studies looking at what we in the United States are teaching about international leadership, but little on what nursing leadership means in other cultural contexts. Literature on leadership capacity building is focused on high income countries, rather than low-income, low resource countries (Curry, Taylor, Chen, Bradley, 2012). Programs aimed at developing leadership skills for nurses from and health professionals from low and middle income countries are limited (Wilson, Crooks, Day, Dawson, Gakumo, Harper, Jones, McCarty, Theus, 2013).

What was available was information from influential leaders such as the past president of STTI, Dr. Mansour Jumaa. In his 2007-2009 Address he noted that there are four key themes to international leadership, "being intentionally global, building knowledge resources, developing further leadership skills and creating greater emphasis on providing services." Another source of leadership themes came from the work of Curry, Taylor, Chen and Bradley (2012) who interviewed 17 health care leaders from four sub-Saharan African countries, including Liberia. The five themes they found were: having a value-based vision for improving the health of the country, being self-aware and having the ability to identify complementary skills in others, tending to relationships, using data to make decisions and a sustained commitment to learning. Incorporating these themes was important as part of the cultural context of leadership in Liberia.

As a nurse who has worked extensively internationally and created other contextually relevant curricula, the author sought other means to understand culturally relevant information to develop the leadership context. Talking with American Liberian nurses and reading books about Liberia gave information and insight in the role of nursing as a profession within the health care system in Liberia. It also gave context to gender roles in Liberia and the patriarchal societal structure, both of which impact the context of leadership. Another contextual component was the way in which decisions are made regarding who is placed in presumed positions of power and influence. These are sensitive social constructs and cultural mores that are long standing. Bringing them to light as topics of discussion in the context of leadership was challenging, especially for someone who was not of the culture. However, it was important for the leadership growth of the nurses in the MSN program who would be living with and be challenged by these very issues.

Three cohorts have graduated from the program. Some graduates have chosen to stay in their role as nurse educators, or deans of their respective schools of nursing. Others have moved into positions of increased leadership and responsibility because they have obtained their MSN. The unfortunate outbreak of Ebola led to the creation of new leadership positions and positions in education and training that opened up new job opportunities for our graduates. One of the themes of leadership is the desire for lifelong learning. Several of our graduates are looking to pursue their doctoral degree through online universities because Liberia doesn't have any doctoral programs. We are working hard to help them realize their dreams.

## **Transforming the Nursing Workforce in Liberia through Graduate Education**

---

*Dorcas E. Kunkel, DNP, RN, APHN-BC, LHIT-HP, USA*

Purpose

to describe an innovative curriculum delivery model for graduate nursing education to improve nursing work force capacity and transform nursing in Liberia.

#### Target Audience

Nursing leaders, nursing educators, and practicing nurses.

#### Abstract

Nursing education in Liberia, West Africa has been slowly recovering from the destruction of health care education institutions that was experienced during the horrific civil wars that took place from 1989-2003. There is a dearth of nurses prepared at the diploma or baccalaureate levels of education to meet practice needs and very few masters or doctoral prepared nurses to lead change to improve population health outcomes, public health and strengthen health systems (Flomo-Jones, 2013, Walsh, 2010). Health care financing is primarily provided by international humanitarian aid as Liberia is one of the poorest countries on the globe and thus there are limitations tied to donor interests (Flomo-Jones, 2013, Varpilah, 2011 ). Health care is delivered to the population as a package of basic health care, heavily weighted on preventive or health promotion services (Flomo-Jones, 2013).

The weaknesses in health system infrastructure, public health and health care worker capacity in West Africa were made extremely evident by the Ebola epidemic of 2014 – 2015, particularly in the developing countries of Liberia, Sierra Leone and Guinea. In addition, the vulnerability of global health was also made evident by events such as regional and international travelers being able to transport Ebola rapidly through land and air travel causing much concern in developed countries in North America and Europe. Nurses are the greatest number of health care workers in Liberia, but even so their numbers and professional competencies must be increased in order to meet the health needs of the population and to rebuild or establish public health systems that assure rapid detection and an effective early response to any future outbreaks (Flomo-Jones, 2013, Varpilah, 2011). While the potential global impact of under-capacitated health care workforces in developing countries has risen to international concern in 2014 because of the reporting of the Ebola epidemic by the media, in fact we have been working to improve nursing work force capacity in Liberia since 2010 through an innovative curriculum delivery model.

Currently there are only two graduate programs for nurses in Liberia. There is a Master of Nursing Management at Cuttington University (Flomo-Jones, 2013). In addition, a Master of Science in Nursing Education (MSN) program was developed in 2010 by expatriate nursing leaders who volunteered their time and expertise. This program is delivered at Mother Patern College of Health Sciences (MPCHS), one of five colleges that make up Stella Maris Polytechnic, all under the Catholic Archdiocese of Monrovia. No doctoral programs for nursing are available in Liberia, and very few doctoral-prepared nurses, so volunteer expatriates fill the faculty gap in the graduate program. Modeled on the National League for Nursing's core competencies for nurse educators, the MSN curriculum at MPCHS is taught by expatriate faculty, some who have past connections to Liberia and others with interests in international nursing. Some instructors who are not nurses teach courses on statistics, writing and technology. All are committed to advancing global health by improving nursing education and by preparing Liberian nursing and midwifery personnel for evidence-based practice.

The initial cohort had an enrollment of 17 students from eight Liberian schools of nursing, the Liberian Board of Nursing and Midwifery, and the Ministry of Health and Social Welfare. Six professors from the United States and one language instructor from England volunteered to teach in the first phase of the program over a period of 18 months. For the education practicum, students returned to their home institutions to put into practice the principles of teaching and learning. Sixteen students graduated in August 2012 and August 2013 and a third cohort of 15 students will graduate in August 2015. The program was developed and directed by Dr. Edna Johnson, PhD, RN, faculty emeritus, University of Connecticut to 2014. As of spring 2015, the MSN program is directed by Edwin Beyan, RN, BSc, MSN, graduate of the first cohort of students in the MSN program. The program is accredited by the Ministry of Education, Republic of Liberia and scholarships for students and related funding provided initially by FORECAST then handed over to WORLD LEARNING. These funding sources are both made possible through USAID (From the American People).

Dorcas Kunkel, BSN, MS, DNP has been a volunteer nurse faculty in the MSN for nurse educators curriculum at MPCHS in Monrovia, Liberia teaching two courses for each cohort of students in 2011, 2012 and 2014.

## **F 15 - Evidence-Based Leadership: Key Strategies for Building a Sustainable EBP Culture to Improve Healthcare Quality, Safety, Patient Outcomes and Costs**

### **Evidence-Based Leaders and Leadership**

---

*Bernadette Mazurek Melnyk, PhD, RN, CPNP/PMHNP, FAANP, FNAP, FAAN, USA*

#### Purpose

provide the participants with an overview of a recent study conducted with CNO/CNEs related to EBP and discuss major findings. In addition, discuss opportunities for leaders to leverage in creating and sustaining environments where EBP and best practice can be sustained.

#### Target Audience

leaders, managers, clinicians, advanced practice nurses

#### Abstract

Today's healthcare environment is increasingly complex and ever changing. Evidence-based practice (EBP) has been identified as a critical requirement to achieve the Triple Aim in healthcare. Although it is well established that evidence-based practice (EBP) improves healthcare quality and patient outcomes as well as reduces morbidities, mortality, medical errors, and costs of healthcare services, it is not standard practice by the majority health professionals in healthcare systems. Many healthcare providers, across the care continuum, continue to deliver care based upon tradition, outdated policies and procedures, and information learned years ago in their educational programs. It is essential for healthcare organizations to transform their institutions to evidence-based enterprises by deeply integrating EBP into their day to day operations, culture, and work environments to meet national goals, exceed benchmarks, and provide high quality care to patients, families, and the community. Many challenges related to implementing and sustaining EBP stem from a lack of EBP knowledge, skills, and attitudes in not only bedside clinicians, but in leaders as well. Nursing leaders are responsible to guide and support clinicians through the transformation to an evidence-based approach to care to ensure excellence and outstanding outcomes. This requires proficiency in traditional leadership practices as well as new knowledge and skills related EBP that must acquired, in order to create work environments/cultures that sustain evidence-based practice. Educational opportunities must be developed that resonate with contemporary nursing leaders and increase their confidence to lead, role model, and support and advance EBP throughout their organization. Leaders' innovative approaches to resource allocation and utilization (people, processes, technology) can be leveraged to create and sustain an EBP rich work environment. The unique possibilities that exist for leaders to utilize their style, position, resources, and their scope of influence to promote and sustain an EBP culture and environment will be explored.

### **Helping Leaders Learn EBP and Recognize Their EBP Potential**

---

*Lynn Gallagher-Ford, PhD, RN, DFPNAP, NE-BC, USA*

#### Purpose

share information about EBP educational programs that have been designed specifically for leaders and how they can be effectively implemented. In addition, leadership styles and how each can be leveraged to support and sustain EBP will be addressed.

#### Target Audience

leaders, managers, clinicians, advanced practice nurses.

### Abstract

Today's healthcare environment is increasingly complex and ever changing. Evidence-based practice (EBP) has been identified as a critical requirement to achieve the Triple Aim in healthcare. Although it is well established that evidence-based practice (EBP) improves healthcare quality and patient outcomes as well as reduces morbidities, mortality, medical errors, and costs of healthcare services, it is not standard practice by the majority health professionals in healthcare systems. Many healthcare providers, across the care continuum, continue to deliver care based upon tradition, outdated policies and procedures, and information learned years ago in their educational programs. It is essential for healthcare organizations to transform their institutions to evidence-based enterprises by deeply integrating EBP into their day to day operations, culture, and work environments to meet national goals, exceed benchmarks, and provide high quality care to patients, families, and the community. Many challenges related to implementing and sustaining EBP stem from a lack of EBP knowledge, skills, and attitudes in not only bedside clinicians, but in leaders as well. Nursing leaders are responsible to guide and support clinicians through the transformation to an evidence-based approach to care to ensure excellence and outstanding outcomes. This requires proficiency in traditional leadership practices as well as new knowledge and skills related EBP that must be acquired, in order to create work environments/cultures that sustain evidence-based practice. Educational opportunities must be developed that resonate with contemporary nursing leaders and increase their confidence to lead, role model, and support and advance EBP throughout their organization. Leaders' innovative approaches to resource allocation and utilization (people, processes, technology) can be leveraged to create and sustain an EBP rich work environment. The unique possibilities that exist for leaders to utilize their style, position, resources, and their scope of influence to promote and sustain an EBP culture and environment will be explored.

## **Leading the Transformation to an EBP Organization with Planned, Strategic Integration of 3 Critical Resources; People, Processes and Technology**

---

*Michelle R. Troseth, MSN, RN, DPNAP, USA*

### Purpose

discuss leaders' responsibilities to: recognize critical resources needed to create/ sustain a culture that supports EBP; use their position/role to attain and leverage these powerful resources effectively; provide the context where synergies of key critical resources can be seized to propel their organizations ahead in best practice and care.

### Target Audience

leaders, managers, clinicians, advanced practice nurses

### Abstract

Today's healthcare environment is increasingly complex and ever changing. Evidence-based practice (EBP) has been identified as a critical requirement to achieve the Triple Aim in healthcare. Although it is well established that evidence-based practice (EBP) improves healthcare quality and patient outcomes as well as reduces morbidities, mortality, medical errors, and costs of healthcare services, it is not standard practice by the majority health professionals in healthcare systems. Many healthcare providers, across the care continuum, continue to deliver care based upon tradition, outdated policies and procedures, and information learned years ago in their educational programs. It is essential for healthcare organizations to transform their institutions to evidence-based enterprises by deeply integrating EBP into their day to day operations, culture, and work environments to meet national goals, exceed benchmarks, and provide high quality care to patients, families, and the community. Many challenges related to implementing and sustaining EBP stem from a lack of EBP knowledge, skills, and attitudes in not only bedside clinicians, but in leaders as well. Nursing leaders are responsible to guide and support clinicians through the transformation to an evidence-based approach to care to ensure excellence and outstanding outcomes.

This requires proficiency in traditional leadership practices as well as new knowledge and skills related EBP that must be acquired, in order to create work environments/cultures that sustain evidence-based practice. Educational opportunities must be developed that resonate with contemporary nursing leaders and increase their confidence to lead, role model, and support and advance EBP throughout their organization. Leaders' innovative approaches to resource allocation and utilization (people, processes, technology) can be leveraged to create and sustain an EBP rich work environment. The unique possibilities that exist for leaders to utilize their style, position, resources, and their scope of influence to promote and sustain an EBP culture and environment will be explored.

## G 15 - Person and Family Centered Care in a Global Context

### A World View of Person and Family Centered Care

---

*Joanne Disch, PhD, RN, FAAN, USA*

#### Purpose

To differentiate the traditional concept of patient centered care from contemporary person and family centered care; explore the concept from the perspective of different countries; and provide a framework for assessing the cultural and social factors that must be considered when partnering with individuals and their families from different cultures.

#### Target Audience

clinicians, administrators, faculty, students who work directly with patients and families or who are responsible for designing and improving systems and structures for providing healthcare.

#### Abstract

Although substantial work is being done in many countries to advance the concept of person and family-centered care, there is no universal definition that has been adopted. The international Alliance of Patients' Organizations (2007, p. 2) uses the term patient-centred healthcare to "describe healthcare that is designed and practiced with the patient at the centre." However it has become clear over the past 20 years that this definition can encompass working with, doing for or doing to – with patients and their families having little say in the design, delivery or evaluation of their health care. The Institute of Medicine (2001, p. 40) has defined patient-centered care as: "a partnership among practitioners, patients and families to ensure that decisions respect patient wants, needs and preferences and that patients have the education and support they require to make decisions and participate in their own care." Rather than a specific definition, attention is being paid to key attributes such as the IAPO's recommendation of patient centered care including: respect, choice and empowerment, patient involvement in health policy, access and support, and information; or the Picker Institute's 8 Principles which include Involvement in decisions and respect for patients' preferences, and Continuity of care and smooth transitions.

The purpose of this presentation is to differentiate the traditional concept of patient centered care from contemporary person and family centered care; explore the concept from the perspective of different countries; and provide a framework for assessing the cultural and social factors that must be considered when partnering with individuals and their families from different cultures.

This session will differentiate the traditional concept of patient centered care from the contemporary view of person and family centered care; explore the concept from the perspective of several different countries and cultures; and provide a framework for assessing the cultural and social factors that must be taken into consideration when partnering with individuals and their families from different cultures.

### Taking Charge: Engaging Patients as Full Partners

---

*Mary Walton, MSN, MSE, RN, USA*

#### Purpose

This symposium will examine the concept of person and family centered care from a global lens, citing international efforts to extend this concept worldwide. Numerous examples of exquisite person and family centered care will be shared, as well as pragmatic strategies for establishing this in one's own organization.

### Target Audience

nurse leaders at all levels who are responsible for creating environments that support person and family centered care

### Abstract

A growing body of evidence demonstrates that improving the patient experience and developing partnerships with patients/families correlates with improved health outcomes. Patients who are more involved in their care are better able to: manage complex chronic conditions, seek appropriate assistance, have reduced lengths of stay, avoid readmissions and emergency department visits, and experience increased satisfaction. To achieve this, health care professionals need to engage patients and families in partnered relationships, and equip them with the relevant information, resources, access and support to fully engage in and/or direct their health care experience. This includes a focus on health literacy and educating people as to how they may become more active. Through the provision of tools, strategies, and support, people become informed and engaged healthcare consumers who are confident in their ability to make a positive impact on their own and their family members' healthcare quality and safety.

When people understand their role in the care process and have the know-how, skills and confidence to manage their healthcare, patient activation also means helping people to move from a traditional model of believing the clinician knows best toward willingly playing an active role in their care. Clinicians need to be adept at assessing patient-engagement levels and the interventions to increase patient participation in their care processes

To achieve this level of functioning, leaders and frontline clinicians must partner with consumers and other health professionals to intentionally lead the necessary culture shift by integrating the person and family voice into not only direct care, but also all improvement efforts, leadership committees, and newly designed programs. For nurses this means moving from the traditional "providing care" and "doing to" to a shared decision-making model where they partner with people so they can assume more responsibility for their care and health status.

Part of symposium submitted.

## **The Leader's Role in Assuring Person and Family Centered Care**

---

*Jane H. Barnsteiner, PhD, RN, FAAN, USA*

### Purpose

None

### Target Audience

None

### Abstract

The role of the leader in promoting person and family centered care is to create the systems, processes and structures for providing care that fully engages the person and family in the design, implementation and evaluation of health care. In addition to the above responsibilities, the Joint Commission (2009, p.3) notes: "...it is the leaders who establish the organization's culture through their words, expectations for action, and behavior – a culture that values high-quality, safe patient care, responsible use of resources, community service, and ethical behavior; or a culture in which these goals are not valued."

This responsibility may be one of the most important for leaders to undertake and yet it can be the most difficult. It requires unwavering commitment, redirection of resources, massive cultural change and a relentless reinforcement of the message. This session will highlight some of these challenges, review a

model for building the case for pursuing this course of action and securing organizational commitment, and offer several concrete strategies for creating environments that are person and family centered. Additional benefits of this work, if done well, is that it also can result in increased staff satisfaction and engagement and reduced costs.

# H 13 - Leading a Team of Front-Line Staff to Own Their Outcomes: How One Unit Transformed the Culture and Significantly Improved Their Patient Quality Outcomes

## Improving HCAHPS in a Challenging Patient Population: Trauma and Burns

---

*Meredith Palmer, BSN, CCRN, USA*

### Purpose

The purpose of this presentation is to describe a quality improvement project aimed at developing an orientation video for patients that would result in improved HCAHPS scores specifically in the domains of communication and overall experience.

### Target Audience

The target audience is any nurse, nurses leader, or administrator in an inpatient setting working to improve the patient experience.

### Abstract

**Introduction:** Hospital Consumer Assessment of Healthcare Providers and Systems (HCAHPS) is a metric that represents the patient's perception of quality care received. Data supports that the patient's experience is linked to great clinical care, reduced medical error, and improved patient outcomes. HCAHPS is part of the value-based purchasing initiative that ties reimbursement to quality outcomes. Each individual patient's survey results matters. These questions measure frequency on a scale of never, sometimes, usually, and always. Three of the six categories of HCAHPS questions relate to communication: with doctors, with nurses, and about medications. The purpose of this presentation is to describe the development and implementation of a standardized orientation process for trauma and burn patients and its impact on the HCAHPS composites related to communication.

**Methods:** In an effort to increase the HCAHPS categories related to communication, a standardized orientation was created. A multidisciplinary team was formed including key stakeholders from the Trauma and Burn Intensive Care Unit (TBICU), Neuro Intensive Care Unit (NICU), Emergency Department (ED), Acute Care Trauma Unit, and the Trauma and Burn Unit. A review of current literature was completed and a best practice identified. The team decided to create a video that patients and families would view within the first 12 hours of admission. Key talking points were identified and distributed to all frontline staff. The team then decided to pilot the standardized orientation process on the Acute Trauma Care Unit. Education was provided to all members of the health care team. During this phase, documentation of the patient viewing the video within the first 12 hours was validated. Nurse leaders on the unit spoke to every patient in the first 24 hours of admission to answer any questions, ensure compliance with the new process, and address any concerns. Staff nurses were asked to complete a brief questionnaire about the new orientation process. HCAHPS survey results were evaluated by discharge date during the three month pilot phase.

**Results:** HCAHPS scores in the categories involving communication improved. Nurses involved in the pilot provided positive feedback with qualitative data supporting the consistency and effectiveness of the new process. The exact process is now being utilized in several other units where burn patients receive care and other specialty areas have used the process as a guide to create unit specific orientation videos.

**Conclusions:** A consistent patient and family centered orientation process, upon admission with individual one on one discussion with the bedside nurse, positively impacts the HCAHPS composites related to communication.

**Applicability of Research to Practice:** Success of the implementation of this initiative in practice relies on the commitment of key people within the organization to see activities through from planning to

implementation and ongoing evaluation. Involving key stakeholders in the project team, created buy in and provided support for sharing best practices throughout a large academic medical center. Additional research could be completed to evaluate the effectiveness of a video versus a written standardized orientation.

## **Secretary Daily Rounding: It Works!**

---

*Courtney Edwards, RN, MSN, CNL, USA*

#### Purpose

The purpose of this presentation is to describe a quality improvement initiative led by non-licensed staff to improve the overall patient experience on an acute trauma care unit at a large academic medical center.

#### Target Audience

The target audience for this presentation include front line staff and nurse leaders who are held accountable for patient outcomes.

#### Abstract

Introduction: Hospital Consumer Assessment of Healthcare Providers and Systems (HCAHPS) is a metric that represents the patient's perception of quality care received. Data supports that the patient's experience is linked to great clinical care, reduced medical error, and improved patient outcomes. Each individual patient's survey results matters. These questions measure frequency on a scale of never, sometimes, usually, and always. Of the six categories, two measure the responsiveness of hospital staff and patient overall satisfaction with care. The purpose of this presentation is to describe the process for incorporating daily secretarial rounds on a trauma and burn unit and its impact on overall patient satisfaction and specifically their perception of staff responsiveness.

Methods: With the idea of increasing HCAHPS in patient satisfaction and improving response time in mind, an innovative approach was taken to utilize the front-line staff responsible for answering the call lights, unit secretaries. A review of current literature was completed and best practices identified. The team decided to incorporate daily secretarial rounding as a part of the patient and family-centered care model. Education was provided; a script highlighting key points was developed and distributed to staff. The objectives of the secretarial rounding is to inform the patients on who will be answering their calls, what needs they can and cannot assist with, and to ensure the patients that they will communicate any needs to the nurse that they themselves are not able to address.

Results: HCAHPS scores in responsiveness of staff and patient satisfaction improved. Patients provided positive feedback on how good it was to place a face with the voice on the other end of the call light when they needed assistance. Unit secretaries also provided positive qualitative information on the increased satisfaction they have for their position due to the amount of gratitude the patients shown them as a result of the rounding. The process has been largely accepted on the unit and will move as a standard of care across the organization.

Conclusions: Secretarial rounding can have a positive influence on patient satisfaction because it gives the patients confidence in knowing that staff is doing all they can to provide quality patient-centered care.

## **Pain Management in the Post Surgical Patient: It Is Not All about Narcotics**

---

*Kate McConathy, BSN, USA*

### Purpose

The purpose of this presentation is to describe the steps in the assessment, project design, implementation, and evaluation of an innovative approach to improve HCAHPS, specifically the pain management domain.

### Target Audience

The target audience of this presentation ranges from academia, new graduates, experienced nurses, leaders, and any other individual that comes in contact with the the patient during any hospitalization.

### Abstract

In response to the growing concern over patient safety, quality, and health care outcomes, the Clinical Nurse Leader (CNL) role was created. As the health care environment changes, it is critical that nurse leaders build upon the foundation of clinical expertise utilizing the CNL skill set in a variety of roles. The influence of the CNL on an acute care floor has created an environment of continual improvement. The staff, on the acute care trauma unit, at a large academic medical center, are constantly looking for opportunities to improve care delivery. Pain Management is always a challenge with the post-traumatic and burn patients the unit serves. The purpose of this presentation is to describe how, a new leader on the unit identified a need to improve how nursing staff addressed pain management on this post-surgical, traumatic, burn, unit. The assistant nurse manager identified quickly an opportunity to improve how well patient's pain was managed on the unit. She had reviewed the literature and evaluated our current practice only to recognize that the staff was doing minimal interventions to address pain. Yes, narcotics were being administered on time but could we not do more? , The lack of knowledge of non-pharmacological interventions to minimize pain was evident. The Assistant nurse manager and other passionate staff nurses created a curriculum to educate the staff on interventions to alleviate pain other than solely with narcotics. This curriculum included specific competencies, procedures, and experiences to be completed by licensed and non-licensed staff. The curriculum continues to be revised based on staff feedback. As the level of clinical expertise has vastly grown on the unit, the entire trauma service now is looking for innovative ways to optimize the nurse's influence across the entire service to improve pain management of their patients

The non-pharmacologic (no narcotic) menu provided to patients has decreased the total number of additional consults related to pain management, decreased the amount of narcotic consumed during hospitalization, and has greatly improved the patient's perception of how their pain has been managed in the inpatient setting, post operatively.

# H 14 - Cultivating and Sustaining a Diverse Nursing Workforce: A Plan for Nursing's Future

## Planting the Seed: Identifying, Developing and Nurturing Diverse Student Nurse Populations

---

*Ann Gakumo, PhD, RN, USA*

### Purpose

The purpose of this presentation is to bring awareness to increasing nursing education opportunities for individuals from diverse backgrounds from high school through matriculation in a baccalaureate nursing program. We will explain the Enrichment Academy for Nursing Success (EANS) program that prepares students by providing social, behavioral and academic support.

### Target Audience

Nursing faculty, administrators and students who are interested in developing a culturally sensitive and diverse pool of nurse clinicians and faculty.

### Abstract

The primary goal of the Enrichment Academy for Nursing Success (EANS) program is to increase the number of baccalaureate prepared RNs from educationally and economically disadvantaged and underrepresented racial and ethnic backgrounds by recruiting and enrolling pre-nursing students, associate degree nurses, and BSN nursing students and supporting them to matriculate and graduate from the University of Alabama at Birmingham School of Nursing (UABSON).

**Needs Assessment:** Minorities comprise 32 percent of Alabama's population, but only 16.7 percent of the nursing workforce in the state. Moreover, Alabama's state ranking of 44<sup>th</sup> in high school graduation further compounds its health disparities and workforce problems. Educationally and economically disadvantaged and minority students often enter college academically and psychosocially unprepared. For this reason, the EANS program was created to provide a high level of intensive intervention in providing social, behavioral and academic support to students from diverse backgrounds and assisting them in earning their BSN degrees. Once students graduate with a BSN, they will increase the diversity of the BSN workforce and can pursue advanced nursing education to impact quality and access to care.

**Preparing students:** The presenter will discuss opportunities provided for disadvantaged and minority high school and college pre-nursing students to learn about professional nursing as a career. EANS faculty and staff collaborated with high school programs to aid in strengthening math and science skills through early academic advisement and active participation in health science programs. Once entering the university, disadvantaged and minority pre-nursing majors are given an opportunity twice a year to apply to the program. This phase of the program further assists in the development of study skills, coping successfully with college life and its expectations, and acquisition of the necessary pre-requisites that will lead to admission to the UABSON BSN program. Once admitted, students continue with faculty mentoring in the retention program designed to support successful matriculation.

**Strategies implemented:** The presenter will share examples of strategies used to enhance student preparedness and retention throughout the various components of the program. Strategies included targeted outreach efforts to high schools, faculty support and mentoring, quantitative assessment and evaluation measures and tools to monitor student progress, networking opportunities, classroom observation experiences, and stipend and scholarship retention efforts.

## **Growing Our Own: Mentoring Talented and Diverse Students Toward a Career in Nursing Education and Clinical Leadership**

---

*Felesia Renee Bowen, PhD, RN, PC-PNP, BC, USA*

### Purpose

The purpose of this presentation is to provide a blueprint for recruiting and mentoring talented nursing students from diverse backgrounds. Presenters will explain how the Center for Urban Youth and Families is using community based opportunities to provide and develop practice and teaching skills of students and early career faculty.

### Target Audience

The target audience is nursing faculty, administrators and students who are interested developing a culturally sensitive and diverse pool of nurse clinicians and faculty.

### Abstract

**Abstract:** The Center for Urban Youth and Families (CUYF) aims to address health disparities through interdisciplinary research. We believe that an inter-professional research center is one way of making inroads to improving the health and future of our most vulnerable children and families. Center members disregard the boundaries of disciplines and work collaboratively with colleagues from other schools and community agencies to explore and develop best practice guidelines. Additionally CUYF acts as an incubator for future nurse clinicians, leaders and educators by recruiting, developing and mentoring students to address various problems of health disparity.

**Addressing Cultural Mis-match:** The presenter will address the lack of workforce diversity and how it impacts the health of minority citizens. In the United States, health inequities persist with African American and Latinos bearing the largest burden of negative health effects associated with chronic diseases. It's no secret that African Americans and Hispanics are underrepresented in nursing. There has been a steady decline in minority enrollment in basic nursing programs when compared to enrollment of Caucasian students. This phenomenon of declining enrollment continues to exacerbate the current patient-provider cultural mismatch. Cultural mis-match can result in continuing health disparities in access and quality health care for minority populations. Increasing the number for underrepresented students in nursing will address the root-cause issues of disparity as outlined in the Institute of Medicine's report, *Unequal Treatment*. We believe addressing this issue requires a two pronged approach. First, schools of nursing must make a conscious effort to recruit, retain and develop underrepresented students. Once students are in nursing programs it is incumbent upon administration to provide the necessary support for the students to be successful. Second, diverse faculty must be available to mentor and provide growth opportunities for these students. Again there must be a conscious effort on the behalf of administrators to recruit and retain faculty from diverse backgrounds.

**Providing Opportunities:** The presenter will discuss barriers to hands on research opportunities in undergraduate nursing programs. This is often the result of a packed nursing curriculum, and lack of opportunity to interact with faculty who are involved in research. Honors students are provided opportunities to work with faculty but in most cases African American and Hispanic students are very underrepresented in this cohort. Graduate nursing students are often educated in cohort programs where students come to campus for a full of day of academics and then they leave until the following week. Under represented students may find it difficult to connect with faculty who are culturally similar or they may be intimidated to reach out. Junior faculty may complain that they have limited time and resources for research activities and are therefore reluctant to work with undergraduate students because they do not have prior experience and require more "investment".

**CUYF Model:** The presenter will discuss the concept of up and down mentorship within the center. In this model, center fellows are mentored by senior faculty and researchers and they in turn mentor graduate and undergraduate students. CUYF fellows recruit underrepresented nursing students for involvement with center activity. Students are provided opportunities to learn about various research

opportunities that faculty are involved in (most are community based with vulnerable populations). Special invitations are sent to students in the Educational Opportunity Program that is comprised of underrepresented and disadvantaged nursing students. This approach has been extremely successful. Fellows also identify and recommend “stars” for special leadership opportunities with community partners and state agencies. We will discuss other programs that encourage and support the development of future nursing faculty and clinical leaders.

#### Contact

[fbowen@rutgers.edu](mailto:fbowen@rutgers.edu)

## **Sustaining Nursing Diversity in Clinical Settings: Leadership and Minority Nurses**

---

*Ronald Hickman, PhD, RN, ACNP-BC, USA*

#### Purpose

The purpose of this presentation is to explore the under-representation of minority nurse leaders and known barriers that encumber their obtaining positions of leadership. The presenter will discuss barriers and review evidence-based strategies that foster the requisite social and behavioral skills for leadership among minority nurses.

#### Target Audience

The target audience for this presentation is nursing faculty, administrators, clinician, and students who are interested in developing a culturally sensitive and diverse pool of clinical leaders.

#### Abstract

The alarmingly low representation of minority nurses in leadership positions poses significant public health concerns in the United States. As the demography of Americans continues to change, there has been minimal efforts to address the lack of diversity among its nurse leaders. Recognized for the potential to reduce health inequities, diversity in nursing leadership holds significant societal benefits for national and international communities.

**Prevalence of Minority Leaders:** The presenter will discuss prevalence of minority nurses in leadership positions in the United States. In 2012, the U.S. Census Bureau estimated that ethnic or racial minorities accounted for 37% of the American population and by 2043, ethnic and racially minority members will become a majority of the American population. Underrepresented racial minorities (e.g., Hispanic, Asian, African, and Native Americans) and men account for less than one-third of the American nursing workforce. According to the American Organization of Nurse Executives, less than 4% of American nurse executives were from an ethnic or racial minority group. National statistics on the prevalence of minority nurses in leadership positions will be presented.

**Known Barriers:** The presenter will discuss the known barriers that hinder racial minorities and other underrepresented individuals from assuming leadership positions in nursing. Nurses from underrepresented and disenfranchised groups face a sociocultural, institutional and systemic factors that contribute to discrimination. The discrimination that limits the numbers of underrepresented groups in nursing leadership is multilayered. In the case of ethnic minorities, primary education is often inadequate thus limiting access to higher education or success in rigorous nursing programs. The number of minority nurses seeking graduate degrees and successfully graduating from those programs is on the decline. The lack of ethnically diverse nurses with advanced degrees limits the available number of qualified diversity candidates in nursing leadership. Minority nurses have reported limited opportunities for leadership in nursing and other report being placed in leadership positions with minimal preparation and support. Guided by the minority leadership model of Bessent and Fleming (2003), sociocultural and behavioral barriers will be discussed.

**Strategies Implemented:** The presenter will share examples of strategies used to enhance the representation of minority nurses in leadership positions. Strategies included targeted outreach

efforts, faculty support and mentoring, quantitative assessment and evaluation measures, and recommendations for future programs. Additionally targeted program that prepare, develop and nurture minority nurse leaders will be explored. In particular the Leadership Enhancement and Development Project for Minority Nurses and the current and future Robert Wood Johnson Foundation's various nurse leadership programs.

## A 28 - Asian Women's Physical Activity: The Asian Women's Health Research Network

### Factors Influencing Physical Activity among Older Women with Type 2 Diabetes

---

*Sun Ju Chang, PhD, RN, South Korea*

#### Purpose

The purpose of this study was to identify factors influencing levels of physical activity in older women aged over 65 with type 2 diabetes in South Korea.

#### Target Audience

Health care providers working with Asian populations, specifically Korean elderly women.

#### Abstract

**Purpose:** With the recent increase in the number of people aged 65 years and over in South Korea, the prevalence of chronic diseases and, hence, related medical costs have rapidly increased. Diabetes is one of the most prevalent chronic diseases among older adults. Approximately 20% of older women aged over 65 years were found to be diagnosed with diabetes in 2013 (Statistics Korea, 2013), and many older women with diabetes were determined to have uncontrolled diabetes. Since adherence to self-management behaviors such as physical activity is crucial to control blood glucose levels and to prevent diabetes-related complications in older women (Ministry of Health and Welfare, Korean Centers for Disease Control & Prevention, 2013), health care providers have focused on enhancing diabetes self-management behaviors, in particular, physical activity in older women. That is because the levels of physical activity in older Korean women are relatively low (Statistics Korea, 2013). The purpose of this study was to identify factors influencing levels of physical activity in older women aged over 65 with type 2 diabetes in South Korea.

**Methods:** A total of 118 older women, who (a) were 65 years or older; (b) had been diagnosed with type 2 diabetes; (c) were taking medications to control glucose levels; and (d) visited community welfare centers, were recruited for the study. To collect data, multiple instruments related to physical activity of older adults including the Self-efficacy for Exercise Questionnaire (Resnick & Jenkins, 2000), the Theory of Planned Behavior Questionnaire (Francis et al., 2004) for social normative beliefs, attitudes toward physical activity, intention to participate in physical activity, the Question on Past Behavior (Hagger, Chatzisarantis, & Biddle, 2001) for experience, and the Korean version of the Physical Activity Scale for the Elderly (Choe, Kim, Jeon, & Chae, 2010) for level of physical activity were used. In addition, six questions on age, education level, comorbidity, perceived health status, duration of diabetes, and current treatments received (oral hypoglycemic agents, insulin) were used to collect background information on the participants. The data were analyzed using descriptive statistics including mean, standard deviations and percentage, and inferential statistics including Pearson's correlation analyses and hierarchical multiple regression analyses.

**Results:** The mean age of the participants was 76.2 (SD=6.1) years, and the highest level of education in about 60% of the older women was middle school or less. Approximately 64% of the older women had one or more comorbidities such as hypertension, arthritis or depression, and 45% perceived that they were healthy. Regarding diabetes-related characteristics, the mean duration of diabetes was 10.1 (SD=9.8) years, and about 98% of the participants took oral hypoglycemic agents for glycemic control. The mean total physical activity score in older women was 86.0 and ranged from zero to 320.0. Specifically, the mean physical activity score for leisure-time, household-related, and job-related physical activities was 18.2, 59.5, and 8.3, respectively. The self-efficacy score had a statistically significant positive correlation with the physical activity scores ( $r=.21$ ,  $p<.05$ ). In addition, self-efficacy was a significant predictor of physical activity in older South Korean women with type 2 diabetes ( $\beta=.20$ ,  $p<.05$ ). These variables accounted for 6% of the total variances in physical activity in the regression model.

Discussion: The study concluded that the level of physical activity was relatively low compared with the results from a previous study (Stiggelbout, Hopman-Rock, Crone, Lechner, & van Mechelen, 2006). This might be due to the fact that the score of job-related physical activity in this study was lower than the one in the previous study (Stiggelbout et al., 2006). Furthermore, the findings of the study revealed the important role of self-efficacy in physical activity in older Korean women with type 2 diabetes. Therefore, health care professionals, including nurses, should encourage older women to participate in regular physical activity. To this, health care professionals, who are interested in developing diabetes education programs for increasing physical activity levels among older South Korean women with type 2 diabetes, should consider the important role of self-efficacy. In addition, health care providers should take into account the strategies for enhancing self-efficacy for physical activity. Finally, the findings of this study need to be tested in older Asian women with type 2 diabetes in other countries through international collaborative studies. It is because older Asian women tend to have low levels of physical activity and high levels of vulnerability in health care system not only in South Korea but also in other countries.

## **Asian-American Midlife Women's Physical Activity and Sleep Related Symptoms**

---

*Yaelim Lee, MSN, BSN, RN, USA  
Ok Kyung Ham, PhD, RN, South Korea  
Youjeong Kang, MPH, CCRN, USA  
Eun-Ok Im, RN, MPH, PhD, CNS, FAAN, USA*

### Purpose

The purpose of this presentation is to explore the relationships between Asian-American midlife women's physical activities and their sleep-related symptoms, while considering other covariates in the study.

### Target Audience

The target audience of this presentation is health care providers and researchers who care for Asian-American women's health.

### Abstract

Background: Physical activities have been reported to improve the sleep quality of midlife women, a group frequently experiencing sleep-related symptoms commonly associated with the transition to menopause (Mansikkamaki et al., 2012; Tworoger et al., 2003). However, these findings have been inconsistent in relation to the types and levels of physical activity. Exercise or leisure-time physical activity was negatively associated with overall sleep duration although they were not significant predictors of the overall sleep duration (Tu et al., 2012). On the contrary, exercise intervention has been reported to improve the sleep quality of midlife women (Tworoger et al., 2003). When race/ethnicity is entered into

the equation on the relationship between physical activity and sleep, the dynamics become more complex (CDC, 2004). In addition, few studies have focused on Asian-American midlife women's sleep difficulties during the menopausal transition (Ramos et al., 2011).

**Purpose/Aims:** The purpose of the study is to explore the relationships between Asian-American midlife women's physical activities and their sleep-related symptoms, while considering other covariates in the study.

**Methods:** This is a secondary analysis of the data from a larger study that included four major racial/ethnic groups of midlife women in the United States (U.S.) (Whites, African-Americans, Asian-Americans, and Hispanics). In the original study, the data were collected nationally using an Internet survey method. Among 542 multi-ethnic midlife women, only 123 Asian-American midlife women were included in this analysis. The analysis utilized the data that were collected using the questions on socio-demographic characteristics, menopausal stages, and health conditions; the Midlife Women's Symptoms Index; and the Kaiser Physical Activity Survey. The data were analyzed using bivariate correlation analyses, hierarchical multiple regression analyses, and multiple logistic regression analyses.

**Findings:** Perceived general health and active living activities were negatively associated with the total number of sleep-related symptoms ( $p < .05$ ) while household/caring activities were positively associated with it ( $p < .05$ ). Similarly, household/caring activities were positively associated and active living activities were negatively associated with the total severity scores of sleep-related symptoms ( $p < .05$ ). Physical activities and other covariates in the study collectively accounted for 26% of the total variances in the total numbers of sleep symptoms ( $R^2 = .26$ ,  $p < .01$ ) and 27% of the total variances in the total severity scores of sleep-related symptoms ( $R^2 = .27$ ,  $p < .01$ ). Lower perceived general health, higher household/caring activities, and lower active living activities were significant factors associated with the total number of sleep-related symptoms ( $p < .01$ ) and the total severity of sleep-related symptoms ( $p < .05$ ).

**Conclusions:** Significant associations of physical activity to Asian American midlife women's sleep-related symptoms during their menopausal transition were found in this analysis. The increase in active living activities (leisure-time physical activities) improved Asian American midlife women's sleep-related symptoms; however, increases in household/caring activities and occupational activities were detrimental to sleep-related symptoms. These differences need to be taken into consideration in future research that aims at improving Asian-American midlife women's sleep-related symptoms. In addition, global collaborative research is necessary to determine the differences in sub-ethnic groups among Asian-American midlife women, to provide cultural comparisons with those in their original countries, and ultimately to help develop culturally sensitive sleep-related interventions.

## Development and Preliminary Evaluation of a Culturally Tailored Web-Based Physical Activity Promotion Program (WPAPP)

---

*Sangmi Kim, MPH, RN, USA*  
*Yaelim Lee, MSN, BSN, RN, USA*  
*Hsiu-Min Tsai, PhD, RN, Taiwan*  
*Eunice Chee, BSc, USA*  
*Wonshik Chee, PhD, USA*  
*Eun-Ok Im, RN, MPH, PhD, CNS, FAAN, USA*

### Purpose

The purpose of this study was to develop and preliminarily evaluate a culturally tailored Web-based physical activity promotion program for Korean American midlife women (WPAPP) through a usability test and an expert review.

### Target Audience

Researchers and clinicians working with midlife women, especially Korean American midlife women.

### Abstract

Background: Many Web-based programs have recently been developed to promote physical activity. Wanner et al. (2009) developed and tested a Web-based physical activity intervention in general online population with positive results. Massoudi et al. (2010) developed a personal health record application that delivered a highly individualized, behaviorally based lifestyle physical activity intervention for sedentary adults, also with positive findings. However, none of these programs was aimed at Asian American midlife women. Rather, most of these programs were aimed at patients with diabetes, adolescents, or general adult populations. Only the intervention that was identified to include Asian Americans was the one by Dunton & Robertson (2008), but their intervention was not tailored to Asian Americans. Virtually no program has been culturally tailored to Asian Americans, including Korean American midlife women, while considering their cultural attitudes toward physical activity.

Purpose: The purpose of this study was to develop and preliminarily evaluate a culturally tailored Web-based physical activity promotion program for Korean American midlife women (WPAPP) through a usability test and an expert review.

Methods: This was a pilot intervention development and evaluation study. Based on the Midlife Women's Attitudes toward Physical Activity model (MAPA)(Im, Stuifbergen, & Walker, 2010), the WPAPP was developed. After development of the program, five Korean American midlife women were recruited for a usability test using a 1-month online forum. This type of early evaluation of a program (specifically targeting the information architecture, navigation, and overall design) requires 5 to 10 participants from among the target users (Lewis, 2006). Studies have indicated that 80-90% of usability problems can be identified by about 5-10 participants (Lewis, 2006). At the beginning of the online forum, participants were asked to visit the forum site, use the Web-based program and then post messages with their evaluation of the program within a week. On the forum site, a total of 7 topics related to specific areas for which the users' evaluation was needed were posted. Then, the participants were informed of the topic postings and asked to visit the project Web site. The topics included: (a) the overall structure of the WPAPP, (b) preferences for color, designs, and menus, (c) preferences for contents, (d) technical support and difficulties, (e) areas for additional content, (f) preferences for links to Internet resources, and (g) other issues that should be considered. Then, five experts were recruited for an expert review of the program using the Cognitive Walkthrough method. The experts were sent the Web address of the program and asked to provide their evaluation on the program. All the experts were given usernames and passwords that they needed to use to login the project Web site and use the program. Then, they were asked to provide their written feedback by email. Their evaluation was sought on: (a) components, (b) presentation style, (c) contents, and (d) any other concerns/issues. Five experts are an adequate number for this type of expert evaluations (Lewis, 2006). The data from the usability test and expert review were transcribed

and analyzed using a content analysis. Then, as a group, the research team made decisions on the refinement of specific areas, which were incorporated into further development of the program.

**Findings:** Among the major concepts of the MAPA model, three modifiable determinants (attitudes, self-efficacy, and perceived barriers) of physical activity were selected for development and refinement of the program. Menus were developed based on the three determinants. The program included interactive online message board, interactive online educational sessions, and online resources. Graphic User Interface controls were used, and the presentation styles were tailored to Korean American. All the experts positively evaluated the program and provided feedback on the content and structure (e.g., adding take-home messages, difficulties in using different web browsers, smoothing some Korean words in the translation). Korean American midlife women also positively evaluated the program and provided feedback on the menu, structure, display, and content. Based on the feedback, additional educational modules on detailed tips for various daily activities with some take-home messages have been added.

**Conclusions:** This study suggests that development of a culturally tailored Web-based program is feasible and that researchers need to make continuous efforts to develop and test culturally tailored Web-based programs for behavior modifications of ethnic minorities. Also, this kind of culturally tailored physical activity promotion programs could be easily adopted to international populations with similar cultural background and further tailored to other Asian American populations. Future international collaborative research developing and testing culturally tailored Web-based physical activity promotion programs could be planned.

## **B 28 - Integrative Strategies to Address Junior Student Stress and Self-Directed Learning in an Active Learning Environment**

### **Integrative Strategies to Help Students Lower Their Anxiety**

---

*G. Jean Klein, PhD, PMHCNS, BC, USA*

#### Purpose

The purpose of this presentation is to identify strategies that students might utilize to lower their anxiety so that

#### Target Audience

The target audience of this presentation is prelicensure nurse educators.

#### Abstract

When students enter the junior year of this program, they begin their clinical experiences. At this time, faculty requests they begin to “draw on previous course & put it all together”. Many students have difficulty making the transition from theory laden course to “real nursing courses”. This transition to junior level nursing courses in conjunction with high stake testing often results in high levels of anxiety in the students. This anxiety is palpable in the nursing building & increases prior to testing times. Although the students are aware of their anxiety, sometimes it is beyond their control. Being sensitive to the student level of anxiety has initiated a variety of measures to help the junior nursing students to lower their anxiety. This section of the symposium will address some of these measures instituted to assist junior nursing students to lower their anxiety. Some of these measures include: relaxation & visual imagery, mindfulness, sighing & healing touch.

### **Addressing Student Stress and Preparation for Upper Division Nursing Courses**

---

*Susan C. Mills, PhD, RN, USA*

*Anne Marie Krouse, PhD, MSN, MBA, BSN, RN-BC, USA*

#### Purpose

The purpose of this session is to describe the results of focus group interview data from a study on stress, student engagement and self-directed learning in an active learning environment in upper division nursing courses.

#### Target Audience

The target audience of this presentation is nurse educators who are interested in student preparation for the stress students may feel in an active learning environment.

#### Abstract

Nursing students must be prepared to face a rapidly changing and increasingly complex health care environment. This preparation requires a challenging curriculum that is often accompanied by an increased workload and student stress regarding their academic progress. The purpose of the qualitative aspect of this mixed method study was to identify student perceptions of active learning practices incorporated into the junior year in a new curriculum. A descriptive qualitative design utilizing focus group interviews for data collection was employed to explore student perceptions of stress, engagement and self-directed learning in an active learning environment. Twenty-three students participated in focus group interviews lasting from 30 minutes to one hour during their junior year. Students were encouraged to discuss the learning and study strategies they used prior to junior year and compare them with how they prepared and learned in a more active learning environment. Interviews were recorded and

transcribed. The interviews were then analyzed by two experienced nurse researchers to identify common patterns of response to the incorporation of active learning strategies utilized in their junior year of nursing. The central theme that emerged from the data was overwhelming levels of stress. Although the quantitative data demonstrated moderate levels of stress when the students were interviewed they reported overwhelming stress in making the transition from lower division nursing courses to upper level clinical courses. Students described disturbing results from the stress they felt during the junior year nursing courses. Subthemes of stress included impacts to their physical and mental health, isolation and support, adversarial faculty/student relationships, and preparation for junior year of nursing school. Students described the various ways they learned to cope with the additional stress of the junior year of nursing school. Role modeling caring behaviors such as empathy and “looking out for” the student were considered helpful to the student in alleviating some of the stress. The students in the study wanted to know that the faculty were there as partners in their journey through the curriculum. Additionally, students described what they wished they had known prior to starting their junior year of nursing school. Many of the students voiced the need to be able to “go deeper” into their learning. Students reported relying on superficial learning strategies prior to junior year. The results of this study highlight how students responded to the increased stress of junior year nursing courses and the lessons learned by both the students and the faculty teaching junior year nursing students.

### **Stress: Impact on Classroom Engagement and Self-Directed Learning**

---

*Rose R. Schwartz, PhD, RN, BC-CNS, USA*

*G. Jean Klein, PhD, PMHCNS, BC, USA*

#### Purpose

The purpose of this presentation is to disseminate the results of a study measuring the relationship among student stress, classroom engagement and self-directed learning.

#### Target Audience

The target audience of this presentation is prelicensure nurse educators.

#### Abstract

The value of student engagement through active learning strategies is well known. Students who are engaged in content have better retention and improved problem solving skills. To meet the needs of these students, learning in higher education must shift from content focused, instructor-centered to a constructivist, learner-centered approach. Focused active learning activities promotes student engagement in their learning. However, students often face barriers that prevent active engagement learning. One such barrier to the student success in a nursing program is stress. Stress has the potential to effect memory, concentration, and problem solving ability that can lead to decreased student engagement and self-directed learning. . The purpose of this study was to examine the perceptions of stress, student engagement and self-directed learning in junior nursing students. Junior students were recruited from the Medical Surgical Nursing II class in the spring and the Medical Surgical Nursing I class in the following fall. Two cohorts consisted of 166 students total (11.6% male, 88.4% female) with a mean age 21.96 (SD= 3.709; range: 18 – 40). The students completed the Class-Level Survey of Student Engagement (CLASSE), the Perceived Stress Reactivity Scale (PSRS) and the Self Directed Learning Readiness Scale (SDLRS) in addition to a demographic questionnaire. The mean score on the PSRS was 22.96 (SD: 6.925; range: 5-40 with a total score range 0-46), CLASSE mean 96.96 (SD: 11.354; range: 68-121 total score range 0-136) and SDLRS mean 165.92 (SD: 14.248; range: 136-198 total score range 40-200). There were no significant differences between the two cohorts' scores on the scales or demographic data. The results demonstrate that the participants reported moderate levels of stress but were engaged in class and utilized self-directed learning strategies. This finding contradicts the literature that purports the negative impact of stress on learning. Nursing students may use the stress to motivate them to be successful in a rigorous program.

## C 28 - Meeting Family Needs at the Bedside and across the Continuum: Theory, Research, Response

### Use of Art, Interview and Survey to Assess Family Needs at the Bedside of Hospitalized Oncology Patients in Acute Care and at the Bedside of Hospitalized Stroke Patients in a Rehabilitation Hospital

---

Anita J. Catlin, DNSc, FNP, FAAN, RN, USA

#### Purpose

Purpose: To present two studies that were completed within a hospital system to determine the needs of family members who maintain vigil at the bedside of their loved ones as part of a larger symposium on Family Needs.

#### Target Audience

The target audience are attendees of the symposium Meeting Family Needs at the Bedside and Across the Continuum: Theory, Research, Response

#### Abstract

Background: Two studies were completed within a hospital system to determine the needs of family members who maintain vigil at the bedside of their loved ones. A movement worldwide, and specifically new to our hospital system, is the implementation of Patient and Family Centered Care. We conducted these two studies to be sure that we knew what needs were of our patients' families. Using an acute care oncology unit and a stroke rehabilitation unit, we conducted a triangulated study used the qualitative methods of interviews and art therapy, and a quantitative method, the Family Needs Inventory (FIN Scale), to ascertain family member's needs.

Method: Three-step process (open ended interview, use of the Draw a Bridge art therapy technique, and a survey eliciting family needs) was conducted with 19 family members of patients with a cancer diagnosis on our oncology unit and 12 family members of patients rehabilitating after a stroke.

Results: Themes of 31 interviews revealed needs for Physical Comfort, Emotional Support, Cultural Sensitivity, Recognition that Family Members Help and Pain Management. Art therapy accurately revealed the stress of caregiving and the need for family member support with interesting differences in the pictures between the two cohorts, oncology family members worried about pain relief and stroke family members worried about home care with a wheelchair. The Family Inventory of Needs, the interviews and the art revealed that care at home after discharge was a major worry.

Conclusions: Knowledge of family members' needs while their loved ones were in the hospital allowed our two facilities to better support family members at the bedside. We now provide maps, meals, shower facilities and other items to increase their comfort. The Case Management team is integrating changes based upon the findings.

## Theoretical Perspective on Families at the Bedside

---

Jeanine M. Carr, PhD, RN, USA

### Purpose

The purpose of the presentation, which is part of the symposium titled "Meeting Family Needs at the Bedside and Across the Continuum: Theory, Research, Response" is to describe a theory that was inductively developed from qualitative research data.

### Target Audience

The target audience is clinicians and researchers.

### Abstract

The family's close, protective involvement with hospitalized relatives, has become a common occurrence in U.S. inpatient settings. Prior to the 1960's, visiting policies restricted family presence at the bedside. However, in the 1960's and 1970's changes in visiting policies encouraged parents to stay with their hospitalized children. Family members are now often visibly present with hospitalized relatives in a multitude of acute care settings. Questions about the family's perspective of vigilance led this researcher to conduct three qualitative studies to explore the meanings, patterns, and day-to-day experience of family members staying with hospitalized relatives. The inductive development of a middle range theory of vigilance is a product of the three research studies. Concept synthesis will be discussed in relation to vigilance and its categories of meaning and defining characteristics. Statements about probable relationships that exist among categories of meaning will be presented and hypotheses will be suggested. Finally, direct and indirect linkages among categories and an overall pattern of relationships will be described through the process of theory synthesis. A systematic view about vigilance enhances professionals' understanding of vigilance, provides theoretical direction for interventions, and has implications for further research.

## Meeting Family Needs at the Bedside and across the Continuum: Theory, Research, Response

---

Anita J. Catlin, DNSc, FNP, FAAN, RN, USA

### Purpose

This is a symposium on Family Needs

### Target Audience

Target audience is staff nurses and administrative leaders.

### Abstract

The movement to incorporate Family Centered Care (FCC) models in the care of hospitalized patients has swept through North America. Previously limited access to loved ones who are hospitalized has changed over the years to a culture within institutions that now recognizes the importance of family involvement in patient care. This shift to a FCC approach is especially critical in a changing healthcare environment where patients are being discharged home with more complex needs and increased functional limitations, and family members are expected to assume the caregiving roles and responsibilities once performed by healthcare professions. Understanding the needs, preferences, and

capacity of the entire family unit for managing long-term chronic health needs of family members is essential to the health of patients and well-being of the entire family. This symposium includes theory and research presentations that provide evidence for the importance of recognizing and addressing the needs of family members. The first presentation is focused on development of a middle range theory of family vigilance. This will be followed by presentations of three research studies. The first two studies, one on an oncology unit and one on a stroke rehabilitation unit assessed family members' needs at the bedside. These two studies used data from art therapy, interviews and the Family Inventory of Needs to develop programs that responded to family members who maintained vigils at the bedside of their hospitalized loved ones. The third study describes the needs of stroke caregivers as their family members with stroke move through the care continuum from acute care to inpatient rehabilitation to home. Evidence will be provided to support the importance of including family members in discussions about patient care and treatment decisions. The symposium will conclude with suggestions for nursing interventions and implications for nursing practice.

## **Assessing and Addressing the Needs of Stroke Survivors and Family Caregivers across the Care Continuum**

---

*Barbara Lutz, PhD, MSN, MS, BSN, RN, CRRN, APHN-BC, FAHA, FNAP, FAAN, USA*

#### Purpose

The purpose of this presentation is to improve understanding of how to assess and address the post-discharge needs of stroke survivors and their family caregivers.

#### Target Audience

The target audiences of this presentation are clinical nurses working with families with debilitating illnesses and nurse researchers who are interested in studies focusing on the needs of family caregivers.

#### Abstract

**Introduction:** Patients who receive inpatient rehabilitation care have often experienced a sudden, life-changing disabling illness or injury that has long-term implications for the patient and family unit. An illness event (e.g. stroke) may elicit a crisis response, and feelings of grief and loss for both patients and family members. With improved survival rates and shorter inpatient stays for patients experiencing these events, family members are now assuming caregiving tasks that previously were only performed by formal caregivers, e.g. nurses and nursing assistants. Family members need assistance and support to help them deal with the event, make informed decisions about treatment, and assume their new roles and responsibilities. In order for family caregivers to successfully assume the caregiving roles and responsibilities post-discharge they need to be included and engaged in patient care discussions and treatment decisions throughout the care trajectory. Understanding the family dynamics, and assessing and addressing family members' needs, preferences, and readiness to assume the caregiving role post-discharge is critical for the long-term health the patient and family unit. The purpose of this presentation is to improve understanding of how to assess and address the post-discharge needs of stroke survivors and their family caregivers.

**Methods:** Using stroke as an exemplar, this presentation will combine findings from 2 grounded theory studies that focused on understanding the needs of stroke survivors and their family members as they moved through the stroke care trajectory. We interviewed 38 stroke patients and 41 family caregivers during inpatient rehabilitation and within 6 months post-discharge. Interviews focused on the impact of stroke and the perceived post-discharge needs and preferences of the stroke survivors and their family members. Data were analyzed using constant comparison and dimensional analysis. Two conceptual models were developed from the data analysis.

**Findings:** As stroke survivors and family members move through the stroke care trajectory their needs and preferences change. They move from the crisis of the stroke event to the hope of recovery to the crisis of discharge home and a beginning realization of how the aftermath of stroke may affect their lives long-term. The first model illustrates these experiences as stroke survivors and their family caregivers move through the stroke care trajectory from onset to inpatient care to home. Once discharged, family members often find themselves unprepared to assume the caregiver role, leaving them feeling isolated, abandoned, and alone. The second model focuses on the steps that are critical for assessing and addressing the post-stroke discharge needs of families as they transition home so they are better prepared to assume the caregiving role and adapt to their post-stroke lives.

**Conclusions:** In order to provide care that is family-centered, members of the inter-professional team need to understand the impact of stroke on the entire family. A comprehensive and systematic assessment should be conducted, not only of the patients' needs post-stroke, but also of the capacity of the family members who will be providing care, to identify gaps between the patients' needs and family members' abilities to assume the caregiver role post-discharge. Using the findings from the assessment, health care professionals can better tailor treatment plans to address the specific needs and preferences of the family unit throughout the stroke care trajectory.

## D 28 - Planning the Nursing Education Research Network

### Getting Serious about Research in Nursing Education

---

*Pam Ironside, PhD, MS, BA, RN, ANEF, FAAN, USA*

#### Purpose

The purpose of this session is to explore and discuss the critical questions facing nursing faculty, students, researchers and administrators in academic nursing programs, key data elements needed to address these questions and the training needed by faculty to analyze data.

#### Target Audience

Faculty, students, researchers and administrators in academic nursing programs

#### Abstract

Calls to advance the science of nursing education have become commonplace, but the literature shows that many studies in nursing education continue to rely on small, single-site studies and rarely are educational phenomena tracked over time. A collaborative Nursing Education Research Network would provide more robust data to answer compelling questions and to analyze trends in nursing education overtime. This session will explore critical questions a large database can answer, how trend data can inform current practice, and how this work can advance the science of nursing education. This session will be interactive with presenters and attendees exploring the most pressing questions facing the discipline, the critical data and training needs for using a large database to answer these questions and how a collaborative Network can be a resource to support local, regional, and national research projects.

#### Contact

[pamirons@iu.edu](mailto:pamirons@iu.edu)

### Building a Database to Answer Pressing Education Issues

---

*Michael Yedidia, PhD, MPH, BA, USA*

#### Purpose

The purpose of this interactive session is to present an overview of how large databases can support pedagogical decision-making, to discuss key issues with attendees, and to identify critical data and training needs.

#### Target Audience

The target audience for this session is faculty, students, and administrators in academic nursing programs

#### Abstract

To answer the pressing questions facing teachers, researchers, and administrators in nursing, an efficient and comprehensive approach to gathering and analyzing data from faculty, students, and schools is needed. This presentation will provide an overview of the kinds of data that can efficiently be collected via surveys, the questions a large database can then answer, and the analytic techniques that can be employed to that end. Following the overview, participants will engage with presenters to identify critical data needs, to provide input into key issues around data gathering, and to identify how analyses can be most useful in pedagogical decision-making.

#### Contact

### Democratizing Data Access Via Web-Based Portals

---

*Linda Flynn, PhD, RN, FAAN, USA*

Purpose

The purpose of this session is to explore how, via a web-based portal, large data sets can be accessed and used to support local and student research projects. Group discussion will identify key access and training issues in using web-based data sets.

Target Audience

Faculty, students, researchers and administrators in academic nursing programs

Abstract

A collaborative Nursing Education Research Network provides a mechanism for gathering, storing, and using large a large data set on nursing education. Making this data (raw and aggregate) in the Network widely available to faculty, students, researchers and administrators provides a means for everyone to use the data to answer questions of interest. As well, access to a large and longitudinal dataset provides a way for doctoral students to conduct more rigorous studies because they can readily access and use a nationally representative dataset. This interactive session will provide an overview of web-based portal access to large data sets and participants will discuss key access and training needs.

## **Getting Serious about Advancing the Science of Nursing Education**

---

*Theresa M. Valiga, EdD, RN, CNE, ANEF, FAAN, USA*

Purpose

The purpose of this session is to explore the pressing questions faculty and schools face as they prepare new nurses for practice. Through discussion attendees will explore the data and training needed to answer these questions and the ways such studies contribute to the science of nursing education.

Target Audience

Faculty, students, researchers and administrators in academic nursing programs

Abstract

Calls to advance the science of nursing education have been commonplace, but the literature shows that many studies in nursing education continue to rely on small, single-site studies and rarely are educational phenomena tracked over time. A collaborative Nursing Education Research Network would provide more robust data to answer compelling questions and to analyze trends in nursing education overtime. This session will explore questions a large database can answer, how trend data can inform current practice, and this work can advance the science of nursing education. This session will be interactive with presenters and attendees exploring the most pressing questions facing the discipline, the critical data and training needs for using a large database to answer these questions and how a collaborative Network can be a resource to support local, regional, and national research projects.

## E 28 - The Effect of Teaching Demands on Research Productivity and Work-Life Balance of Doctoral Program Nursing Faculty

### A Profile of U.S. Nursing Faculty in Research- and Practice-Focused Doctoral Education

---

*Nancy Sharts-Hopko, PhD, MA, BSN, RN, FAAN, USA*

#### Purpose

The purpose of this presentation is to document the profile of US nursing faculty engaged in research- and practice-focused doctoral education, in light of the IOM recommendation that the number of doctorally prepared nurses double by 2020.

#### Target Audience

The target audience of this presentation is administrators and faculty in schools of nursing with research- and practice-doctorate programs.

#### Abstract

**Purpose and Significance:** Growth in DNP programs has outpaced growth in PhD programs, and DNP graduates have moved into doctoral education in greater numbers than PhD graduates. This study aimed to ascertain characteristics of faculty teaching in DNP and PhD programs and of the schools in which they teach with particular attention to scholarly productivity.

**Methods:** Data were collected via an on-line researcher-developed survey distributed nationally and completed by 554 faculty teaching in PhD, DNP, or both types of programs. The survey was based on review of the literature and on data from two focus groups involving PhD and DNP faculty. It addressed relative commitments to teaching, research/scholarship, and service, doctoral faculty members' scholarly productivity, work-life balance, strategies to support research/scholarship activities and work-life balance, and characteristics of a successful faculty member. Data were analyzed using frequencies as well as tests of chi square and analysis of variance to compare faculty teaching only in PhD programs, faculty teaching only in DNP programs, and faculty teaching in both types of doctoral programs.

**Findings:** DNP faculty reported less prior experience and current productivity in scholarship than faculty teaching in PhD programs only or both types of programs, though a majority reported that they are expected to conduct and publish research. PhD faculty are more likely to engage in grantsmanship and spend more time on scholarship; in addition they reported more support for scholarship from their institutions.

**Conclusions/Implications:** Strategies are needed to ensure that doctoral programs are staffed by faculty who are prepared for doctoral education and that institutions are able to fulfill their research mission. Recommendations for strategies to address these issues will be discussed in the presentation.

### The Effect of Teaching and Mentoring Doctoral Students on Their Work-Life Balance

---

*Suzanne C. Smeltzer, EdD, MS, RN, ANEF, FAAN, USA*

#### Purpose

The purpose of this presentation is to discuss the results of a national study of work-life balance of doctoral program faculty who teach and mentor PhD, DNP or both PhD and DNP students

### Target Audience

The target audience of this presentation is nursing faculty, including those who teach or aspire to teach in PhD and DNP programs.

### Abstract

**Purpose and Significance:** Work-life balance (WLB), which refers to one's ability to achieve and maintain a "balance" or equilibrium between one's paid work and life outside work, whatever "life" involves for the individual, has been identified as one of the elements of a healthy work environment for nursing faculty. It may also be important in faculty members' intent to remain in or leave a position. As part of the larger study, this study examined WLB of doctoral program faculty and explored strategies they used to achieve and maintain a 'balance' between work and life outside work.

**Methods:** Data were collected via an on-line survey distributed nationally and completed by 554 faculty teaching in PhD or DNP programs. The survey was based on literature review and focus group data from PhD and DNP faculty. The focus groups addressed teaching/research/scholarship/service commitments, scholarly productivity, strategies to support research/scholarship activities and work-life balance. The 15-item Work/Life Balance Self-Assessment scale was used in this study to assess faculty's perception of WLB. They were asked to indicate the frequency of performance of specific behaviors on the scale during the past three months using a 7-point time-related scale. Data were analyzed using frequencies, analysis of variance, and hierarchical regression.

**Results:** Hierarchical regression revealed that current faculty position, hours spent weekly teaching, availability of research/teaching assistants, and the presence of an MSN program option explained 7.3% of the variance in WLB. After controlling for these characteristics, sacrificing time for self to fulfill work responsibilities, perception that family responsibilities are incompatible with work role, feeling that time spent focusing on doctoral students resulted in exhaustion, reporting that workload is detrimental to health and well-being, and experiencing fulfillment in performing the work role together predicted an additional 56.5% of the variance in WLB. Of note, younger faculty had poorer work-life balance than older, more seasoned faculty.

**Conclusions and Implications:** Although several factors found to be associated with WLB are a function of faculty members' age, faculty rank, and time in their faculty role, other factors can be modified to improve faculty members' WLB. With the increased wave of nursing faculty retirements anticipated in the next few years, strategies to improve faculty members' work-life balance so may be important in retaining experienced faculty to teach and mentor future doctoral students. The retirements of senior faculty will result in new, younger faculty members from generation X and generation Y who are less tolerant of the heavy workloads and lack of work-life balance than their colleagues, resulting in the need to address this issue in subsequent years.

## **The Effect of Teaching and Mentoring Doctoral Students on Faculty Members' Research and Scholarship Productivity**

---

*Mary Ann Cantrell, PhD, RN, CNE, USA*

### Purpose

The purpose of this presentation is report strategies that promote scholarship productivity used by doctoral nurse faculty, as well as perceptions about benefits and barriers to scholarship productivity among doctoral nurse faculty.

### Target Audience

The target audience is nursing faculty teaching or aspiring to teach doctoral nursing students.

## Abstract

**Purpose and Significance:** The Institute of Medicine identified an urgent need for a significant increase of doctorally-prepared faculty to address nurse and nurse faculty shortages. This need is accompanied by a concomitant call for these nurse faculty scholars to address national health care needs through scientific inquiry. These demands have implications on these nurse scholars' scholarly productivity. This study reports the findings of three aims of a larger study. Specifically, this study examined the scholarship productivity among nursing faculty teaching in doctoral programs and mentoring doctoral students, explored strategies that promote scholarship productivity used by these faculty, and identified their perceptions about benefits and barriers to their scholarship productivity.

**Methods:** Data were collected via an on-line researcher-developed survey distributed nationally and completed by 554 faculty teaching in PhD or DNP programs. The survey was based on review of the literature and on data from two focus groups involving PhD and DNP faculty. It addressed teaching/research/scholarship/service commitments, doctoral faculty members' scholarly productivity, work-life balance, and strategies to support research/scholarship activities and work-life balance, characteristics of a successful faculty member. Data were analyzed using frequencies, means, correlations and a regression analysis.

**Results:** Survey respondents reported spending a large amount of time engaged in research-related activities with 58.9% (n = 326) spending anywhere from 6 to 20 hours per week conducting research, writing research-based papers, giving presentations, grant writing or conducting evidence-based improvement projects. The results of the hierarchical regression analysis determined that the strongest predictor of scholarly productivity was the average number of hours spent on research/scholarship-related activities.

**Conclusions:** Scholarly productivity among the respondents was robust. Personal practices that most strongly supported faculty maintaining their level of scholarship productivity were the belief that engaging in scholarship made them a better teacher and the personal gratification in experiencing doctoral students' successes.

## F 28 - Technology Enhanced Self-Management across the Illness Trajectory

### Internet-Based Intervention for Self-Management in Fibromyalgia Syndrome

---

*Nada Lukkahatai, PhD, MSN, RN, USA*

#### Purpose

The purpose of this presentation is to report systematic review result of internet based interventions used in self managing fibromyalgia syndrome

#### Target Audience

Target audience of this presentation is nurses, researchers and nursing educators.

#### Abstract

**Background:** Fibromyalgia syndrome (FMS) is primarily characterized by widespread musculoskeletal pain, accompanied by fatigue, cognitive dysfunction and sleep deprivation; the etiology of FMS is unclear. Due to a lack of understanding of the disorder, patients often rely on technology, specifically the World Wide Web, as a resource for health information and support to manage symptoms (Fox, 2008). It has been used as a delivery platform for several chronic conditions (Cuijpers, van Straten, & Andersson, 2008).

**Purpose:** The purpose of this systematic review was to (a) identify web-based self-management interventions for adult patients with FMS, and (b) the effectiveness of these interventions.

**Methods:** A literature search was performed using PubMed and PsycINFO, for internet- or web-based interventions and fibromyalgia. After the initial results of 96 articles, studies that included children and/or used a descriptive study design were excluded from this review. Inclusion criteria included (a) interventions were delivered through the web or internet, (b) participants were adult (age 18 or older) diagnosed with fibromyalgia.

**Findings:**After an initial screen a total of 15 articles which met criteria were selected to be included in this analysis. Web-based interventions used to enhance self-management included (1) educational, (2) group support, (3) self-monitoring, (4) mindfulness, (5) situational feedback, and (6) cognitive behavioral therapy. Three of the 15 studies delivered the web-based intervention through a smart-phone. All studies suggested that web-based interventions increased patient's knowledge, improved self-management, and decreased the impact of fibromyalgia on quality of life. Studies reported that web-based self-management interventions reduced fibromyalgia symptoms such as pain, memory, depression, fatigue, and sleep difficulties over time.

**Conclusions/Implications:** Web-based interventions can be an effective resource for the delivery of patient education and support. This technology has a great potential to impact the global health care system by becoming a tool to deliver support for self-management. However, when developing a web-based intervention, patient involvement is recommended during the program development phase. Specifically, programs need to be tailored to meet individual needs.

### Fibromyalgia: Implementation of Health Information Technology in Routine Care

---

*Toni Sparks, DNP, MSN, APRN, FNP-BC, USA*

*Jennifer Kawi, PhD, MSN, APRN, FNP-BC, USA*

*Nancy N. Menzel, PhD, RN, PHCNS-BC, CPH, CNE, USA*

*Kendall Hartley, PhD, USA*

#### Purpose

The purpose of this presentation is to describe a process developed for implementing health information technology (FibroGuide©) into the routine care of patients with fibromyalgia and evaluate the overall impact of this health information technology before and after a 12-week implementation.

#### Target Audience

The target audience of this presentation are nurses, other healthcare providers, educators, and researchers.

#### Abstract

**Background:** Fibromyalgia is a global condition and its management remains complicated and challenging. Implementation of health information technology is an evidence-based non-pharmacological self and symptom management strategy that has application in fibromyalgia (Vanderboom, Vincent, Luedtke, Rhudy, & Bowles, 2014). However, there is a paucity of studies evaluating the feasibility of such technology in assisting toward the management of fibromyalgia patients in clinical practice. FibroGuide© is an example of an evidence-based, interactive, and computer-based program comprised of 10 educational modules on fibromyalgia (Williams et al., 2010).

**Purpose:** A process was developed for implementing FibroGuide© into the routine care of patients with fibromyalgia. The overall impact of this health information technology was evaluated before and after a 12-week implementation. Patient perspectives on using FibroGuide© to assist in self-management were also assessed.

**Methods:** In this pilot study, 35 participants with fibromyalgia were recruited from an Advanced Practice Registered Nurse's outpatient clinic. Using a descriptive design, quantitative and qualitative analyses were employed to address study aims.

**Findings:** Based on data collection pre- and post-intervention using paired samples testing, a statistically significant change ( $p = .017$ ) was observed in overall fibromyalgia impact (improved symptom severity, activity, and function). Majority of the participants felt that FibroGuide© was helpful as part of their routine care, and nearly half reported that it assisted in their self-management. Although 65% noted that technology was an effective and efficient way to receive education for fibromyalgia management, 57% preferred talking to their healthcare providers.

**Conclusions/Implications:** Health information technology like FibroGuide© has a global implication as a promising adjunct to clinical management of fibromyalgia. However, larger longitudinal studies are essential evaluating both statistical and clinical significance, while decreasing barriers to participant use of health information technology to facilitate engagement and sustain self and symptom management. Providers need to be well educated on supporting self-management strategies and health information technology toward potentially improving healthcare outcomes.

## **Examining the Outcomes of Web-Based Interventions on Anthropometric Measurements**

---

*Reimund Serafica, PhD, MSN, RN, USA*

*Jillian Inouye, PhD, APRN, FAAN, USA*

#### Purpose

The purpose of this presentation is to disseminate recent findings on the effectiveness of web-based interventions on anthropometric measurements to promote self-care lifestyles among adult individuals with various conditions

#### Target Audience

The target audience of this presentation are health care providers, nursing educators, and nursing researchers interested in knowing the current trends in promoting web-based interventions among adults with various health conditions.

#### Abstract

**Background:** Web-based interventions offer low cost and practical strategies to promote self-care for adult individuals with health related issues around the globe.

**Purpose:** The purpose of this systematic review was to summarize the current literature in examining the effectiveness of web-based interventions to promote self-care of lifestyles related to anthropometric measurements in adult individuals with various conditions.

**Methods:** The search terms included anthropometric measurements, web-based technology, effectiveness, and interventions were used to search four electronic engines including PubMed, Ovid, MEDLINE, the Cumulative Index of Nursing and Allied Health Literature (CINAHL), and Google Scholar. Inclusion criteria were primary randomized control studies published in English which utilized web-based interventions in relationship to actual measured anthropometric outcomes of adults with health related conditions. Further, interventions using web-based health education alone, or as a part of a complex intervention were also included in the review. Studies involving major health issues or psychiatric diseases, pregnancy, and children as participants were excluded, as were those involving self-reported anthropometric measurements. Ten articles were selected based on the criteria. The databases were searched from 2008 to December 2014. All studies were double reviewed for eligibility using the JADAD scoring system.

**Findings:** Six studies met criteria in this review and revealed significant associations between the utilization of web-based health promotion interventions on anthropometric measurements in adult populations with health related conditions. Four studies involving participants with obesity and overweight conditions experienced overall body weight reductions (Allen, Stephens, Himmelfarb, Stewart, & Hack, 2013). One study showed a significant reduction in waist circumference of participants with diabetes. Another study involving obese participants demonstrated reduction in BMI while one stand-alone web based intervention study did not show any significant changes on the anthropometric measurements of hypertensive patients (Shaya et al., 2013). Four of the six studies used a combination of social support, feedback from moderators and counseling in addition to web-based health promotion interventions.

**Conclusions/Implications:** Given the enthusiasm to the benefits of web-based interventions on healthy lifestyle to the anthropometric outcomes, most of these studies revealed that social support, feedback, and counseling also added to the effectiveness of these web-based technology interventions. The outcomes from this review may prove useful information of effectiveness of web-based programs along with social and motivational interventions relative to developing future innovative health promotion programs. These programs can inform transformative practice within the context of inter-professional and improvement of global health.

## G 28 - Enhancing Social Support for Self-Management

### Self-Management and Weight Loss in Adolescents: A Systematic Review

---

*Diane Thomason, PhD, MN, RN, USA*  
*Jennifer Kawi, PhD, MSN, APRN, FNP-BC, USA*  
*Nada Lukkahatai, PhD, MSN, RN, USA*  
*Kirsten E. Connelly, MPH, USA*  
*Jillian Inouye, PhD, APRN, FAAN, USA*

#### Purpose

To develop a better understanding of effective parental support in self-management weight loss strategies for overweight and obese youth.

#### Target Audience

Clinical practice and research

#### Abstract

**Background:** Evidence of parental support in weight loss of overweight and obese adolescents provide significant decrease in overweight adolescents compared to standard care or self-help in the short term and over the long term (Oude Luttikhuis et al., 2009). However, there is limited information on which parental components are effective in supporting the adolescent's self-management of weight loss.

**Purpose:** To develop a better understanding of effective parental support in self-management weight loss strategies for overweight and obese youth.

**Methods:** This integrative review evaluates the effects of current adolescent self-management weight loss interventions in racially and ethnically diverse adolescents aged 10 to 18 years. Studies published between 2010 and 2014 were identified by electronic database searches. The Jadad Scoring of Quality Reports of Randomized Clinical Trials was used to examine the quality of the studies. Three people independently reviewed the articles based on the Jadad criteria.

**Findings:** Ten studies, which met the inclusion criteria, were included in the final review. Jadad scores ranged from 7 to 11. Nine of the studies included a parental component. Educating parents on self-behavioral monitoring, mentoring, and role modeling are promising components for adolescents self-managing their weight loss.

**Conclusion/Implications:** This review found that parental components played an important part in sustaining adolescent's weight loss across time. Effective parental components that helped parents provide support of their child in weight loss and weight loss maintenance included educating parents on positive role modeling of eating and physical activity, motivational techniques, culturally appropriate meal planning, skills enhancing adolescent self-efficacy, assisting adolescent with realistic goal setting, and problem solving. Including parental components, such as the latter, increases support and decreases feelings of segregation that adolescents may acquire when treated separately from the family (World Health Organization, 2000). Researchers should evaluate associations between parental support components and changes in adolescent Body Mass Index. By implementing parental components effective in supporting the adolescent that is self-managing weight loss could reduce the global prevalence of obesity among adolescents.

[diane.thomason@unlv.edu](mailto:diane.thomason@unlv.edu)

### Effects of Dance in Chronic Illness: A Systematic Review

---

*Alona Angosta, PhD, APRN, NP-C, USA*  
*Patricia K. Gatlin, PhD, USA*  
*Reimund Serafica, PhD, MSN, RN, USA*

### Purpose

The purpose of this presentation is to explore clinical trial studies on dance and its impact in chronic illness.

### Target Audience

The target audience of this presentation includes: nurse researchers, nurse practitioners, and registered nurses who work in clinical settings.

### Abstract

**Background:** Dance is a social and physical activity. It has been used therapeutically for thousands of years and was thought to influence healing (Ritter & Low, 1996). Research in dance therapy has substantially increased in recent years particularly research related to cancer and among healthy individuals. However, it is unknown whether dance impacts health-related outcomes among individuals with chronic illness. Additionally, empirical studies need to be evaluated to determine the effectiveness of dance as evidence-based intervention.

**Purpose:** This systematic review explored studies on dance and its impact in chronic illness.

**Methods:** A literature search was conducted utilizing electronic searches using PubMed, EBSCO, and CINAHL databases. When the keywords “dance,” “chronic illness,” “chronic disease,” “diabetes,” and “cardiovascular disease” were entered, there were 147 studies found. However, only 10 articles met the inclusion criteria of: (a) randomized control trial studies, (b) written in English, (c) published between 2005 and 2014. The Jadad scale (Berger & Alpers, 2009) was used for reporting the quality of the published studies. Three faculty researchers reviewed the studies separately and reached consensus using the scoring criteria.

**Findings:** Based on the Jadad scoring system, the scores ranged from 7-11 out of 13 points. Dance had positive effects on quality of life (QOL), pain, fatigue, and functional capacity among individuals with fibromyalgia and congestive heart failure (Baptista, Villela, Jones, & Natour, 2012; Belardinelli, Lacalaprice, Ventrella, Volpe, & Faccenda, 2008; Carbonelli-Baeza et al., 2010; Kaltsatou, Kouidi, Anifanti, Douka, & Deligiannis, 2014). Dance had positive effects on QOL, balance, and physical function among individuals with depression, anxiety, and Parkinson’s disease (Eyigor, Karapolat, Durmaz, Ibisoglu, & Cakir, 2009; Foster, Golden, Duncan, & Earhart, 2013; Hackney & Earhart, 2009; Mavrovouniotis, Argiriadou, & Papaioannou, 2010; Pinninger, Brown, & Thorsteinsson, 2012). Dance improved the blood pressures of individuals with hypertension (Maruf, Akinpelu, & Salako, 2013).

**Conclusions/Implications:** This systematic review provides a summary of the current state of research on the effects of dance in chronic illness. This review suggests that dance may be a safe and effective intervention in improving QOL, physical function, blood pressure, fatigue, depression, and anxiety in different populations worldwide.

## **The Effects of a Diabetes Support Group among Underserved: A Feasibility Study**

---

*Patricia K. Gatlin, PhD, USA*  
*Jillian Inouye, PhD, APRN, FAAN, USA*

### Purpose

The purpose of this presentation is to present the results of a feasibility study regarding the effects of a diabetes support group on underserved individuals with type 2 diabetes at a Federally Qualified Health Care Clinic.

#### Target Audience

The target audience of this presentation is nurse scientist and clinical nurses working in the areas of self-management, self-care and/or diabetes.

#### Abstract

**Background:** Diabetes is a global health care problem with increasing number in all countries. Particularly, underserved diverse individuals in the United States are among the hardest hit by diabetes, having higher rates of diabetes and poorer outcomes (Black, 2002; Hu, Shi, Rane, Jinsheng, & Chen, 2014; Lanting, Joung, Mackenbach, Lamberts, & Bootsma, 2005; Mokdad et al., 2001; Saydah & Lochner, 2010; Wild, McKnight, McConnachie, & Lindsay, 2010). Good self-management can improve glucose control and improve diabetes complications. However, this can be challenging to achieve due to multiple factors among the underserved (Black, 2002; Hu et al., 2014; Lanting et al., 2005; Mokdad et al., 2001; Saydah & Lochner, 2010; Wild et al., 2010). Peer support has been shown to improve glucose control and provide an avenue to develop self-care activities to promote health (Philis-Tsimikas, Adelaide, Lieva-Ocana, Walker, & Gallo, 2011; Thom et al., 2013; Wulp, de Leeuw, Gorter, & Rutten, 2012).

**Purpose:** The purpose of this study was to test the feasibility and examine the effects of a diabetes support group on underserved individuals with type 2 diabetes at a Federally Qualified Health Care Clinic.

**Methods:** The study used a pretest/posttest design to examine diabetes knowledge, diabetes attitude, and empowerment, after a 6-week support group intervention. Feasibility and acceptability of the support group intervention was assessed by examining ease of recruitment, retention rates, and overall satisfaction.

**Findings:** Successful recruitment of participants came from the providers at the clinic via flyers and word of mouth. Thirteen individuals initially attended the support group with 10 individuals (average age 53 years) completing the designed program, yielding a retention rate of 76.9%. Of the three participants that dropped out of the support group, one moved out of state due to financial reasons, one due to hospitalization and the other was due to unknown reasons. Overall satisfaction with the support group was 100%. Paired sample t-test indicated that participants' demonstrated significantly higher levels of knowledge about diabetes ( $p < .0005$ ), a significant increase in diabetes attitude score ( $p < .006$ ), and a significant increase in empowerment scores/self-efficacy ( $p < .0005$ ) following the intervention of the diabetes support group.

**Conclusions/Implications:** Findings from this feasibility study suggest that a diabetes support group can have a positive effect on underserved individuals and may result in increased diabetes knowledge, positive changes in attitude over the disease and increased empowerment/self-efficacy. Also, peer support programs can have global implications by improving diabetes self-care.

## H 28 - Cognitive-Behavioral Skills Building to Promote Healthy Lifestyle Behavior Change in Adolescents and Their Parents

### Evidence to Support Adolescents as Healthy Lifestyle Behavior Change Agents for Their Families

---

*Bernadette Mazurek Melnyk, PhD, RN, CPNP/PMHNP, FAANP, FNAP, FAAN, USA*

#### Purpose

Purpose of presentation is to disseminate results of this random controlled trial.

#### Target Audience

Target audience is all who will attend this conference.

#### Abstract

Background: There are numerous studies in the literature that support the key role of parents in facilitating healthy lifestyle behavior change in their children and families. However, evidence is lacking to support whether children and adolescents can be active change agents for healthy lifestyle behavior change in their parents and families.

Aims: The purpose of this presentation is to: (a) describe the healthy lifestyle behavior changes that occurred in parents and families of high school teens who were participating in a randomized clinical trial to test the efficacy of a 15-session cognitive-behavioral skills building program (COPE: Creating Opportunities for Personal Empowerment) on the teens' physical, mental health, social skills and academic outcomes, and (b) discuss implications for clinical practice and future research.

Methods: A randomized controlled trial was conducted with 779 culturally diverse high school adolescents enrolled in 11 high schools in the southwest United States. Adolescents who were taking a health course within these high schools received either the 15-session COPE Healthy Lifestyles TEEN (Thinking, Emotions, Exercise, Nutrition) program or an attention control program that covered common adolescent health issues, such as dental hygiene, acne, and motor vehicle safety. The COPE program consisted of 7 cognitive behavioral skills building sessions and 8 sessions focused on nutrition and physical activity. Each of the 15 COPE sessions, approximately 50 minutes in length and taught once a week by the health course teachers, had 20 minutes of physical activity integrated into the session. As part of the COPE program, teens were asked to take a newsletter home to their parents four times during the 15-week program that covered topics that they were learning and to review the newsletter with their parents. Parents completed an evaluation at the end of the 15-week program that asked questions regarding the program's helpfulness and what behaviors if any they changed based upon the program. For this analysis, post-intervention evaluation data from the parents of the teens in the COPE group was reviewed and analyzed. Frequencies were calculated, and string data was analyzed and categorized.

Results: One hundred-thirty four (82%) of the 169 parents of COPE teens who completed the post-intervention evaluation reported that the teens shared the informational newsletters with them. Of the parents who responded, 126 (82%) said the information was helpful to them. One hundred eight parents (69%) indicated they had changed their behaviors as a result of the teen sharing the program material with them. The most common behaviors changed by the parents were an increase in activity (33.2%), improvements in nutrition (24.3%), and an increase in healthy choices and lifestyles (20.1%).

Conclusions: Adolescents can indeed act as agents of healthy lifestyle behavior change for their families. Clinicians who care for adolescents to facilitate healthy lifestyle behavior change should recognize that they can be key in promoting healthy lifestyle behavior change in their parents. Schools should incorporate parent health promotion newsletters in their health curricula and assign homework to the teens to review this information with the parents. Additional randomized controlled trials are needed to build a body of evidence regarding teens as agents of healthy lifestyle change for their families.

## **Evidence of Cognitive-Behavioral Skill Use after a Physical and Mental Health Promotion Intervention (COPE for TEEN)**

---

*Stephanie A. Kelly, PhD, FNP-C, USA*

### Purpose

Purpose of presentation is to discuss cognitive-behavioral skills and describe use of this technique.

### Target Audience

Any researcher who wants to develop their expertise in cognitive-behavioral skills based strategies.

### Abstract

Background: COPE (Creating Opportunities for Personal Empowerment) Healthy Lifestyles TEEN (Thinking, Emotions, Exercise, Nutrition), a cognitive-behavioral skills building intervention, strives to develop lifelong healthy behaviors to enhance physical and mental health. Healthy lifestyle behaviors are difficult to attain and sustain. Evidence suggests behavior change may be sustainable when cognitive-behavioral skills are taught and used as the technique for change. Such strategies include: goal setting, cognitive reframing, problem-solving, relaxation techniques, social interaction and communication skills, mood monitoring, emotional regulation, and self-regulation.

Aims: The purposes of this presentation are: (a) to discuss cognitive-behavioral skills building as a technique for changing and sustaining healthy lifestyle behaviors to promote physical and mental health and (b) to describe evidence of use of cognitive-behavioral change strategies after a physical and mental health promotion intervention (COPE Healthy Lifestyles TEEN).

Methods: COPE Healthy Lifestyles TEEN was a large multi-site blinded randomized controlled trial in the southwest United States with 790 teens. For this analysis, post-intervention evaluation data of the COPE (intervention) group (n=318) was reviewed and analyzed. Frequencies were measured for dichotomous outcomes. String data was analyzed and categorized.

Results: Self-report evaluation data indicated 184 (57.9%) teens had changed their behaviors as a result of the program at post-intervention. Changes in behaviors were identified stemming from use of multiple cognitive-behavioral skills including positive thinking, setting goals, stress management, emotional regulation, communication and self-regulation. Behaviors changed included healthier nutrition choices, more physical activity, enhance communication, and healthy coping strategies for stress and anger.

Conclusions: The COPE Healthy Lifestyles TEEN intervention using cognitive-behavioral skills building techniques fostered healthy lifestyle behavior change in teens at post-intervention. Teens utilized a variety of skills suggesting teaching many skills may be more beneficial than just including one or two skills in an intervention. Interventions using cognitive-behavioral skills building techniques show great promise to assist teens in adopting healthy lifestyles.

## **“Real World” Adolescent Intervention Research Meets Randomized Controlled Trial Methodology: Lessons Learned**

---

*Diana L. Jacobson, PhD, RN, PNP-BC, USA*

### Purpose

Purpose is to disseminate findings and practical tips for conducting successful intervention research within school settings with adolescents.

### Target Audience

Target audience would be anyone interested in learning how to do intervention research within school settings.

### Abstract

The purpose of this presentation is to delineate some practical factors inherent in conducting successful healthy lifestyle intervention research within school settings with adolescents. Implementation of the Creating Opportunities for Personal Empowerment (COPE) Healthy Lifestyles TEEN (Thinking, Emotions, Exercise and Nutrition) Program was challenged by a number of delivery and setting issues. The development of the COPE intervention components and delivery methodology are guided by Cognitive Theory (Beck, 1979) which postulates that cognitive distortions, learned misconceptions and/or exposure to unhealthy environments can negatively influence an individual's emotions and behaviors. Utilizing cognitive behavior skills building techniques, behavior change is supported by increasing the adolescent's evaluation of his or her own emotional responses and behavior and by correcting misconceptions to help guide the adolescent to choose more adaptive, realistic attitudes in response to negative thoughts, emotions and behavior. Therefore, it is vital that intervention researchers examine how the critical inputs of the planned intervention and theorized mediating processes are linked to selected measured outcomes and implementation processes in order to be able to explain the study's results (Braden, 1998). Major points for discussion will focus on implementation challenges that center on recruitment and training of high school teachers to deliver the intervention with fidelity; presence of the problems of interest in the participants at baseline (i.e., overweight and obesity; depressive and anxiety symptomology); the emphasis on intervention components that facilitate negative schema change (i.e., homework completion; problem solving utilizing case scenarios; creation of positive self-statements); the creation and delivery of the comparison group, Health for Teens, attention control intervention; techniques utilized to increase parent involvement; and adaptation of the study team to school and health class scheduling, semester breaks and obtaining student information from the school districts (i.e., attendance, grades, and number of in or out of "house" suspensions). Approaches found to be successful in resolving some of the dilemmas and challenges encountered will be discussed.
